Sample (N)	307	100,0%

Made by the author based on the conducted research

Table 4 – IV electoral unit women – Did you make your voting decision prior to or during the election campaign?

	TOTAL	
	N	%
I made a decision before prior to the campaign	301	76,01 %
I made a decision during the campaign	44	14,33 %
I still have not made a decision	33	10,75 %
The campaign will not affect my decision	10	3,26 %
I do not know	7	2,28 %
I refuse to declare my views	1	0,33%
Sample (N)	396	100,0%

Made by the author based on the conducted research

Table 3 and 4 show answers according to gender to question: “Did you make your voting decision prior to or during the election campaign?”. In IV electoral unit there is no significant difference between men and women. In both cases, about 80 % of participants made the decision prior to the campaign. The difference that needs to be emphasized is that 14, 33 % of women made a voting decision during the campaign, in comparison to 9, 45 men.

Below is an analysis overview of the same question in the VIII electoral unit.

Table 5 – VIII electoral unit men – Did you make your voting decision prior to or during the election campaign?

	TOTAL	
	N	%
I made a decision before prior to the campaign	210	78,5 %
I made a decision during the campaign	29	9,45 %
I still have not made a decision	24	7,82 %
The campaign will not affect my decision	8	2,61 %
I do not know	4	1,3 %
I refuse to declare my views	1	0,33%

Table 6 – VIII electoral unit women – Did you make your voting decision prior to or during the election campaign?

	TOTAL	
	N	%
I made a decision before prior to the campaign	301	76,01 %
I made a decision during the campaign	44	14,33 %
I still have not made a decision	33	10,75 %
The campaign will not affect my decision	10	3,26 %
I do not know	7	2,28 %
I refuse to declare my views	1	0,33%
Sample (N)	432	100,0%

Made by the author based on the conducted research

Tables 5 and 6 show answers according to gender to a question: “Did you make your voting decision prior to or during the election campaign?”. In VIII electoral unit as well as in IV electoral unit, there is no significant difference

between women and men. A similar percentage of participants regardless of gender make their voting decision prior to the election campaign. In an urban environment, a lesser percentage of women and men make their voting decision during the campaign, which is an interesting piece of information. The difference in percentage is not great, but it represents interesting data. Both electoral units thereby confirm that Croatians make their decision prior to the elections and that the election campaign, and thus political marketing, do not influence greatly the results of the elections.

Table 7. – IV electoral unit – Did you follow the candidates’ campaign on the Internet and social networks?

Division of answers within each subgroup of participants (line)		I actively followed the campaign on the Internet	I saw the campaign on the Internet, but I did not actively follow	I did not see the campaign on the Internet	Campaign on the Internet does not affect me	Sample (N)
GENDER	Male	19,5%	29,0%	51,1%	0,3%	307
	Female	12,1%	33,6%	53,5%	0,8%	396

Made by the author based on the conducted research

Table 7 shows the results of following the political campaign in the digital environment. Results are almost identical for VIII electoral unit. There is no significant difference between men and women. Campaigns are equally visible to everyone, but men follow them actively to some extent. The fourth item on the list is surprising; according to it, 50 % of participants did not see the campaign on the Internet, which is almost impossible. Political subjects advertised on websites, social networks, search engines and other communication channels, which means that an active Internet user could not avoid them.

Table 8 – IV electoral unit men – Did the Internet campaign affect your decision?

	TOTAL	
	N	%
Yes, I found out information about candidates during the campaign	13	8,72 %
No, they did not affect me	135	90,6 %
I refuse to declare my views	1	0,68 %
Sample (N)*	149	100,0%

Made by the author based on the conducted research

Out of 149 participants who saw the campaign in the digital environment, only 13 of them stated that the campaign affected them, which is only 8,72 %. According to stated information, it can be concluded that men in IV electoral unit were affected by the political campaign in the digital environment in a very small percentage.

Table 9 – IV electoral unit women – Did the Internet campaign affect your decision?

	TOTAL	
	N	%
Yes, I found out information about candidates during the campaign	27	14,92 %
No, they did not affect me	152	83,97 %
I refuse to declare my views	2	1,10 %
Sample (N)*	181	100,0%

Made by the author based on the conducted research

Out of 181 female participants who saw the campaign in the digital environment, 27 of them stated that the campaign affected them, which is only 14,92 %. Compared to men, it is concluded that the initial hypothesis is confirmed – men are affected less by political marketing in a digital environment. The analysis of the same question item for VIII electoral unit follows.

Table 10 – VIII electoral unit men – Did the Internet campaign affect your decision?

	TOTAL	
	N	%
Yes, I found out information about candidates during the campaign	10	8,7 %
No, they did not affect me	104	90,43 %
I refuse to declare my views	1	0,87 %
Sample (N)*	115	100,0%

Made by the author based on the conducted research

Out of 115 participants who saw the campaign in the digital environment, only 10 of them stated that the campaign affected them, which is only 8,7 %. The result is identical to IV electoral unit, which means that there is no difference in the impact of a political campaign in the digital environment in urban and rural areas among men. 90,43 % states how campaign did not affect them. The aforementioned is a devastating fact, given very large investments in marketing experts who carry out the complete political campaign that includes the digital environment as well.

Table 11 – VIII electoral unit women – Did the Internet campaign affect your decision?

	TOTAL	
	N	%
Yes, I found out information about candidates during the campaign	13	7,18 %
No, they did not affect me	165	91,16 %
I refuse to declare my views	3	1,65 %
Sample (N)*	181	100,0%

Made by the author based on the conducted research

Out of 181 female participants who saw the campaign in the digital environment, only 13 of them stated that the campaign affected them, which is only 7, 18 %. Compared to men from VIII electoral unit, a political campaign in the digital environment had a lesser effect on women than on men.

To conclude, as stated in the introduction, Croatian voters make their voting decision prior to elections. Dissatisfied people left Croatia or do not vote on the elections. Most voters support certain parties due to their beliefs or personal gain. Croatia is a country with a very large percentage of workers employed in the public sector, which results in long-term voting for the party in power. Analysis of research results yielded the hypothesis: “Political marketing in a digital environment has a lesser impact on men than on women” is partially confirmed. In IV electoral unit, impact on men is 8, 7 %, while it is 7, 18 % on women. Generally concluded, IV and VIII electoral units observe a slightly bigger impact on women. The aforementioned result creates an opportunity for parties and marketing experts to improve the final e-marketing product, and to focus on women who represent a potential difference in the elections.

3. CONCLUSION

Marketing is based on satisfying the needs of consumers. Experts are trying to find new consumers and keep the existing ones by improving the attractiveness and quality of the product and based on knowledge gained through the sales results and management of repeated orders. According to all definitions of marketing, it can be explained as a process that ensures sales of products or services by satisfying the needs of consumers, i.e. by informing them on their needs.

Political marketing is a synonym to marketing, but on another market and with a different product. It denotes a set of techniques that aim at contributing to the adequacy of candidates with regard to their potential body of voters, to familiarize the largest possible number of voters with candidates, and each of them individually, and to emphasize the differences in comparison with competition, as well as opponents and to optimize the number of votes necessary to gain during the campaign using minimum resources. The goal of each political marketing is gaining political power. Main channels used by political marketing are electronic media (radio and television), print media (daily and weekly press, magazines...), display media (posters, billboards), interpersonal communication channels (personal contact) and the Internet. Political marketing combines traditional techniques with the digital environment, which has great potential for achieving success.

“Political marketing in a digital environment has a lesser impact on men than on women” is partially accepted. The research was conducted among voters of IV and VIII electoral units during the campaign for Croatian Parliament in 2016. Results yielded show that political marketing in a digital environment has a greater impact on women than on men. Political marketing in the digital environment has a great potential that is not fully used by Croatian political parties due to the political climate, consumers’ habits and traditional body of voters due to a lack of awareness of its potential.

VORWORT

Es ist uns ein Vergnügen, das Konferenzband "Interdisciplinary Management Research XV/ Interdisziplinäre Managementforschung XV" vorstellen zu können. Ein Buch aus dieser Reihe ist zum ersten Mal 2005 erschienen, als Resultat der Zusammenarbeit zwischen der Wirtschaftsfakultät in Osijek, Kroatien und der Hochschule Pforzheim, Deutschland, und insbesondere durch das Magisterstudium des Management. Die Zusammenarbeit der zwei genannten Partnerinstitutionen ist unter anderem durch jährliche wissenschaftliche Symposien gekennzeichnet, auf welchen interessante Themen aus verschiedenen Bereichen der Wirtschaft und des Managements vorgestellt und folglich in einem Band veröffentlicht werden. Jedes Jahr ziehen die wissenschaftlichen Symposien Akademiker anderer kroatischer, sowie ausländischer Universitäten, einschließlich Deutschland, Ungarn, Polen, Rumänien, Slovenien, Montenegro, Bosnien und Herzegovina, Serbien, Indien, Irland, Czechien, Israel, Italien, Sudafrica, Kanada, Litauen, Kosovo, Türkei, Belgien, Schweiz, USA, Slowakei, Dänemark, Mazedonien, Mexico, Zypern und Großbritannien an, die ihren wissenschaftlichen und professionellen Beitrag zur Diskussion über zeitgenössische Fragen aus dem Bereich des Managements leisten. Die Aktualität der behandelten Fragen, der internationale Charakter im Hinblick auf Themen und Autoren, die höchsten Standards der Forschungsmethodologie sowie die Kontinuität dieser Konferenzreihe wurden auch von der internationalen akademischen Gemeinde erkannt, weswegen sie auch in internationalen Datenbanken, wie Clarivate Web of Science, Thomson ISI, RePEc, EconPapers und Socionet, zu finden ist.

Die neueste Ausgabe von "Interdisciplinary Management Research XV/ Interdisziplinäre Managementforschung XV" umfasst 104 Arbeiten geschrieben von 257 Autoren. Der Erfolg früherer Ausgaben ging über die Grenzen der Länder hinaus, deren Autoren schon traditionell Teil der Reihe waren. Jedes der Autoren leistete einen bedeutenden Beitrag zu diesem fachübergreifenden Managementforum.

Als Herausgeber dieses Bandes hoffen wir, dass diese Reihe auch weiterhin Akademiker und Professionelle dazu bewegen wird, in Forschung und Beruf die höchsten Standards zu beanspruchen, und dass es weiterhin als Ansporn zu weiteren Formen von Zusammenarbeit unter Teilnehmern dieses Projektes dienen wird.

FOREWORD

It is our pleasure to introduce the book “Interdisciplinary Management Research XV/ Interdisziplinäre Managementforschung XV” to you. The first volume appeared in 2005 as a result of co-operation between the Faculty of Economics in Osijek (Croatia) and Pforzheim University (Germany), particularly through the postgraduate programme “Management”. The co-operation between these partnering institutions has been nurtured, amongst else, through annual scientific colloquiums at which interesting topics in various fields of economics and management have been presented and later published in the proceedings. Over the years, the scientific colloquiums have drawn the attention of academic scholars from other Croatian universities, as well as from other countries including Australia, Germany, Hungary, Poland, Romania, Slovenia, Montenegro, Bosnia and Herzegovina, Serbia, India, Ireland, Czech Republic, Israel, Italy, South Africa, Canada, Lithuania, Kosovo, Turkey, Belgium, Switzerland, USA, Slovakia, Denmark, Macedonia, Mexico, Cyprus and the United Kingdom each making a contribution in academic and professional discussion about contemporary management issues. Actuality and importance of the issues discussed, the international character of the book in terms of authors and topics, the highest standards of research methodology and continuity in publishing have been recognized by the international academic community, resulting in the book of proceedings being indexed in world-known data bases such as Clariavate Web of Science, Thomson ISI, RePEc, EconPapers, and Socionet.

The latest edition, i.e. ““Interdisciplinary Management Research XV/ Interdisziplinäre Managementforschung XV” encompasses 104 papers written by 257 authors. The success of former editions has echoed beyond the traditionally participative countries and authors.

As editors we hope that this book will continue to encourage academic scholars and professionals to pursue excellence in their work and research, and to provide an incentive for developing various forms of co-operation among all involved in this project.

Abstract

The aim of this paper is to set some scenarios for small and medium enterprises (SMEs) from a critical analysis of the provisions in the North American Free Trade Agreement (NAFTA) renegotiation, its challenges, and opportunities. The critical analysis departs from the questionable position of the withdrawal from NAFTA and their consequences for SMEs of not giving continuity through a process of renegotiation among the three partners. The method used is the critical analysis based mainly in some sources of information, analysis

of results of NAFTA, and the strategic examination of its challenges and opportunities for SMEs. Finally, the analysis establishes some possible scenarios post-NAFTA renegotiation and some strategic proposals for the SMEs.

Keywords: Challenge, NAFTA, opportunity, renegotiation, scenario, SMEs.

JEL: F13, F15, F20, F41, F43, F51, F53, F61, F62, N82, N86.

1. INTRODUCTION

The global economy has changed significantly in the last three decades especially due to technology advances with the widespread use of the internet for e-commerce and trade, affecting consumer habits, communication and managerial practices, supply chain management, etc. While the notion that trade is an engine of economic growth (Kravis 1970) and Lewis (1980) benefiting all the involved participants, an assumption that cannot easily be refuted theoretically, however, free international trade has never been implemented.

The approval of NAFTA in 1993 brought the three North American Countries, Canada, United States, and Mexico into an economic rationale according to the conclusions of international free trade theory which claim that allows each country for specialization based on comparative advantage. Free trade through specialization benefits all countries involved promoting economic efficiency and growth (Kondonassis and Malliaris, 1996).

Despite the serious and broader concerns of disparities in income and cultural and ethnic differences that could pose serious obstacles for economic and market integration among the three partners of NAFTA, 24 years of implementation and operation, the results confirm that the agreement has benefitted all the three partners. It also has confirmed that the two neighbors of United States, Canada, and Mexico are of considerable foreign-policy importance, (Ann Krueger (1992), which is to say that the political dimension is linked to economic decisions in NAFTA.

The renegotiations of NAFTA is a unique opportunity for economic analysts, to investigate, analyze and contrast the new and the old issues that have motivated the North American economic and market integration. Proponents and critics of the renegotiation of NAFTA agree on modernization and reevaluation of the agreement considering the challenges and opportunities, although they have contrasting views on the process of revision.

This paper addresses the main concerns on NAFTA provisions renegotiation and its impact on SMEs making a critical analysis of recent developments in strategic terms of challenges and opportunities. Finally, this paper develops some scenarios and make some proposals.

2. NAFTA RENEGOTIATIONS

NAFTA entered into force on January 1, 1994, as the first of a new generation and most comprehensive free trade agreement negotiated at the time (Villarreal and Fergusson, February 27, 2018). NAFTA was instrumental in developing closer trade and investment relations among the three countries: the United States, Canada, and Mexico. Through NAFTA, the United States and Canada could have more access to the Mexican market after the removal of tariffs and quotas and the U.S. market was opened to increased imports from Canada and Mexico. Tariffs phased out for sensitive products such as sugar and corn, after 15 years when the agreement went into effect to become duty-free.

NAFTA removed investment barriers, protected investors and provided mechanisms for the settlement of disputes. Hufbauer and Schott (1992) suggested that Mexico anticipated that NAFTA would reduce the threat of U.S. protectionism, would reinforce trade reforms and would provide Mexican SMEs with more opportunities for export to the United States. As a consequence, Mexico would raise the employment and income which could further increase the gains of Canadian and U.S. small and medium-sized business. For example, NAFTA integrated the motor vehicle industry by removing protectionist policies. NAFTA included liberalization commitments and specific exceptions to national treatment.

NAFTA lock in trade and investment liberalization among the three countries. Since NAFTA, the three partners have relationships of cooperation on issues of mutual interest, expanding economic linkages and forming integrated production, distribution, logistics, and marketing chains, improving working conditions and living standards of employees and consumers Villarreal, and Fergusson (February 27, 2018).

NAFTA market has become the largest destination for small and medium enterprises of partners. Mexico and Canada were the largest destinations of U.S. small and medium-sized enterprises with more than 95 percent of their

exports in 2014. Some economic analysts contend that Mexican economic reforms added resilience to its economy that will bring greater economic growth. The recent financial and fiscal reforms in Mexico create more competition in the banking sector increasing the access to finance and credit for small and medium-sized business

NAFTA represented the first opportunity for establishing labor and environmental provisions in a new type of relationships of cooperation among the NAFTA partners. However, some critics blame NAFTA for a decline in labor conditions, employment, and wages in the United States and for lack of improvement on labor and environmental standards (Hufbauer, Cimino and Moran 2014; U.S. Chamber of Commerce 2015).

The North American Free Trade Agreement initiated in 1994 linking the Canadian, Mexican and United States economies creating a market with 490 million consumers. The renegotiation talks began in August 2017. The economic model emerged out from NAFTA arrangements faces new challenges. The interdependence on trade among the three partners of NAFTA is challenged by a high percentage of U.S. content on Canadian and Mexican exports.

United States has officially proposed for updating the trade agreement with its Summary of Objectives for the NAFTA Renegotiation centered on modernization to address a fairer deal expanding rules of origin to include more U.S. content and to balance trade reducing bilateral trade deficits with Canada and Mexico. NAFTA renegotiation and modernization has been a priority for the U.S. Government and now it is also for Mexico.

The reason behind the U.S. renegotiation is because NAFTA is characterized by the President as the “worst trade deal,” that has resulted in a trade deficit with Mexico and Canada and has stated several times the potential withdrawal from the agreement. NAFTA renegotiation is a constructive alternative to strengthen economies. However, it is very debatable the use of trade agreement provisions to overcome the trade deficit because macroeconomic fundamentals determine trade imbalances (Bergsten, 2017). Renegotiation of NAFTA is more likely to affect the composition of trade partners, but it is very questionable its impact on the trade deficit. If in the renegotiation of NAFTA, there are no clear provisions it is not clear how is possible to reduce the trade deficit.

U.S. is seeking in the NAFTA renegotiations to enhance trilateral cooperation on security and energy sectors having more open access to invest and trade

in the oil sector. On the part of Mexico may seek to enhance the energy sector, mainly the state-owned PEMEX oil Company, to compete in the market.

Renegotiation of NAFTA includes the issues of energy trade, government procurement, IPR protection, rules of origin, and small- and medium-sized businesses. NAFTA has significantly benefitted the motor vehicles, auto parts, agriculture industries, and the small and medium businesses.

Only a few small and medium-sized businesses follow the key issues and potential outcomes of the renegotiation process of NAFTA.

3. BACKGROUND OF THE SMES

Small and medium business are living in an era of tremendous global development and change which requires decision making and policy implementation confronted by challenges and opportunities to shape their own developments and serve their best interests. The industrial sectors of automobiles, motor vehicles and parts, agriculture and small and medium enterprises have been significantly received benefits from the creation of NAFTA. Exports from the United States to Mexico have grown in motor vehicles and parts 262 percent. Agricultural exports to Canada and Mexico have increased by 350 percent.

Mexico and Canada are the largest market destinations for U. S. small and medium-sized enterprise's (Dubbert, and Sengenberger, 2018). NAFTA generates multi-million-dollar industries in the SMEs in most of the American states because of its business facilities and commercial advantages. In its 24 years of operation, 33 states have sold more goods and services to Canada and Mexico than to the rest of the United States. In 2016, the last exercise prior to the declaration of the commercial war, exports to Canada ranged from 9,000 million dollars from Washington State to 23,700 million dollars from Michigan. While the sales to Mexico went from the 2,000 million of Hawaii to the 91,700 of Texas.

Fiscal reforms in Mexico incentivize participation of SMEs in the formal, tax-paying economy by offering credit, home loans, insurance, retirements. Among the SMEs, NAFTA seeks to boost formal-sector productivity and employment. Small-and medium-sized enterprises employ over 60 percent of Mexican workers including the informal sector. Millions of jobs created by SMEs depend on NAFTA trade, which remains critical to workers, owners,

and companies to generate new opportunities. However, productivity in Mexican small businesses fell by 6.5% per year between 1999 and 2009 while during the same period, large companies increased by 5.8% per year (McKinsey Global Institute 2014).

Majority of small and medium enterprises (SMEs) participate and use NAFTA to save costs, in cross-border transactions although sometimes they remain dangerously passive as to its outcome. Since NAFTA went into effect, Mexico and Canada have evolved into the largest two export destinations for U.S. small and medium-sized businesses (U.S. Chamber of Commerce 2017). Across Canada, there are 109,000 small and medium-sized member businesses (Canadian Federation of Independent Business, 2018) out of which one in five are involved in foreign trade.

The issue of growing and strengthening small-to-medium enterprises (SMEs) that accounts for 90 percent of the worldwide business, is an important business case (Gasiorowski-Denis, 2015). SMEs constitute over 90 percent of exporters of goods and services in the three countries members of NAFTA. Currently, SMEs two-thirds import and one-third export either products or services (CFIB, 2018).

The resource-based theory and the capability theory of firms sustain that the internationalization process of SMEs requires resources and capabilities (Martineau and Pastoriza, 2016). Also, the institutional theory suggests that institutions and public policy play an important role in strategic decision making about locating, scaling and linking SMEs to value-added chains of investment, design, production, logistics, marketing, and international trade. Also, institutions and public policy supporting investments, credit, certification process, etc., are relevant to the internationalization processes of SMEs.

Competitive economics is critical for SMEs to cross-border trade and international trade procedures to achieve cost-effective solutions through the access to technology delivering speed, ease, and security such as the block change technology. Borders among the three countries have thickened due to the enforced security measures damaging the trade relationships. This situation gives an opportunity to find initiatives and procedures based on reciprocal collaboration to facilitate cross-border trading.

SMEs engaging in international markets make major contributions to the economy by being more productive Baldwin and Gu (2003) become more likely

to export (Melitz, 2003 and Baldwin & Gu, 2003) and having higher revenues, paying higher wages (Mayer & Ottaviano 2008), investing more on research, innovation and development having higher rates of technology adoption (Lileeva and Trefler 2010).

The innovation of SMEs boosts production, employment, and more competition to benefit consumers. Innovation in SMEs can come after better access to credit and other financial instruments that enable international and cross-border trade. Small and medium-sized enterprises (SMEs) can innovate and develop the capacity to conduct cross-border transactions of goods and services through the use of the internet, digital devices, reducing cost and space of firm size required. SMEs are heavy web and internet users to trade and to source products and services internationally. Besides, SMEs with high web use realize a higher percentage of sales growth on average and low web users had no presence or sales decline.

Martineau and Pastoriza (2016) suggest that education, experience and growth orientation personality of the SMEs owners are relevant factors in decision making to export. SMEs owners with a higher level of education and management experience are more positively correlated with export propensity because they are enabled to likely become an exporter of products and services.

Small and medium enterprises (SMEs) under the framework of the North American Free Trade Agreement (NAFTA) have to keep searching for new markets. Small and medium enterprises (SMEs) are efficient exporters contributing significantly to the economy of NAFTA members. Small and medium-sized enterprises among the NAFTA countries make up a growing percentage in the share of international trade. The state's members of NAFTA are committed to provide support and stimulate to establish mechanisms for SME to meet requirements for trade liberalization, encouraging greater participation by SMEs in regional supply chains aimed to export orientation. The agreement includes a Trilateral Dialogue to increase the efforts for access of SME to the North American Free Trade market.

Given the importance of the North American free market, many SMEs are concerned about the renegotiation process of NAFTA. Protecting the free trade fundamentals in the negotiations of NAFTA is a relevant matter to have settled the small and medium enterprises (SMEs). Matters on SMEs subject

to negotiations are the markets, strategic information sharing, and cooperative activities with other local, domestic and international business.

The renegotiation of the new NAFTA normal has positive and negative impacts on SMEs, generally determined by geography and industry. Large companies from the e-commerce sector have supported small and medium-sized enterprises (SMEs) to marketing, distribute and sell products to foreign markets, for example, “e-Bay enabled SMEs,” were exporters in Mexico, Canada, and in the United States. Regarding e-commerce, Mexico faces substantial challenges regarding public distrust on digital and online systems, low internet connectivity, etc. Despite this problem, the e-commerce market has grown (Export.gov, 2017).

SMEs need to adapt quickly the new trade arrangements to the new NAFTA normal in order to avoid potential harm manufacturing and services while benefitting others.

4. CHALLENGES OF SMES

A report of the OECD (2017) stated that “...a key challenge for many SMEs is to identify and connect to appropriate knowledge partners and networks”. The success for the SMEs depends on their “their access to strategic resources... such as education and training, innovation and infrastructure.”

The North American Free Trade agreement is a challenge for SMEs to gain preferred access to more than 500 million consumers. NAFTA partners are the largest destinations for small-business exports between each other. For example, U.S. small and medium-sized business represented more than 95 percent of all its exports equivalent to 25 percent of total value into the Canada and Mexico markets. 95 percent of U.S. SMEs are small and medium companies’ exports into the other members of NAFTA, Canada, and Mexico. The largest export destinations of U.S. small and medium-sized enterprises (SMEs) are Canada and Mexico representing more than 95 percent in 2014 and becoming the largest markets for U. S. (International Trade Administration 2016).

Canadian small and medium-sized firms that already trade with the other NAFTA parties, U. S. and Mexico, are not very or somewhat familiar with the agreement (Kelly, 2018). However, exports from Canada and Mexico to U. S.

have risen substantially since NAFTA. Similarly, cross-border investment has increased significantly as well. Over the past three years, the Canadian

Canadian and Mexican SMEs are facing the uncertainties of the NAFTA renegotiation with the possibility of the trade deal collapse.

SMEs face several challenges to position themselves getting support to achieve resources and capabilities aimed to create, develop and reinforce the links within the international value chain. Free trade among the three countries has been complex and diverse because the final product could have combinations of value added from all trading partners. Trade tariffs and trade barriers disrupt production chains of SMEs, which increase costs for consumers, reduce efficiency and competitiveness in production and thousands of lost jobs.

An important challenge is the reduction of low-value shipments requiring minimal custom paperwork and costs by supporting the digital marketplace and promoting inclusivity for SMEs. Engaged SMEs leverage digital platforms to access different markets. The existent integration in North America translates into high opportunity costs derived from inconsistent and incompatible regulations.

The eco-system for SMEs shares policy information among the different regions to access to the best practices of financial processes connected through a web portal that allows encoding invoices. SMEs optimize some internal processes of export initiatives through digitalization such as payments, invoices, settlements, and reconciliations to improve speed, security and ease of trade transactions. However, Hufbauer and Wong (2011) found that savings to customs, express shipping, SMEs and consumers from raising the threshold outweighed lost government revenue.

The majority of female-owned SMEs (51.9) and non-female SMEs owned (9.3) of all SMEs (49.7) grew between 1 percent and 10 percent of an average annual revenue between 2012 and 2014. The export propensity of Canadian small-sized SMEs in 2014 was 20.7 percent meaning the share of all SMEs that export Canadian female-owned SMEs follow the same trends as all SMEs but outshine female owned non-exporters in larger size located in export-intensive industries, education and experience, more likely to be born outside Canada (Office of the Chief Economist, 2016).

The propensity of micro-sized SMEs, between 1 and 4 employees, was 53.0 percent, tiny SMEs between 5 and 19 employees were 34 percent, small SMEs between 20 and 99 employees 11.1 percent and medium-sized SMEs between 100 and 499 employees were 1.6 percent. The industries of manufacturing, wholesale trade, and professional and technical services, have the highest export propensities of enterprises for exporting. In Canada, Ontario is the location where SMEs have greater propensity to export likely tied to industry (Office of the Chief Economist, 2016).

There is also increasing participation of female-owned exporting SMEs, as it has been reported by the Chief Economist (2016). According to this report, SMEs female owned represented only 15.7 percent and only 11.1 percent of all exporting SMEs. The data used is from the Survey on Financing and Growth of Small and Medium Enterprises with over 97 thousand female SMEs. This report examines the characteristics and differences between majority of female-owned SMEs exporters and non-exporters.

Canadian SMEs exporters are larger and have more control and ownership over relevant resources and capabilities than the other SMEs non-exporters (Orser et al. 2010). Investors and owners of SMEs challenge regulations using broad language and designed to further policies related to issues of environment, labor, safety, health, etc. (Hufbauer and Schott 2005).

Female's owners of businesses tend to be smaller more oriented towards local markets and less likely to participate in international markets. Female owners of exporting SMEs in Canada are larger in terms of number, more educated and experienced than non-exporting SMEs owned by non-females. Female SME exporters are more traditionally export-intensive industries, although they are smaller and are less likely to participate in less export-intensive than non-females (Office of the Chief Economist, 2016). Female SME owners face perceived and real obstacles to growth (Orser 2007) although may be less interested in growth as a revenue (Poggesi, Mari, and De Vita 2016).

5. RENEGOTIATION CHALLENGES OF NAFTA

Small and medium-sized enterprises is an issue for NAFTA renegotiation that could be modernized using as a reference other more recent agreements such as the TPP, considering recent technological and scientific developments,

managerial and regulatory practices. Regulatory challenges brought SMEs under the investor-state dispute resolution provisions of NAFTA have to be overcome as a source of controversies.

SMEs are being discouraged for growing and expanding businesses by the rising tensions in NAFTA renegotiations and the imposition of marginal trade tariffs. Also, the related industry is already suffering from the trade tariff already imposed on steel and aluminum by the United States, such as the documented case of the firm in the boating industry. Local business could suffer from the withdrawal as the case of Boating Ontario representing several SMEs across the province with more than 30,000 direct and indirect jobs is projecting a 20 percent job reduction in 2019. Rutherford, K. /CBC 2018).

Any disruption to the economic relationships of NAFTA could have economic adverse effects for the three partners on productivity, competitiveness, employment, investments, etc. Low skilled employment would decline by 125,000 for Canada and 951,000, for Mexico respectively (Walmsley and Minor 2017). Any change to NAFTA has a broad and varied impact on Canadian, Mexican and even United States small and medium businesses. If the United States decides, as it has been threatening, to pull out of NAFTA, trade with Canada will revert to 1988 signed Canada-US trade agreement (Galarneau, February 24, 2017). The case of Mexico is different not having a previous US-Mexico trade agreement and the impact on Mexican SMEs will be devastating.

Today the three economies are economically interdependent in such a way that any decoupling would be an economic catastrophe and risking the cooperation and shared intelligence to deal with strategic challenges. Among these strategic challenges are migration and regional security, free movement of goods and services, coordinated response to natural disasters and pandemics, etc. (Anderson, 2017).

United States is being renegotiated NAFTA with the goal of slapping tariffs on imported goods from Canada and Mexico driving to small and medium business owners to face a triple whammy that could wipe out the value of their business and their life's work. The Canadian province, Ontario and the cities of Monterrey in the State of Nuevo Leon or Naucalpan in the State of Mexico have a substantial manufacturing small and medium enterprises that are highly dependent on exports to the U.S. to survive. This situation may lead to small and medium-sized businesses to be sold by the owners who have worked very

hard in their lives are pushed to the only count on selling their business to have healthy finances.

Canada's trade commissioners and the Mexican government are concern about the imposed trade tariffs by the U.S. government and committed to including small business in the NAFTA trade agenda. Governments of Canada and Mexico support small and medium businesses to renew NAFTA on new grounds in international trade of goods and services despite the threats of U.S. imposed trade tariffs, which are damaging the U. S. SMEs.

SMEs business hiring is slowing cutting back jobs of companies, hurting workers by the escalating trade disputes. Employment and investments of car dealers in Canada and Mexico could be at risk if automobiles and auto parts tariffs happen imposed for imports to the United States and the new NAFTA deal is not secured.

Importers and exporters SMEs on NAFTA are under attack of aggressive trade policies such as the tariffs. United States has hit back the other members of NAFTA, Mexico, and Canada, for retaliating against tariffs with WTO complaint. The main challenge facing SMEs on NAFTA renegotiation is to reach an agreement with clear and stable regulations supporting the free fair trade and investments flows in North America, providing certainty to all the economic agents involved. Under the assumption that free trade must be a fair trade, Canadian small and medium firms have urged their government to stand against any increase on trade tariffs and at the end charging the duties and sales taxes to the consumers. Tax regimes and other legislation of each country member of NAFTA affect the SMEs and have an impact on final consumers. Tariffs are driving up the costs of imports needed by companies, including the SMEs.

Small and medium businesses have a passive approach to the NAFTA renegotiations considered to be a sense of fatalism. Most of the SMEs casually follow or are not following the NAFTA discussions and only a few small and medium-sized business have contingency plans in the event of U.S. Withdrawal from NAFTA. If the threat of U.S. to withdraw from NAFTA is achieved, there will be legal challenges from small, medium and large business to claim compensation for damage, members of Congress may take legislative action or blocking funding to carry out the withdrawal.

The existing substantial research demonstrates that smaller and medium companies are likely to be hardest hit by the uncertainty of NAFTA withdrawal

because they respond to policy uncertainties by reducing investments, jobs, and risks (European Commission, 2016), which tend to be harder to absorb when having few customers to spread risk among them. The cost of U.S. withdrawal from NAFTA would increase the cost to more than \$ 50 billion U.S. Dollars.

A little more than half of and medium-size businesses are aware that the discussions will lead to a successful renegotiation of NAFTA or with little effects. Less than half of SMEs are aware that the withdrawal from NAFTA would have negative effects in the industry and the other half is aware of a negative effect on individual businesses. Canadian small and medium-sized businesses are aware of the need to back up a plan to face the tariff disputes.

The outcomes of NAFTA renegotiations will have direction on policy implications for the broader relationship of economic cooperation on investment, trade, labor, environment, etc., among the parties. The renegotiated NAFTA partners have an opportunity to develop policy guidelines and constraints to SMEs on trade interventions to prevent and preclude new trade frictions in the future. The new generations require that NAFTA renegotiation expands upon further liberalizing trade and investment, creating new markets of goods and services to provide further benefits in terms of job creation, better wages, major quality and lower prices of goods and services, economic efficiency, etc.

Some of the relevant challenges that NAFTA renegotiation have they should include stronger and more enforceable labor regulations and protections, provisions on potential currency manipulation, and stricter rules of regional origin. The complexity of the rules of origin application add to the traditional trade costs some additional administrative costs for small and medium enterprises which lead not to be benefited of NAFTA tariff preferences and take advantage of the most favored nation (MFN) tariffs to import products and services. NAFTA's rules of origin are toughest and burdensome for SMEs as an estimated 7 % in compliance costs. Tightening rules of origin add costs to trade that in turn could be costly to consumers and may introduce inefficiencies for businesses (Freund. 2017).

More than half of small and medium-sized businesses will pass down the costs of tariffs to consumers or absorb costs and reducing investments, which lead to reduce competitiveness. NAFTA renegotiations have the potential to affect an impact on developments made on issues of common interest between

the three countries for the last two decades in cooperation in areas of security, energy, and competitiveness, migration, etc.

Concerns over NAFTA labor and environmental provisions challenge the renegotiation of NAFTA. Environmental regulations and programs could be challenged under a framework of the trade agreement and not under national trade laws to guarantee a legitimate nondiscriminatory implementation. Environmental regulations, standards, issues, and concerns are usually challenged under dispute resolution mechanisms (Gaines 2007, Sinclair 2015). Sustainable development should be a core commitment in any new framework of renegotiated NAFTA. Renegotiation of NAFTA's implies the inclusion of regulations related to environmental concerns to manage the environmental challenges (Torres 2002, Carpentier 2006).

For example, Canada had faced 35 challenges on environmental regulations concerning pollution control, resource management, toxic waste disposal, mining, lumbering, etc. (Sinclair 2015). An ongoing action is a challenge brought by an oil and gas company against a Quebec's fracking ban (ICSID 2017). The United States has been challenged by 20 claims including six challenges to environmental regulations and resource management and have not paid out compensation (Alvarez and Park 2003). Mexico has faced 22 challenges of which only 4 cases involved environmental issues. The most critical has been the case of *Metalclad* as an abuse of the investor-state dispute settlement structure. This case confirms that the dispute mechanisms systematically favors investor interests to the detriment of the environment and the public.

It seems that the proposals on trade policymaking in NAFTA renegotiation encompasses environmental and social concerns and issues including income distribution, public health, labor rights, worker dislocation, and poverty alleviation, etc. As a priority on the NAFTA negotiation, labor, and environmental standards should be updated, improved and enforceable to comply, for example with the Trade Promotion Authority (TPA) objectives for labor.

6. OPPORTUNITIES

The NAFTA renegotiation offers a unique opportunity for economic analysts to investigate, analyze and contrast the issues related to SMEs that have motivated the economic integration process in North America. SMEs have a

large stake in NAFTA renegotiation because they have a very significant market of products and services. Renegotiation of NAFTA is a new opportunity for SMEs to assess cross-border market conditions and opportunities to improving trade related to labor and environmental collaboration.

The renegotiation of NAFTA could provide an opportunity to modernize certain related issues to SMEs exports and imports. Small and medium-sized enterprises is an issue for NAFTA renegotiation that could be modernized using as a reference other more recent agreements such as the TPP, considering recent technological and scientific developments, managerial and regulatory practices. Modernization of NAFTA building on shared interests, commercial and security ties requires to SMEs to update technological developments and agree on new rules of governing digital flows, financial services, e-commerce, export of digital goods and services, energy, etc., to take full advantage of new opportunities. For that, it is also required protection of intellectual property on digital contents.

The renegotiation of NAFTA offers the opportunity to governments of the three countries of North America to create fair trade for SMEs and protect their local interests in accordance to the business communities in order to build relationships of cooperation and harness the benefits of the agreement. Also, NAFTA renegotiated could contribute to creating new opportunities for investment and trade for small and medium-sized enterprises in North America, having a positive effect on employment.

The renegotiation of NAFTA has the opportunity to make it more progressive by strengthening among other provisions, the ones related to SMEs, labor, and environment. International trade when expanding the export markets must benefit the three countries members of NAFTA, ensuring that exports and imports of products and services for small and medium-sized companies can be done easily, with cost efficiency, thus benefitting consumers and SMEs.

The opportunity cost of low-level achievements and commitments in NAFTA is higher due to the existing deep integration among the three national economies and markets. A set of negotiating objectives to update NAFTA provisions could prioritize fair free trade of goods and services of SMEs, inclusive and responsible by incorporating mechanisms of cooperation related to labor environment standards, energy security, transparency and anti-corruption, etc.

Among the NAFTA negotiating objectives should be included provisions on government anticorruption (Corchado, 2017). Also, trade relations should not remain separated from security cooperation in the relationship (Wilson, 2017).

The governments of Canada, the United States, and Mexico agree on the inclusion of a small and medium-sized business chapter in the renewed agreement, even amid the uncertainties of the renegotiation process of NAFTA. However, the awareness of the renegotiations of NAFTA remains low, but interest in partnering with small and medium companies among the parties as an opportunity to develop in international markets is high. The Canadian and Mexican governments have committed to modernizing NAFTA by staying at the negotiating table, although the renegotiation is unclear.

The modernization of NAFTA requires to update the new labor, digital and environmental developments strengthening data privacy and intellectual property rights. Renegotiation of NAFTA offers an opportunity to address the issues of efficient environmental regulations and SMEs trade and environment dynamics to establish goals, programs, procedures, and institutional arrangements toward a more sustainable future (Rockstrom and Klum 2015, Sachs 2015).

For everyone small and medium-sized business harmed by free trade under NAFTA, there were five that came out ahead and got insulated from international competition (Canadian Federation of Independent Businesses 2018). Also, SMEs owners born in foreign countries are more likely to export despite that they may have fewer opportunities compared to national – born owners (Orser et al., 2010). A small or medium business owner being born outside the country of citizenship might make it more likely to seek international opportunities, but it might make it harder to grow a business, a key component of exports. More education, experience and being born in a foreign country are factors that lead to greater export opportunities.

U. S. small and medium business leaders would like to expand NAFTA as an objective of an opportunity to grow U.S. exports in both Canada and Mexico, the neighboring and partner countries, but the trade tariffs recently imposed are complicated and are a large burden for the renegotiation.

Small and medium firms are up to the challenge of building relationships with local and foreign business communities to harness the benefits of rene-

tiated NAFTA. The cross-border growth of SMEs is lagging behind, missing business opportunities on their contributions to local marketplaces and economies, mainly for not having full access to infrastructure, credit, knowledge, regulatory expertise and competitive technology (Gasiorowski-Denis, 2015). A regional vision on small and medium-sized business opportunities could help ramp up the infrastructure of all the three partners.

7. PROPOSALS OF CHANGES AFTER RENEGOTIATING NAFTA

Any change on NAFTA should affect small and medium business as different, varied and broad as the nature of business itself. Renegotiations of NAFTA have an impact on manufacturing and services SMEs not only determined by industry and location while potentially affecting by benefitting those of one country and harm others from the other countries, such as the case of textile manufacturers and clothing retailers.

A fair-trade deal for SMEs must have reciprocal duty-free access for goods and services and trade balanced to expand competitive market opportunities for the three NAFTA partners.

Mexican SMEs have great limitations that restrict integration and position themselves at the lowest levels of the value chain, mainly due to the competition of US and Canadian SMEs. Thus, technological transfer and economic impact are not the best for the regions where the SMEs are settled. Mexican SMEs explore possibilities to get involved and integrated into international investment, production, logistics, and trade flows, as it has been reported by the analysis of Hernández and Carrillo (2018) on aeronautics companies taking advantage of strategic global market location, availability of resources and capabilities, favorable public policy and administration and local integrators.

However, local SMEs to get insertion and integration into the value chain of the aeronautics sector require to meet several factors (Hernández, 2015) and to overcome barriers related to a vertical integration (Carrincazeaux & Frigant 2007) large investment, dynamics of production and quality issues.

In Baja California, some SMEs counting on access to required resources and capabilities entered the aerospace sector. The study of Hernández and Carrillo (2018) found that SMEs holding a certification may have the capacity to supply

at different levels of the value chain after overcoming the obstacles of meeting the requirements of production and facing the complexity of management.

NAFTA affects employment and jobs in small and medium-sized enterprises that rely on high-volume trade with neighboring partner countries. The death of NAFTA may result in potential vanquish of jobs at the small and medium-sized businesses that rely on trade between the country members. In other words, among the benefits, the SMEs create the needed employment. To address employment, jobs and wages challenges posed by technological developments and macroeconomic policies to EMS, it is not through protectionism but through restraining a robust social safety net through provided by better regulations and strong enforceable labor laws.

SMEs in the dynamic industrial sector offer diversification of products and services for potential and real international markets. However, NAFTA renegotiated should not include increased levels of protection and strengthen the rules of origin by increasing contents requirements for one partner.

The proposal on the rules of origin should be based on North American content to avoid contentions among the countries.

SMEs need to adapt to whatever the changes of the renegotiation details might be which may involve a disruptive flurry of activities. Changes on NAFTA normal as the result of negotiations will affect profoundly the business models of SME due to disruptions on reserves and redundancies to protect against interruptions on the value supply chain. Suppliers supporting the activities of SMEs are being destabilized by the ongoing trade renegotiations giving rise to speculations and doubts on trade policy. To emerge from this period of trade and economic destabilization, SMEs need to have and maintain a strong resolve as well as the capacity to nimble respond managing change out of this tumultuous chaotic situation (Galarneau, 2017)

After renegotiations of NAFTA, the SMEs will need to identify their new consumer markets and to design new business models, new suppliers, logistics and transportation modes of goods, etc.

Stakeholders and public-private partnerships could be involved in the formulation of public policies and influence SMEs regulations to improve and make easier cross-border trade. The public-private partnership is a model that can serve to SME for knowledge sharing and make information accessible such

as the partnerships between MasterCard and IDB Export-Import Bank and the International Trade Commission.

Small and medium-sized businesses are optimistic about the renegotiations of NAFTA despite that prospects turn around their upbeat attitude due to escalating disputes between the proposals of partners. SMEs remain as hot commodities to be sold as they should expand their current business while buyers are willing to pay more. Thus, SMEs to be sold are growing and increasing the median revenue in the marketplace.

On the NAFTA renegotiations, an issue that is a priority for Mexico is the inclusivity of SMEs. Negotiated NAFTA could encourage greater participation by SMEs in trade and boost competitiveness. Transparency for SME and macroeconomic knowledge are potential issues to be developed. A core value of the renegotiated NAFTA should be transparency and accountability of market regulations to expand opportunities of SMEs for public institutional engagement with a proper governance system arrangement to set up the new agreement.

The NAFTA renegotiation should address the effects of the potential impacts of trade on the environment, labor and associated social conflicts such as the proposed environmental reviews of trade agreements (Salzman 2001). The renegotiated NAFTA could state that each country's environmental laws, regulations, and standards must reflect national priorities and preferences to be considered NAFTA-consistent unless a challenge can demonstrate the contrary, with convincing evidence. Therefore, local environmental challenges can remain in all three countries and must be nondiscriminatory. NAFTA renegotiation should draw from the experience of the model developed by the European Union.

8. NAFTA RENEGOTIATION SCENARIOS AND PROPOSALS

Canada and Mexico are already preparing for a post-NAFTA scenario, waiting for some conciliatory signal from the other partner in NAFTA, United States, after the threat of withdrawing from the agreement, but still in dialogue. In fact, both countries are launching to seal new business alliances and negotiating with the Trans-Pacific Partnership and with nine other markets. However,

if United States withdrew from NAFTA, Canada and Mexico are willing to maintain it.

Mexican and Canadian small and medium-sized business need to prepare to an eventual break up of NAFTA. However, trade ministers of the three partners have stated to be committed to “an accelerated and comprehensive negotiation process that will upgrade our agreement and establish 21st century standards to the benefit of our citizens”. (Office of the USTR 2017).

One possible scenario for Canadian SMEs if NAFTA dies, is the resurrection of the Canada-U.S. Trade Agreement while the scenario for Mexican SMEs is to move to the World Trade Organization (WTO) tariffs. In the scenario of ending the NAFTA, Canada has the option to apply the bilateral free trade agreement between Canada and the United States. Resurrecting the Canadian-U.S. bilateral free trade agreement is a limited option for SMEs of both countries since it still requires action from the Canadian Parliament and U.S. Congress. It is hard to imagine passing on an opportunity for SMEs. Mexico has the option to pursue a bilateral agreement with Canada and the United States.

For a small or family-owned business that not have the resources and capabilities to develop some business strategies to survive and grow under the scenario of the NAFTA withdrawal. It is important for SMEs to find ways and establish initiatives for strategic alliances and partnerships to complement business efforts with collaboration among other institutional public and private organizations to maximize competitiveness and efficiency.

In a scenario in which NAFTA continues as an agreement between Canada and Mexico, SMEs from both countries, exporting or importing could operate under the actual tariffs and rules and the challenge could be the transshipment of products and services between Canada and Mexico through the U.S. territory. In this scenario, the U.S., could impose non-tariff barriers, longer inspections at the borders, etc., just to make trade between Canada and Mexico more complex and difficult. U. S. has mused about imposing 20% tariff on imports from Mexico aiming to fund construction of a border wall.

SMEs should design scenarios in front of the potential NAFTA withdrawal and their differentiated impacts on trading among the parties. The scenario should prepare SMEs for the potential end of NAFTA. One of these scenarios, “Just in case Plan” has been designed for the Small Business in Western Canada

establish a committee to promote government procurement and identification of opportunities for training, a business interested in becoming trading partners, development of databases, consultations and other activities related.

Granting access to Canadian sub-federal procurement, US federal government procurement, and Mexican government procurement system is beneficial for SMEs suppliers and providers of goods and services. This granted access to government procurement would provide business opportunities for SMEs, increasing transparency y reducing institutional corruption.

Entrepreneurs and business managers of SMEs will need to design and implement a long-term strategy with short term alternatives to ultimately achieve success in this new world order of trade protectionism (Galarneau, 2017). SMEs have to source the best available data and information to design and implement strategic decisions to face uncertainties.

Regarding the NAFTA renegotiation issues on agriculture-related objectives should be the proposal to establish new regulations for seasonal and perishable products with the corresponding separate domestic industry provisions in antidumping and countervailing duties proceedings Decisions on antidumping and countervailing duties can be challenged through a mechanism to review determinations before an extraordinary challenge committee (ECC).

A major issue for NAFTA renegotiation is the mechanism of Investor-State Dispute Settlement (ISDS) to afford greater protection to domestic and foreign investors. NAFTA renegotiation proposes effective and adequate protection of intellectual property rights.

The proposals for NAFTA negotiations include government procurement practices and opportunities for government contracts to U.S. firms, severely restricting opportunities for Mexican and Canadian companies. Currently, NAFTA prohibits preferential treatment and gives equal access to the three partners companies. Foreign SMEs firms and domestic SMEs have the same rights, protections, and benefits which require national governments to give “fair and equitable treatment”, compel fair compensation for expropriated property (Hufbauer 2016) and challenge discriminatory treatment.

Institutional comprehensive programs and policies are needed to support SMEs to achieve and upgrade potential capacities and develop organizational and technological capabilities, which may be aimed to facilitate access mecha-

nisms that allow them to insert in the integration and internationalization processes of value-added chains. Financial and other programs aimed to strengthen the international trade processes of SMEs are necessary to support these companies that provide important benefits to the economies of the country members of NAFTA.

Workers would like to have higher wages in the case of Mexico, but government considers that the labor policy is a domestic matter and should be excluded the discussion in renegotiations of NAFTA (Quinn and Martin, 2017).

Entrepreneurs and business managers of SMEs will need to design and implement a long-term strategy with short term alternatives to ultimately achieve success in this new world order of trade protectionism (Galarneau, 2017).

The renegotiated NAFTA should be more flexible than the original one in many provisions related to SMEs, including on rules of origin that could soon become obsolete. The new NAFTA has the opportunity to fully take into account the potential development of a vertiginous technological change.

To make an analysis of the main factors involved in the process of NAFTA renegotiation to help the decision and policymakers to meet the challenges posed to SMEs by the recent developments in the economic process of globalization, political power, regional market, fair trade, investment, technological changes, etc., all the stakeholders must be engaged in the design of policy solutions to the difficult and complex challenges confronting the SMEs in the renegotiated NAFTA.

9. CONCLUSIONS

NAFTA renegotiation is a good opportunity to realize the economic cooperation relationships among the SMEs of partners as a new habit of a fair-trade strategic partnership in order to take full advantage of all the economic opportunities it has created. The renegotiated NAFTA must facilitate trade by small-and-medium-sized enterprises, considering that these SMEs constitute a majority of exporters in the U.S. and Canada.

NAFTA as the North American free market has given SMEs an unprecedented amount of opportunities and choices that have enabled to realize the critical components of trade liberalization. NAFTA has been largely beneficial to the three country members and should be renegotiated, modernized to reflect

developments and maintained because it is a valuable opportunity SMEs to embolden the gains provided by NAFTA. Focus on issues that sidestepping controversy that make a positive difference for SMEs in the renegotiated NAFTA could create more jobs of quality and provide the workers with more security.

Business leaders, politicians, government officials, business organizations, communities, companies, employees, etc. all should be concerned on the processes of NAFTA renegotiations to expand opportunities on fair trade and environmentally sustainable development.

Provisions in NAFTA renegotiation could be used to modernize it through the deepening of commitments and further cooperation of SMEs addressing all the challenges. All the options should be on the table for modernizing NAFTA through a process of renegotiation, to boost North American competitiveness of SMEs and better address the conditions of international trade, commerce, and investment, challenge regulations for liberalizing and reforming the agreement.

Renegotiation of NAFTA should further advance trade liberalization of SMEs goods and services instead of protecting national trade interests and avoiding regulations that reduce trading opportunities such as more restrictive rules of origin or public procurement requirements.

Abstract

The root of social crisis originates in the goals of human activity and the way in which man transforms the natural capital into his private capital. Consequently, alternative ways of development have been looked for, which need to respect the harmony between nature (environment) and the human community. There are various ecological parties in the society such as state, economic entities, and civil society. They may also have their own ecological policy, but they need to act simultaneously in order to achieve the ecological goals of the society. Everything depends on the ecological awareness of the society. When human activities start to affect the natural resources, sustainability acquires social significance. This is the reason why the concept of sustainable development needs to be interpreted both scientifically and professionally and not in accordance with the current interests of different interest groups. Tourism, the

driving force of both the Republic of Croatia and its islands, results in intense pressure on its coastal area during the tourist season. Recent law regulations try to align the economic and ecological policy of the state. Consequently, the Croatian Parliament passed the Island Act in order to encourage sustainable development of its islands through the project conducted in accordance with the provisions of the Initiative and the Smart Islands Declaration. Bearing in mind the abovementioned starting points, the center of this thought is recognition and analysis of the present situation in terms of sustainable development of the Croatian part of the Adriatic and implementation of the Smart Islands Declaration. The findings of this paper, as well as some of the subjective opinions, are dedicated to all the interested parties which may find them helpful when looking at certain encouraging but also warning indicators.

Keywords: *strategy, sustainable development, the Smart Islands Declaration, the Republic of Croatia*

1. INTRODUCTION

Contemporary lifestyle around the world, unfortunately, triggers an increasing level of violence towards man and nature. Likewise, the aggressiveness of tourism, the most prospective industry of the day, threatens the areas that are relentlessly being exploited. The concept of sustainable development appeared as a compromise solution which, besides further economic growth and development, implies social prosperity and ecological sustainability. The sustainable development of tourism assumes a complete change in the developmental paradigm, i.e. of most of the assumptions which the present development of the Republic of Croatia was based on. Sustainable development indicates the ways and manners of economic development and, when it starts to stall, it needs to be discarded and replaced with other ways and models because keeping the existing ones would lead to harmful consequences for the entire society. In this way, sustainable development is accomplished through the dynamic economy with full employment, economic, social and territorial cohesion, a high degree of education of citizens, a high level of protection of health and environmental protection.

2. SUSTAINABLE DEVELOPMENT OF TOURISM

Sustainable development of tourism can be defined as a balanced economic and social tourism and the tourism that is enduring for the environment. Sustainable development of tourism, based on ecological principles, occurs as a contemporary stage of tourism development and the reply to the unsustainability of mass tourism. Sustainable development of tourism meets the needs of tourists and domestic population and at the same time preserves the resources for future development. The concept of sustainable development of tourism is not an “anti-developmental” concept, although it points out the limits of development, which need to be considered when tourism development is considered. Sustainable development of tourism starts from the assumption that resources are limited and searches for a way to define these limits and, in accordance with it, possible boundaries of development (Vujić, 2005, 23).

Table 1. Characteristics of sustainable development of tourism

ECONOMIC PROSPERITY	Competitive and cost-effective business activity
	A high-quality source of employment
SOCIAL BALANCE AND COHESION	Tourism which improves the quality of life of the local community
	The involvement of the community in tourism planning and management
PROTECTION OF THE ENVIRONMENT AND CULTURAL HERITAGE	Reduction in pollution and environmental degradation globally and locally
	Tourism which enhances the distinctiveness and diversity of cultural heritage

Source: http://www.rolandberger.hr/media/pdf/rb_press/Roland_Berger_Tourism_Croatia_20081121.pdf, (access 16.03.2019.)

For achieving the long-term sustainability of tourism development, it is essential:

- to understand, recognize and meet the needs of tourists because, if their needs aren't met, they will share the negative implications of their personal experience with everybody around them, which greatly harms the image of the destination
- to provide the prerequisites for a profitable business activity of the subjects on the market;
- to invest in education and training of the employees in tourism at all levels because of the distinct personal contact with guests and the need for educated management, and to insist on the protection and renewal of natural resources as a primary resource of the Croatian tourism;

- ♦ to respect cultural values and diversity of localities and residents, i.e. destinations and their inhabitants, who have a direct benefit from tourism development. Their relationship towards tourism and tourists is vital for the impression a country leaves and it influences the satisfaction of guests and the overall level of tourism benefit;
- ♦ to ensure the continuous active role of a country, which greatly effects the tourist potential of a country through the development of infrastructure, updating the legal legislation, etc. In the long term, it has enormous benefits from tourism development.

The management of sustainable development is increasingly developing when human activity negatively influences the natural processes and sustainable development moves beyond scientific debate and develops as a social process of the 21st century (Črnjar & Črnjar; 2009, 82).

2.1. FACTORS OF SUSTAINABLE DEVELOPMENT IN TOURISM

The key factor in the implementation of sustainable development in tourism is certain people, who contribute to it by having different roles and actions. Primarily, these are tourists, whose behavior directly effects sustainability. Tourists also cause numerous kinds of natural disorder, particularly in the animal kingdom (Črnjar & Šverko, 1999, 41). Furthermore, in this category, there are the companies whose business activity relates to tourism, i.e. the employees of these companies who directly or indirectly effect the sustainability because of their need to renovate their facilities for the accommodation of tourists. Construction in tourism is one of the biggest causes of devastation, especially the coastal one, because of the need to organize the free time of tourists including numerous sports and recreational areas for tourists. The local population is one of the factors of tourism development, but it also plays the part in the development of sustainable tourism of a tourist destination in terms of the culture of the local community, which is inevitably and irreversibly being changed by the development of tourism. The local community needs to be able to accept the new inputs, in the case of tourism the tourists, either for a shorter or a longer period and despite this continue to function without social disharmony that these inputs can lead to if the development is not carefully planned (Vujić, 2005, 17). Finally, public services also have a direct or indirect influence on sustainability. All the mentioned types of ecological influences of tourism - both

the ones caused by the organizers of tourism and the ones caused by tourists themselves - are most evident on the homogenous natural localities which are often the most developed and visited in terms of tourism as well, such as traditional coastal and mountain areas, and in those rural zones which have become completely involved in tourism. According to the Developmental Action Plan of the Green Tourism (Institute for Tourism, 2016, 8-10), the most significant influence on the environment is generated when travelling to and from a destination, i.e. by the transport of tourists and the emission of the greenhouse gasses and other polluting agents related to it into the air, water and the sea. Unregulated increase in tourist capacities is a great consumer of the most attractive and valuable space, it generates focused pressures on resources and environmental functions, creates problems in the logistics of the communal services and aesthetically devastates the scenery. Some commonly known examples of excessive construction of the coast can be found in numerous developed tourist destinations of the mass tourism of the Mediterranean and in the last ten years in a growing number of cases of tourist development on the Croatian coast. On one hand, the healthy and attractive environment is one of the basic resources for most kinds of tourism, which means that its preservation is one of the key prerequisites of their competitiveness and sustainability. The Developmental Action Plan¹ (Institute for Tourism, 2016, 13) further proposes that the green practice in tourism has a positive effect on informing and raising awareness of the visitors of the importance and direct experience of the possibilities of the choices and practices that are environmentally more responsible. The green tourism can play an important role in one of the leaders in the transition towards the green economy.

The main instruments and measures for the sustainability or making tourism “greener” include: recognition and appreciation of the aspects of environmental sustainability of the developmental plans in tourism at all levels, from the national to the local level of a tourist destination; plans that appreciate structural capacity by zoning the activity in space and time and, thus, protect the attractive basis, i.e. they don't allow those tourist activities that degrade the resourceful basis of the area; investment of the public sector in public goods which constitute

¹ The Action Plan was presented in 2016 and was based on the Developmental Strategy for Tourism to 2020 with the purpose of determining the steps to develop one of the key tourist products in the years that follow. The intention of the Action Plan is to serve as an additional catalyzer to use from the European structural and investment (ESI) funds and Union Programs.

the infrastructure for the green tourism, including the protection and sustainable management of natural and cultural heritage, better waste management, public transport, water management, and the like; creating the surroundings which encourage and support the investment in the green tourist products and making the current tourist products greener, which includes tax reliefs and stimulations for the green investments; integral technical, financial, marketing and administrative support for small and medium-sized enterprises; enabling networking; education; enabling the implementation and providing credibility of the environmental standards; investments of the private sector in making tourist products greener through the investments in the green technological solutions, implementation of the processes and procedures which decrease environmental pressures; monitoring the “sustainability” of the tourist development by using some of the developed standards and indicators of sustainability of tourism at all the levels of service provision in tourism, from the national level and the level of destination to the level of a singular subject; active and adaptive management of the “green” processes by integrated usage of all the mentioned measures and based on the information gathered by a set system of sustainability observation; raising the awareness of tourists of the ways they can contribute to a more sustainable and higher quality tourism. They, the natural and cultural heritage and the community they visit that accommodates them all benefit from that kind of tourism.

2.2. SUSTAINABLE DEVELOPMENT AS THE NEW PARADIGM OF TOURISM DEVELOPMENT IN THE REPUBLIC OF CROATIA

Thinking about the future of a country like the Republic of Croatia is an extremely complex task because it assumes a complete change in the developmental paradigm, i.e. of most of the assumptions which the present development has been based on. The importance of tourism as a social and economic phenomenon has been confirmed by an increasing number of people involved in tourism. The Republic of Croatia, as one of the most significant tourist destinations in the Mediterranean, has a long tourist tradition and outstanding developmental abilities. Its goal is to profile itself as one of the highest-quality tourist destinations of the Mediterranean and Europe. Tourism is one of the most important triggers of economic development in the Republic of Croatia. It, directly and indirectly, generates around 22% of gross domestic product and more than 40% of the overall export, which undoubtedly places it among the key components of the national economy and foreign trade exchange. In the Repub-

lic of Croatia controversies regarding the sustainable development of tourism are still existent, particularly in terms of the right understanding of the concept of sustainable tourism, the readiness to take actions by all the actors because of the sustainable tourism and the development of efficient techniques that could help achieve sustainable development of tourism. There are also many doubts regarding the destination that can be considered sustainable, i.e. which type of travel fits into the standards of sustainability. All the early strategies of the development of the Croatian tourism (since the 1990s) have put emphasis on the development of sustainable tourism.

All the remaining crucial documents are important for the Republic of Croatia and related to a sustainable environment and the development of sustainable tourism (such as the National Environmental Action Plan, Sustainable Development Strategy, Area Development Strategy) place importance to environmental responsibility as well as the sustainable development of tourism. Each of them provides guidelines on the direction that should be taken in order to protect the environment – the primary resource in tourism. Therefore, the Report on the Environmental Situation for the Republic of Croatia² (Agency for Environmental Protection, 2014, 86) indicates that the flow of tourists in the Republic of Croatia is still primarily related to coastal counties (96%) and summer months (from June to September). Despite continuous activities for encouraging a more even and balanced regional distribution of tourist flow, these efforts still fail in bringing relevant developments. Therefore, coastal counties still bear the greatest burden. This is especially related to the protected areas of coastal counties, including the specific localities of national parks, which are exposed to growing tourist intensity, which again represents a potential danger for ecosystems of the area but also for the quality and attractiveness of that tourist destination. The vital role will be played by the necessity of a more balanced distribution of the burden on both coastal and continental tourist destinations and the prolongation of tourist season. For this purpose, the abovementioned Report emphasizes, specific programs and measures will be necessary at the national level, which will financially and technically facilitate these developments. The increase in tourist

² In 2014 the Agency for Environmental Protection issued a Report on the Environmental Situation in the Republic of Croatia. The tool used for the creation of the Report was the National List of Indicators although cooperation with the European Agency for Environment, the local level data which are the component part of the Document database of the sustainable development and environmental protection (Report on the Environmental State of the Local and Regional Authorities, i.e. counties and cities) as well as the global examples of best practices (the UN) are also essential.

flow and the characteristics of a specific type of tourism increase the pressure put on the environment. Increased water consumption, increased disposal of wastewater, increased amount of waste, traffic emissions that pollute the air, noise, all of these represent pressure that demands systematic monitoring according to a unique methodology and an obligation for collecting and processing data and defined bearers of responsibility. Only then will the realistic estimation of the level of influence of tourism on the environment will be possible and the creation of guidelines and measures for decreasing this pressure.

Table 2. The objectives of the Environmental National Action Plan in relation to the tourist sector

OBJECTIVE	STATUS
The protection of all the potentials of resources and their systematic valorization	There is no single and complete cadaster and atlas of the tourist attractions of the country, nor is there a set accommodation capacity of the most important and sensitive tourist destinations
A balanced development devised on the principle of sustainability	Taking measures through projects and activities for sustainable and balanced development of tourism is encouraged although mainly locally (the county and city level). There are no data on the pressure tourism puts on the quality of the immediate environment, which are essential for achieving this objective
A more significant role in increasing the quality of the immediate environment	Projects and activities for improving and restoring neglected tourist destinations and communal infrastructure, whose initiative and implementation local authorities are competent for, are limited and intermittent. Some tourist destinations are highly successful in this sense. There is no coordinate and intersectoral interdisciplinary approach led by the relevant Ministry

Source: http://www.haop.hr/sites/default/files/uploads/dokumenti/06_integrirane/dokumenti/niso/Izvjescje%20o%20stanju%20okolisa%20u%20RH_%202009-2012.pdf (access 20.03.2019.)

There is the general estimate that the objectives are getting fulfilled partially, meaning that some work is being done related to all the objectives. However, most of the key measures which need a systematic approach are not implemented.

3. STRATEGIES AND PRINCIPLES OF THE MANAGEMENT OF THE SUSTAINABLE DEVELOPMENT OF TOURISM

Management of sustainable development is new knowledge and the practice of achieving entrepreneurial objectives, i.e. the ones related to the survival of

man and his life quality. It enters a tourist destination as one of the very important factors of business activity. Sustainable development management implies the initiative and partnership of all the actors at the global, national, regional and local level in terms of the implementation of the spatial and ecological standards. Users of various products and services and a growing number of citizens expect a better relation to sustainable development, which is also increasingly getting used as a competitive advantage of certain tourist destinations (Vujić, 2005, 60). The fact is that the Republic of Croatia hasn't implemented the national campaign for sustainable development yet and that there is a deficit of the professionals for different aspects of sustainable development. Currently, at the county and state level, there is a lack of (Vujić, 2005, 83):

- sustainable development managers, competent for correct methodological and professional guidance of a local authority into the sustainable development process;
- methodological reference books for managing different aspects of the process of sustainable development;
- educational programs for professional employees and chosen representatives in the counties and local authorities, which would help them become acquainted with the principles of sustainability and their role in this process;
- the collections of the indicators of sustainability professionally; with their help we could estimate if the state in certain spheres of lives of our county is improving or deteriorating;
- the scientific and professional core group, which would do a research on the trends and interdependence of various phenomena in a county and suggest the actions that need to be taken in order to change the state for the better, based on the sustainability indicators;
- a point for contact/questions for every domain of the sustainable development – the local authorities have nowhere to turn to when they need advice on sustainability;
- a network of the Croatian, European and global organizations, which promote sustainable development

The most appropriate way to make the general principles of sustainable development take root in practice is to create the presumptions for gaining the objectives of sustainable development. For that purpose, the Ministry of Tourism launched the website "Sustainable Development Croatia" (<http://www.odrzivi>).

turizam.hr) in 2012, which still collects and organizes information relevant to sustainable tourism: from sharing the news and the best practice examples to the database of knowledge and resources. The experience of the most visited countries, including the Republic of Croatia, has shown that looking at the problem of development in tourism solely through economic effects is not enough. Therefore, simultaneously with the development of the awareness of the need for co-existence with the environment, a need for strategic tourism management has been developed as well, which is extremely important because of the development of tourism but also because of the environmental protection and the development quality in general. The importance of strategic management in tourism stems from the fact that the process of enabling and conducting the principles of sustainable development at all the levels of management is long-lived. Strategic management in tourism should make sure that the Republic of Croatia reaches the position of one of the most respectable and successful European destinations in the next 15-20 years. The priorities are a balanced and well-designed development besides the protection of all the resource potentials and their fuller valorization, strengthening, and development of various new types of tourism, better-distributed tourism in terms of time, with the activities available for a longer period throughout a year. Despite the National Strategy of the Environmental Protection and despite the fact that this is one of the prerequisites for integration into Europe, sustainable development is still low on the list of priorities of the decision makers at all the levels – from the local to the national one (www.mzoiip.hr/doc/strateski_plan_ministarstva_zastite_okolisa_i_prirode_za_razdoblje_2015-2017__1.pdf). The reason can be found in the weak knowledge of the complex problem of sustainable development in the entire society as well as the misunderstanding of the consequences of uncontrolled development in tourism. The law regulations of the Republic of Croatia are trying to adjust the economic and ecological policy. A certain number of important documents have been issued, which emphasize the need for sustainable development including the sustainable development of tourism. Among them, spatial plans of all levels have specific strength because these documents are binding. Difficulties occur because of the lack of spatial plans, especially at the local authority level, and because of the failure to comply with the spatial plans, where there are ones.

3.1. THE “SMART ISLANDS” INITIATIVE- KEY CHALLENGES OF ACHIEVING THE SUSTAINABLE DEVELOPMENT OF THE REPUBLIC OF CROATIA

The most sensitive natural systems of the Republic of Croatia are in the Adriatic Sea, its coast and islands. This is the area where various processes take place, which depends on the mutual influence of the sea and the mainland (Čorić & Debeljak-Rukavina, 2008, 960). The developmental pressures and negative influences on the natural systems are most evident. In that regard, the Adriatic needs to be paid special attention to in terms of its usage and protection. The pressures on the ecosystem of the Croatian part of the Adriatic (polluters such as the overall level of phosphorus and nitrogen, heavy metals, organic and fecal pollutions) are more evident in the vicinity of port cities and large river mouths, but they are also significant in smaller places because of the porous septic tanks and bad sewage system. The rest of the Adriatic has a relatively low level of the pressure caused by the polluters, which is why the state in the Adriatic, in general, is satisfactory. Sanitary quality of the sea on the beaches is high (98.5%), which classifies the Croatian part of the Adriatic into the cleanest marital areas of the Mediterranean and Europe. During the tourist season, the coastal area and the islands are exposed to extensive pressure. Tourism is the main source of the economic activities of the area, with a constant rise of approximately 3% of tourist a year, which consequently puts huge pressure on the coastal area throughout the tourist season. The main goal of the protection of the Adriatic, its coast and islands is to promote sustainable management of the Adriatic, its coast and islands and to preserve maritime ecosystems by decreasing the intake of waste and foreign microorganisms and pathogens into the sea from all sources of pollution by giving the support to the local communities, especially the inhabitants of the islands but by restricting the influence of economy, tourism in particular, on the environment.

The Smart Islands Declaration, the initiative of local authorities of the islands and other island stakeholders, states that the goal is the development of smart, inclusive and successful island communities for the innovative and sustainable Europe. The Initiative stems precisely from the isolation of islands, which forces them to think about how to enable the optimal usage and management of the resources and how to contribute to the sustainable and balanced development, which will make use of the island potentials (geographical elements, natural and human resources, products). Further on, the “Smart Islands” Initiative advocates

localized activities, which lead to noticeable changes through maximal usage of comparative advantages of the islands, encouraging local growth and prosperity and contributing to the goals of the EU in the field of energetics, climate changes and adjustments, innovations, circular economy, transport and mobility, the blue growth and European digital agenda. European islands have been trying the new forms of sustainable living for years through the innovative inclusive management, which leads to a higher social involvement of all the social groups; further on, through different business models and implantation of new services; through the usage of the most modern technologies for the optimization of the resource and infrastructure management; through educating the population and raising awareness of the visitors about the sustainable development. Through entrepreneurial innovations, which result from the realistic needs, the islands developed a series of examples of the best practices in the field of sustainable local development, setting an example for all the non-island continental communities in Europe and around the world. Next, according to this document, the smart island is defined as an island area which successfully adapts itself to the climate changes combining the decrease in the effects of climate changes and adjustment to them, all with a view to enabling sustainable local and economic development and the rise in life quality of all the inhabitants by means of smart ways of integrated management over infrastructure, natural resources and the environment as a whole, using the information and communication tools and promoting the innovative and inclusive ways of management and funding. The abilities of the “Smart Islands” Initiative would be the result of the natural ability of the islands to develop as specific ecosystems, establishing the balance between the dynamics of movement of their population, availability of resources and the performance of economic activities. For this purpose, the Ministry of Regional Development and European Funds at the conference in 2018 suggested developmental directions for the Republic of Croatia until 2030: a competitive and smart, recognizable, green, connected, safe, inclusive and citizen-oriented country.

The development of smart islands is related to the island areas characterized by sustainable local and economic development and high quality of life as they achieve excellence in several key fields. Besides the abovementioned issues, the key area of intervention is also being mentioned in line with the Smart Island Declaration, so the following can be set: an active participation in the adjustment and mitigation of the climate changes and strengthening the resilience to them at the local level, faster usage of advanced technologies in order to enable

the optimal management and local resources and infrastructure usage, decrease in the usage of fossil fuels by increasing the sustainable usage of renewable sources of energy and energetic efficiency, promoting sustainable ways of mobility on the island including electro-mobility, decrease in the lack and shortage of water using the unconventional and smart way to manage water resources, generating the areas with no waste disposal by promoting the principles of circular economy, preservation of the characteristic natural and cultural capital of the islands, diversification of the economy of the islands by making use of the specificities of the islands when creating the new and innovative local activities, strengthening and promoting the social inclusion, education and citizen support and encouraging the shift to alternative, long-term, sustainable and responsible kinds of coastal tourism and the tourism of the interior of the islands.

3.2. KVARNER BAY ISLANDS AS THE EXAMPLES OF SUSTAINABLE DEVELOPMENT AND THE “SMART ISLAND” INITIATIVE

This part of the research paper gives an overview of the island of Rab as one of the centers of the development of the Croatian tourism on its islands and as a recognized tourist attraction, which knows how to respond to the needs of a growing number of tourists besides having the natural beauty as the major factor of tourist flow. Tourist valorization of the island of Rab has already begun at the beginning of the 19th century when steamship lines were set up, which used to connect the northern and southern Adriatic.

Table 3. Tourist flow of the island of Rab through history

YEAR	ARRIVALS	OVERNIGHT STAYS
1924.	1.224	-
1930.	11.023	123.845
1936.	12.252	124.961
1951.	15.633	139.481
1961.	31.129	324.098
1971.	85.976	842.189
1981.	185.642	1.754.046
1988.	228.684	2.112.298
1996.	113.502	874.201
2005.	215.986	1.550.882
2010.	226.763	1.722.243
2015.	255.633	1.910.485
2018.	292.371	2.212.668

Source: created by the authors

According to the data shown in the table, the development of the number of tourists can be monitored from the moment the records of arrivals began to be kept until the present day. Strictly speaking, the tourism industry and organized arrivals to Rab were possible only when the Italian army of occupation left the island with the signing of the Treaty of Rapallo in the 1920s. Regular growth in the number of tourists from the first records until today can be seen. The period of a light ascent in the 1930s was followed by stagnation in the period between and after the Second World War. After that, there is a regular growth in the number of tourists. In the 1980s this number rises rapidly, and the number of arrivals and overnight stays is identical to the present state. The armed conflict of the 1990s had a detrimental effect on the economy and tourism. Consequently, this period shows a typical fall in the number of arrivals followed by a new ascent at the end of the 20th century until today, with the tendency to increase further in the future.

The island of Rab shows a constant in terms of tourist travels, i.e. a continuous rise of tourist arrivals. This situation demands an adequate approach to the issue of the pressures on water resources and enabling enough drinking water for both the permanent and temporary residents who are on the island in the specific moment. In other words, this requires the engagement of the entire community and the cohesion of all the working groups in order to find a useful approach and solution to the issue of water supply for the entire island during tourist season. Constant monitoring of the states and processes in tourism and water supplies needs to be the priority of the governmental authorities of the island in order to respond adequately to the needs and the demand of the temporary and future conditions. The island of Rab has a certain amount of its own supplies of drinking water, which have been used in case of the increased demand, seasonally and during water reductions from the mainland by the southern line of the water supply system. With the increased tourist flow in summer months, the local population resorts to their own supplies almost entirely during the peak of the season, in summer months, when the number of tourists is highest as well as the demand.

Water consumption during tourist season and outside this period can be analyzed following the delivered water data per season from 2010 to 2017. A period outside season is defined as the period starting from January until May and from October until December while a seasoning period is defined as the period from June to September. The average consumption outside the season

for the period considered is approximately 370,000 m³ of water. Water consumption outside the season never exceeds 400,000 m³ a year with 2017 being the closest to this number. The average consumption during the tourist season for the period considered is approximately 687,000 m³, with a maximum of 738,000 m³ in 2017.

Chart 1. Estimated touristic consumption (m³)

Source: Vrelo d.o.o. Rab (access 15.04.2019.)

In order to reach the average monthly water consumption of tourists, the average monthly consumption outside the season is deducted from the average monthly seasonal consumption for each year. This kind of approximation of the average monthly consumption of water by tourists ranges at least from the rounded 110,500 m³ (in 2014) to 135,700 m³ at most (in 2017). According to that, a conclusion can be reached that the water consumption in tourist season almost doubles, which confirms the fact that the number of tourists is a truly significant factor for supplying the island with drinking water.

Table 4. Water delivered per settlement by the water supply system in Rab in 2017 (m³)

SETTLEMENT	INVOICED WATER				
	HOUSE HOLDS	%	ECONOMY	%	Σ
Banjol	149.744	66,91%	74.062	33,09%	223.806
Barbat	123.405	89,81%	13.997	10,19%	137.402
Kampor	78.534	52,91%	69.891	47,09%	148.425
Mundanije	27.991	90,82%	2.828	9,18%	30.819
Palit	113.969	66,27%	58.014	33,73%	171.983
Grad Rab	25.372	37,26%	42.727	62,74%	68.099
Supetarska Draga	88.301	86,48%	13.805	13,52%	102.106
Lopar	126.594	52,37%	115.129	47,63%	241.723
Σ / AVERAGE (%)	733.910	65,27%	390.453	34,73%	1.124.363

Source: Vrelo d.o.o. Rab (access 15.04.2019.)

The table shows that almost 2/3 of the delivered water is used in households, which can be explained by the fact that family accommodation generates the largest proportion of the tourist overflow (over 50% of the share in terms of overnight stays, followed by the campsites by 19% and the hotels by 17%, while the remainder belongs to the crafts and companies and the non-commercial accommodation). In terms of the overall share of the households, the largest settlements of the island are also the biggest consumers having a significant number of apartments (e.g. Banjol, Lopar, Barbat, Palit) while in terms of the relative share the settlement of Mundanije takes the lead, which is together with the town of Rab the smallest settlement regarding the number of inhabitants. The invoiced water in the economy is primarily related to service activities and the facilities closely connected to tourism, such as hotels/hostels, restaurants, shops, crafts, health institutions, etc. The largest share belongs to the settlements with adequate related infrastructure, and these are Lopar, Banjol, and Kampor. Rab has the relatively highest consumption as the only urban settlement on the island. Considering the permanent inhabitants and the increase in the number of the area users in summer, which exceeds the number of 50,000 a month in relation to the overall population, it is apparent that this concerns distinct seasonal differences in the exploitation of the water resources and imposes the burden on the island area. As sustainable tourism can be defined as the tourism which completely covers the temporary and future economic, social and environmental impacts, takes care of the needs of visitors, environment and destination, the island of Rab consequently needs to strive to enable long-term

harmony of the supply and demand, all of this in the manner that the needs of permanent and seasonal area users are met without much damaging effect on the environment or water supplies. For that reason, considering only water consumption at the height of tourist season, the island of Rab has all the grounds for the implementation of the model of the Smart Islands Initiative.

In March 2017 a delegation of the Croatian representatives, together with the representatives of the other European countries, signed the above-mentioned Smart Island Declaration. The “Smart Island” Initiative extended the focus to water and waste, besides the existing one given to energy, transport and information and communication technology, directly connecting the principles of the circular economy. Despite numerous problems with which the islands face, especially a continuous depopulation, the Initiative is directed towards finding the concrete measures.

In October 2018 the town of Krk hosted the Smart Islands Conference, whose goal was to inspire the development of the local authorities and show that sustainable management in unique environments, such as islands, can have the desirable effect on the social community. The examples from the island of Samso and the island of Bornholm (Denmark) were presented, whose representatives showed how they succeeded in stopping depopulation, organizing the system of circular economy and enabled sustainable life on the islands. The conclusions of the 7th Krk Energy Conference as a part of the European Climate Initiative, which took place in December 2018, clearly indicate that the island of Krk has a clear intention to be the first independent and CO₂ neutral island of the Mediterranean.

European Commission’s EU Island Secretariat has recently issued a list of 26 European island communities which are chosen to, with the support of the professionals, initiate the transition towards the clean sources and forms of energy. Among them, six island communities have been singled out, including the Cres and Lošinj archipelago, which will, as pilot projects, be directly assisted in the creation of the energy transition plan. The first public event, a part of this initiative, is the Clean Energy Days of the Islands of Lošinj and Cres, which were marked on 8th and 9th March 2019. The conference consisted of numerous lectures, discussions, and consultations, which tried to answer many questions related to the energy future of islands. The intention is to include all the stakeholders in the transition process from the fossil fuels to clean energy: public

administration, entrepreneurs, catering professionals, farmers, as well as all the people who can somehow contribute to the energy transition of the island. It was mentioned that Costa Rica is the first country with the zero rates of CO₂ and meets the energy needs from renewable sources for 312 days a year. The island of Samsø in Denmark has already met all the needs for energy from the renewable sources and this is the goal that the island of Krk is hoping to reach until 2030. This year the construction of the biggest Croatian solar-powered power plant is going to start on the island of Cres and the island of Unije is included in the Horizon 2020 European program. The idea behind it is to offer the solution and reply to the economic crisis, investments in the future business activities and development, solutions to the questions of the EU citizens related to their material security and the environment as well strengthening of the global position of the EU in terms of research, innovations, and technologies. The Clean Energy Days of the island of Lošinj and Cres resulted in signing the memorandum, which binds the island representatives to create the Energy Transition Agenda of the islands of Lošinj and Cres in 6 months.

4. CONCLUSION

The biggest problems of the Croatian islands include limited resources, availability, institutional mechanism and dependence on foreign influences. For that reason, the signatories of the Smart Islands Declaration will try to try to enable that the natural abilities of island develop as specific ecosystems, establishing a balance between the dynamics of the movement of its population, the availability of resources and economic activities. The strategy as an instrument of sustainable development of the Croatian islands is particularly necessary for cooperation, support to the island communities and other actors, all with a view to finding the right integrated and sustainable ways of managing the resources and infrastructure that could enable strengthening of the activities of research and development, coordinate investment in projects and improve the life quality on the islands by their implementation. Considering the trends in the application of the environmental sustainability in the Republic of Croatia, a conclusion can be reached that the Republic of Croatia, as a relatively developed tourist destination, follows the global and EU trends and often takes part in the pilot projects which test new tools and practices. In addition, the development of the island of Rab needs to be based on strategic developmental planning and

taking prompt decisions. The effectiveness of the development itself depends significantly on the character of local authorities, which need to stimulate developmental thinking, record problems and constantly serve as initiators of mobilization of all the participants.

The environmental sustainability of the Croatian tourism is to a high degree recognized among the priorities in terms of strategies and plans, although the reality lags behind considerably because of an incomplete integration in the developmental plans, with its still modest share in the overall and diverse offer and the unestablished incentive and stimulating surroundings with all the standard elements such as informing, awareness raising, educating, technical assistance, financial support, networking, promotion, and similar elements.

Abstract

Pharmacy, as the most accessible form of healthcare in primary health care, has experienced numerous changes in the last 30 years, primarily by changing the social order in the nineties, when the market competition was introduced in the pharmacy sector.

Major changes of that time have resulted in various proprietary structures within the pharmacy system, which are still visible today, and are one of the main obstacles in defining the strategic directions of pharmacy development.

That is particularly visible in terms of business policy, pharmacy service, the profitability of the pharmacy system as well as possible directions for upgrading the pharmacy system.

Of course, the influence of liberalization and deregulation should be added to the trends that are present in European countries in terms of pharmacy systems.

Croatian pharmacy, both traditional and conservative, has, in certain segments, fallen under the influence of liberalization and deregulation trends.

In this paper, we used the primary research presented in the PhD thesis "Strategic Directions of the Pharmacy Development in Croatia", which included all the key actors within the pharmacy system, pharmacist and patient survey and in-depth interviews with key actors within the pharmacy business as well as the interviews with the pharmacists with master's degree in Pharmacy who perform daily pharmacy activity.

In this way, we wanted to examine the liberalization and deregulation of the market in terms of ownership structure and liberalization and deregulation affecting the quality of pharmacy services and the availability of medicines to the (end) user.

The future model should consider the quality of pharmacy services, drug availability and business sustainability of the model.

Keywords: *pharmacy strategy, liberalization, deregulation, pharmacy, pharmacy ownership structure*

JEL Classification: L10, L43

1. INTRODUCTION

Pharmacological methods have been present in Croatia since the country's very beginnings. Since the reign of Rome in Croatia, the production of medicines has been evolving, a claim which is supported by the archaeological findings near Trogir, Nin and Benkovac (Grdinić, 1996, p18) where different pharmaceutical equipment was found, and this discovery speaks volumes about the historical standing of pharmacy and its importance to Croatian society.

However, with the many changes of societal organization, the entire pharmacy profession is also being transformed, which is highly noticeable during the last few decades, especially when it comes to its relationship with the State. The State, of course, remains the most significant factor in health care's organization, and its role is being further transformed by the introduction of private market elements. Along with the transformed role of the State, tendencies for re-organization within the health care systems are also present, mostly in regard to decentralization and privatization. (Kovač, 2013, p561)

The huge changes that are taking place in the health care sector have affected pharmacy as well, which needs to be adjusted to accommodate these new trends. It is especially true in the pharmaceutical industry upon which pharmacy largely depends, and, according to Barbić, these changes are coming, and these conditions in the industry will differ drastically from those of a decade ago. Amid the unfavorable economic conditions, the acceleration of pharmaceutical expenses has slowed, impacting the overall expenses of the healthcare industry. Conditions in the domestic market in comparison with the world

market are even more challenging, especially regarding the high accumulated expenses of health care. (Barbić T, 2013, p3)

For all these aforementioned reasons, it is important to emphasize the role of pharmaceutical services, which some of the authors define as following: "Service is an activity or a benefit that one side can offer to another, it is mostly intangible and it does not result in ownership of anything. Its role can, but it doesn't have to be, connected with a tangible, physical product." (Kotler & Armstrong, 1991, p603)

With that segment in mind, the development of pharmaceutical services needs to be properly perceived as it becomes the focus of the pharmaceutical activities, unlike in previous times when the focus was medication. Especially so when we know that pharmaceutical workers are the most available health care workers, which is confirmed by data that shows that the EU currently has 154.000 public pharmacies. Thus, they are the most widespread health care facilities in Europe, employing more than 400 000 pharmacists (highly qualified health care workers) and 600 000 secondary employees. (<http://www.hljk.hr/Portals/0/BLEUPRINT-HR-final-10-07-2013.pdf>)

The role of the pharmacist is becoming more and more complex - current literature highlights the multifaceted role of the community pharmacist. Evidence of the effectiveness of community pharmacy/ community pharmacist interventions exists for lipid, diabetes, and hypertension management and for preventive services such as weight management, osteoporosis prevention, and flu immunization services. (Pradeep et al, 2010, p866)

However, according to some studies, a complete liberalization and deregulation of the industry, as well as a complete transition of the pharmaceutical activities to the marketplace is not the best solution: The community pharmacy sectors should not be left to market forces alone. As part of the health care system, which is not a standard commodity market, the pharmacy sector should be supported by a sound regulatory framework for community pharmacies, supporting them as they fulfill their key tasks (i.e. providing safe medicines to patients, counseling and advice, involvement in health promotion and prevention). A focus on merely optimizing retail sales should be avoided.

We will look at it in the following text, at the example of the Croatian pharmaceutical market, and the possible models of development of pharmaceutical

services in the perspective of deregulation and liberalization, as well as possible directions of development.

2. PHARMACY IN CROATIA

The health system develops along with the development and progress of the community. Due to its complexity, special attention should be paid to achieving appropriate models of system management and financing as well as ultimate customer satisfaction. These concepts are often conflicted because on one hand there is patient pressure for a better, faster and more efficient and modern health service, while, on the other hand, the management structures seek to rationalize ever-growing financial burden all modern systems suffer from. The great progress in medicine over the last couple of decades has also brought demands for greater financial expenditures for health systems.

Pharmacy system in the Republic of Croatia is an integral part of the general health system. Pharmacy system, as a part of the healthcare, is of particular interest to the Republic of Croatia and is performed as a public service at the primary, secondary and tertiary level of health care. Primary health care is performed in pharmacies which are established as pharmacy facilities or private practices. At the secondary and tertiary healthcare level, there are hospital pharmacies. Pharmacy is the most accessible healthcare form at the primary healthcare level, and it is carried out by highly qualified people, i.e. pharmacists with a master's degree.

Changes in social organization in the nineties led to changes within the pharmacy system. The competition was introduced and with it the possibility of privatizing the existing ones, i.e. opening new pharmacies, resulting in different ownership structures within the pharmacy system, which is also one of the main stumbling blocks in defining the pharmacy development strategy.

Croatian pharmacy, traditional and conservative, is slowly changing but the change is disorganized due to the lack of a clear vision and objective.

Therefore, it is necessary to investigate the effects of the liberalization of the pharmacy market in terms of ownership structure as well as the effects of the liberalization on the quality of pharmacy services and the availability of the medication to the (end) user. Furthermore, it is necessary to consider the importance of the pharmacy network especially in relation to the number of

MAs and their ability to process the prescriptions in a quality and expert manner. Particular emphasis needs to be placed on the importance of education and its impact on the quality, comprehensiveness of pharmacy services and their impact on business results.

3. THE EFFECT OF DEREGULATION AND LIBERALIZATION ON THE USERS OF THE PHARMACY SERVICES

In order to be able to better respond to the issues the pharmacy system faces in terms of deregulation and liberalization, it is necessary to first examine the existing opinion of the users, who are the main reason of the existence of the system.

The methodology used for quantitative research carried out on the patients was *online* interviewing, i.e., interviewing via e-mail; the link for filling out the questionnaire was sent to e-mail addresses of participants. Patients who were beneficiaries of pharmaceutical services were the key participants within the pharmaceutical system, therefore their opinions are significant for determining the efficiency and the quality of the pharmaceutical system. For processing their answers, that is, processing data gathered through research carried out with them, we utilized multivariate analysis techniques, as well as other techniques that were convenient, such as SPSS and Microsoft Office Excell apps/software.

It is especially so regarding the availability of pharmacy services as well as the quality of services provided.

Therefore, the respondents were asked to express a certain degree of agreement with the statements. Majority of respondents (80%) agrees or strongly agrees with the first statement that "In my place of residence there is an adequate number of pharmacies and all drugs are available". To be more exact, 13% of respondents strongly agree with the statement and 67% agree, which leaves 10% of respondents who neither agree nor disagree and zero respondents who strongly disagree. Furthermore, there is a larger percentage of women who agree with the statement than men, 78.8% of women compared to 54.2% of men. Also, there is a slightly higher share of respondents from Zagreb and Split who agree with the statement in comparison to other respondents who have differ-

ent place of employment – 75% from Zagreb; 71% from Split and 65% from other places of employment.

Regarding the second statement that “The pharmacist spent adequate time to advise me and explain everything I need to know when giving me the prescribed medication and therapy” there is a slightly lower level of agreement, 65%. Thus, only 9% of respondents strongly agree with the statement, while on the other hand many respondents answered neither agree nor disagree – 23%; 11% disagrees, and 1 respondent strongly disagrees. The gender differences in responses to the second statement are not significant. Also, the share of respondents with secondary vocational qualifications (SSS), high-skilled workers (VŠS) and unskilled workers (NK-KV) who agree with the statement is slightly higher (58.5%) than the share of respondents with tertiary education (VSS) or MA degree (54.5%), even though they are not as numerous – 41% compared to 59% of respondents. The results are presented in Table 1.

Table 1 Opinion on statements

		Total Male	Sex		Age		Place of employment				Education	
			Female	18-40	41 and over	Zagreb	Split	Other	N/A	SSS, VŠS (+ NK-KV)	VSS, mtr. sc.	
There is an adequate number of pharmacies in my place of residence and all medication is available.	Disagree	10.0	14.6	5.8	10.0	10.0	12.5	3.2	10.0	23.1	14.6	6.8
	Neither agree nor disagree	10.0	18.8	1.9	11.4	6.7	0.0	16.1	12.5	0.0	12.2	8.5
	Agree	67.0	54.2	78.8	65.7	70.0	75.0	71.0	65.0	53.8	65.9	67.8
	Strongly agree	13.0	12.5	13.5	12.9	13.3	12.5	9.7	12.5	23.1	7.3	16.9

The pharmacist (mag. pharm.) spent adequate time to advise me and explain everything I need to know when giving me the proscribed medication and therapy.	Strongly disagree	1.0	0.0	1.9	1.4	0.0	0.0	0.0	0.0	7.7	0.0	1.7
	Disagree	11.0	10.4	11.5	14.3	3.3	18.8	12.9	10.0	0.0	7.3	13.6
	Neither agree nor disagree	23.0	25.0	21.2	21.4	26.7	18.8	22.6	27.5	15.4	24.4	22.0
	Agree	56.0	54.2	57.7	54.3	60.0	56.3	48.4	57.5	69.2	58.5	54.2
	Strongly agree	9.0	10.4	7.7	8.6	10.0	6.3	16.1	5.0	7.7	9.8	8.5
Total	Number of respondents (N)	100	48	52	70	30	16	31	40	13	41	59
	Share of Respondents (%)	100.0	48.0	52.0	70.0	30.0	16.0	31.0	40.0	13.0	41.0	59.0

Note: N/A (no answer - not applicable) designates questions that were not answered or answers not related to question, i.e. the respondents misunderstood the question so the answers cannot be used

Source: Mihanović, A., 2019.

The next question respondents needed to answer was related to the time it took for the MA pharmacist to advise them and explain in a quality manner everything related to the medicine and therapy prescribed to them. The largest number of respondents said it took up to 3 minutes, 49%. 29% of the respon-

dents stated it took up to 5 minutes for the pharmacist to explain everything related to the medicine, while 16% said it took pharmacist less than a minute and up to a minute to provide all the necessary information. A significantly higher percentage of women (32.7%) in comparison to men (22.9%) answered it took pharmacist up to five minutes to provide information. 4.2% of men and zero women said it took pharmacist more than 10 minutes to provide the necessary information. Apart from that, a significantly higher percentage of respondents of tertiary and graduate education stated it took pharmacist less than 3 minutes to provide information, while 19% of respondents of secondary education and high-skilled workers stated the same. 2% of the latter group stated it took pharmacist more than 10 minutes and 3% it took him/her up to 10 minutes to provide the necessary information. The results are presented in Table 2.

Table 2 How much time do you think it takes the pharmacist (mag. pharm.) to advise you and explain in an adequate manner everything related to the medicine and the therapy you is proscribed?

	Total	Sex		Age		Place of employment				Education	
		Female	18 – 40	41 and over	Zagreb	Split	Other	N/A	SSS, VŠS (+ NK-KV)	VSS, mtr. sc	
Up to 1 minute	16.0	18.8	13.5	17.1	13.3	25.0	16.1	12.5	15.4	5.0	11.0
Up to 3 minutes	49.0	47.9	50.0	50.0	46.7	50.0	48.4	47.5	53.8	19.0	30.0
Up to 5 minutes	28.0	22.9	32.7	27.1	30.0	25.0	29.0	27.5	30.8	12.0	16.0

4. THE IMPORTANCE OF SERVICE AND THE AVAILABILITY OF MEDICATION AS SEEN BY THE PHARMACISTS

Pharmacists with MA degrees, as the backbone of the pharmacy as the profession, are best acquainted with the existing pharmacy system, i.e. its qualities as well as its shortcomings and the prospects of progress. It is important to emphasize that due to different ownership relations in pharmaceutical institutions there are different views of the future of pharmacy, especially because numerous owners are not of the medical profession. Therefore, the great importance of the future of pharmacy lies within the hands of pharmacists with an MA degree in pharmacy and their attitudes.

The methodology used for quantitative research carried out on pharmacists with a master's degree was *online* interviewing, i.e., interviewing via e-mail; the link for filling out the questionnaire was sent to the e-mail addresses of participants. Along with patients, pharmacists with a master's degree, i.e. pharmacists, are the key participants within the pharmaceutical system and their opinions are of crucial significance for determining efficiency and the quality of the pharmaceutical system. For processing their answers, that is, processing data gathered through research carried out with them, multivariate analysis techniques were used on them too, as well as other techniques that were convenient, SPSS and Microsoft Office Excell apps/software, for example. On the basis of the result analysis, Ph.D. students synthesized the basic techniques and opinions of the pharmacists with master's degrees. The research was carried out with the intent of obtaining a detailed quantitative and partially qualitative insight into the state of the pharmaceutical market in all its aspects.

When asked whether the pharmacy market should be liberalized, majority, i.e. 96.2% answered no, that medicine should only be available in pharmacies.

Table 3 Do you think pharmacy market should be liberalized?

	Total Male	Sex		Age		Place of employment		
		Female	23 – 45	46 and over	Zagreb	Split	Other	
Availability of medicine solely in pharmacies	96.2	100.0	96.7	97.3	96.4	91.7	100.0	98.3
Availability of medicine in pharmacies and specialized stores	2.9	0.0	3.3	2.7	3.6	8.3	0.0	1.7
Availability of medicine in stores (consumer goods)	1.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
Number of respondents (N)	105	13	90	73	28	24	18	60
Share of respondents (%)	100.0	12.6	87.4	72.3	27.7	23.5	17.6	58.8

Source: Mihanović, A., 2019.

Next, the respondents were required to express the degree of agreement with the statements, expressing it numerically from 1 to 5, 1 being *I strongly disagree* and 5 *I strongly agree*. The majority of respondents agrees or strongly agrees with medicine being accessible to the wider population – 85.7%. Only 5.7% disagree or strongly disagree with the accessibility of the medication. Equally to that, there are only 5.7% of respondents who agree to some extent that the existing health service in pharmacies is adequate and professional, while 81.9% agrees or strongly agrees with that statement. 12.4% of respondents neither agree nor disagree, while there aren't any respondents who strongly disagree. The last statement is "There is an adequate ratio of pharmacists and prescriptions in each unit to be able to provide quality and adequate accessibility of medication". Only 68.2% of respondents agree or strongly agree with that statement, 16.3% neither agree nor disagree, and 15.4% disagree or strongly disagree.

Table 4 Statements, part 1

		Total Male	Sex		Age		Place of employment		
			Female	23 – 45	46 and over	Zagreb	Split	Other	
Medication is inadequately accessible to a wide population	I strongly disagree	1.9	0.0	2.2	1.4	3.6	4.2	0.0	1.7
	I disagree	3.8	0.0	3.3	4.1	0.0	4.2	0.0	3.3
	I neither agree nor disagree	8.6	7.7	8.9	11.0	3.6	12.5	5.6	8.3

	I strongly agree	24.0	23.1	23.6	23.6	21.4	25.0	22.2	23.7
Total	Median (M)	3.75	3.38	3.80	3.74	3.75	3.50	3.83	3.83
	Number of respondents (N)	104	13	89	72	28	24	18	59
	Share of respondents (%)	100.0	12.7	87.3	72.0	28.0	23.8	17.8	58.4

Source: Mihanović, A., 2019.

The respondents were also required to give their opinion on how many prescriptions a pharmacist can process during his/her shift if all the conditions and regulations are respected. 48.8% of respondents answered between 81 and 120, 40% stated the number is between 50 and 80, while only 2.9% of respondents answered between 161 and 200.

Table 5 How many prescriptions a pharmacist can process during his/her shift if all the conditions and regulations are respected?

	Total Male	Sex		Age		Place of employment			
		Female	23 – 45	46 and over	Zagreb	Split	Other		
50 – 80	40.0	38.5	41.1	46.6	25.0	50.0	44.4	36.7	
81 – 120	48.6	46.2	47.8	45.2	53.6	41.7	55.6	48.3	
121 – 160	8.6	7.7	8.9	6.8	14.3	8.3	0.0	11.7	
161 – 200	2.9	7.7	2.2	1.4	7.1	0.0	0.0	3.3	
	Number of respondents (N)	105	13	90	73	28	24	18	60
	Share of respondents (%)	100.0	12.6	87.4	72.3	27.7	23.5	17.6	58.8

Source: Mihanović, A., 2019.

Next, the respondents were asked to express agreement with certain statements by grading the statements from 1 to 5, where 1 is *I strongly disagree* and 5 *I strongly agree*. It does not surprise that 97.1% of respondents believe that “Investing in the education of pharmacists and quality of the service leads to better business results”. There are not any significant deviations among groups of respondents divided by sociodemographic features when it comes to this statement. The majority of respondents, i.e. 86.7%, disagrees or disagrees strongly with the statement: “The compensation for pharmaceutical services determined by the Croatian Health Insurance Fund is adequate to cover all the necessary costs of pharmacies”. The respondents are divided in opinion when it comes to the third statement in this group: “The amount of compensation for pharmaceutical services should be differentiated according to the place of issue of the medication.” 27.6% agree with the statement, but 31.4% disagree. Also, 8.6% of the respondents strongly agree with this statement, but 10.5% strongly disagree. Furthermore, there is a significant number of respondents who neither agree nor disagree – 21.9%. Still, it is clear that a slightly higher number of respondents disagree with this statement. Finally, the fourth claim states: “The higher number of pharmacies would increase the quality of service”. Majority of respondents believe that not to be the case – 73.4% answered they disagree or strongly disagree. Altogether, only a small percentage of respondents agree with that statement – 14.3%.

Table 6 Opinion on statements, part 2

		Total Male	Seks		Age		Place of employment		
			Female	23 – 45	46 and over	Zagreb	Split	Other	
Investing in the education of pharmacists and quality of the service leads to better business results.	I strongly disagree	1.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
	I disagree	1.0	0.0	1.1	1.4	0.0	0.0	0.0	1.7
	I neither agree nor disagree	1.0	7.7	0.0	0.0	3.6	0.0	0.0	1.7

Source: Mihanović, A., 2019.

The information from the survey indicates pharmacists believe there is a sufficient ratio of professionals and prescriptions in their facilities to provide professional and quality availability of medication. The higher number of pharmacies would not affect the quality of the service, but investment in education

and quality pharmaceutical services would lead to better business results. On the other hand, pharmacists do not think the compensation for pharmaceutical services determined by the Croatian Health Insurance Fund is adequate to cover all the necessary costs of pharmacies. Finally, almost all pharmacists (mag. pharm.) believe that the pharmacy market should not be liberalized and that medication should only be available in pharmacies.

5. CONCLUSION

This paper confirmed that the existing model in pharmacy is, though in significant part corresponds to the needs of society and health care, however, in certain segments, requires certain modifications.

Observing other pharmaceutical systems and pharmacy management, we can point out that not every change which led to liberalization and deregulation has brought the expected positive changes. Croatian pharmacy system, traditional and conservative, did not follow the trends strongly, even though there was a certain pressure. With this time lapse, we can argue that such a decision was the right one. Nowadays, in the neighboring countries, there are some contradictory trends regarding the reestablishment of certain rules and regulations from the time before deregulation and liberalization.

Croatian pharmacy needs to maintain the existing model and its positive features, but it is also apparent from the research that the model needs modifications as well.

First and foremost, pharmacy system needs to be seen as an integral part of the health system, i.e. the quality and the professional work need to be priorities because, as we have emphasized in the previous chapters, the health system as a regulated profession is an integral part of the society, and its importance can only be measured through direct financial effects. It is, therefore, necessary to set a personnel minimum as well as the time period needed by a pharmacist to do his/her work in a professional manner. It is apparent in this study that almost 90 percent of respondents believe it is possible to process from 50 to 120 prescriptions in one shift, i.e. the arithmetic mean of all subjects would be 92 prescriptions per shift. Also, as the survey indicated, most respondents believe that one of the most important criteria when determining the norm should be the time normative per the prescription. If we know that the shift lasts seven

and a half hours, we can easily come to the conclusion that the average time needed by a pharmacist to provide the patient with a quality and professional service is 4.9 minutes per prescription. Turning this calculation into practice we would not only enable professional and regulated work but also equalize the criteria in pharmacies because the current legal solutions make it possible for a single pharmacist to work in a particular pharmacy no matter the number of prescriptions and patients he/she needs to handle within a single shift. This would also enable avoiding malformations currently occurring in practice, where sometimes because of the enormous workload unauthorized persons issue medication and advise patients.

Abstract

When it comes to motivation, it is more common to talk about what motivates employees than what motivates management. It is assumed that manager motivation is not required to be specifically re-examined since it is expected to be fully aligned with the organizational goals of the company. Motivation is the main precondition for success and good manager image. The manager will only achieve success if his knowledge, skills, and abilities are transformed into concrete actions that are consistent with the business strategy, thus actively contributing to the creation of value for the enterprise (profits, new guests, better image, more successful organization of work), and this is needed strong motivation.

The manager decides, contracts, organizes, distributes, creates teams, manages, delegates, motivates, cares about the advancement of associates, manages financial and other resources (space, equipment, time, people, money) carrying

out different assignments, informing about business and encouraging economic and technological development. In all of this, it is expected of him to be effective.

The effectiveness of a manager is reflected in his/her success, and in order to be successful, he/she must be highly motivated and possess skills such as leadership skills, emotional intelligence, negotiation skills, that will enable him/her to understand and successfully lead people he works with.

Keywords: manager, motivation, success, employees

JEL Classification: M00, O15

1. INTRODUCTION

In the modern and fast-paced life of today, every individual aim for satisfaction in both his private and professional life. As the private and professional lives are intertwined with the lifestyle, it is no longer enough for only one of these two components to fulfill all the needs, but the goal is to achieve the balance of satisfaction in both segments. Nowadays, job satisfaction is rarely closely related only to the salary level which is why many managers are looking for different motivational tools and methods.

The objective of this paper was drawn upon the fact that successful organizations have comprehensive and continuous human resource management. One of the main sources of competitive advantage among modern successful organizations is an appropriate selection and motivation of the employees. The organization that invests in human capital and understands its value is recognized as a good place to work and hence becomes more competitive, productive and efficient.

The paper is divided into two major parts – theoretical and empirical. The theoretical part provides a general overview of motivation, different motivational theories, and possible motivational techniques that managers can use. Empirical part gives an overview of the rewarding system in The Sports Facilities Management Institution led by the City of Zagreb.

2. MOTIVATION THEORIES

Baldoni (2004) mentioned famous Eisenhower's statement that motivation is the art of getting people to do what you want them to do because they want to

do it. Langton (2000) further elaborates this statement emphasizing that motivated individual achieves organizational goals by showing direction, persistence, and intensity. Motivation can be defined as “a desire to achieve beyond expectations, being driven by internal rather than external factors, and to be involved in a continuous striving for improvement” (Torrington et. al, 2009: 276). This definition explains why people behave the way they behave, and it puts an emphasis on preferences, aspirations, values, and needs of employees as the driving force of the person performance (Erceg and Šuljug, 2016). Those internal motivators differ between employee and it usually depends on the stage of personal development. According to the George and Jones (2007), there are three main parts of work motivation: (i) direction of person’s behavior in an organization; (ii) person’s level of efforts; and (iii) person’s level of persistence when facing obstacles. Bahtijarević-Šiber (1999) stated four characteristics which are influencing motivation in companies: (i) individual characteristics of employees; (ii) characteristics of organization, (iii) characteristics of the job; and (iv) society.

Theories of motivation have resulted from years of research in different sciences (i.e. economy, sociology, psychology, etc.). Gibson (2012) divides theories of motivation into two main categories: the theory of content needs and process theory. Both categories present significant implications for managers due to their participation in the motivational process. Main characteristics of the process theories of motivation and theory of content needs are summarized in Table 1.

Table 1. The managerial perspective of content and process theories of motivation

Theory base	Theory explanation	Theories	Management implementation
Content	Oriented to factors within the person who encourages, directs, maintains, or stop a behavior.	Maslow's Hierarchy of Needs	Managers need to be aware of differences in terms of needs, desires, and goals of each person because each individual is unique in many ways.
		Alderfer - ERG model	
		Herzberg's motivation-hygiene theory and dual-factor theory	
		McClelland - Theory of Needs	
Processes	Describes, explains, and analyzes what leads to stimulation, guidance, maintenance or stopping a behavior.	Vroom's expectation theory	Managers need to understand the motivation process and how each individual makes decisions based on their own preferences, awards, and achievements.
		Adams equity theory	
		Skinner's enhancement theory	
		Locke's goal theory	

Source: Gibson, et al, 2012: 128

The contemporary employee motivation techniques have been developed gradually, following numerous motivation theories. They are based on different assumptions and they stress different spheres of human behavior. The originator of the motivation theory development was Abraham Maslow and his well-known Hierarchy of Needs Theory (Marušić, 2006: 318).

Maslow's theory contributed to the development of a range of new theories. In order to provide a better understanding of the contemporary perception of an approach to motivation, the following theories are going to be presented in this paper (Marušić, 2006: 321):

- Maslow's theory of motivation
- Herzberg's Two-Factor theory of motivation
- McGregor's Theory X and Theory Y
- McClelland's Motivation Theory
- J. Stacy Adams's Equity Theory
- a contemporary understanding of motivation strategies.

One of the most frequently cited theories of motivation is the Hierarchy of Needs Theory, developed by psychologist Abraham Maslow. Maslow observed human needs in the form of a hierarchy climbing from the lowest to the highest need and he concluded that when one group of needs is fulfilled, this group of needs stops being the motivator. Maslow's hierarchy of needs differentiates between basic and psychological needs. The basic needs include physiological needs and safety needs, whereas the psychological needs include social needs, esteem, and the need for self-actualization. When the basic human needs have been fulfilled, the person strives to achieve higher-level needs (Dassler, 2015: 356)

According to Maslow, the basic and psychological human needs go from the bottom to the top of the pyramid in a certain order (Dassler, 2015: 365).

- ✦ Physiological needs are basic needs required for sustaining human life itself, such as, for example, food, water, warmth, and shelter. Maslow believed that if these needs are not fulfilled to the point enough to sustain life, other needs will not motivate people.
- ✦ Safety needs are needs for security against physical harm and needs for freedom from the fear of loss of employment, property, food or shelter.
- ✦ The needs for affiliating or belonging consider the fact that people are social beings who have a need to connect with and be accepted by other people.
- ✦ The need for esteem occurs, according to Maslow, when people have satisfied their needs for connecting. They then try to gain respect from other people, but also self-esteem. This kind of need creates satisfactions such as power, reputation, status, and confidence.
- ✦ Maslow considers the need for self-actualization to be the highest need in his hierarchy of needs. This is a desire to achieve what one can become, to maximize one's potential and achieve something.

Frederick Herzberg built on Maslow's theory, but he modified Maslow's theory to a great extent. He believed that the attitude a person has towards their job defines how successful they will be at it. After conducting research, he realized that people who felt bad at work provided different answers than people who felt good at work.

Herzberg concluded that different factors have a different impact on job satisfaction and job dissatisfaction and that the opposite of satisfaction is not dissatisfaction but a lack of satisfaction, while the opposite of dissatisfaction is a lack of satisfaction.

After framing the theory like this, Herzberg broke the work components down into the ones that cause dissatisfaction and the ones that increase the workers' satisfaction and motivate them. He called the factors that cause dissatisfaction hygiene factors and the factors that cause satisfaction, motivators (Dassler, 2015: 370).

Herzberg categorized salary, physical working conditions, security of employment and similar to the hygiene factors, and he categorized factors connected to work itself or its results as the motivators. Therefore, he considered motivators to be promotion, recognition, responsibility and so on.

In short:

- ♦ maintenance factors
 - are not motivators, but their absence results in dissatisfaction
 - are considered to be company policy, administration, working conditions, status, salary and similar
- ♦ motivators
 - cause satisfaction but their absence does not result in dissatisfaction
 - are considering to be a challenging job, achievements, responsibility, advancement, recognition.

It is important to emphasize that Herzberg, in his Two-Factor Theory, set certain hypotheses that imply an immediate connection between satisfaction and success at work – in addition to the factor of satisfaction, he referred to the factors of work motivation and work behavior.

The originator of Theory X and Theory Y is Douglas McGregor. He observed people from two completely opposing points of view. The first one is negative, which he called Theory X, and the second one is positive, named Theory Y. Depending on what the employees are like, the manager should adapt to them, which means adapting the methods used to motivate them (Marušić, 2006: 326).

Theory X observes people as individuals who dislike work and thus avoid it. The managers, in this case, have to constantly supervise the workers and threaten them with punishments. The theory further defines that workers avoid any kind of responsibility and that they like formal instructions. In addition to all this, the workers are, according to Theory X, considered to have no ambition and to place their own security in the first place.

Unlike Theory X, Theory Y looks at workers from a completely different perspective. According to Theory Y, workers find work natural and they consider it to be a game or a kind of rest. Managers should not direct and control workers if the workers are committed to the objectives. Workers like to take on responsibility and they like to come up with innovative solutions on their own.

According to McGregor, the workers from Theory X place Maslow's lower-ranking needs in the first place, while the Theory Y workers find higher-ranking needs more important (Marušić, 2006: 326).

In the 1960s, McClelland set the framework for the motivation theory called McClelland's Acquired Needs Theory, under which he defined three types of basic motivational needs (Certo et al., 2008., 388):

- ✦ the need for power
 - people who feel the need for power give great importance to influence and control
 - they aspire to the positions of leaders, they are good speakers, prone to discussions, open, stubborn and demanding, they enjoy teaching and performing in public
- ✦ the need for affiliation
 - people who feel the need for affiliation are content if they are loved and they do not want to be cut out from the group
 - they enjoy the feeling of intimacy and understanding, they are ready to help and provide consolation
- ✦ the need for achievement
 - they have an intense need for success, but also an intense fear of failure
 - they set difficult goals for themselves and they like to work a lot.

The importance of Adams's Equity Theory lies in the emphasis it puts on the perception of people. If they are treated (un)fairly, this significantly affects their motivation and performance and it can lead to changes in behavior. An

important factor of motivation is everyone's subjective judgment of the fairness of their reward in relation to the other members of the organization. In this context there are:

1. an unfair reward
 - ✦ results in dissatisfaction reduced output or even leaving the organization
2. a fair reward
 - ✦ the same level of output is maintained
3. a more than fair reward
 - ✦ results in harder work and the reward is given in advance

3. TECHNIQUES OF MOTIVATION OF SUCCESSFUL MANAGERS

Employee motivation is one of the techniques used in human resource management. The purpose of employee motivation is primarily to reach the objectives of the company but the techniques that are to be applied depend on a manager's decision. Managers usually base their decision on relevant assessment of the motivation method, hence choosing the method that will achieve the best effect – a satisfied employee (Varga, 2011).

The problems in motivating employees usually occur because of the different personal characteristics of each employee. In order for a higher level of motivation to be achieved, each employee needs a separate and custom approach

Therefore, a manager cannot use the same motivation technique for all employees, which means a manager needs to be able to use and apply different techniques. Managers are advised to apply the following motivation techniques (Omazić et al., 2011):

- ✦ material compensations,
- ✦ non-material motivators.

Material or financial compensation is composed of different forms of motivation, all aimed at ensuring and improving the employees' material position and providing financial compensation for their work. This is mostly related to money received by the employee, but it can also refer to indirect material gains that contribute to the rise in the employees' material standard and which are

not included in the salary nor given in any monetary form (bonuses, covered relocation expenses, legal services and similar). Considering that not all employees have the same preferences, a flexible compensation program is usually used, which enables the employees to select a type of compensation which suits them the most, thus raising the awareness of being taken care of and in turn achieving that they are loyal to the organization (Omazić et al. 2011).

Organizations often have an elaborate system of non-material incentives that fulfills various needs of employees. Factors such as development and recognition, appreciation, status, and others have been increasingly important for many people. The non-material motivators are job designing, participating in decision-making, objective-orientated management, flexible working hours, acknowledgment, training and career development and many others. Together with the material motivators, these strategies make a complete motivation system of an organization (Bahtijarević-Šiber, 1999).

Companies which use the precise combination of non-financial and financial rewards are able to motivate employees and strengthen their commitment to the company. Thompson (2002) stated that the total reward system describes the strategy of rewarding that brings components such as learning and development together with the aspect of the working environment. Micander (2010) concluded that purpose of reaching and having total reward is in maximizing the positive impact which a range of rewards can have on the motivation of employees, their job engagement and commitment to the organization. The components of the total reward can be described as in the following Table 2.

Table 2 The total reward system components

Transactional rewards	Base pay	Total remuneration	Total reward
	Contingent pay		
	Employee benefits		
Relational rewards	Learning and development	Non-Financial/Intrinsic rewards	
	The work experience		

Source: adapted from Armstrong and Brown, 2006: 22

Armstrong and Brown (2006) stated that if there is a wish to achieve internal consistency, then the total reward strategies should be horizontally integrated with human resource activities and vertically integrated with business strategies.

4. THE LINK BETWEEN MOTIVATION AND SUCCESSFUL HUMAN RESOURCE MANAGEMENT

Managers are any organization's most important asset and resource. At the same time, since large investments and a lot of time are needed to build a good managerial team, they are also considered to be one of the scarcest resources. During the process of discovering and developing management potential, one should consider candidates' personal, professional, and business qualities such as taking initiative, communication skills, creativity, efficiency, knowledge of management methods, reliability, dedication to the job and the company and so on. Important factors for personality assessment are the ability to lead people and ability to develop positive traits, delegating tasks, communication skills, familiarity with the job, determining planning and organizing skills, assessing co-workers' personal qualities and so on. Numerous techniques are used to determine management potential, such as psychological tests, questionnaires, resumes, colleagues' appraisals, interviews, references and so on. An important presumption for identifying managers' potentials and for selecting managers is determining the scope of a manager's motivation and elaborating the instruments that would serve to measure and identify it. Certain attitudes have been found to contribute to the choice of a managerial career, and these are (Varga, 2011):

- ✦ positive attitudes towards authority and the people that hold the positions of authority
- ✦ need for competition
- ✦ need for proving oneself and for affirmation
- ✦ need for showing the power
- ✦ the need for a prominent position and behavior
- ✦ the need for responsibility and the feeling of responsibility.

A successful manager must have certain competencies and be highly motivated to be able to lead subordinate employees and an organization. Managers' success depends primarily on the extent of their knowledge, their skills, and abilities, which need to be continuously built upon and in line with the trends, both in theory and in practice, and especially within the field of their expertise. Managers' success is visible in their ability to transform their knowledge and

skills into concrete actions with the aim of implementing the organizational strategies and creating values for the company (Sambol, 2009: 40).

It is the task of a manager to lead business operations and to achieve organizational objectives. As one of the aspects of leadership is motivating employees, a manager should, in addition to general and professional knowledge, have certain competencies such as a developed perceptive skill, skills of expressing oneself, analytical problem tackling skills and timely decision-making skills as well as assessment skills. A successful manager knows that his or her knowledge and skills should be constantly upgraded, developed, and innovated. The total presuppositions for a manager's business success include three basic groups of factors that are mutually dependent and related to the working environment. These presuppositions are total working ability, motivation, and emotional intelligence. And as Samobol (2009: 41) stated: "Management is an art".

However, everyone creates their own perception and definition of success and happiness or work satisfaction often form a part of that definition. A successfully performed assignment, or more widely a successful business, means that an individual's or organization's predefined objectives have been met. The individual's success is commonly manifested in the form of advancement, that is, moving or transferring from a previous job position to a better job position which ranks higher in the hierarchy and includes performing more complex tasks. A job well done can be rewarded in the form of public acknowledgment, higher salary, but other forms of rewards can also be used, depending on the interests and motivation factors of the individual who is to be rewarded; for example, paid professional training or specialization, bonuses and similar.

The definition of success is a quick promotion from one position to another, always for the better. Organizations have a tremendous ability to determine the success of their members (Collins, 2002: 190-191).

An individual's success should be publicly acknowledged and, in this way, serve as a motivator to that individual, but also to others in the organization. Companies that can recognize and reward effort, responsibility, creativity, and outstanding commitment invest in individuals by encouraging such qualities and traits through awards. Also, the effect is positive for other employees or for attracting new and talented, staff.

5. EMPLOYEE MOTIVATION AND THE REWARDING SYSTEM BY THE MANAGEMENT - THE EXAMPLE OF THE SPORTS FACILITIES MANAGEMENT INSTITUTION

The Sports Facilities Management Institution performs the activities of managing the sports facilities in the City of Zagreb. It was established at the end of 2013 on the basis of a previous institution called Sports Facilities Management, which had been a branch of Zagrebački Holding. The business activities of the institution are the following:

- sports facilities management and maintenance,
- sports training,
- sports recreation.

The Institution manages twenty-two economic units that comprise about thirty facilities, most of them having been built for the 1987 Universiade and have since been operational in maximum capacity. Although the sports facilities in Zagreb are faced with virtually no competition, the management is aware of its social responsibility and its development is accordingly directed towards the future. Although there is no competition on the local level, the Institution aims to step out of the local framework and to position itself on the European market. One of the Institution's strategic objectives is to increase its competitiveness in the European market by renovating the sports facilities in order to attract important sports events to Zagreb. The Institution's main strategic objective is to promulgate the sports recreational services among the citizens of Zagreb in such a way that the prices and services remain competitive for all the facilities lessees. This means investing in the staff in order to keep in the Institution the best swimming, skiing and coaches of other sports held in the sports halls of the Institution.

5.1. RESEARCH METHODOLOGY AND DISCUSSION

In order to review the utilization of motivational techniques and hence, give recommendation for how to retain and attract quality employees a short questionnaire was created. Questionnaire covered employees from every departments of the company. Altogether 30 employees stated their opinion on what motivate and what demotivate them in their current job position. The

results of this research has showed that almost 30% of employees do not feel motivated. The main demotivation is bad interpersonal relationship, but it was closely followed by injustice at the workplace, an impossibility for advancement in career and unclear working objectives. A working environment was a first component in the motivational side as well, followed by salary, teamwork and working hours. However, when asked about what would motivate them to work even harder the money was more important issue than good working environment (Figure 1). As can be seen in the table the possibility to advance in a career is a strong personal motivator, which, in employees' opinion, is hard to achieve in their organization.

Figure 1. What will motivate workers

Source: authors, 2019

Almost all employees agree that organization would be even more efficient and successful if there is a formal motivational program with transparent information and equal opportunities for every employees. However, not all employees believe that such motivational program would succeed primarily because it is a public organization that does not have tradition in validating personal achievements (it does not reward excellence, nor it punishes mediocracy and inefficiency.) Still, employees are aware that in order to be competitive in the European market organization must find a way to acknowledge the importance of human capital and find methods that will motivate employees to be more efficient, productive and successful, at mutual benefits.

5.2. MOTIVATION PROGRAMS PROPOSALS

The company currently does not have any formal program for motivation, which, according to respondents, has an impact of overall employee performance. Therefore, set of recommendations are created which are considered to positively affect personal and organizational effectiveness.

- ♦ Lifelong learning

Since the expansion and development of a project depend on workers' knowledge, skills and abilities, development of competences are achieved by placing the focus on lifelong learning. Education programs can be implemented at or outside the place of work, through collaboration with education institutions, international bodies, by enrolling in post-graduate studies, participating in research projects, seminars, conferences, workshops, courses and working groups in bodies whose activities are closely related to the Institution's activity, all with the aim of upgrading knowledge, exchanging experiences, recognizing best practices and following sports trends in the world and in the EU. The workers and their competencies, talents, skills, and dedication to work are the most important business factors. Therefore, the institution should constantly be investing in professional development and advancement of such workers.

- ♦ Institution Day

The Institution Day can be introduced as a yearly one-day trip with specific sports activities intended to give the employees a chance to get to know each other better, to relax, socialize, and often some good business ideas emerge too. This should be an informal event aimed at team building, that is, improving efficiency by strengthening the relationship among the workers and building a team spirit.

- ♦ Open Day

The idea is to organize a day when all the activities of the Institution would be promoted through a series of sports activities, but in a fun and informal way, including also the employees from various sectors whose job is not normally related to working with the clients. Different activities on the markets can be presented on this day, as well as the Institution's objectives for the upcoming period, which can be followed by a panel discussion related to a certain current topic and participants' suggestions.

- ♦ Giving employees, who are parents, a priority when choosing when to take the annual leave

The annual leave plan is sent by electronic mail to the administrators who then forward it to the workers within a department. The workers propose the dates that they prefer, and they usually arrange the replacements among themselves, and then the administrator checks if all the positions are covered by replacements. It is a common practice for the administrators to announce at department meetings that the employees who have children are given priority when selecting the dates for the annual leave. This, however, is not stipulated by internal procedures, but usually, when two employees select the same period for annual leave, priority is given to the employee with children.

- ♦ Access to information regarding work tasks

All business processes, procedures, and work instructions are available on the internal internet pages or shared maps of the Institution departments, but responsibilities and duties required for each task should be stated together with a description of the processes, and that would enable easier induction of new employees.

- ♦ Informal socializing inside the Institution

Informal events during the official break included in the working hours in the facilities should be encouraged. The employees could celebrate birthdays, weddings, childbirths, graduate or post-graduate graduations and other occasions, and they could invite a certain number of their colleagues to such a gathering, what would strengthen the working staff environment and human relationships.

- ♦ Possibility to leave work early

In addition to flexible working hours, which means coming to work in the period between 7.00 a.m. and 8.30 a.m. and leaving work between 3.30 p.m. and 5.30 p.m., the employees should have the possibility to leave work early or to run personal errands during working hours, with the condition of fulfilling the legal norm for working hours by the end of the month.

- ♦ Family policies

Introducing a series of so-called family policies including various measures and programs at the workers' disposal for the purpose of increasing the birth rate and promoting pro-family policy, meaning measures aimed at balancing the family and business life. Apart from benefits related to flexible working hours that all the workers can use, parents would also be supported and encouraged

with the option of being able to work part-time, while the internal rules could stipulate awarding financial support to new parents after their child is born.

All these propositions would contribute to an improved working environment and a higher quality of work.

6. CONCLUSION

The aim of this paper was to demonstrate that the employees are the most important factor for productivity and achieving competitiveness in the contemporary business environment. The attempt was to emphasize the importance for managers to understand that continuous education, training, and employee motivation are one of the most important forms of management and human resources development as well as turning the human capital into the company's most valuable capital. It is important to encourage and reward the employees' creative potential because this will have a positive impact on business results. The motivation system is the sum of motivation factors, incentives and motivation strategies that are consciously and comprehensively implemented into the working and organizational situation in order to motivate people.

The paper referred to the most famous motivation theories, as well as to the factors that have a positive impact on employee motivation used by organizations in the form of material and non-material rewards.

When the employees are satisfied and their expectations are met (the possibility of promotion, further education, appropriate working conditions and so on), they will work at their full capacity what will have a positive impact on their performance. The example of the incentives that could be introduced for the employees of the Sports Facilities Management Institution and the investments into the workers show that such measures would result in employees who are more satisfied with their job because their employers care about them, and who perform their tasks more easily and more efficiently, also spreading the positive reputation of the organization they work for.

Findings however give an example of a motivational process within one public organisation which is not enough for general conclusion. However, given recommendation can serve as a good base for exploring a motivational level in other public companies.

Abstract

In an age when the creation, dissemination and application of knowledge are at the heart of a value-added economy and society, the relationship between higher education (HE) and businesses as a prerequisite for sustainable wealth creation has become a popular research topic. This paper is a part of a more comprehensive online Graduate employability survey, which employed open and closed questions, as well as 7-point Linkert scales for answers. In total 132 Croatian employers from large, medium and small companies of different types participated in the survey. Only 7% of employers reckon that during HE enough attention is placed on the application of acquired knowledge, and a vast majority believe that students upon graduation, in general, lack soft skills. The results show that employers regard HE partnerships with businesses as the

most important factor for increasing employability of students. Apart from the cooperation of departments at the University for the exchange of experience, employers consider teacher training in the use of innovative teaching methods as very important. These results provide useful information for taking action to improve graduate employability in Croatia. To maximize the benefits of partnerships, cooperative education, a cross representation on the boards of business and universities, as well as liaison panels are suggested. The role of university career centres, which work systematically with employers and serve as a catalyst for employer engagement, must not be underestimated. The research is not exempt from limitations as it includes a rather small number of companies in Croatia. It is suggested that further studies should be conducted to include a wider range of businesses. It would also be beneficial to research the perceptions of the university teaching staff regarding these partnerships.

Keywords: Graduate employability, higher education, business, curriculum changes

JEL classification: I21, I23

1. INTRODUCTION

Although university-business cooperation (UBC) in Europe has a great potential for regional development, innovation and employability. It is still a fragmented and indistinct field of research, and the understanding of it remains inadequate. The results of the largest European university-business cooperation show that UBC can be a highly positive activity for all parties involved, and that businesses are starting to realize the benefits of working with higher education institutions (HEI) as a source of future-oriented innovation, as well as talent development that can build a competitive advantage (Davey et al., 2018a). Despite the fact that UBC has become a popular research topic, the understanding of UBC remains inadequate, and its practical and scientific development remains a major challenge for managers, policy makers and researchers (Galán-Muros, 2016).

HE and businesses are sources of brainpower, experience, innovation and ideas (Brown et al., 2002). Their cooperation can be seen as strategic and addressing some of the major social as well as economic issues facing the economy. Higher education is critical for developing more knowledgeable, wealthy and open societies. Furthermore, HEIs in Europe are seen as a source of talent,

entrepreneurship and lead power in regional development. Therefore, HE has to understand and respond to the concerns of the world, it needs to be engaged and embedded in those societies, it has to be relevant. At the same time, HE has to be the key agent for change, influencing, and not just responding to events and immediate pressures. In conclusion, the primary purpose of HE should be to prepare graduates for the world of work by enhancing students' knowledge, skills, attributes and abilities while simultaneously empowering them to be critical, reflective lifelong learners (Harvey, 2000).

It has been found earlier (Griesel, 2003; Lowden et al., 2011) that employers look for flexible, adaptable and intellectually talented individuals with a sound knowledge and skills appropriate to the demands of the 21st-century world. If students, teachers and employers want to achieve that, they should work towards a common goal – integrating theory and practice for the purpose of raising the employability prospects of graduates. Employers, being the end-users of HE outputs, should take part in providing resources for the development of new courses, curriculum co-delivery, as well as in giving feedback and monitoring HE processes. Apart from that, establishing and maintaining cooperation with employers is the key factor in providing authentic learning experience for students, which promotes graduate employability (Ferns, 2012). Furthermore, mutually beneficial relationships between businesses and higher education institutions (HEI) are fundamental to an inclusive student experience with desirable outcomes for all stakeholders. Some programs of study (e.g. medicine, nursing, teacher training etc.) are closely linked to learning in practice settings that are directly related to future employment. In other studies, employability is increasingly built into programs through work placements, internships and other work based-learning opportunities, employer-linked projects, guest speakers and visits, or work-shadowing. Nevertheless, opportunities for UBC are far more ample, as for the purpose of increasing graduate employability, HEIs and businesses can cooperate in other fields such as research, academic entrepreneurship and commercialization of R&D results. They can cooperate in recruiting and employing graduates, too. However, academics are often suspicious of closer links with businesses because they fear that enhanced employability links will infringe academic autonomy, undermine critique and result in training rather than education (Bates, 1999). At the same time, a lot of businesses do not engage in UBC despite significant efforts by the European Com-

mission and national governments, due to a lack of awareness of mutual benefits of such cooperation.

This paper aims to capture employers' views on UBC, focusing on increasing graduate employability, and the role of partnerships between Higher Education Institutions and businesses, in particular in preparing graduates for the changing needs of work, and proposes the following hypotheses:

H1: Employers value HE partnerships with businesses important for graduate employability.

H2: Employers estimate that during HE students are provided with enough opportunities to apply acquired knowledge.

H3: Employers believe that soft skills are sufficiently developed during HE.

It is organized as follows: After the presentation of the relevant literature on UBC in Europe and Croatia, the methods used in the research are presented, followed by the main findings and the discussion of the results. The paper finishes with a discussion of the implications, limitations and areas of further research.

2. LITERATURE REVIEW

Although there has always been some form of relationship between HE and businesses, this topic has become particularly popular among researchers recently, sharpened by a renewed sense of accountability and relevance on the part of HE and by the pervasive view that HE does not produce the right kind of graduates to meet the changing demands of workplace (Brennan et al., 1996). On the other hand, traditional role of HE is being challenged, and due to mass high education, graduate status has become the principal signifier of cultural capital with universities producing, not simply reproducing or reflecting, social hierarchies (Scott, 1997).

2.1. THE IMPORTANCE OF UBC

UBC is understood as an interaction between HEIs and businesses for mutual benefit (Davey et al., 2011) which incorporates a broad set of potential cooperation activities. It is considered that UBC does not only satisfy the need

for funding and innovation, but can have a critical effect on regional economy as it helps tackle very relevant organizational and social problems in European countries. According to the largest international study into cooperation between HEIs and businesses yet compiled (Davey et al., 2018a), UBCs are advancing in Europe and regional governments are increasing their support. UBC has been a strong policy priority if the European Commission, referenced consistently in Commission communications and supported through numerous initiatives for a decade. UBC is considered a driver and a connector that links different policy areas: innovation, higher education, enterprise, entrepreneurship, social development, globalization and economic recovery.

Galán-Muros (2016) identified a number of organizational and social factors for UBC. UBC, considered an engine towards knowledge-based society, can address the problem of decreasing funding of universities, low levels of innovation in businesses and the need for skilled employees, as well as unemployment issues, lack of competitiveness and increased competition.

There are many diverse forms of UBC. They range from cooperation in education, such as dual education programs, curriculum co-design and co-delivery, internships, placements and lifelong learning programs (executive education, industry training and professional courses, professional upgrading and staff retraining); cooperation in research, joint R&D and knowledge transfer, consulting and mobility of professionals; joint valorisation efforts, such as commercialization of R&D results, academic and student entrepreneurship, to collaboration in management which includes cross-representation at management boards, liaison panels, shared resources, endowments, sponsorship and scholarships, as well as cooperation in employing HE graduates. In Europe (Davey et al., 2018a), cooperation in research (particularly cooperation in R&D) is the most developed activity, followed by education (particularly student mobility), while valorisation and management activities are far less common. This research also found that once an individual or an organization cooperate in one activity, they are more likely to cooperate in others.

Both businesses and HEIs can secure real benefits from UBC. Collaboration with business sector is one of the pathways for universities to engage with society and thus fulfil their “third mission”. In addition, HEIs, faced with lower amounts of direct public funding, can diversify their funding sources and increase their funding base, either by attracting business funding (Wood, 2011),

applying for HEI research (Lee, 2011), offering lifelong learning programs or applying for programs targeting exclusively collaboration projects with businesses (European Commission, 2011). Also, by developing strategic relationships with businesses they may ensure a wider economic and social relevance and innovativeness of their courses and apply their research in practice (Debackere & Veugelers, 2005), thus making HEIs more attractive for potential talented students and researchers. On the other hand, businesses can benefit from UBC through improving innovation and competitiveness (Tresserras et al., 2005), as they (SMEs in particular) witness the lack of financial and human resources to undertake innovation in a systematic way. Through UBC, they get access to new knowledge, technology, methods, processes and talent (Saboori, B. et al., 2014). Subsequently, new job creation, social and economic growth, increased standard of living are gains from UBC for the society as a whole.

Various barriers to cooperation between business and HEIs exist. According to the recent EU study of UBC (Davey et al., 2018a) academics, HEI managers and businesses agree that lack of funding and resources is the main barrier to cooperation. In addition, academics accentuate bureaucracy and lack of time as obstacles. Interestingly, the results of the above-mentioned study show that the removal of barriers does not necessarily trigger UBC. It has been found that if sufficient drivers for cooperation exist, stakeholders will find ways to cooperate. The drivers include motivators, which trigger the activity and are often related to expected outcome(s), and facilitators which enable and ease the process. The Final report on the state of UBC in Europe identifies different motivators for different stakeholders in UBC. Academics cooperate primarily to benefit their research, HEI managers have diverse reasons for wanting their institutions to engage, including funding, graduate employability and the use of research in practice, and businesses are motivated by innovation, potential access to talent and competitive advantage they can develop from UBC. All stakeholders are inspired for UBC by mutual trust, commitment, common interest and goals. The report concludes that in Europe people and relationship drive UBC, and therefore a shift in thinking about UBC policies is required from a focus on barriers to drivers, and from facilitating transactions to establishing and nurturing relationships. In order to improve relationships, governments, HEIs and businesses can provide funding to develop such relationships, expand opportunities for professional mobility, create opportunities for academics and business people to develop trust and UBC expertise through small funding opportunities and existing relationships. New mechanisms for advancing contacts and relationships

include: communities and networks, networking events, university-business forums on regional and national level, as well as matchmaking to establish a collaboration culture and experience set for UBC.

For both HEIs and businesses, UBC is a discretionary activity, and commonly reported problems such as unclear objectives or lack of commitment are not surprising. Therefore, appropriate mechanisms need to be provided to encourage and support cooperation. These mechanisms should aim to help reduce the largest barriers (bureaucracy), emphasize facilitators, such as common goals, and provide incentives that motivate HEIs and businesses to cooperate. Supporting mechanisms are interventions designed to support the development of cooperation between HEIs and businesses. These mechanisms can be in policy, strategic, structural or operational.

National governments play an important role in facilitating and encouraging UBC, and their support is necessary to ensure the initial success of UBC. For example, national funding for HEIs is still mostly based on student numbers, yet HEI managers identified funding as a major barrier and the driver for cooperation (Davey et al., 2018a). In addition, involvement of different ministries (education, economy, innovation, entrepreneurship, employment) in different aspects of UBC could result in misaligned and even conflicting policies. Although many HEIs include UBC in their mission and vision, incentives for academics are the least developed UBC mechanism.

Opportunities for facilitating UBC are numerous. In order to broaden the understanding of UBC and widen its development, European Commission, national and regional governments, HEIs and businesses can finance project consortiums, provide funding for long term cooperation initiatives, create new opportunities for cooperation within and cross-faculty, create more “small packaged” opportunities for collaboration. i.e. student consulting programs, joint papers, master thesis supervision, provide support to the creation and /or modernization of new/redesigned curricula, promote the benefits of UBC, develop improved employment and recruitment pathways from HEIs to businesses, promote entrepreneurship education and facilitate regional entrepreneurship ecosystem (Davey et al., 2018a).

The report on the state of UBC in Europe realizes that businesses that undertake UBC tend to initiate collaboration and cooperate primarily in research. They cooperate with their academic partners in more than one way which indi-

cates that it is a relationship, rather than a one-off transaction. The results show that as the business gets older, they are more likely to cooperate in education, and as they get larger, they are more likely to increase cooperation in more long-term cooperation areas such as education and management. The more years of experience they have with UBC, the more cooperation activities they undertake. The biggest motivator for cooperation is to support business's innovation efforts, particularly with a long-term perspective, which is supported by external funding. The business collaborator perceives cultural differences to be the largest barriers to UBC, particularly differing motivations, and lack of business experience in HEIs, as well as differing time horizons. They are highly likely to recommend to their business partners and colleagues to engage with HEIs in R&D more so than in education and training, however, 99% of cooperating businesses say they want to continue, if not increase their UBC in the future.

2.2. State of UBC in Croatia

European countries and regions have different UBC policies and initiatives (Geuna & Nesta, 2006) and there exist substantial differences in the level of development and the scope of UBC activities.

The national study of the UBC state in Croatia (Davey et al., 2018b) found that although UBC is vital to creating a knowledge society, it is at an early stage of development in Croatia and that the creation and development of supporting mechanisms is critical for UBC. The results show that, similar to EU results, UBC ecosystem is complex and that integrated personal relationships drive the cooperation. Perceptions of high benefits and incentives are motivators for UBC in Croatia. Businesses that engage in UBC tend to be small (with less than 50 employees), privately-owned companies (72%). The majority of Croatian businesses (69%) cooperate with 1- 4 HEIs, mainly from Croatia (96%). These results are aligned with the EU results. Businesses engage mainly in mobility of students (4.3), joint R&D (4.0) and industry support (4.0), with student and academic entrepreneurship being the least developed collaborative activity (2.2 and 2.4 respectively). On average, 40% of businesses in Croatia do not engage in these collaborative activities at all, in particular state-owned companies. Those that do engage, perceive themselves supportive towards UBC. They believe that businesses have a lot to offer to HEIs in developing and delivering education and training, and have the capability to absorb the knowledge and technology

coming from universities. Furthermore, they believe that it is business's responsibility to collaborate with HEIs in education, and they support this commitment with resources, a responsible executive and allocation of work time. On the other hand, businesses do not believe they have sufficient contacts and relationships with HEIs, or that they are informed about what HEIs expect from such collaboration.

Individual academics and businesses in Croatia initiate UBC more often (always or usually: 74% and 54% respectively) than other stakeholders (alumni, students, HEI management, internal and external intermediaries) do. Government is perceived as the most passive initiator of UBC in Croatia. Until recently, there were few platforms and initiatives to promote UBC, which has significantly inhibited UBC in Croatia.

Croatian and European perspectives align with respect to barriers hindering UBC, however, Croatian businesses perceive the barriers somewhat stronger. The top 5 barriers in Croatia relate to resources, lack of communication and administrative issues, with the most emphasized ones being: lack of people with business knowledge at universities, lack of government funding for UBC and the lack of awareness at universities about the opportunities from UBC. Bureaucracy also emerged as one of the strongest factors inhibiting UBC in Croatia, which is not surprising as most HEIs in Croatia are state owned. In an earlier research (Biondić, I. & Novaković, N., 2016) 57.3% of businesses stated the lack of experience in UBC as the main reason for not cooperating. Only 7.3% affirmed that there was no need for such cooperation. Businesses in that research also named inertia and sluggishness of Croatian HEI, as well as their lack of understanding of corporate needs as major barriers to cooperation and only 8% communicated that employees are not motivated for the cooperation. On the national level, they identified the lack of national strategies and legislation as critical barriers and suggested an online platform for cooperation.

While some relationship facilitators bear considerable importance for UBC in Croatia, a number of resources related factors also emerged as facilitators. The top five facilitators, i.e. factors that enable or ease cooperation, are the existence of: shared goal, funding, mutual trust, prior relation with the partner from HEI and access to university R&D facilities. When compared to the EU data, it is evident that on average, European businesses adopt a stronger perspective in respect to drivers of UBC than Croatian businesses.

Croatian and European businesses have different views on motivators driving them towards UBC. While European businesses are driven by innovation related reasons, Croatian businesses are highly motivated for UBC because they want to impact the society in a positive way, gain competitive advantage from improving the skills of their current employees through training, from access to new discoveries in the early stages, and from customized solutions for their business. Croatian businesses do not perceive access to HEI's facilities as important, possibly due to the fact that not many HEIs in Croatia have state-of-the-art R&D facilities that would be of interest for businesses.

Both Croatian and European businesses perceive that students are the main UBC beneficiaries. In addition, Croatian businesses observe that academics and HEIs have more positive outcomes/benefits from UBC than businesses do. Croatian businesses that engage in UBC seem to be satisfied with the cooperation and are willing to recommend this cooperation in both education and training (Net Promotor Scale metric score of 31%) as well as R&D (NPS 20%). Higher scores for education and training are not surprising as these UBC activities clearly have a longer tradition in Croatia.

The degree in which UBC takes place is influenced by a set of elements present in the context, such as human resources, strong innovation/R&D profile, strength of the business sector and regional economy in general, and interestingly, Croatian businesses active in UBC recognize this context less positively than their European counterparts.

3. METHOD

This paper is a part of a more comprehensive online Graduate Employability Survey, which employed open and closed questions, as well as 7-point Likert scales for answers. In total 132 responses were received from employers from large, medium and small companies in Croatia and of different types of business entities. The instrument, therefore, provides useful information that can be used for taking action to improve graduate employability in Croatia. Statistical methods involved in carrying out a study included planning, designing, collecting data, analysing using PASW statistical tool, primarily related to univariate and bivariate descriptive statistical analysis, interpretation and reporting of the research findings. A detailed sample structure of employers per company size,

region, type of business entity, and per market where income is generated is shown in Table 1.

Table 1. Sample structure of employers

Company Size	%
<10	33.8%
10-50	36.9%
50-250	12.3%
>250	16.9%
Total	100.0%
Region	%
Eastern Croatia	5.4%
Central Croatia	2.3%
North Coast	39.2%
South Coast	53.1%
Total	100,0%
Type of business entity	%
Ltd.	81.4%
Craft	4.2%
Joint-stock	14.4%
Total	100.0%
Where the company generates its income	%
Only domestic market	48.8%
Only abroad	3.9%
Combination	47.3%
Total	100.0%

Source: Authors' own calculations

The respondents are almost equally distributed in terms of the sex: 48.5% are male and 51.5% are female, where 25% of them are younger than 34, 61% are between 35 and 54 years old, and 14% are older than 55.

4. RESULTS AND DISCUSSION

In our sample, only 7% of employers reckon that during HE enough attention is paid to the application of acquired knowledge, and as many as 93% believe that students upon graduation, in general, lack soft skills. Thus, our data do not support H3 that employers believe soft skills are sufficiently developed during HE, or H2 that HE students are provided enough opportunity to apply acquired knowledge. The results clearly signal that HEI need to consider significant curriculum changes, and a major modification of teaching and as-

assessment methods at the HEI. The data suggest that HE equips graduates only moderately well for the demands of the modern workplace. The need for skilled and knowledgeable graduates necessitates UBC, which is additionally needed to improve the understanding of what HE can best deliver. This was additionally highlighted when employers were asked to identify factors that contribute to increasing students' employability.

High unemployment rates, particularly youth unemployment remain an issue not only in Croatia, but in EU, too (Eurostat, 2016). Perhaps UBC's greatest contribution to graduate employability is in developing improved competences, which has been detected earlier by Gibb & Hannon (2006) and Razvan and Dainora (2009). These competences, adapted to market needs, in particular entrepreneurial thinking (Herrmann et al., 2008), can consequently lead to better job prospects for graduates (Dutrénit & Arza, 2010; Bozeman & Boardman, 2013). The untapped potential of UBC in developing these competences has to be acknowledged and unlocked. These results are broadly in line with the trends initiated by the European Commission asking for joint (HEI-students'-businesses') responsibility for the development of talent and competences. Apart from increasing employability of graduates, UBC can additionally contribute to upskilling existing employees through training and lifelong learning programs offered by HEIs.

Our data reveal that employers are very homogeneous in understanding the importance of UBC, as 96% of them find UBC important. Moreover, employers in this survey regard it as the most important factor for increasing the employability of students (Mean = 4.81). This confirms the Hypothesis 1. These results tie well with the previous report on the state of UBC in Croatia (Davey et al., 2018b) that employers believe it is their responsibility to collaborate with HEIs and that over a third of EU businesses commit to UBC as part of their strategy (Davey et al., 2018a). Additionally, when assessing the importance of the four variables for increasing graduate employability, not one was evaluated as unimportant (Graph 2). Descriptive analysis was backed up with central measures: Mean ranged from 5,7 to 6,4; Median ranged from 6 to 7, and most frequent answer (Mode) for all statements was extreme grade 7 (Graph 1).

Graph 1. Statement importance central measures (scale 1 to 7, 1 not important at all, 7 extremely important), TOP 3 boxes

Source: Authors' own calculations

Employers consider cooperation of HEIs for the exchange of experience (4.54), and teacher training in the use of innovative teaching methods (4.65) as very important for increasing graduate employability. This is in accordance with debates in the European Commission encouraging inter-sectoral and interdisciplinary approaches to teaching and learning for knowledge society. This is also in line with previous research (Lowden et al., 2011) which concluded that close and systematic links between HEI and employers were likely to be present where institutions had a focus on teacher training. Furthermore, as much as 82.4 % of employers see participation of prominent, successful business people in the design of courses as important.

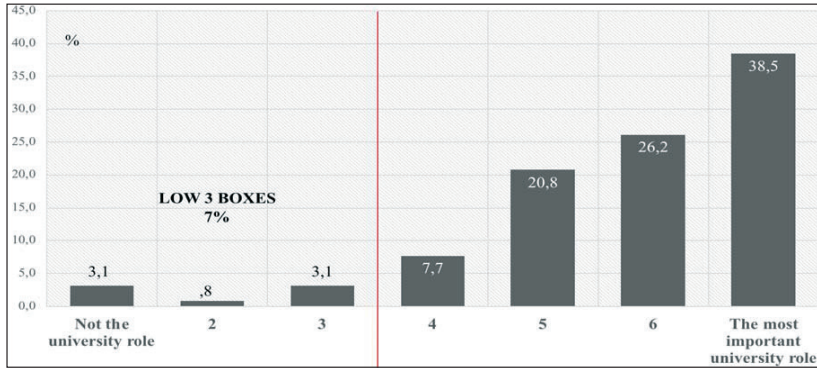

Graph 2. Statement importance for employability of graduates (scale 1 to 7, 1 not important at all, 7 extremely important), TOP 3 boxes

Source: Authors' own calculations

The same homogeneity can be detected when observing attitude towards HEI's role in employability of graduates (Graph 3).

Graph 3. HEI role in educating employable graduates

Source: Authors' own calculations

Only 7% of the employers claim that HEI do not have an important role in the employability of graduates (Mean 5.75; Median 6 and Mode again 7), and 64.7% believe that increasing employability of graduates is a very important or the most important role of HEI.

Due to the above-mentioned homogeneous attitudes, differences in answers were not expected when per company profile variables or respondents' gender and age were tested. This was confirmed by ANOVA testing in which no statistical difference was detected. Although not statically significant, indicative difference can be detected between female and male employers (Graph 4).

Graph 4. Attitude differences per gender (Affinity Index, average grade per item = 100)

Source: Authors' own calculations

Women valued UBC and HEI cooperation slightly more important than men did, but evaluated the involvement of prominent employers in curriculum design and the role of HEIs in creating employable graduates somewhat less important than male employers did.

Active, systematic partnerships of HE and businesses in Croatia are rare. Yet, employers, at least the ones who responded to our survey, seem to be very interested in working in such partnerships. For example, 83.2% express their wish to participate in curriculum design, and 87% would accept students for internships. Employers, obviously, agree that placements and internships as opportunities for experiential learning, students' mastering employment skills, knowledge and awareness of employer culture are valuable for their own business as well as students, and thus for enhancing the employability of graduates. Interestingly, no significant differences in answers have been observed regarding the size of company, the type of business entity or where the company generates its income (on the Croatian market or abroad).

5. IMPLICATIONS AND CONTRIBUTIONS

Obviously, partnerships of HE and businesses, which can have diverse forms, and which are one of things that differentiates good HEIs from the extraordinary ones, have a huge potential. There are many obstacles to employer involvement in teaching and assessment at HEIs in Croatia. Therefore, this paper suggests Cooperative education (Fleming, J., & Hickey, C., 2013) as a model of work integrated learning, where all stakeholders recognize each party's needs. The aim of such an approach is to integrate theory and practice and develop capabilities to enhance employability through partnerships between students, HEIs and employers, in which stakeholders understand the meaning, expectations, outcomes, associated responsibilities and level of commitment, and actively and consciously participate, cooperate and collaborate. To accomplish that, clearer communication strategies and ongoing and active management are required. It must also be noted that governments play an important role in facilitating and encouraging such cooperation and should offer support as is appropriate to ensure success. Furthermore, efforts should be made to evaluate students' participation in UBC as a part of their academic assessment. This could be achieved through dual education programs, which represent an emerging hybrid form of higher education, which includes the opportunity to com-

plete a degree program at a HEI while simultaneously receiving a certification of practical training or work experience in a company (Kagermann, 2016) In such programs, students spend extended periods of time in both an academic and business sector (Euler, 2013).

To maximize the benefits of partnerships, a cross representation on the boards of business and universities and some kind of liaison panels as well as seeking other opportunities to engage with businesses in curriculum development and delivery are also suggested. The role of university career centres, which work systematically with employers and serve as catalyst for employer engagement, must not be underestimated. Businesses, on the other hand, need to look for opportunities to meet relevant contacts within academia in order to better understand motivations of academics and HEIs for UBC and seek to partner on projects or provide finance for UBC.

The research is not exempt from limitations as it includes a rather small number of companies in Croatia. It is clear that UBC will remain a prevailing research topic, and it is suggested that further studies should be conducted to include a wider range of businesses. It is also advised to research the perceptions of the university teaching staff regarding these partnerships.

Abstract

Employee turnover rate is a fundamental value and reflection of organizational management, and it is a clear indication of the number of employees leaving the organization for a variety of reasons. For the outside world, it provides a homogeneous insight into the issues surrounding the organizational structure. Entering the core of organizational structure sharpens a view on the causes of the problem so, the reasons why employees leave the organization are more evident. The result of strengthening the individual's position in society through peculiar global activities that empower and emphasize individualism, encourage organizations to increase responsibility in employee management and therefore avoid high costs of employee turnover. In order to study this issue, this paper aim is to investigate whether there is an indirect or immediate impact of the matrix organizational structure on the human resources in the

organization, i.e. to detect factors within the matrix organizational structure that cause employee turnover. Literature review helped in establishing brighter inspection into difficulties of matrix organization such as double responsibility, resource constraint, possible complications in the communication channel, and the leading role problems that can affect employee turnover. The matrix organizational structure produces several reasons for the undesirable, dysfunctional voluntary turnover, which is primarily and mostly caused by the increased pressure and stress within the organization, and time constraints as well as the lack of resources. The main limitation of this study is a worrisome lack of scientific papers in the field of influence of the matrix organisation on the employee turnover, even though the fact that a large number of organizations work within the matrix structure and face numerous and unexplored problems.

Keywords: employee turnover, matrix organization

JEL Classification: J21, L22

1. INTRODUCTION

Organizations around the world invest enormous financial resources in education, development, and retention of their employees. It is clear that managers have a task to minimize employee turnover because the costs of finding, the time needed for adaptation, and the process of creating new employees values are often too high for the organizations. Although there is no standard framework describing the reasons why employees are leaving certain organizations, there is a wide range of factors that can be used to interpret employee turnover. According to Stovel and Bontis (2002), with the emergence of globalization that strengthens and expands competition, organizations need to develop real products and provide services based on employee strategies. They represent the critical resource of an organization creating an inexhaustible structure of knowledge, skills, and abilities and make them the most important competitive advantage. This paper studies the assumption that specific characteristics of a matrix organizational structure, such as double responsibility, resource constraint, possible complications in the communication channel, and the role of leadership may affect the degree of employee turnover.

2. MATRIX ORGANISATION

As an alternative to traditional organizational structures, the matrix structure gained popularity in the late 1970s and early 1980s and was implemented in a wide range of industries such as aerospace, banking, chemical, telecommunications, computer, electronics, and petroleum. Combining the benefits of functional and product-oriented organizational structure, the matrix organization at the same time provides complex companies with flexibility in directing their focus to broad production and specific organizational goals (Sy & Cote; 2004, 452). The need for modern international organisations for a broader customer and client and the presence of their services in many different countries or continents creates a large amount of data, demands, tasks, and disturbances that stand in the way of unharmed activity of the organization. Therefore, accepting a matrix organisational structure is an effective solution to the growing needs of significant capitalist organizations. "The matrix organizational structure, as well as the project organization, represents a new adaptive model of organisational structuring. It is characterized by the existence of classical departments in which specialists work, who occasionally join projects run by other departments or divisions. Most commonly, matrix organizations are a combination of production and functional organisational structure, but it is possible to combine organizational structures based on the type of customer and geographic location " (Pfeifer; 2012; 13). The matrix structure is also often a combination of functional and project structure where project teams are incorporated into existing functional departments.

According to Verzuh (2007), the matrix organizational structure has emerged as a solution to the growing complexity of the organizational environment, and as a consequence of this threat there is a need for a balance between the main drivers of organizational development and at the same time the process of more efficient use of skills and talents of employees in order to succeed environment rhythm. The matrix structure characteristics meet the above mentioned organizational and market requirements through a dual control, control, and management system, which reflects through a vertical and horizontal hierarchy. In other words, a high number of employees in the matrix organization correspond to two superiors simultaneously. Within such a system, employees have increased the flexibility of mobility within the organization where they are most needed, that is, where their skills can ultimately contribute to the achievement of organizational tasks and goals. The matrix organizational structure is

designed for companies that have different products selling to different markets (Hindle; 2012, 130). In such organisations, responsibility for products is left from the bottom in one dimension, and responsibility for the markets in the other. Such a way of scheduling leaves most managers a dual line of responsibility, meaning that they are at the same time responsible to the director of the production division and director of all markets of a particular organization. Davis and Lawrence (1978, 43) characterise a matrix organization as far more than a matrix structure. It needs to be strengthened and supported by matrix systems such as double control and assessment system, leaders need to act with decision-makers efficiently, and in the end, the matrix organization must cultivate the culture of negotiation, communication, and acceptance of open conflicts and equilibrium of power. Furthermore, in most matrix organizations there is a dual command responsibility system that assigns to functional departments (marketing, engineering, etc.) and manufacturing and marketing departments. Each matrix organization has three unique and critical roles: a top manager who maintains a balance within a dual chain of command, a manager of functional suits who have subordinates and manager who is required to execute orders by two different matrix directors above him. Of course, each of these roles has clear and specific tasks, as well as particular requirements that managers, depending on the position, must meet. The matrix organisational structure is the usual choice for strategic goals, but it strongly affects individuals and teams working within the structure because the information and decision-making process is significantly different in comparison to traditional structures (Malloy; 2012). A large percentage of organizations trying to implement the matrix organizational structure have been downplayed.

The matrix organization requires “producer” leaders, individuals capable of delegating and who have a high tolerance for insecurity (Burton et al.; 2015, 43). Top management is not able to direct the entire organization independently, so they have to rely heavily on functional, project and divisional managers in the structure, and in their detailed, coordinated adjustment to their requirements in order for the organization to profit. However, top management is expected to prioritize, collaborate in diversity within the organization, and overall control over the company, though the decision-making process should be assigned to them always. The capability and quality of top management lie in their ability to evaluate employees who are sufficiently responsible, educated and experienced

to be able to decide for the benefit of the entire organization, placing them in high positions to some extent ensures a quality leadership of the organization.

Creating cohesion, synergy, organizational culture and feelings of affiliation with employees is key to building a stable, credible and respected organization. Therefore, according to Krell (2011), the distinctive feature of the matrix organization is the convergence of employees, while the synthesis of the organizational unit contributes to the accelerated growth and culture. The matrix structure empowers the organisation and enables it to create more views of the situation while at the same time achieving balance in the entire operational and functional part of the company. Researches have shown that possible matrix structure applications in individual parts of an organization, without necessarily implementing the whole structure across the organisation, allow better data analysis, thus ensuring more efficient execution of organizational tasks. Consequently, more and more organisations are involved in the matrix structure when coordinating complex projects where they are timely and effectively performing, necessary resources and knowledge of a variety of different employees from different areas of the organization, such as finance, marketing, sales, accounting, and procurement. With a proper combination of these, a considerable amount of organizational intellectual capital accumulates, and along with this process, strengthens organisational relationships. Krell (2011) states that Human Resources employees have the crucial role in the initial development of a matrix organizational structure, with the task of properly evaluating the skills and knowledge of all employees so they are responsible for controlling, implementation and analysis of the success of changing the existing organizational structure into a matrix.

3. EMPLOYEE TURNOVER

According to Polsky (1999, 571), the rate of employee turnover shows the number of employees who leave the organization for a variety of reasons. The abandonment of an organisation is defined as the termination of the work in the organisation and may be the result of an employee initiative, self-indulgent abandonment of an organisation (e.g. termination of employment contract or retirement) or may be the result of an employer's initiative - involuntary turnover (dismissal due technological surpluses, etc.). For Abassi et al. (2000) turnover represents the rotation of employees within the labor market, between

organizations, businesses, and states. Price (1997) defined the notion of turnover as the ratio between employee cords leaving the organization during the observed period and the average number of employees in the organization in that same period. Also, some authors claim that the cause of employee turnover is often a combination of multiple dependent and independent factors that obstruct employee work over a long period which may also be a frequent problem for the organization if the turnover analysis is not done correctly, thoroughly and responsibly. Previous research by Raikes and Vernier (2004) shows that the organizational process of attracting and retaining talented individuals in the organisation is a critical strategy in which the organisation achieves high financial results and lowers costs. The trace that employee turnover leaves to the organization has its direct and indirect costs, ranging between 50% and 150% of the annual salary of employees (Mercer; 2004). Also, additional costs are generated and the crisis is deepened due to the increased volume of tasks and work that such events cause for the human resources of a particular organization. Increasing the volume of work by researching, analysing, and solving employees' turnover problems, along with the minimum time available to human resources staff, address current issues and boost the growth of existing employees.

Griffeth and Hom (2001, 5) divide employee turnover into a voluntary and involuntary turnover. In other words, the turnover differs in whether the employee has decided to leave the job voluntarily or was it the employer's decision. Furthermore, turnover can be functional (loss of under-average employees), and the dysfunctional, (loss of above-average employees). Finally, dysfunctional turnover is divided into the one that can be avoided and one that cannot be prevented. This suggests that the organization should focus on avoidable dysfunctional turnover that can be prevented in order to ensure the retention of quality employees.

Since managers make a significant interaction with a large number of employees, they are, if adequately educated, aware of how to create a productive and prosperous atmosphere. Moreover, such policy will increase employee satisfaction, which will result in a lower turnover rate so, there is a strong and apparent need for competent and quality people in managerial positions. Therefore, it would be wise to invest and examine the quality of future managers before they are in management positions, and although such an approach creates an additional cost, this cost is undoubtedly lower than the one that can be generated by a high turnover rate that indirectly is result of poor leadership (Loquercio; 2005, 72). Investing in education and training, especially for managers,

is indeed a priority of organizations and human resources agencies who want, not only to provide better conditions to their employees but also to increase self-confidence and improve the operational capabilities of their managers. The result of such investments according to CIPD (2005) reflects on the organization's success by creating channels through which employees may express their dissatisfaction, such as consultancy bodies, regular human resource meetings, surveys, etc. The authors also emphasize the benefits of such approach by which dissatisfied employees provides a chance to solve the problem before they leave the organization because when there is no chance to talk, the termination or leaving the organization is the only logical sequence.

The first step in the process of determining the optimal turnover rate is acceptance of the fact that the optimal turnover rate is not the lowest possible, but the one that reproduces the highest long-term productivity and organizational progress (Hansen; 2005). In order to do so, the organization has the task of determining the specific profiles of employees, their skills and organizational positions that are of crucial importance to the company. Also, through a continuous building of organizational involvement, teamwork and cohesion among employees and identifying employees with the goals, vision, and mission of the jointly-created organization, drastically reduces undesirable turnover and creates organizational pride in employees (Loquercio; 2006). The causes of undesirable turnover are found in various spheres of organizational life and environment, in certain situations it is impossible to accurately estimate the reason for leaving, but according to Firth et al. (2004) experience suggests that the continuity of repetition of specific stressors, coupled with a lack of stressful commitment to stressors and generally job dissatisfaction, will cause stress on an employee to overcome a particular act. Although the decision to leave the organization represents the single individual will, the impact of the negative organizational climate cannot be denied. Nevertheless, most authors emphasize the importance of creating an organizational climate that is suitable for the growth and development of an internal control loop in an individual, characterized by taking responsibility and controlling for one's actions, thereby contributing to increased satisfaction, independence and power that is distributed to employees. Social processes affect individual attitudes and behaviors, so the person's social embeddedness is critical and axiomatic (Krackhardt, Porter; 1986, 54).

According to Deloitte study (2004), the responsibility for building trust, openness, and care for employees lies in the organization. That means that the or-

ganization has the task of developing the skills of its employees, not only through formal training but by specific training with the help of colleagues, by learning on workplace where mistakes must be seen as a necessary obstacle to success. In this study, it is also mentioned that not all employees can have the same characteristics and abilities and that a proper evaluation of employees' potential abilities must precede each organizational training. It is emphasized the importance of internal organizational mobility, whereby employees will find where their contribution to the organization is the biggest so turnover would be only internal. Finally, the use of internal and external help to build rich bonds is suggested through relaxation programmes and social gatherings where employees can engage in an open conversation, strengthen and empower community feelings, and create informal organizational relationships that enhance the organization's information flow and efficiency. Employee involvement, the organisational capacity to attract, retain and optimize the value of its employees depends on the quality of job design, how employee time is spent, and the commitment and support of managers motivating employees to remain in the organization (Meaghan; 2002). Breuer (2000) advocates providing a more realistic view of future job opportunities for job candidates, and increased care and employee control in the first months after employment. Corporate culture, hiring, and promotions and training practices influence non-management employee retention and at the same time, management retention, as well (Moncarz et al., 2009; 437). On the other hand, organizational mission, goals, and direction, and employee recognition, rewards and compensation were found to reduce non-management employee turnover positively, but not management employee turnover (Moncarz et al., 2009; 437).

4. TURNOVER IN MATRIX ORGANISATION

The matrix organizational structure produces several reasons for the undesirable turnover which, according to Chapman (1998, 242), is primarily and mostly caused by increased pressure and stress within the organization, and according to Arvidsson (2009, 105), time constraints and lack of resources. Firstly, Maylor (2010) states that the dual responsibility of superiors or the existence of two superiors creates ambiguity, distorted priorities and causes a state of increased stress and pressure on execution. Employees in such a position achieve lower efficiency and become more pessimistic about the future, resulting in a new job search within the organization if it is possible to reach

an agreement with their superiors otherwise the quest is expanding outside the organization. Poor communication and lack of information cause ambiguity in employee roles, unreasonable expectations of superior and constant pressure on employees, coupled with lack of consensus in the delegation of responsibility and organizational tasks, increase dissatisfaction and rate of employee turnover. The matrix structure exhibits a specific characteristic (dual lines of authority, responsibility, and accountability that violate the traditional 'one-boss' principle of management) so it requires strong horizontal integration through communication and coordination between departments (Chennai; 2006, 1). Krackhardt and Porter (1986, 54) found that turnover does not occur randomly throughout a workgroup and it concentrates in patterns that can be delineated by role similarities in a communication network. One study on export sales managers' intentions to quit in matrix organizations revealed the favorable impact of formalization and the unfavorable impact of centralisation upon both role ambiguity and role conflict (Katsikea et al.; 2015, 367). This study shows that both formalization and centralization relate positively to the export sales management behaviour control system and that role stressors deleteriously affect export sales managers' job satisfaction, which in turn affects negatively intentions to quit. The role stressors of role ambiguity and role conflict deleteriously affect job satisfaction so when managers suffer an array of demands, each at variance with another, their job satisfaction declines and their propensity to leave is a likely consequence of this chain of effects.

A thorough case study in one company analyzed the impact of organizational change, structure, and leadership on employee turnover accompanying the process of structural change into a matrix organization. Their structure evolved from an autonomous business unit led by one general manager to a matrix organizational corporate structure and this change in structure was detrimental and time-consuming, and although it led to an initial drifting, the annual turnover increased from 15,63% to 23,58% in one year (Appelbaum et al.; 2008, 29). Gillet et al. (2013) mentioned the importance of understanding the mechanisms through which higher turnover intentions and lower worker satisfaction take place, eventually leading to appropriate interventions. They found that turnover intentions are negatively related to perceived organisational support and work autonomous motivation, and positively related to work controlled motivation. In matrix structure, little autonomy is left to blue-collar employees in the decision-making process which is one of the common reasons for dissatisfaction

that leads to intention to quit. There is a significant positive association between autocratic leadership style and employee turnover intentions and employees under democratic leadership style are less likely to involve in turnover intentions (Puni et al.; 2016, 1). Poor autonomy levels are often correlated with lower work and organisational engagement. Work engagement mediates the impacts of supervisor support and self-efficacy on quitting intentions so when there is sufficient supportive supervision, employees repay the organization by being loyal (Ibrahim et al.; 2019, 12).

Furthermore, the process of creating project teams, in essence, consists of selecting people with the specific skills that are needed to make a project or a task. On that occasion, there is the encounter of different and distinct personalities that connect, especially in large organizations, for the first time. Due to the diversity of characters within the project team, some conflicts can seriously escalate and are usually influenced by time constraints and lack of resources. Line managers in the matrix organizational structure retreat and relocate employees through projects, depending on their need to fill vacancies (Hendry; 1975, 37). There is a double result: on the one hand there is inefficient resource allocation in the organization, and on the other hand, undesirable turnover within the organization increase ambiguity and with such an irresponsible approach, employees are brought into a state of extreme stress and separation on many different sides. Therefore, the incentive for management responsibility during timely planning and assessment of employee skills, needs, and ambitions in the design process of the project team, is significant to emphasize. Also, close human resource cooperation is a prerequisite for the growth of employee motivation, quality and efficiency and, consequently, the reduction of turnover rate. Creating a balance between employee welfare and care and a healthy and profitable organization is a challenge that management must approach uncompromisingly responsibly. In matrix project teams the use of electronic knowledge repositories and succession planning reduce the negative effect of turnover on the project performance but job enlargement does not have a significant mitigating effect (Pee et al.; 2014, 702). The main findings in one study dealing with project management turnover showed that turnover occurs predominantly during the execution phase of the project life cycle, with the main causes being related to career and personal development and dissatisfaction with the organizational culture and project management role disrupting and negatively affecting the performance of the project team and the whole project (Parker & Skitmore; 2005, 205).

Kryvenda (2012) carried out research about employees' turnover within the organization and confirmed that the stronger problem is internal turnovers than external. In the research, she also identified many errors and disturbances occurring in the matrix organizational structure, hence loss of project knowledge where time or organizational culture effect voluntary internal turnover. In such processes the loss of valuable time to execute the project and the growth of stress among employees occurs because the same employees are not engaged on a project from the beginning till the end, but during the lifecycle of a particular project, a larger number of employees are rotated by working in some parts of it, while a small number of employees stay all the time. Kryvenda (2012) pointed out that it takes some time to build a team and establish communication, and the costs associated with the education and adaptation time of new employees to a particular project are extremely volatile and often exceed high levels. There are also positive influences of internal turnover on employees who want to work on new, exciting and powerful projects and look at the project as a rare business opportunity for career development. According to Morrell et al. (2004, 169), employees are aware of possible career development and usually benefit personal development and expect full support from employers. The matrix organization provides for such employees various opportunities for progress and knowledge growth through work on different projects that are of paramount importance to the organisation. Such opportunities enhance the organization's identity and reduce the possibility of undesirable external turnover, and generally noticeably create an ambitious and attractive organizational environment.

Lau and Albright (2011, 20) propose that organizations should continuously analyze individual employees' turnover intentions and real turnover in order to determine what benefits and disadvantages are. Also, the authors argue that the occasional employee turnover shifts their staff to positive organizational growth and enables them to hire new talents and expand the organization's ability. Moreover, occasional turnover may encourage management to improve staff development programs. Hence, employee turnover can be viewed as a tool to increase organizational productivity and morale if more efficient and more ambitious employees replace the average. Feeley and Barnett (1997; 385) recommend that organisations should strive to add links to those nodes on the periphery of the organization so these added links or social support should be centralized individuals who are committed to staying at the organization.

5. CONCLUSION

This paper highlights the possible implications and consequences that arise as secondary results of the process of implementing the matrix organizational structure and its influence on the rate of employee turnover in the organization. It points out the disadvantages of the matrix organization, and its structure reinforces the lack of clarity in responsibility and expectations. The effect created by such a structure encourages employees to continually send inquiries to their superiors about the direction and tasks they are to perform, and what exactly their role in the organisation is. Therefore, matrix structure managers must convey organizational strategy constantly, mission and goal to subordinates, and to explain them their role in detail in order to avoid misunderstandings. A high level of coordination, accountability, and commitment of managers about employees and in managing organizational tasks will bring the benefits of a matrix organization and reduce the effects of potential information deficit, stress and increased turnover levels in the organization. Hourly employees' retention can be predicted by self-fulfillment and working conditions, even over monetary rewards (Milman & Rici, 2004; 23). Optimizing employee results by creating standard procedures for performing specific tasks, providing the right working conditions, creating climate responsiveness, and selecting quality employees reduces turnover in the organization.

Recommendation for the empirical research includes tracking and measuring the reasons why people stay and why they leave, with emphasis on staying reasons and organizational commitment. It would be interesting to find the triggers of turnover intentions in matrix organizations especially in the critical moment of a structure implementation. Another suggestion is the introduction of the outbound interviews or questionnaires that would be carefully crafted to identify actual leavers and their turnover causes.

When there are right labor market conditions that should, in normal circumstances, contribute to organizational stability, in such situations, they cause a higher and more frequent rate of employee turnover due to increased opportunities for finding new employment and achieving a better working condition. Consequently, retention of best employees is more difficult when the labor market is more competitive so creating a competitive internal organizational climate is the only way to gain loyalty.

Abstract

The implementation of projects funded by the European Union has opened up many possibilities for the development of existing potentials on a local, regional, and national level, as well as on those naturally developed areas – cross-border areas. The development of local and regional areas with regard to the overall national economy demands a different approach and should be addressed with proper, more tailor-made actions. Therefore, a clearer understanding of possible allocations of all types of resources has become one of the key issues in this matter. Although the implementation of projects affects the resources of an area and can, in theory, contribute to the reduction of social and economic inequalities and balance the development of regions, it is necessary to assess the justification of the investments, the relevance of the implemented projects and their scope in

each individual border area involved, so that all of its characteristics could be apprehended and observed in the context of the achieved results and possible missed opportunities.

The aim of this paper is to contribute to the discussion on Geographic Information Systems (GIS) and their contribution to decision making on NUTS III level in the cross-border area, as well as the possibilities they could create in the resources management of an area in the period of sustainability of project results created in the seven years of cross border cooperation Hungary-Croatia 2007-2013 programme as an example.

Keywords: GIS, Spatial Data, Management, Cross-Border Cooperation, Regional Development, European Union

JEL Classification: M15, R58

1. INTRODUCTION

Since its founding days, the European Union has put a great emphasis on regional politics, promoting the idea of exploiting the comparative advantages of space that forms a natural geographical unit. „Regional policy is one of the major pillars of the entire EU’s public policy, focused on the redistribution of resources of the member states with a view to boosting economic growth and sustainable development of the lagging areas“ (Đulabić, 2011, p. 1043).

The financial aspect of allocating funds confirms that the development process, with an emphasis on the border regions in the European Union, enjoys an increasingly privileged status and plays an important role in the development of the region, given that “approximately a third of the EU’s total budget is invested in regional policy in order to achieve greater economic and social cohesion of the Union more equitable development of member states and their regional units (Tišma et al., 2012, p.120). The justification is found in the fact that such spaces often have similar or nearly identical opportunities and threats, linking them to the same spatial features that often provide similar opportunities to the population of the region as well as the fact that the border regions occupy almost a third of the EU space (Ravlić, 2019, p.6).

Due to the existing divergence in development among the regions of the Republic of Croatia, one of the possible ways of coming closer to the desired state are certainly the cross-border cooperation programmes in which, given the form and geographical position, all counties of the Republic of Croatia had

the opportunity to participate along with member and non-member states. In the document *Strategic Framework for Development of Republic of Croatia 2006-2013*.¹ it was defined that a special emphasis is put on cross-border cooperation as one of the instruments of regional development, which encourages not only investment in infrastructure but also activities of improving investment conditions, entrepreneurship development, education, tourism development, and environmental conservation. The latter is certainly consistent with the goal of the regional development policy, which is to “contribute to the socio-economic development of the Republic of Croatia, in accordance with the principles of sustainable development, by creating conditions that will enable all parts of the country to strengthen competitiveness and realize their own development potentials” (Bilas et al., 2011, p.296).

By implementing projects, networking, knowledge transfer, education, skills development and learning based on examples of best case practices, there is a chance to develop human and other resources of bordering counties, but it is necessary to determine which direct and indirect effects, over a long period of time, are ultimately achieved. Precisely to that purpose it is necessary to initiate the process of quantification and clear delimitation of the level of impact and performance achieved by each of the cross-border programmes, as well as their share in the overall development, taking into account the particularities of each area of cross-border cooperation and the views of the organisations implementing activities during and after the formal completion of the project, which would be the period of monitoring the sustainability of its results.

Because we live in a rapidly changing world, our future is contingent on what we do today and the nature of our intervention. We need the future to not simply happen to us but rather be one that we shape and define today. We need greater knowledge of our environment and our relationship with it as well as awareness of how to protect its valuable resources through the conservation of nature (Abukhater, 2011). To this purpose, it is possible to use geographic information systems since GIS „enables spatial analysis, managing large datasets, and the display of information in a map/graphical form². GIS technology is widely applied in resources management and allocation, environmental modeling, information system, emergency response, business and

marking facilities management, network system analysis, visualization” (Fei et al., 2001, 2).

2. POSSIBILITIES OPENED BY THE CROSS-BORDER COOPERATION PROGRAMME

European integration and the disappearance of national political borders have unleashed an enormous potential for direct co-operation between states, regions, and municipalities belonging to different countries (Kiefer, 2014, p.70). Given that today „there are virtually no local or regional authorities in border areas that are not somehow involved in cross-border co-operation (CBC) initiatives“ (Perkmann, 2003, p.153), it is of utmost importance not be excluded from the processes that take place at all levels of the European Union, of which we are full members, meaning we can use all available resources to achieve the desired results both locally, regionally and nationally.

Through its financing measures, the cohesion policy serves to overcome the social and economic differences in the Union, the integration of underdeveloped markets and economies into the regular flows of developed European countries and the capacity building of less developed members to participate equally in the European market³. This is a significant impetus for the cooperation between regions in the cross-border area and regional development, opening up opportunities for the cooperation between regions and usage of available EU funds. In addition, it is possible to develop one’s own operational programmes and strategic development documents without the intermediation of central governments, which, in certain situations, can result in a more efficient and meaningful use of financial resources as the needs are detected and the programmes are being implemented precisely „at the source“ of the problem.

Additionally, effects, such as creating and strengthening networking of individuals and organizations in local and regional areas, enhancing trust in the community, or increasing the level of education (formal, informal, informal) of other members of the immediate or extended family, will surely depend on micro-location and smaller communities in the observed area.

³ <http://www.raza.hr/Poduzetnicki-pojmovnik/Instrumenti-kohezijske-politike> [access February 18, 2019]

Different attributes of a region's space and the specificity of human capital are often conditioned by culture, customs, historical inheritance, short-term, medium-term or long-term periods in which impacts can be realized.

Every town, city, and community has unique local conditions that either help or hinder its economic development. These conditions will form the basis for designing and implementing a local economic development strategy (Swinburn, 2006, p.3). The issues faced by each local, cross-border area is subject to the specifics of each region, and a part of the problem lies in solving such challenges with a tailor-made approach. Long-term efforts and comprehensive observation of a given territory are needed, taking into account all of its specific features so that it's possible to create specially tailored measures that will result in a maximizing effect in that area.

To build a strong local economy, good practice tells us that each community should undertake a collaborative, strategically planned process to understand, and then act upon, its own strengths, weaknesses, opportunities, and threats. This process should enable local areas to become more attractive to businesses, workers and supporting institutions (Swinburn, 2006, p.3).

When speaking of project implementation, it should be noted that there is a component of the implementation or the component of the sustainability of the project results which occurs after the implementation of all activities during which organizations and institutions are continuing with a part of the activities. The use of these resources and their multiplier effect over time in the domain of increasing human resources or capital for economic growth purposes is rarely addressed. The effects that the mentioned funds created in terms of new value are seldom discussed, thus causing an increase in the quality of life in a local community for all its stakeholders. „It has long been recognized that the benefits of investing in human capital are not restricted to the direct recipient but spills over to others in society“ (Wilson & Briscoe, 2004, p.47).

Although some of the effects are visible immediately after the initial implementation of project activities, some still take time to develop their full potential. However, their importance is shown from the initial steps of the project, its applications, and it requires a very clear description of the long-term social, economic and environmental impact that the project will have. Having in mind the size of projects, the number of partners, the coverage of the space and the funds allocated, it is clear that it will leave an impact on the local communities

where the activities will be carried out, but the quality itself and the long-term effect it should and will cause remains unclear and undetected.

Some of the research results conducted in the post-communist, transition countries, now members of the European Union, discouragingly talk about investment by EU funds in the development of human capital in the local/regional area and its insufficient significance in order to clearly confirm the need for investing in local human capital which should be the bearer of local development. (Jurajda, 2004, p.19).

Recent conditions that rule the market in the form of rapid obsolescence of the skills and workers capabilities, the failure to meet the market needs in a given time and space may, in addition to the multiplicity resulting in growth, potentially result in negative consequences, such as unemployment and the loss of human potential, followed by a series of other difficulties, which will ultimately increase the divergence between the regions, hence, „Knowledge is the most strategic resource and learning the most important process“ (Lundvall, 2002, p.26), which can be supported by projects funded by the European Union, such as Cross-border cooperations.

3. CROSS-BORDER COOPERATION PROGRAMME HUNGARY-CROATIA

Despite the wide-ranging scientific interest in the problems of (state) borders, the Croatian-Hungarian border area has not attracted special attention in the literature during the last 20 years (Čelan, 2016, p.43). The boundary, colloquially often identified mainly with Drava river (and the lower part of Mura), as a typical natural (physical-geographical) and language border, is one of the oldest European borders along its major parts (Čelan, 2016, p.45).

Cross-border cooperation started in 2002 when local participants along the border launched the creation of the Hungarian-Croatian pilot fund for small projects under the Hungarian State Program PHARE, launched in 2003. The main objective of the program called INTERREG PHARE was to support non-profit cross-border co-operation and prepare potential candidates for future funding opportunities from the INTERREG Program⁴.

⁴ http://europski-fondovi.eu/sites/default/files/dokumenti/Hrvatska_Ma%C4%91arska.pdf [access January 14, 2019]

The post-war situation in the Republic of Croatia, the loss of human capital and the inability to catch up with the market over a long period of time, further complicated the already complex situation. Although, during the observed period of implementation of this cross-border cooperation, when a/the crisis reached its peak in Europe and the world, Hungary was in a somewhat favorable position vis-à-vis the Republic of Croatia since they already initiated processes of solving identified problems by withdrawing funds from the EU funds over the past years. Nevertheless, the influence of the “iron curtain” on its human potential and on other resources that certainly left a great mark on it should not be forgotten because of its great impact and possible influence on future generations and on local communities in general.

3.1. CROSS-BORDER COOPERATION PROGRAMME HUNGARY-CROATIA 2007-2013

The observed IPA Cross-border Program Hungary-Croatia 2007-2013, with more than 52.000.000.00 € allocated funds for seven years of the program, which has been the focus of this study, funded projects in the area of sustainable environment and tourism, development of economic cooperation and common human capacities, which are recognized as areas of exceptional local-specific importance of the cross-border area. During the implementation of the seven-year project, interventions were carried out on a spatially defined area, the Acceptable Area and the Area of the Associated Regions of the Program, geographically located along the southwestern and southern borders of the Hungary and the North and North-Eastern borders of the Republic of Croatia.

Given that there are no clear indicators at the level of the whole program that would give answers about the quality of the long-term effect of the invested funds, but only at the level of an individual project, the most important source of data and their achievement are the partners on both sides of the border, responsible for the implementation of the project activities. The implemented research encompassed both the lead beneficiary and the project partners since they are responsible for maintaining results after project implementation. The research included several project components, in this case the value of investment in revitalization of infrastructure in the cross-border area, tourism and investment in human potential, which will give an insight into the actual impact of the allocated funds on the basis of immediate target group members in terms

of the direct effect of the project, as well as human capital in local communities and its other important factors.

4. RESEARCH

The research was carried out during the sustainability period of the project in order to determine the impact on the development of human potential in the observed area in the period when it should be multiplied and even achieve additional effects at all levels. From April to May 2018, a survey was conducted involving respondents taking part in 102 projects from both participating countries, out of a total of 170 projects. Thus, out of a total of 581 institutions participating in the implementation of the projects, 102 completed surveys represent 358 institutions that implemented projects on both sides of the border.

The research was carried out on the Acceptable Area and the Area of the Associated Regions, which includes the Croatian Međimurje, Koprivnica-Križevci, Virovitica-Podravina and Osijek-Baranja county and the associated counties –Varaždin County, Bjelovar-Bilogora County, Požega-Slavonia and Vukovar-Srijem County. The areas that participated in the research on the Hungarian side are the Zala County, which is part of the Western Danubia region, as well as Somogy and Baranya counties, which are part of the South Transdanubia region. Survey respondents are organizations, institutions in the status of the lead partner, a partner in the project or affiliated partner within all 3 Calls.

Geographic information systems have been used as a source of geographic information, i.e. spatial depiction of invested financial resources within IPA Cross-border Co-operation between Hungary and Croatia in the seven-year period, in order to demonstrate dispersion or focus in that area as „GIS is a philosophy of information management and integration of spatial display and data analysis.“ (Jurišić et al., 2016, p.3). „GIS technology is widely applied in resources management and allocation, environmental modeling, urban planning and management, land information system, emergency response, business and marketing facilities management, network system analysis and visualization“ (Jenkins, 1990, p.8), so its wide usage could also benefit other sectors such as planning and decision making on all levels. Furthermore, GIS will determine the degree of impact on a certain space and the investment of cross-border co-operation resources that can serve as a decision-making basis to improve the economic aspect of the business, especially if the user has limited resources

or has a large number of options available. Managing the resources of a given space and utilizing EU funds gives the user a realistic opportunity to detect bottlenecks at a particular location, use the resources in the most economical way and make better decisions in the situation when resources are scarce.

“Thorough planning within available resources resource management gives the user a realistic possibility for faster and better production, as well as a greater income than it would be possible in the situation of having immense resources available, which would not be used economically” (Jurišić et al., 2018, p.2). Also, a very important segment of GIS is the possibility to further understand the impact of invested resources in some space. Although there are many factors of influence that can be detected in some area, it is still necessary to locate exactly those that per unit of impact result in the greatest effect, both in the short and long term.

5. RESULTS AND DISCUSSION

As a result, several maps were chosen in order to show the possibilities offered by the geographic information systems. Only three maps out of the entire scope of research and results are selected to show the impact of the funds invested in different areas of intervention. Both sides of the eligible area of the Programme can be characterized as rural areas with the only large urban centers in the region, “Pecs (162 498 inhabitants) and Osijek (114 616 inhabitants). Other urban centers, including Kaposvár (67 662), Zalaegerszeg (60 061), Nagykanizsa (51 694), Komló (27 387) on the Hungarian side and Koprivnica (25 776), Čakovec (15 885), Virovitica 15 683), Varaždin (49 075) and Bjelovar (41 869) on the Croatian side have more local significance”⁵.

The data shown below is selected because of the importance of the information itself that is presented in different statistical data, which is only relevant when placed in the context of the space, i.e. treated area, in this case, the invested funds with regard to the local communities.

The first section shows the differences among the amounts of funds that were invested in a certain area of the Cross-Border Cooperation programme when it comes to the education component of the project. The second part

⁵ <https://narodne-novine.nn.hr/clanci/medunarodni/dodatni/415584.pdf> [access January 10, 2019]

highlights the dependence on project implementation (the financial/human capacity of implementing institutions) in the cross-border area of IPA CBC HU - HR funds. The third part shows the impact of IPA CBC HU-HR projects on the local community network and the border area of implementation.

Maps show the transition from simpler forms of GIS display to something more complex, with the purpose of showing opportunities in decision-making at all levels and those decision-makers who do not have the necessary training for the GIS, because the representations shown here include only one to two variables, although it is possible to see a lot more complex shape.

5.1. THE DISTRIBUTION OF FUNDS INVESTED IN DIFFERENT TYPES OF EDUCATION IN THE IPA CBC HU-HR 2007-2013 CROSS-BORDER AREA

By analyzing the answers received for the 102 projects implemented, it is evident (Figure 1) that 42% of the projects for the implementation of educational activities spent 10% of the total project budget. Given the nature of the implemented projects, it is possible to conclude that the amount of up to 10% is largely chosen by all infrastructure projects where only a small part of the budget went to the educational component because it was a considerable allocation of funds for each of them. 20% of the budget for the implementation of these activities was spent in the case of 17.6% of projects, and 14.7% of implemented projects spent 30% of the budget on some form of education. For a small but relevant number of 9.8% of projects, 40% of the budget was spent on educational activities. Out of the total number of projects, 4.9% of projects spent 50% of their budget on educational activities, and the same percentage of projects, 4.9%, spent 60% of the project budget in the educational component. Only 2% of projects spent as much as 70% of funds in education and the same percentage of projects invested 80% of the budget in education. 90% and 100% of its budget have invested 1% of the implemented projects, but it does not say almost anything about the distribution of the funds invested in the observed area of cross-border cooperation.

Figure 1: The share of the total budget of the project planned for education

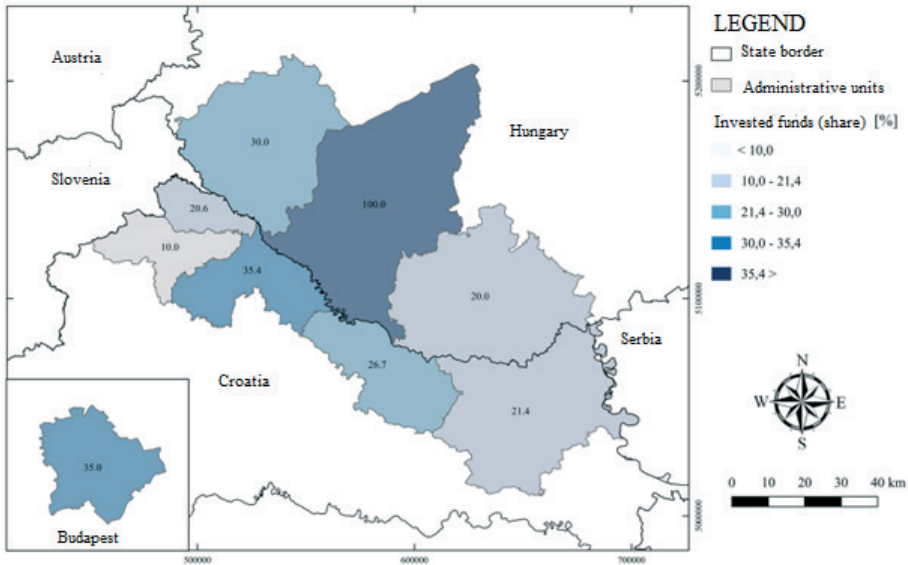

Source: Field research from April to May 2018

With regard to the distribution of funds invested in different types of education in the cross-border area of the IPA CBC HU-HR, it can clearly be concluded where a larger number of projects with a significant educational component was implemented, and that additionally also highlights other results which may have been obtained in this area in a shorter or longer period after the implementation of the planned activities. Such data can be used as a basis for future interventions or can be seen as the strength of already accomplished effects. For example, has the higher percentage of funds allocated to education increased the employability of the population, income, additional education or some other indicators in a certain area or has it completely omitted the effect which clearly indicates the necessity of additional adjustment of interventions?

This type of display (Figure 2) can also be combined on one map with all of the aforementioned parameters and the effects caused by the interventions made during that time could be observed, serving as a basis for more informed decisions for future activities at all levels.

Figure 2: The share of project budget intended for educational activities by counties

Source: Field research from April to May 2018

5.2. PROJECT IMPLEMENTATION DEPENDENCE (FINANCIAL/HUMAN CAPACITY OF INSTITUTIONS) ON IPA CBC HU-HR 2007-2013.

For the claim – “The project of this size (financial/human capacities) would certainly be carried out regardless of the received EU funds”, the answer clearly shows that the implementer has a definite attitude on the dependence of financing the applied activities. However, it is necessary to repeat that this is actually the case of initial funding, as each partner in the period of sustainability of the project results has to invest their own funds in that extent in which they carry out the sustainability of the results. As much as 49% of respondents (Figure 3) shared the opinion that they would not carry out planned activities without the EU funds. If we add up the 18.6% of respondents who do not agree with the statement, it is clear from the analysis of the survey results that more than a half of the projects would not have been conducted in the area on both sides of the border. Out of the total percentage of respondents, 17.6%, do not have a strong stand on the dependence of project implementation and the allocation of initial financial resources. Only a small percentage (4,9%) of respondents disagree and would carry out the project without the initial financial assistance allocated to the cross-border area from the IPA pre-

accession assistance program. Almost 10%, or more precisely 9.8% of respondents believe that the projects planned by their cross-border partnerships would also be carried out without financial assistance from the EU funds.

Figure 3: Project implementation dependence on allocated IPA CBC HU-HR 2007-2013 funds

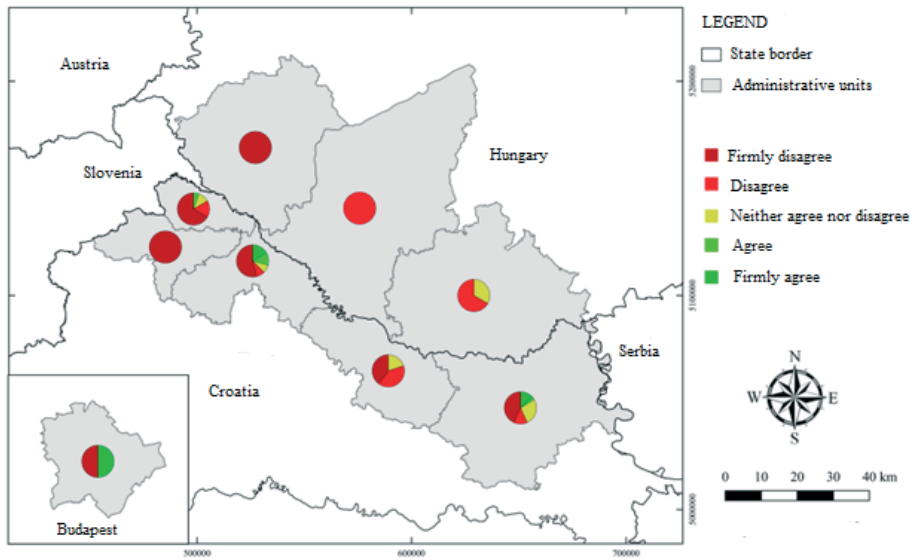

Source: Field research from April to May 2018

A clearer picture is certainly gained by a spatial representation of the results obtained, where we can see (Figure 4) the differences between the regions when it comes to the dependence of the implementing institution capacity on EU funded projects. Of the total number of implemented projects, those conducted by users in the counties of Somogy and Zala from the Hungarian side and the Varaždin County on the Croatian side show the greatest disagreement with the claim, i.e. the dependence on EU funds. According to the chart below, in all counties disagreement exceeds 50%, which is confirmed by a high percentage of the dependence of implementing project activities on the implementation of projects funded by the EU. Only 4,9% and 9,8% of the respondents, who would certainly carry out the planned activities of the projects, are located in Osijek-Baranja, Međimurje and Koprivnica-Križevci County.

The data presented is just the beginning of the ability to display geoinformation tools that are able, by stacking multiple layers and associated attributes, to display data in the observed space that can serve decision-makers at all levels. Planning and implementing the intervention itself in the area will allow a clearer understanding of the “wider and broader picture” of an area and all its special features. Considering the number of inhabitants living in border areas

and the number of financial resources that are intended for cross-border cooperation, but also the need to manage some local resources, the importance of understanding spatial data is even more notable.

Figure 4: Dependence of project implementation on allocated IPA CBC HU-HR 2007-2013 funds by counties

Source: Field research from April to May 2018

5.3. THE IMPACT CREATED BY IPA CBC HU-HR IMPLEMENTED PROJECTS ON LOCAL COMMUNITY NETWORKING AND CROSS-BORDER AREA

More than half of the respondents, or 60.8%, believe that the implementation of the project activities encouraged other organizations to carry out activities in terms of actions, initiatives, projects, regardless of cross-border cooperation in these local communities. Out of that, 25.5% firmly agreed with the statement and 35.3% agreed. Less than a third, namely, 29.4% could not agree nor disagree with the statement, while less than 10% of respondents disagreed. Only 8.8% selected the answer to disagree, while merely 1% expressed their strong disagreement with the statement. The latter is a very important indicator since in this way the results of the projects are actually coming out “from their original framework” of cross-border cooperation partnership and multiply in

the local community and among its stakeholders. When this kind of effect occurs, for which there is no “compulsion” but it occurs from the needs perceived by the stakeholder for the local area or institution they work for, then we can state that the multiplicative effect started to take place in local communities along the border, in this case by the initially invested funds during the implementation of IPA CBC HU-HR funds.

This type of multiplier effect is not identical in terms of form, meaning or content with the concept of sustainability of project results, which primarily means the continuation of activities or a part of them after the initial project financing, in this case, made by the EU funds. The multiplication effect carries much more weight since it is not obligatory and all its creations are additional assets for the community. Due to that, answers to this question given by organizations that have been implementing projects in the area, those who know the opportunities in their local community, who carry out activities with target groups members and also cooperate with other organizations, stakeholders of that local space, have served as a positive example for new actions, activities, initiatives and projects implemented and thus created a multiplicative effect as an unforeseen result of invested funds.

Figure 5: The impact created by implemented projects on the creation of new projects in local communities

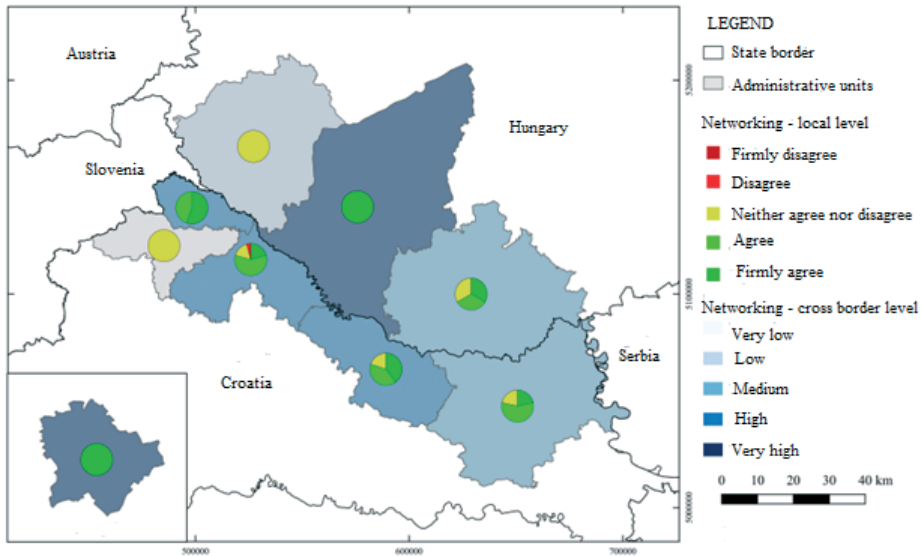

Source: Field research from April to May 2018

The map (Figure 6) more clearly demonstrates the attitude of organizations regarding implemented projects and the increase in the level of local networking

when it comes to people and organizations in the border area by counties. With this type of presenting collected data, multiple answers shown within one map can give us much information which might not be visible at first. While a great number of institutions entirely agree that the implemented projects have a positive impact on networking among people and organizations at that local level and that they have increased the networking of people and organizations in the border area. In the counties on the Croatian side, there is a unified opinion on the high importance of implemented projects and increased networking in all counties, except in the case of Varaždin County. This data could also be linked with multiple layers of data from each county and could serve for a better understanding of conditions in each county since they clearly do not have the same stand on this issue regardless of the country they come from.

When programming cross-border co-operation and other EU programs, given the fact that the program has a seven-year implementation period, a great opportunity lies in GIS tools in order to better understand the starting point but also the results or their absence lies in the spatial view of the given data. A large number of space attributes could be presented and thus influence better decisions for a certain area. Apart from that, the achieved progress that can also be monitored this way should have a central role in planning on all levels, but also the subsequent analysis of the results obtained should play an important role for any future step for any local areas where interventions should take place.

Figure 6: Impact of IPA CBC HU-HR implemented projects on the local community and cross-border areas

Source: Field research from April to May 2018

6. CONCLUSION

Encouraging different processes at local levels, such as networking and cooperation in areas sharing the same opportunities and having the opportunity to exploit common resources in a sustainable manner, stands at the top of the priorities since it has the potential to stimulate the various processes necessary for progress, both locally and across border, on which it could have an indirect effect. Cooperation driven by investment funds, such as those funded by the European Union, would enable multi-level cooperation but it is needed to activate various resources in that direction. Consequently, in that manner, it is possible to expect the creation of the foundation for the future development of each individual in the communities of the observed (cross-border) areas. On the other hand, a much desired regional development will happen in correlation to that without any direct involvement of the central government and their planning, but to the natural needs of the area that share the same or similar opportunities, threats, and/or resources.

Certainly, it is necessary to repeat once again that the implementation of projects is open to everyone in the European Union since that is regarded as

taxpayers' money. We should not ignore the fact that a significant amount of annual participation each country, including the Republic of Croatia, is investing to have access to funds and therefore it is necessary to plan interventions based on information from the field that will be dealt with by appropriate methods and services for better decisions at all levels. Although access to financial resources is made available to everyone, the effects of the funds will depend on resources, such as institutions that will prepare projects, those who will participate in them, decision-makers who will multiply the results achieved by additional financial means, but also the attitude of all involved stakeholders, from those in small local communities to those in a high-ranking position.

When talking about decisions made at a community or regional level, GIS tools can offer a wide range of solutions that will allow simpler detection of the causes but also the consequences of some factors, in this case, funds invested in a cross-border area. Detecting processes that are simultaneously triggered by investing resources of this kind in some area can enable all stakeholders (and, more importantly, decision makers) to have a clearer understanding of its effects. Understanding the impact of the created centers of power in some area, the scarcity of resources or its repeated investment in a space that does not generate additional value should be further researched in order to find an approach that will yield desired results. Such synergies will create the basis for further steps in the desirable direction of these very delicate processes that need to occur at a personal level (perception of personal influence and continuous motivation for the same), institution level (understanding of the impact on the local level and the role of the development initiator) and ultimately the local community as a whole.

It is worrying that there is no research in the area of development conditioned by the EU's investment of resources and the correlation with the results of growth at the regional, local and even personal level, which could contribute to the discourse on the difficulties we are detecting for decades in the Republic of Croatia. By using tools, such as GIS, it will be possible to understand the impacts on the local space irrespective of where they come from and to find efficient and effective ways of using local resources to detect whether some regions are lagging behind due to their capacities that are not being used in an appropriate way or because of the circumstances and impacts that are not fully within their competence. This could allow the possibility to more clearly determine

which future direction to take and could result in much-desired growth and sustainable development on all levels.

Abstract

The purpose of this paper is to explain and distinguish the process of guest traveling and the guest's booking process to subprocesses, and in that context deepen and broaden the understanding of Google's Ranking Factors, whose quality determines the position of the SERP (Search Engine Result Pages). Each hotel as a business system strives to direct as many online users as possible to convert through an online reservation form on a direct online channel or web site compared to OTAs.

The aim of the work is to identify, classify and define all the factors influencing the final decision on the online booking of the hotel. In this respect, this paper

seeks to point out the fact that besides RF, which are an integral part of Google's Search Engine Optimization (SEO) analytics, the final decision on booking is also influenced by the factors that Google algorithms work indirectly and are defined through expanded paradigm Google algorithm.

Methodology - The research will be conducted in 3 phases. In the first phase, all relevant literature and research will be studied and analyzed. In the second phase, all current RF and software reference sources and their software updates for depth analysis (Google, MOZ, SEMrush) are investigated to determine their current relevance and optimization capabilities more accurately. In the third phase of the research, the relationship between the individual phase of the online booking process and the travelling cycle phase will be put in place to determine the factors that directly or indirectly affect the generation of the SERP result.

Limitations at this stage show the lack of space for conducting empirical research in terms of conducting factor analysis on concrete examples and analyzes because such an approach would have significantly exceeded the scope of this paper.

Practical implications - On the basis of research of factors, industry practitioners can learn about up-to-date factors that affect direct online sales and optimize them in business practice.

The scientific contribution of the work is reflected in determining influencing factors for direct online booking in the hotel industry and the introduction of RF matrix for a positive impact on sales improvement through direct online sales channels based on the expanded paradigm of Google's ranking algorithm variables.

Keywords: Google algorithm Ranking Factors (RF), SERP (Search Engine Result Pages), online booking, travel/booking process, SEO

JEL Classification: M15, Z39

1. INTRODUCTION

The ultimate meaning of business is revenue or profit. The profits are influenced by many direct and indirect factors. Hotel industry as a business branch is very complex. Also, the whole process from sales planning to sales realization consists of a very large number of sub processes and variables that are affected by sales processes and sub processes (distribution of capacity to sales channels, planning and dynamics / rate parity, quality of accommodation facilities and

accommodation units, competition analysis, ... etc.). Business processes in the tourism and hotel industry are very intensely sensitive and conditioned by the development of information communication technology (Khan, 2018). Many authors have written about the use of ICT in sales, whereby the most relevant is the research on the evaluation of web sites (Law, R. 2019), about online booking factors that directly affect the booking decision (N. K. Liu James, 2014), about the factor analysis that indirectly affects on-line booking in hotel industry (example: Dogan, 2019). With regard to the development of ICT, business policy changes according to the way technology are applied in business. In the context of business activity, the role of ICT in the hotel business is multidimensional and complex. ICT can have a positive impact on business in a number of ways (accelerating the workflow, reducing the number of people in processes, cost reduction, better control, direct sales, etc.). In this paper **special attention is devoted to the role and functioning of ICT in the segment of online booking process** (Park, S. 2018). When it comes to sales in the hotel industry, special attention is paid to **online sales channels and user decisions on their use** (Datta, B.2018). In order for ICT integration in the business sales segment to be justified ICT must have a positive impact on revenue/profit so that:

1. Should “bring” as many web/internet users on the hotel web site as possible,
2. Using a simple and understandable user interface (UI) on the hotel’s web site (Bilgihan, 2015) (and on the reservation form in particular) to provide the best user experience (UX) (Tomlin, 2018), so that the visitor-to-conversion ratio was as positive as it could be,
3. In house ICT needs to be implemented by providing the hotel guest with all the information about products and services offered within the hotel (planned and according to the pre-determined microtime-ing) with easy buying and consuming them in real time (touch screens, ipads, laptops, TVs, smartphone apps, ...) (Beldona, S 2018).

In accordance with the title, this paper aims to point to the role and importance of promoting direct online sales in the hotel industry by introducing an extended paradigm of factors affecting online booking through direct online channels where the paradigm is a set of basic rules or assumptions that are taken as facts in order to better understand reality and its phenomena. In the science, the notion of paradigm is often used to describe different concepts whereas The Oxford English Dictionary defines a paradigm as “a typical example or pattern of

something; a pattern or model” (The Oxford English Dictionary online). Similarly, Thomas Khun defines the scientific paradigm as universally acknowledged scientific accomplishments in his book, “The structure of Scientific Revolutions (1962)”, which, for a while, provides model problems and solutions for a community of practitioners (Kuhn, 1996). Every hotel as a business system has the intent to make as many conversions as possible via direct online channel sales. In order to do so, the web site and the online booking form must be developed, optimized and maintained to the highest standards. For this reason, analyzes of numerous dynamic and stochastic factors that affect different times in different processes in travel and booking cycles must be continually performed.

In this context, furthermore **the process of traveling** and **the process of online booking** from different aspects will be divided into subprocess and through an expanded paradigm of perception of search through the search engine will define the factors that determine them, and then explore the ICT adaptability to which they can best affect.

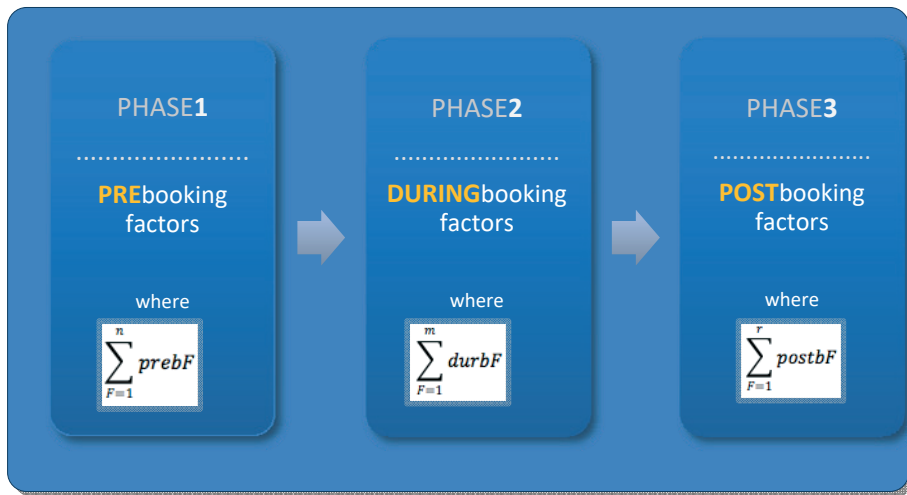

2. THE FACTOR COMPLEMENTARITY OF ONLINE BOOKING AND TRAVELING CYCLE PROCESSES

As explained in the introduction, the business processes in hotel industry are very highly influenced by the development of information communication technology. As information communication technology is being developed, new business opportunities are being opened up and the way new business possibility evolves. In this context, business policies have become very dynamic and stochastic processes. With regard to the development of ICT and business processes that connect supply and demand, they are taking place in a new context and new circumstances. In order to better understand the online booking process and the factors affecting it, it is necessary to understand the phases of the travel cycle as well as the factors that determine them, apart from observing the time aspect of the online booking process. When talking about the process of online booking, it should be emphasized that at any moment it is not determined by the same factors or the same factors do not always work with the same intensity (A. Emir et al., 2016). Taking all the above into consideration, this work will identify variables, their intensity of action on the online booking process, and propose the use of technology for their improvement. Also, to increase sales through direct online sales channels it is also necessary to continuously

monitor and optimize direct booking and cooperation with online travel agents (Fei Ye et al., 2017).

In order to better and more accurately determine the factors affecting the online booking process, we can observe it from time to time in three main phases as shown in the following Figure 1.

Figure 1. Online Booking Process Phase online and Online Booking Factors (OBFs) which determine them in terms of time aspect

Source: Authors

From the previous scheme, a general expression/formula can be derived that expresses the total value of the Online Booking Factor in relation to the time aspect relative to the traveling.

Equation 1. Summarizing the Online Booking Factors with regard to the time aspect

$$OBF = \sum_{F=1}^n prebF + \sum_{F=1}^m durbF + \sum_{F=1}^r postbF \quad (1)$$

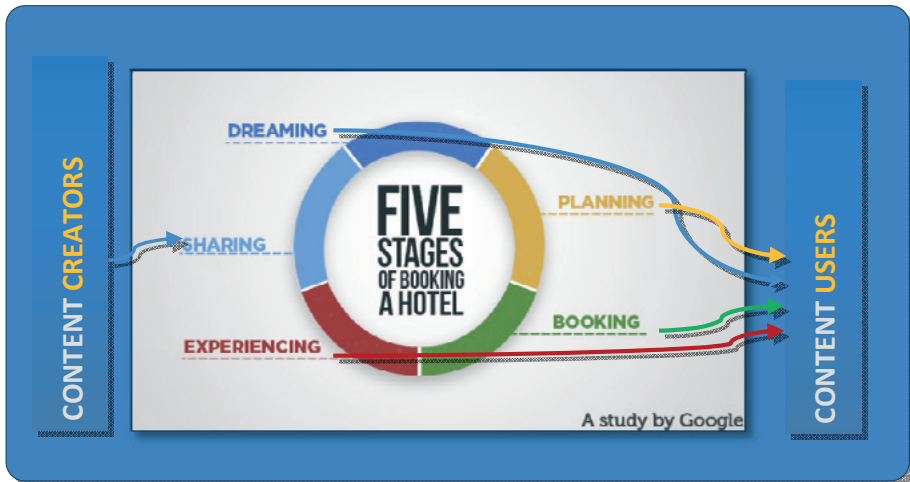

where

prebF	=	Factors affecting the booking process prior to the booking process (on Users that are at this stage sharing all the information and experience shared by all previous users who have shared information generating new content through, for example, reviews, and this information acts in a way of thinking about users who are still indecisive. This information could, for example, be divided into subgroups: staff, facilities, cleanliness, comfort, value for money, location...)
durbF	=	Factors affecting the booking process during the booking process (UI elements, UX elements, ease of reservation form / confidence in data sharing security ...).
postbF	=	Factors affecting the process of booking, as a result of a successful completion of the process of previous users booking, and the experienced and "shared" travel experience.

Source: Authors

After reviewing the phase of the online booking process, for complete insight into the factors affecting the online booking process, the stages of the travel cycle are shown below (according to the Google study, the travel cycle of the guest consists of the 5 main phases shown in Figure 2).

Figure 2. The five stages of travel (Content Users & Creators)

Source: John Maclang: Business Development, Hotel Online Marketing: The five Stage of Travel: <http://johnmaclang.com/the-five-stages-of-travel/> - / - 09.03.2019. – with the elaboration of the author

Each phase in the travel cycle (Figure 2) is determined by a large number of direct or indirectly influencing factors that need not at all times have the same ponder value (determining the value of each individual factor would go

beyond the scope of this article, and these issues should be the subject of separate research).

Before analyzing the specifics of the phases in the travel cycle and the factors that determine them, several important facts should be highlighted:

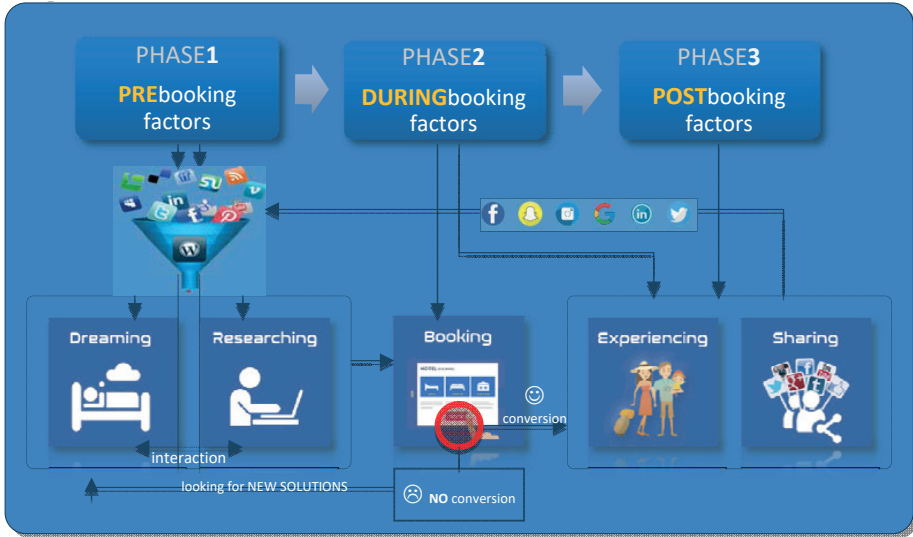

- The travel cycle begins with the dreaming phase,
- At every moment in the world, millions of people as **online content users** are found in one of the first 4 stages of the travel cycle (Dreaming, Planning, Booking, and Experiencing). In these phases they behave mainly as users of previously created and shared online content,
- At every moment in the world millions of people are in the sharing phase of the travel cycle. After traveling, User passes from the phase of experience to the sharing phase and moves from the status of user online content to the status **creator of online content / information creators**,
- Google machine learning is a highly complex algorithm that is constantly taught both by content users and content creators (**monitors keywords, semantic algorithms systematizes search activity, collects and analyzes content**, concludes and suggests that each subsequent user experience is of better quality and quantity).

The following schematic representation presents **simultaneous observation of factor interdependence with respect to:**

- a) **The time aspect of observing the online booking process and**
- b) Phases in the guest's travel cycle,

which indirectly (through factors influencing them) affect the decision about online booking. Reservation form/system must ensure that users are simply automatically passed through the process of online booking and that the user finally clicks on the booking button (CONVERSION!).

Figure 3. Interaction of factors affecting online booking process and travel cycle process

Source: Authors

3. TRAVEL CYCLE PROCESS PHASES

In the continuation of this paper, the specifics of the individual phases of the travel cycle are mentioned, and the most dominant factors are determined.

3.1 . DREAMING

A large number of decisions in life begin with the phase of dreaming. So does the travel cycle. At this stage, one imagines imaginable and unreachable “wishes”. Each travel cycle starts with the DREAMING phase. At this stage, the minds of travelers are determined by the present circumstances and experience from objective reality and from the on-line world. Objective reality factors should be influenced by long-term placement policies of offline and online information on already well-known market demand and potentially interesting markets (based on conclusions and understanding of the context of various Google data sources (Google Analytics, Google Adds, Google Keyword Planner, Google Trends, Google Correlate, etc.). Factors affecting the dreaming phase, resulting from online sources (web pages, social media releases, YouTube video clips, online reviews, etc.) should work with the greatest impact and qual-

ity of information placement (respecting the rank of Google algorithm in the sense of respecting the quality standards of the page ranking factor on the most dominant online factors of interest of a business entity (Google+, Facebook, YouTube, LinkedIn, web ...).

The following expression can describe the Dreaming Factor phase,

Equation 2. drF – Dreaming phase Factors

$$drF = \sum_{F=1}^n of fdrF + \sum_{F=1}^m ondrF \quad (2)$$

where

drF	=	Dreaming phase factors
$of fdrF$	=	Dreaming factors from the offline world (influential factors from objective reality)
$ondrF$	=	Dreaming factors from the online world (influential factors from the online digital world)

Source: Authors

3.2. RESEARCHING/PLANNING

After the dreaming phase, the user goes into action and begins to explore. According to Google’s statistics, the user / potential guest will visit more than 20 different sites to find the appropriate hotel. The question is how to be as good as possible on Google, how to attract a user to a web site, and keep the user on our site? Good SEO (Search Engine Optimization) ensures a better website ranking.

SEO is a technique which optimizes the web site and makes it come up at the top in the search result of search engines like Google, Yahoo, Yandex, Bing, ... SEO must bring more organic traffic to a specific web site. On-site SEO is the practice of optimizing individual web pages/sites in order to rank higher and earn more relevant traffic in search engines. On-site refers to both the content and HTML source code of a site/page that can be optimized (keywords, URL, title, headings H1, H2, meta description, content, images, mobile friendliness, links speed, ...). Off-site SEO refers to links and other external signals. Off-site SEO” refers to actions taken outside of the website to impact rankings within search engine results pages (SERPs). Optimizing for off Page Ranking factors

involves improving search engine and user perception of a site's popularity, relevance, trustworthiness and authority (1. Search Engine submission – Google, Bing, Yahoo, Alexa, Altavista, 2. Directory Submission, 3. Social Bookmarking - free sites - Digg, Mix, del.icio.us, folks, Reddit, Scoop.it, 4. Forum posting, 5. Blogging, 6. Links (Inter Linking, Link Baiting, Cross-Linking).

The following expression can describe the Factor Planning / Researching Phases:

Equation 3. drF – Researching phase Factors

$$rF = \sum_{F=1}^n ronsF + \sum_{F=1}^m roffsF \tag{3}$$

where

rF	=	Researching phase factors (SEO factors)
$ronsF$	=	On-site factors
$roffsF$	=	Off – site factors

Source: Authors

3.3. BOOKING

A successful hotel must be found on most of the popular online travel agency portals. This ensures free advertising on the travel agency sites where most tourists start their planning stage. Consider using solutions such as The Channel Manager and Booking Engine. Also, every hotel as a business entity should strive to bring as many users as possible on their own web site (no OTA fees are paid). One must constantly analyze activity on the reservation form and track the number of visits to the number of conversions. The number of conversions most often depends on the general factors that make the first impression, namely the simplicity, functionality, and attractiveness of the reservation form, and the UX & UI factors. UX should be (Morville, 2004) 1. Useful, 2. Usable, 3. Findable, 4. Credible, 5. Desirable, 6. Accessible, 7. Valuable, and UI should be 1. Clear, 2. Concise, 3. Familiar, 4. Responsive, 5. Consistent, 6. Attractive, 7. Efficient, 8. Forgiving.

The following expression can describe the Booking Phase Factor:

Equation 4. drF – Booking phase Factors

$$b^F = \sum_{F=1}^3 bfi^F + \sum_{F=1}^7 bUXF + \sum_{F=1}^8 bUIF \quad (4)$$

where

b ^F	=	Booking Phase Factors
bfi ^F	=	Booking First Impression - Factors that create an impression
bUXF	=	Booking User experience factors
bUIF	=	Booking User interface factors

Source: Authors

3.4. EXPERIENCING

A successful hotel must provide the guests with the ultimate experience of staying at the hotel. The guests experience in the hotel can be viewed from different points and it depends on a lot of facts (e.g. staff, facilities, cleanliness, comfort, value for money, food, wifi, parking, ..). Disadvantages and mistakes are possible, but in-house ICT solutions should enable their debugging in shortest possible time (example: app for real-time interaction with hotel management via tablets, tvs, smartphones, touch screens). The hotel as a business entity enables instant problem solving, thus showing guests the utmost care of them. Although maybe not all was great in the hotel so treated guests will leave positive comments after leaving the hotel.

The following expression can describe the Experience Phase Factor:

Equation 5. drF – Experience phase Factors

e ^F	=	Experiencing Phase Factors - the totality of all factors (products and services in the hotel that the customer consumes) that affect the quality of the experience/pleasure of the guest staying at the hotel
ce ^F	=	Creating Experience Factors - Factors affecting the creation of experiences / experiences during the stay at the hotel (products and services at the hotel and OTAs rating areas)
edd ^F	=	Experience Disadvantages Debugging Factors

where

eF	=	Experiencing Phase Factors - the totality of all factors (products and services in the hotel that the customer consumes) that affect the quality of the experience/pleasure of the guest staying at the hotel
ceF	=	Creating Experience Factors - Factors affecting the creation of experiences / experiences during the stay at the hotel (products and services at the hotel and OTAs rating areas)
eddf	=	Experience Disadvantages Debugging Factors

Source: Authors

2.5. SHARING

Most people choose their travel options based on recommendations from family and friends or based on the recommendations and reviews of other people. At the end of the trip the guests share their experiences. Their reviews affect other potential travelers / guests who go through the same phases of the travel / booking cycle. If hotel management is convinced of the quality of its services, it should find a way to kindly invite guests to write reviews and encourage them to communicate with the hotel via social media.

Sharing phase factors can be described by the following expression:

$$\text{Equation 6. } sF = \sum_{F=1}^n swqF + \sum_{F=1}^m sppsF + \sum_{F=1}^r seddF \quad (6)$$

where

sF	=	Sharing Phase Factors - the totality of all factors encouraging the submission of positive comments.
swqF	=	Staff Work Quality -. The quality of hotel staff works in every department (maids, waiters, receptionists ...) that creates a positive customer experience - especially for the categories being rated.
sppsF	=	Pre-planned Staff activities to get good reviews.
seddF	=	Experience Disadvantages Debugging Factors (real-time communication with hotel management, apps...)

Source: Authors

At the end of the process, a sematic formula can be implemented that encompasses all factors that directly and indirectly affect the position of hotel websites as a business system within SERP.

Equation 7. drF – EP GPRA (Expanded Paradigm of Google’s PageRank Algorithm variables)

$$EP\ GPRA = drF + rF + bF + eF + sF \quad (7)$$

where

drF	=	Dreaming phase Factors
rF	=	Researching phase Factors
bF	=	Booking phase Factors
eF	=	Experience phase Factors
sF	=	Sharing phase Factors

Source: Authors

4. EXTENDED PERCEPTION MATRIX OF GOOGLE ALGORITHM

When an online user searches for online content of interest (e.g. a hotel that will meet his / her needs), the search engine enumerates keywords, phrases, and expressions of interest. The Google algorithm based on a large number of factors (with ponder value) returns the user’s result in the form of SERP. Each hotel wants to sell more of its services through a direct sales channel. Because of this, it is important for every hotel to always be positioned better within SERP (first page). Just looking at the search process from the moment of entering the term in the search engine, and to the process of obtaining results, it can be stated that those hotels will have a better SERP position that have done better SEM and SEO (On-Site + Off-Site). However, the point of this article is to point out those factors (events, circumstances, knowledge, experiences ... etc. that are conscious or unconscious in the human brain) that need to be taken into consideration, **which determine:**

1. Keywords, phrases that online content users enter in search engines
2. The way in which the reservation system/hotel form is experienced and used by guests,
3. The guest experience from which reviews are written.

In that sense, Table 1 shows the scheme of factors that determine the decision about booking through an expanded understanding of Google’s algorithm. The table represents the matrix of factor action with respect to:

1. Time aspect compared to booking process
2. Affiliation to a particular stage in the travel cycle

The table shows the factors with regard to the process that they belong to within the travel / booking process cycle. Likewise, factors are grouped with regard to the time component of the online booking process. Given relevance, Factors are assigned (High, Medium, Low), and note that ponder value-allocation may be a complex study. Column Action wants to point to activities, tools or suggestions that can best optimize a particular factor.

Table 1. Extended paradigm factor of Google Algorithm to improve direct online booking in hotel business

EXTENDED PARADIGM OF GOOGLE ALGORITHM FACTORS												
SPECIFIC FACTORS WITHIN THE SCOPE OF THE PASSAGE / PROCESS IN BOOKING CYCLE – TRAVELING DREAMING ⇄ RESEARCHING ⇄ BOOKING ⇄ EXPERIENCING ⇄ SHARING				ROLE & IMPORTANCE OF FACTORS ACCORDING TO PHASES OF THE ONLINE BOOKING PROCESS								
drF - DREAMINGPHASE factors				PREBOOKING PHASE			DURING BOOKING PHASE			POSTBOOKING PHASE		
Label	Factor Description			Aff	P	Act	Aff	P	Act	Aff	P	Act
offdr1	offline - jumbo billboards (emitively interesting markets) (sensitizing the public with keywords used in online activities)			+	M	IA	-	-	-	+	L	IA
offdr2	offline - TV (emitively interesting markets) (sensitizing the public with keywords used in online activities)			+	M	IA	-	-	-	+	L	IA
drF - DREAMINGPHASE factors				PREBOOKING PHASE			DURING BOOKING PHASE			POSTBOOKING PHASE		
Label	Factor Description			Aff	P	Act	Aff	P	Act	Aff	P	Act
offdr3	offline - newspapers, (emitively interesting markets) (sensitizing the public with keywords used in online activities)			+	M	IA	-	-	-	+	L	IA
ondr1	on line: we site content			+	H	SEO				+	M	SEO

In the further work, the emphasis is on the analysis of ICT tools that determine these processes and factors and on the use of ICT for the purpose of their optimization to the highest level.

5. GOOGLE ALGORITHM, ANALYTICS AND OPTIMIZATION OF INFLUENCE FACTORS AT BOOKING PROCESS

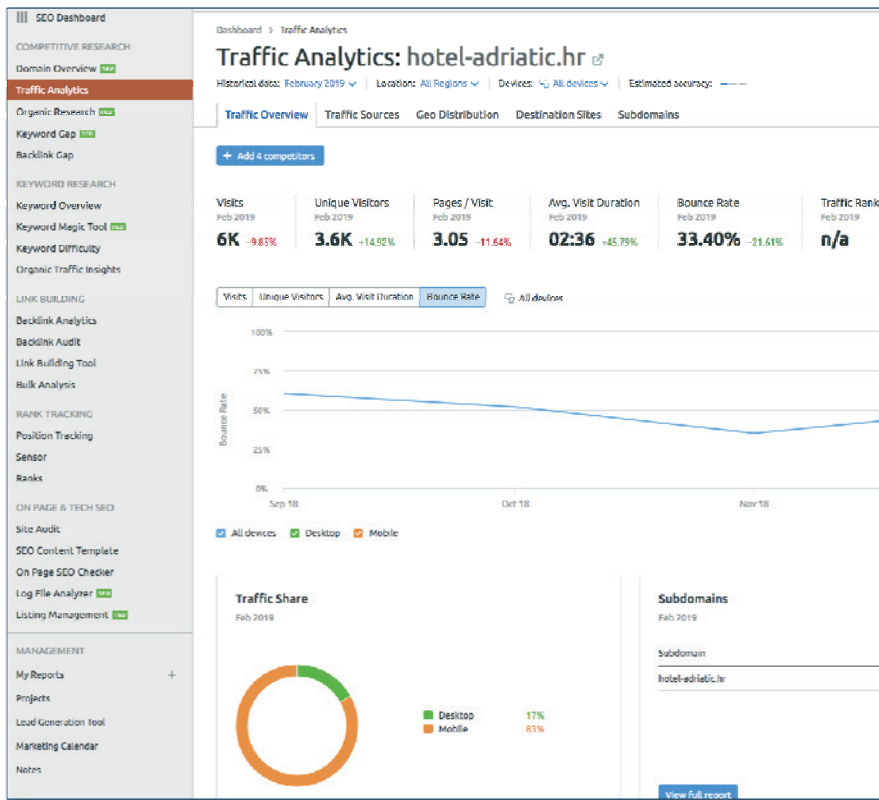

Based on research and determining individual phases of online booking processes and individual observation of individual phases in the travel cycle factors are defined that directly or indirectly affect the Google algorithm and factors that determine the decision about online booking. Table 1 shows the Factors of the Extended Paradigm of Google's Algorithm with regard to the affiliation of the phase in the travel cycle and given the time context with respect to the booking process. Factors have been analyzed and systematized with regard to the affiliation of processes in the travel cycle. Also, factors are attributed to attributes with regard to the estimated ponder value and their advancement through ICT. A detailed description of the individual (different types of software solutions for implementing Technical, On-Page, Off-Page, and Competitor Analysis of more than 200 factor Google algorithms such as Ahrefs, ScreamingFog, SEMrush, Google Search Console, Majestic, MozDeepCrawl, MOZ, GTMetrix, Advanced Web Ranking, LinkResearch Tool, Google Analytics ...) tools to analyze factor considerably and their options in terms of performing depth analysis of particular parameters would go beyond the scope of this paper. As with the work provided (factor determinations), below are examples of analysis and analysis reports on specific examples of hotels implemented with SEMrush analytics (Guru License Features). The following figure shows the main SEMrush SEO Dashboard on the example of web site analytics of the Dubrovnik Zagreb Hotel.

Source: Authors

If, for some analytical parameters, they want to undertake deeper analysis e.g. Traffic Analytics and analyze it Visits, Unique Visitors, Pages / Visit, Avg. Visit Duration, Bounce Rate, Traffic Rank, it is possible to select and conduct a thorough Traffic Analysis within the SEO Dashboard menu within Competitive Research. See the Traffic Analytics section in the following picture on the example of Hotel Adriatic in Opatija.

Figure 5. Hotel Adriatic Opatija Zagreb: SEMrush SEO Dashboard Screenshot: Traffic Analytics

Source: Authors

Each of the Reports can be further analyzed and optimized and compared.

In addition to factors that analytically identify and analyze program solutions such as SEMrush for factors that are not directly part of the Google algorithm (but indirectly determine the user's search results within the SERP), it is necessary to think through and develop analytical ICT (independent of analytical SEO tools) to permanently provide better position within the SERP. By planned and targeted influences and optimization of factors that are not part of the Google algorithm analytics it will, in the long run, contribute to directing users to direct sales channels. Such a statement is certainly a challenge and opens up space for new scientific research.

Why is Google important? Google algorithms are a complex system used to retrieve data from its search index and instantly deliver the best possible results for a query. The search engine uses a combination of algorithms and numerous ranking signals to deliver webpages ranked by relevance on its SERPs - search engine results pages. Web designers and site owners use search engine optimization (SEO) methods to make their sites and pages appear at or near the top of a SERP. Google uses over 200 ranking factors in their algorithm. Some are more important, and some are less important. It should also be mentioned; Google algorithm is changing more than 500 times a year. SERP, or results in Google searches, most often appear as a link between different web pages one below the other. These are so-called "Organic" results that are most common. However, besides them, there are other forms of Google search. These are: Google AdWords - Paid Ads, Rich snippets, Various visual extras for existing results, Universal results (integration of additional media such as video clips, images, and folders into search results), Knowledge Graph (Graphic Views) some concept shown in the box on the right side of the search results.

However, organic results in the form of "ordinary" links to different web pages are the most important. E.g. there are now software add-ons that will easily prevent the display of all kinds of ads, including those mentioned in AdWords, in your browser. As a result, investment in SEO is becoming more and more important because the websites of hotels found first in organic search results bring their owners a lot more sales and earnings. The opposite is true: those who are not in Google searches usually fail to sell online because they simply do not have visitors. It's like having a super hotel with a super offer but nobody has heard about it and simply no online visitors or online customers. You should keep in mind that "SERP never sleeps." In a nutshell, Google provides recommendations and provides useful information for website design and optimization, while at the same time rewarding (better ranking within the scope of the search results - SERP) the degree of compliance with these recommendations since this way Google is more systematized and more valuable.

At this moment SEO comes for business systems to the point. Thus, SERP is a list that Google generates based on the Ranking Factor Quality (> 200). The quality ranking factor of hotels as business systems can be affected by RF optimization. This is the process called Search Engine Optimization - SEO and Make It On-Site SEO Activities and Off-site SEO Activities. On-site SEO (also known as on-page SEO) is the practice of optimizing elements on a web-

site (as opposed to links elsewhere on the Internet and other external signals collectively known as “off-site SEO”) in order to improve search engine ranking and visibility. This can involve optimizing both the content and HTML source code of pages on a site (MOZ, 2019.)

6. CONCLUSION

One of the main goals of every market-oriented business entity, in this context a hotel, is profit. In order to achieve the budget, the Information and Communication Technology (ICT) is being applied increasingly and intensively. ICT increasingly determines the processes of booking or online booking at the hotel. The intent of any hotel is to improve direct online booking in relation to the booking through Third Party Websites. As the process of booking is part of the process of guest traveling, these two processes have been brought into the relationship. A moment of decision about booking is influenced by many factors. Part of the factors are an integral part of the official RF List of the Google algorithm while part of the factors are not listed in the factor list that the Google algorithm processes as the “reference values” for ranking within the SERP but they directly or indirectly with a higher or lower intensity also determine the position in the SERP framework, and the final decision to book (conversion!). In this context, through the matrix of the expanded Google Algorithm paradigm matrix, the factors that influence the decision on direct online booking are also detected in this paper. The expanded perception of the Google algorithm allows profound research, analysis, comparison, and simultaneous influences of a much larger number of factors at a much higher level. Such an approach will lead to more exact and accurate data and conclusions whose implementation should have positive implications both on the number of conversions within direct channel sales and on hotel profits. Further elaboration of all the factors of the expanded paradigm of Google algorithm, software analysis, research, optimization, and their implications for other business processes are the foundation of the latest scientific research in this problem area.

Abstract

Demand for information and online materials on the websites of economics faculties in Croatia is now surging. While printed faculty guides and other material are still used, students are increasingly using faculty websites as the main source of detailed course and programme information. This paper presents an observational study of website usability among students at five faculties of economics in Croatia. The study includes search performance, navigation interface design, finding information about administrative departments, phone numbers, working hours of the registrar's office and library, teacher office hours and other teacher's information, teaching materials, courses and programme information, course documents, online conversations with faculty staff, faculty guides and other material regarding faculty procedures and policies. The goal of this observational study is not statistical significance, but rather identifying the strengths and weaknesses of websites of the five Faculties of Economics in

disseminating information to their students. The usability evaluation model of this observational study could be used to improve navigation and searching design, accessibility, understandability, content quality and accuracy.

Keywords: *Faculties of Economics, Website usability model, Evaluation model, Usability evaluation model, Analysis*

JEL Classification: L23, M15

1. INTRODUCTION

Owing to the World Wide Web, business organizations around the world, including those in the Republic of Croatia, can continuously disseminate information about their activities, services, products, etc. Thus, having a website ensures an organization a permanent presence in the virtual environment and facilitates the worldwide dissemination of information. The websites of the faculties of economics in the Republic of Croatia are no exception in this regard. As a rule, they provide various stakeholders with all the relevant information about a particular faculty, which is why they have become the preferred source of information. In this context, the faculties' websites also have a promotional role, as they generally shape users' impressions about a particular institution. Hence, faculties should be aware of the importance of the quality of the information provided on their websites, and although many of them are, a question arises as to whether their approach to evaluating website content is systematic and objective. In order to address this issue, it is necessary to develop a methodology for comparing approaches used by different faculties to providing information on their websites. In order to develop a good quality methodology, an analysis was performed of the usability of the websites of economics faculties in Croatia. The analysis was an important step in this research as it gave an insight into whether the faculties' websites fulfill their main purpose, which is to provide information to their stakeholders, first and foremost the students. The results of this research can help develop a systematic methodology for comparing and evaluating the websites of economics faculties and suggest improvements to their ergonomics, information accessibility, and speed performance.

The websites of the faculties of economics in Croatia are a primary source of information for current students about the degree levels, study programmes, courses, and teachers. Moreover, they provide future students with information about enrolment schedule and requirements, faculty' activities, exam procedures

and regulations, as well as the knowledge and titles acquired upon completion of individual study programmes. They also provide information on course requirements; materials and reading for individual courses; facilitate communication with the teachers, and post-exam schedules. The scope and quality of the information provided on the websites of economics faculties are key factors to consider when assessing their quality, which is why they are the focus of this research.

2. RESEARCH METHODOLOGY

The premise that today's virtual space created by a web service is a primary source of information infers that the efficiency of a system depends on the quality of its presence in an online environment. Given that the faculties of economics are business organizations that mainly interact with the younger population, who use the web environment as a primary source of information, it may be concluded that the quality of the information provided by the faculties' websites is positively correlated with the efficiency of the faculties' activities. However, in order to evaluate the quality of individual websites, it is necessary to establish standards that, on the one hand, consider the information provided and, and thus, the promotional potential of the website, and on the other, rank the quality of information provided by one faculty compared to other faculties. This research aims to develop a standardized measurement model. To achieve this, it was necessary to explore the scope of information covered, and thus the information potential of the faculties of economics in Croatia. Hence, the main aim of this research was to analyze the websites of the following five faculties:

1. Faculty of Economics in Osijek - <http://www.efos.unios.hr/>
2. Faculty of Economics in Zagreb - <http://www.efzg.unizg.hr/>
3. Faculty of Economics in Rijeka - <https://www.efri.uniri.hr/>
4. Faculty of Economics in Split - <https://www.efst.unist.hr/>
5. Faculty of Economics in Pula - <https://fet.unipu.hr/>

To achieve this goal, the primary research involved analyzing the usability of the economics faculties' websites through two survey questionnaires. The first asked the respondents to indicate their satisfaction using a 1-5 Likert scale (Likert, 1932), while the second comprised questions that asked for a descriptive answer. In addition to the survey and statistical analysis of the data collected, the following methods were used in this research: deduction, abstraction,

classification, causal inference, analysis and synthesis, analogy, the experimental method, and descriptive modeling. The results of the research presented in this paper are part of a larger research project carried out by the authors which focus on the quality of the information provided to the stakeholders by the faculties of economics, in particular, the Faculty of Economics in Osijek.

3. WEBSITE USABILITY

The term usability was first used by Bevan in 1991 to describe the various approaches to the ease of use of a product (Bevan, Kirakowski, & Maissel, 1991). For Shackel (2009) the term “usability” means “a technology’s capability to be used easily and effectively by the specified range of users, given specified training and user support, to fulfill the specified range of tasks, within the specified range of environmental scenarios” (Shackel, 2009). According to Zaphiris and Ellis (2001), web usability means “anyone using any kind of web browsing technology must be able to visit any site and get a complete understanding of the information, as well as have the full and complete ability to interact with the site if that is necessary” (Zaphiris & Ellis, 2001). In Preece et al. (1994) usability is defined as “a measure of the ease with which a system can be learned and used, its safety, effectiveness and efficiency and the attitude of its users towards it” (Preece et al., 1994). According to Nielsen (2012) “Usability is a quality attribute that assesses how easy user interfaces are to use” (Nielsen, 2012). Nielsen (2012) asserts that usability is defined by five quality components (Nielsen, 2012):

1. Learnability: How easy is it for users to accomplish basic tasks the first time they encounter the design?
2. Efficiency: Once users have learned the design, how quickly can they perform tasks?
3. Memorability: When users return to the design after a period of not using it, how easily can they re-establish proficiency?
4. Errors: How many errors do users make, how severe are these errors, and how easily can they recover from the errors?
5. Satisfaction: How pleasant is it to use the design?

ISO 9241-11 defines the term usability as “the effectiveness, efficiency, and satisfaction with which specified users can achieve specified goals in particular environments” (Dillon, 2001). Most scholars and researchers have accepted this definition of the term utility (Rahman & Ahmed, 2013).

4. WEBSITE USABILITY IN THE CONTEXT OF HIGHER EDUCATION INSTITUTIONS

A number of scientific articles have been written about web usability analysis and the application of different methods and techniques for web usability evaluation (Amed, 2008). However, web service usability studies in the context of higher education institutions are relatively scarce. Ahmet Mentés and Turan (2012) investigated the usability level of Namık Kemal University (NKU) website using the WAMMI (Website Analysis and Measurement Inventory). This tool uses six factors to evaluate website usability (WAMMI):

1. Attractiveness
2. Controllability
3. Efficiency
4. Helpfulness
5. Learnability
6. Global Usability Score (GUS)

The results of their study have revealed that five of the six factors can positively and significantly affect the website usability perceptions of NKU members (Ahmet Mentés & Turan, 2012). Aziz, Wan Mohd Isa, and Nordin (2010) analyzed website ergonomics according to Web Content Accessibility Guidelines 1.0 (W3C, 1999) and website usability by higher education institutions in Malaysia. The study identified some weaknesses and suggested methods for improving usability and accessibility for end users. Lautenbach, Schegget, Schoute, and Witteman (1999) carried out an analysis of the usability of Utrecht University's website using two criteria: the user's satisfaction with the ease of finding the information they were looking for and website navigation. Lautenbach et al. (1999) surveyed 240 students at Utrecht University. Mustafa and Al-Zoua'bi (2009) analyzed the usability of the websites of Jordanian universities by dividing the questionnaire into five sections (Mustafa & Al-Zoua'bi, 2009):

1. Content, Organization and Readability
2. Navigation and Links
3. User Interface Design
4. Performance & Effectiveness
5. Educational Information

Although the results of this survey were mainly positive, some weaknesses were identified in the website design and speed (Mustafa & Al-Zoua'bi, 2009).

Hasan (2012) also analyzed the usability of the websites of nine Jordanian universities. 237 students were asked to rate website usability in terms of the following five factors (Hasan, 2012):

1. Navigation
2. Architecture/Organisation
3. Ease of use and communication
4. Design
5. Content

The results revealed that students were satisfied with the content and ease of use, while the website design was negatively rated (Hasan, 2012). Al-Ananbeh, Abuata, Al-Kabi, and Alsmadi (2012) investigated website usability at Arab universities using automated site evaluation tools: HTML Toolbox, PageRank Checker and SEO PageRank. Caglar and Mentés (2012) investigated the usability of the website of the European University of Lefke (EUL) using a WAMMI questionnaire. 293 students from various faculties of the University were surveyed. The survey results revealed that students were dissatisfied with the website (Caglar & Mentés, 2012).

The mentioned studies explored the usability of websites of universities and higher education institutions in general, without focusing on economics and business faculties. Therefore, the purpose of this research was to identify, among other things, the common criteria for economics faculties and the characteristics they should have, in order to draw up guidelines for developing a web usability evaluation model that can be applied at all faculties of economics and business in Croatia.

5. PRIMARY RESEARCH RESULTS

5.1. RESEARCH METHODS: THE EXPERIMENTAL METHOD AND STUDENT SURVEY

The aim of the primary research was to assess the usability of the websites of economics faculties in Croatia. The results of the research should provide supporting evidence of the importance of the functionality of the websites of Croatian higher education institutions. In other words, an analysis was carried out of the websites of higher education institutions, in particular, the faculties

of economics, in order to determine if they are successful in performing their role as primary information providers for the students.

An experimental method was used to establish website ergonomics and informativeness. The respondents were instructed to give descriptive answers to the questions.

Theoretical insights into website functionality, usability and usefulness were gained through an anonymous survey. A convenience sample made up of a large number of students was used.

5.2. RESEARCH QUESTIONS

The research is based on the premise that all research questions are positively correlated with website usability. These are the research questions:

1. What are the differences among the websites of individual faculties of economics in Croatia?
2. Are the websites of the faculties of economics in Croatia ergonomic and informative, and how many clicks and how much time does it take to find the necessary information?
3. What do students think of the quality, informativeness, and ergonomics of the websites of the faculties of economics in Croatia?
4. Is there room for improvement of the ergonomics, informativeness, and speed of the websites of the faculties of economics in Croatia?

The research questions were answered based on the results of the experimental method and the survey questionnaire. The results obtained were used for developing a website usability evaluation model and proposing possible improvements in terms of website functionality, ergonomics, informativeness, and speed.

5.3. ANALYSIS OF RESULTS AND DISCUSSION

As the aim of this research was not to establish the statistical significance using a large number of respondents, but rather to identify the strengths and weaknesses of the websites of the faculties of economics in Croatia by means of an experimental method, neither statistical nor regression analysis was used. Table 1 shows the average ratings given by students for each question and each

website of the five faculties of economics in Croatia. A five-point Likert scale was used, where 1 means that the information cannot be found; that it is difficult to find it; and that it takes a long time to find it, while 5 means that the necessary information is available; that it is found quickly; and that finding it was easy.

Table 1: Results of the experimental method

Question	Faculty of Economics in Osijek	Faculty of Economics in Zagreb	Faculty of Economics in Rijeka	Faculty of Economics in Split	Faculty of Economics in Pula
1	5	4.7	4.8	5	4.9
2	4.9	3.3	5	5	3.3
3	4.8	3.3	2.5	4.2	3.9
4	4.6	1.9	2.6	2.1	2.4
5	5	2.7	1.2	3.2	2.1
6	4.5	3.1	3	3	3.5
7	5	4.6	3.1	4.9	5
8	4.4	1.2	1	1	1
9	4.6	4.2	3.2	3.7	2.2
10	4.1	1.4	1	1	4.4
11	4.8	1.3	1.4	1	1

The following paragraphs contain instructions given to students and questions asked, as well as their descriptive answers about the websites of the five faculties of economics in Croatia:

Q1: Find the mission and vision of the faculty on its website. Is this information available? If so, rate and describe the difficulty of finding it.

The mission and vision are available on all five websites and the students had no difficulty finding this information through the main navigation menu. The link to the subpage containing the mission and vision of the faculty is found in a logical place.

Q2: Find the statute, regulations, decisions and standard operating procedures of the faculty on its website. Is this information available? If so, rate and describe the difficulty of finding it.

Statutes, regulations, decisions and standard operating procedures are available on all websites, except on the website of the Faculty of Economics in Pula, where the respondents could not find the statute. Finding the link to these doc-

uments on the websites of the Faculty of Economics in Zagreb and the Faculty of Economics in Pula took more time and clicks.

Q3: Find the degree levels and study programme descriptions that comply with the Bologna degree structure. Is this information available on the website? If so, describe the difficulty of finding it.

The degree levels and study programme descriptions are available on all five websites. However, finding this information on the websites of the Faculty of Economics in Zagreb, the Faculty of Economics in Rijeka, and the Faculty of Economics in Pula was more difficult and time-consuming. Some of the students found it through additional menus, while some were unable to find it.

Q4: Find the regulations on studying under the Bologna Process on the faculty website. Is this information available? If so, describe the difficulty of finding it.

Although one would expect to find the document containing regulations on studying under regulations, this was not the case for all websites. Students experienced some difficulty finding this document on the website of the Faculty of Economics in Zagreb as it took several clicks to get to it, while on the website of the Faculty of Economics in Pula, it was found under the Students - Documents menu.

Q5: Find the learning outcomes of the study programmes delivered by the faculty. Is this information available on the faculty's website? If so, describe the difficulty of finding it.

It took only one click to find the learning outcomes on the website of the Faculty of Economics in Osijek – they were under the menu Teaching - Learning outcomes. The process of finding this information on the websites of other faculties was time-consuming and it took multiple clicks to get to it.

Q6: Find brochures for all undergraduate, graduate, specialist and doctoral study programmes. Is this information available on the faculty's website? If so, describe the difficulty of finding it.

It was difficult to find brochures for some degree levels as they had to be accessed through different sub-links on individual study programme web pages.

For some study programmes, they were not available. They can be found using the website search engine, but finding them on the search results list was time-consuming.

Q7: Find library working hours, location, manager, and contact details on the faculty website. Is this information available? If so, describe the difficulty of finding it.

Library working hours, location, manager and contact details are available on all five websites. The information is easily accessible on most websites. The only exceptions were the Faculty of Economics in Zagreb and the Faculty of Economics in Rijeka, where it took multiple clicks in the menu to access the information needed.

Q8: Is there an option to register for library membership online using an electronic ID (AAI@EduHr account)? Is this option indicated on the website? If so, describe the difficulty of finding it.

At the Faculty of Economics in Osijek, registration for library membership is done by filling in an online form, but a Google form is used, not an official system with AAI@EduHr accounts. The online registration option is not available on other websites. However, students enrolled in the Faculty of Economics in Rijeka can borrow books using a student card or an ID without having to register for membership online or in person.

Q9: Find working hours, location, registrar's name and contact details for the registrar's office on the website of the faculty. Is this information available? If so, describe the difficulty of finding it.

Information about the working hours, location, registrar's name, and contact details for the registrar's office is available on all five websites. It was easy to find it on the website of the Faculty of Economics in Osijek. It took multiple clicks in the menu to access this information on the website of the Faculty of Economics in Zagreb. On the website of the Faculty of Economics in Rijeka, information about the registrar's office and registrar's name is located on two different subpages and therefore it took longer to find it. On the website of the Faculty of Economics in Pula, the horizontal menu is in the header. You need to click on the arrow next to the option "Students", and then select the link "Common services". The link "Office for student affairs and study programmes" leads to the page with information about office working hours, contact details, location and

registrar's name for all faculties of the university. Finding the necessary information was difficult here because the website was being redesigned and visitors redirected to the new university website.

Q10: Find working hours, location, manager and contact details of bookstore and course material services. Is this information available on the website? If so, describe the difficulty of finding it.

The information about the bookstore and course material services was available and it was easy to find it on the websites of the Faculty of Economics in Osijek and the Faculty of Economics in Pula. On other websites, finding this information was complicated; the information was incomplete, or it could be not found at all.

Q11: Find out how you can open AAI@EduHr and CARNET accounts as a student on the faculty's website. Is this information available? If so, describe the difficulty of finding it.

Information about opening AAI@EduHr and CARNET accounts is available on the website of the Faculty of Economics in Osijek. It is easily accessible and found under a logical category. The information is not available on other faculties' websites; the process of finding it was complicated, or it could not be found at all.

A second survey was carried out to gain an insight into the availability of information about a course, course materials, and teachers. An Informatics course was chosen for this purpose. Finding information about this course on the websites of the Faculty of Economics in Osijek, Faculty of Economics in Pula and the Faculty of Economics in Rijeka was easy and simple. In contrast, the process was complicated and time-consuming in the case of the Faculty of Economics in Split and the Faculty of Economics in Zagreb. Information about the course, such as news, course description, syllabus, requirements, and learning outcomes, is publicly available on the websites of the Faculty of Economics in Osijek and the Faculty of Economics in Zagreb. On the websites of the Faculty of Economics in Pula, the Faculty of Economics in Rijeka, and the Faculty of Economics in Split, not all course information was publicly available. The Faculty of Economics in Osijek is the only one that provides full public access to the course and practicum materials on its website. Other faculties allow public access to some of the materials.

Finding teacher details on the website of the Faculty of Economics in Osijek was quick and simple. Multiple clicks were needed to access the web page with teacher information on the websites of other faculties. Office numbers, telephone numbers, e-mail addresses, and office hours are provided on the website of the Faculty of Economics in Osijek, the Faculty of Economics in Rijeka, and the Faculty of Economics in Pula. In contrast, the Faculty of Economics in Zagreb and the Faculty of Economics in Split do not provide complete information about their teachers on their websites.

The survey results show that the websites of the five faculties of economics in Croatia differ considerably in their design features, visual elements, and the architecture of the navigation menu. The latter has a major impact on the ergonomics and informativeness, as well as the number of clicks and the amount of time needed to find the desired content. Students reported that on the website of the Faculty of Economics in Osijek they often managed to access the information they needed with one click only because the main navigation menu automatically opens submenus. The website menu architecture of the Faculty of Economics in Zagreb was extremely complicated. Students reported that after opening the menu, they had to click on the expansion arrow, select an option and only after selecting an option they got to the content they needed. The students were very satisfied with the informativeness of the website of the Faculty of Economics in Osijek as it is the only one that provides public access to all course requirements and reading material. They find that the informativeness of other websites is lower. The results of the survey, which provided a valuable insight into the strengths and weaknesses of the websites of the faculties of economics in Croatia, suggest that there is room for improvement of website ergonomics, informativeness, and speed, which would enhance their overall quality.

6. MODEL FOR IMPROVING THE USABILITY OF THE WEBSITES OF ECONOMICS FACULTIES IN CROATIA

A model for improving the usability of the faculties of economics' websites in Croatia cannot rely solely on automated tools for tracking web metrics such as Web Metrics of the National Institute of Standards and Technology that uses six different computer tools for automated website usability analysis (Scholtz, Laskowski, & Downey, 1998). These and similar tools can determine the per-

formance and quality of specific website features. However, they cannot determine the importance of functionality, while the model proposed by the authors can. Table 2 shows the proposed mode.

Table 2: Model for improving the usability of websites of the faculties of economics in Croatia

Performance factors	Performance and quality				
	1	2	3	4	5
Ergonomics					
Informativeness					
Menu architecture					
Speed					

The functionality of the websites of the faculties of economics in Croatia is measured by the speed of retrieval, convenience and ease of access to the content students need. In view of the above, the presented model for monitoring the performance and quality of websites implies the need for experimental testing of website ergonomics, informativeness, menu architecture, and speed. These factors are evaluated on a scale of 1-5. Average grades are used for the evaluation of individual websites.

7. CONCLUSION

The websites of the faculties of economics in Croatia are the main source of information on degree levels and study programmes available, as well as courses, teachers, etc. Therefore, in order to determine their functionality, it is vital to carry out a website usability analysis. An experimental method was used to assess their ergonomics and informativeness, while the theoretical insights into their function, usability, and usefulness were gained through a survey of students.

Through analysis and synthesis of the collected data, it was established that there are major differences between individual faculties of economics in terms of their website design features, visual elements, and menu architecture. Students were very satisfied with the high level of quality and informativeness of the website of the Faculty of Economics in Osijek, as the process of finding the content they were looking for was straightforward and quick. In addition, the website of this Faculty is the only one which allows full public access to infor-

mation about course requirements and reading material. Data synthesis identified the possible avenues for improvement of the ergonomics, informativeness, and speed of the websites of the faculties of economics in Croatia.

Finally, a model was proposed for improving the usability of the websites of economics faculties in Croatia, which measures website functionality based on its ergonomics, informativeness, menu architecture, and speed. In addition to answering the research questions posed herein and proposing an experimental model for measuring the quality of Croatian economics faculties' websites, this research has identified new research questions that warrant investigation. Future research should aim at developing an objective system for measuring the quality and performance of the websites of higher education institutions in Croatia.

Abstract

Both business data and databases are becoming increasingly important for enterprises of all sizes and with different business activities. Hence, the purpose of this paper is to analyze and to synthesize specifics about the creation process of the business database, with the help of which the authors have successfully integrated various and numerous business processes in the researched enterprise. Regarding the methodology, for the purpose of this paper, the authors have conducted the research using both qualitative approach (e.g. interviews with researched enterprise's employees) and quantitative approach (e.g. grades by both of the authors for fulfilment of expectations from business database after its creation), to make it multifaceted and comprehensive in its own right. Scope of this paper is essentially broad, yet it gradually narrows from the brief general view of data within business databases of Small and Medium Enterprises (abbr. SMEs) to the extensive detailed overview of data within the specific business database, which has been created for the researched medium-sized enterprise. On the topic of main findings, they were summarised in the paper, depending on the level that they are associated with. Those levels are the level of expectations from the business database before its creation, the level of business database

creation and the level of fulfillment of expectations from the business database after its creation. Inherent research limitation was in the fact that this research was primarily conducted on a single medium sized-enterprise, yet these research findings on multiple levels, have justified this approach as being objective, appropriate and holistic. As to suggestions for further research, those actually revolve around the need to move this business database, from simulation phase, into utilization phase i.e. into day-to-day use and, ideally, real-time data entry, what would surely raise additional research questions. Finally, practical implications of this paper and the herein created business database can be summarised as follows: it is expected that the enterprise can derive benefits; from properly integrated internal data, from created (business database-supported) integrated application and from structured electronic versions of its valuable business data. However, to derive considerable benefits, the enterprise would have to put this business database into day-to-day use with, ideally, real-time data entry

Keywords: business database, data, DBMS, business process integration, SME

JEL Classification: M15, M19

1. INTRODUCTION

Successful Small and Medium Enterprises (abbr. SMEs) are vital to most economies. For example, in the recent years, within European Union, SMEs provided 66% of the total employment in private sector, 85% of new jobs were created by them and they also stand for around 99% of all EU-based businesses (European Commission, 2014). Today's SMEs, in spite of their current size and, essentially, regardless of their business activities or location, create an increasing amount of various data on daily basis, either intentionally (e.g. with data entries in database tables) and/or unintentionally (e.g. with providing data for official electronic documents). Besides, some kinds of data that were previously considered irrelevant (e.g. specific items on customer's purchase order) and/or difficult to gather (e.g. customer's purchases from the same enterprise, in its stores at different locations) as well as other previously unattractive data, in the recent years, have become the valuable business assets (e.g. insights and competitive advantage), even for SMEs. What is more, transfer of certain datum i.e. a single piece of data, (e.g. store manager's approval of discount to an employee in the sales department who must match or

undercut competitor's price to retain a customer), that previously lasted for hours or days, nowadays, even in smaller SMEs, should last for seconds or minutes.

In short, if, even SMEs, want to take the advantage of data that is available to them from their business operations, they should, at least, be able to store and to manage them properly. In order to achieve that, SMEs should consider some specialized computer-based solution(s), since computers have become an integral part or even the smallest offices. Yet, empirically, SMEs are still inclined to (less frequently) utilize software such as word processors and/or spreadsheets (much more frequently) to store relevant and/or sensitive business data. While both, word processors and spreadsheets, continuously improve, despite being 40+ years old software sub-types (Reed, M., 2009) (Bricklin, D., 2001), their functionalities, especially those related to advanced data-related operations, still lag behind databases, that have emerged cca 15-20 years earlier than them (Foote, K., D., 2017). There are numerous examples of other business-related software types and sub-types, that are utilized by SMEs, yet, their main disadvantage(s), in the context of this paper, can be identified as unorganized and/or unrelated and/or non-integrated data.

Related to all issues mentioned above, were exact reasons for writing this paper that can be summarised as: the authors (1st author as the supervising professor) and (2nd author as the supervised student), motivated by these and other data-related issues, have decided to methodically and systematically create the functional business database, for the presented (carefully chosen and consent-to-research) SME, in order to simulate concrete business data(bases)-related functionalities.

After all, this paper's objectives are closely related to the researched enterprise and can be outlined as follows:

- to present key issues related to researched enterprise's data and applications
- to portray how to form realistic expectations from the business database
- to show how to recognize the potential limitations of the business database
- to display the process of creating the business database for researched enterprise
- to show how and on what basis to grade the level of fulfillment of expectations from the business database.

2. MAIN CHARACTERISTICS OF THE RESEARCHED ENTERPRISE

The enterprise that was presented, chosen for and researched in this paper is named Međimurje graditeljstvo Ltd., the private construction enterprise. Main business activities of this enterprise are building construction, other constructions, civil engineering, and other related activities. Related to these specific activities, they own, ISO 9001:2015 i.e. Quality Management Systems, certificate, issued by SGS Certification Company (Međimurje graditeljstvo Ltd., 2017).

In addition, this enterprise was registered at Commercial court in Varaždin, Croatia i.e. founded on 05.06.2000 i.e. nearly 19 years ago. However, this enterprise's address is Zagrebačka 42a in Čakovec, Croatia, cca 15 kilometers north from Varaždin.

As of its size, this enterprise can definitely be categorized among SMEs, as shown in Table 1. More specifically, since it meets 2 (Number of employees and Turnover) out of 3 EU criteria, based on data from 2017, it was categorized as a medium enterprise, as defined by EU and, respectively, by Republic of Croatia (European Commission, 2014).

Table 1: Categorisation of Međimurje graditeljstvo Ltd. among SMEs, as defined by EU

	1st criterion	and	2nd criterion	or	3rd criterion
Company category	Number of employees	and	Turnover	or	Balance sheet total
Micro	< 10	and	<= € 2 m	or	<= € 2 m
Small	< 50	and	<= € 10 m	or	<= € 10 m
Međimurje graditeljstvo Ltd.	154	and	~ € 11,28 m	or	~ € 5,81 m
Medium	< 250	and	<= € 50 m	or	<= € 43 m

Source: created by the authors, based on data by the European Union and Međimurje graditeljstvo Ltd.

Therefore, on 16.04.2019, this enterprise had a total of 154 full-time employees, in various and numerous departments, as shown in Figure 1. However, the most notable departments for the purpose of this paper were: Board of Directors, Finances and Procurement (that allowed the authors to use enterprise's data and that provided the authors with the most valuable data). Also, of great impor-

tance was the individual department related to enterprise's construction sites i.e. Production (that provided the ample amount of data, yet because of diverse and plentiful data related to this department, it was identified as common point for all enterprise's operations and activities).

Figure 1: Organisation chart of the researched enterprise

Source: Translated and adjusted by the authors based on the original by Medimurje graditeljstvo Ltd.

As of currently installed (software) applications, recently this enterprise possessed various specialized applications, including those related to accounting, taxes, employees, warehouse, costs, construction, planning, and works. However, by conducting a series of interviews with enterprise employees, the authors have detected the following key issues related to the enterprise's current situation regarding data and applications:

- + data that enterprise possessed were not integrated
- + accordingly, applications that enterprise possessed were not integrated
- + enterprise lacked structured electronic versions of its valuable business data

Hence, these were identified as issues, which consequently motivated the authors to create the business database, for the researched medium-sized SME.

3. EXPECTATIONS FROM AND PERCEIVED LIMITATIONS OF BUSINESS DATABASE BEFORE ITS CREATION

Proper detection of key issues has substantially helped the authors, prior to business database's creation, to intentionally set immediate, clear and attainable goals, of the entire process. To make them even more transparent and enter-

prise-oriented, the authors have reduced the number, shortened the length and redefined the structure, of those goals into a total of 14 realistic expectations from this business database, as follows:

- ♦ Tracking of direct material usage and costs
- ♦ Reduction of direct material costs
- ♦ Integration of the value creation activities in the business process
- ♦ Acceleration of the business process and its operations
- ♦ Reduction of idle time
- ♦ Improvement of business process transparency
- ♦ Increase in accuracy of determining the length of business operations
- ♦ Increase in productivity
- ♦ Increase in data and information availability
- ♦ Increase in data and information transparency
- ♦ Improvement of operative decision-making
- ♦ Increase in employee satisfaction regarding data availability
- ♦ Increase in employee efficiency regarding data availability
- ♦ Increase in employee efficiency vis-à-vis data presentation

However, at this period in time, the authors have also become keenly aware of the inherent and the possible database-creation-related limitations that may be revealed during this research. To begin with, they were not able to foresee, i.e. to anticipate; firstly, the availability of enterprise's general data; and secondly, the current availability of additional specialized data that will, eventually, be needed in the process of creation of this database. Thirdly, even with, expectedly, limited amounts of data the authors have decided to fulfill all 14 expectations in the largest measure currently possible. In addition, fourthly, the authors have been conscious that there were cca 6, short, months available to fully complete this business database and the accompanying master thesis of the 2nd author. For that reason, fifthly, the authors have become well aware that the pertinent level of knowledge, needed during the creation of this database, definitely must be that of the 2nd author i.e. the supervised student, which was to be continuously directed, deepened and broadened by knowledge, experience, and guidelines of the 1st author i.e. the supervising professor.

Finally, with such direct, pragmatic somewhat uncertain, yet broad and bright outlook on the expectations and limitations, it was possible to properly begin with the process of this business database creation. Details of this process were elaborated in the subsequent part of this paper.

4. PROCESS OF BUSINESS DATABASE CREATION

In the beginning, before the creation of this business database, it was necessary to choose the appropriate DBMS (DataBase Management System). However, database creation does require prior knowledge (Alexander, M. & Kusleika, R., 2016, p. 3). Moreover, given that, this business database was to be created as an integrative part of student's (2nd author's) master thesis, the student was strongly advised, by his supervisor (1st author), to create it by taking into account specific criteria. Thus, 5 criteria were established as follows: (1) primarily, student (author of master thesis) had to have a good experience of chosen DBMS, (2) chosen DBMS had to be either free (freeware and/or open source) or completely freely available (via special software licenses for students and professors) to student and to professors in the master thesis defence committee, (3) DBMS of choice must have had built-in all needed data types, objects and other functionalities (without commercial add-ons that student must, eventually, buy), (4) chosen DBMS must have had functional GUI (Graphical User Interface) for all its respective objects, (5) lastly, but hugely important, DBMS of choice, must have had the considerable flexibility to support easy-to-create exchange, communication and handling, of detailed data, between the business model of the chosen enterprise and, accordingly, the data model of the created database, and vice versa.

Regarding the fulfillment of criterion (1), the student already had a good experience of Microsoft Access DBMS, due to the knowledge that he gained at the graduate study course entitled Applications of Databases at the Faculty of Business and Economics at University of Rijeka, Croatia, Europe.

Appropriately, because the aforementioned DBMS amply fulfills criteria (2) to (5), student's supervisor had advised and encouraged him, to utilise it in the process of database creation within his master thesis, since it was essential to growing this database into its most applicable and most valuable part, as explained in subsequent paragraphs.

Regarding fulfillment of criterion (2), the database for the enterprise was created successfully and timely, in Microsoft Access 2016, more specifically in its edition that is freely available to professors and students at University of Rijeka.

Concerning criterion (3), it can be marked as fulfilled, since a substantial number of features was incorporated in this particular database. These features can be described and analyzed from, both, the perspective of particular DBMS objects and perspective of built-in DBMS functionalities, as it was done in two fol-

lowing paragraphs. Besides, all elaborated DBMS objects have GUI, both in their design (object creation) view and/or datasheet (data preview) view, what completely fulfills criterion (4).

From the perspective of particular DBMS objects, a total of: 11 tables, 18 queries (11 selected, 2 crosstabs, 1 make table, 1 update, 1 append, 2 delete), 9 forms (5 main, 4 sub), 3 reports, 44 macros (1 standalone, 43 button-associated) and 4 (4 button-associated) modules. In that sense, tables were created as normalized; queries, forms, and reports were created based on the most relevant data; macros and modules were created to individually automatically perform a specific action.

Moreover, from the perspective of built-in DBMS functionalities, a large number of them were utilized in this database, yet the most relevant ones among them were:

- ✦ table creation by using most of the data types to increase data variety and quality
- ✦ creation and preview of relationships between tables in Relationships window
- ✦ both filtering and mining of data, by various criteria, in select and crosstab queries
- ✦ parameter queries (in select queries) as user-friendly query-related functionality
- ✦ crosstab queries for alternative views and to calculate numerical totals of relevant data
- ✦ action (make a table, update, append, delete) queries to perform various actions on data
- ✦ forms (with and without subforms) to create advanced user-friendly data layouts
- ✦ reports to create a variety of customizable print-ready data layouts
- ✦ macros to automatically open the main menu form and to automate various buttons on forms
- ✦ modules for various calculations within forms and their fields.

As of criterion (5), its proper fulfillment can primarily be observed and proved within DBMS, by Relationships window of the created database, as shown in Figure 2.

Additionally, in Relationships window within DBMS of choice, one can precisely observe all created tables, fields, relationships and types of relationships. That

makes the data model much more flexible in terms of potential additions, alterations, deletions. Plus, it represents (in comparison to DBMSs sans GUI and Relationships window) the worthy visual addition to the overall data model that should, as early as possible, be properly aligned with the business model, in order to facilitate accurate and quality data exchange, communication, and handling, between them.

Figure 2: Relationship window of the created database

Source: created by the authors

Summarily, after this elaboration, by taking into account this database as a whole, the establishment of these 5 criteria in the early stage of its development, was logically necessary. This necessity has arisen from the need for direct, regular and two-way communication with the chosen enterprise, what has proven to be valuable asset to constant alignments and adjustments within various database objects as required by continuous back and forth, completely human-mediated, fairly close interaction, between database’s data model and enterprise’s business model. Lastly, everything previously mentioned was done with the particular and special purpose of amassing, structuring and processing data, to integrate processes within the chosen enterprise.

5. GRADES FOR FULFILMENT OF EXPECTATIONS FROM BUSINESS DATABASE AFTER ITS CREATION AND RECOMMENDATIONS FOR IMPROVEMENTS

In Table 2, 14 previously mentioned expectations were (briefly) numbered and listed. Also, they were graded numerically (from 1 i.e. the lowest grade to 5 i.e. the highest grade), whereas the displayed grade is the average of 1st author’s grade and 2nd author’s grade. In general, the authors were consent in terms of grades, while grade 3,5 indicates that individual grades were 3 and 4, while grade 4,5 indicates that

individual grades were 4 and 5. In addition, all expectations were elaborated within comments, while some of them also include a recommendation for improvement. Finally, in order to avoid table rows that split across pages, the authors have evenly distributed 14 expectations from Table 2 over subsequent pages.

Table 2: Expectations from the created database

Number:	1	
Expectation:	Tracking of direct material usage and costs	
Grade:	4	
Comment:	Consumption of material is tracked, and it can be filtered and/or mined by various criteria and it is made easier to search it by various criteria. With timely data entry on material consumptions, they are ideally available in real time.	
Recommendation:	More automated data entry for new orders.	
Number:	2	
Expectation:	Reduction of direct material costs	
Grade:	2	
Comment:	The reasonably solid functional basis for reduction of direct material costs are the ability to track individual costs and for individual construction sites. That way, it can be expected that direct material costs can be indirectly decreased: 1) based on exact tracking of already ordered material and 2) based on easier-to-reduce surpluses related to orders of material, both with consequent minimization of probability of running out of stock of individual material.	
Number:	3	
Expectation:	Integration of the value creation activities in the business process	
Grade:	4	
Comment:	Business processes are integrated around value creation process at construction sites: suppliers (of materials), materials, cooperators, vehicles, workers and insurances, have one point i.e. construction sites, in common.	
Recommendation:	Introduction of the capability to plan an individual schedule for workers, instead of collective schedule for construction sites, to know which, where and how much, the individual worker works.	
Number:	4	
Expectation:	Acceleration of the business process and its operations	
Grade:	3,5	
Comment:	By integration of separate individual enterprise's records into a single unified database, data are, ideally, continuously available in real time. That consequently leads to faster and more informed decision making by management and by employees in individual departments, dependent on their level of involvement in induction of, accordingly accelerated, specific business operations, with construction sites as a common point for all enterprise's operations and activities.	
Number:	5	
Expectation:	Reduction of idle time	

Grade:	4	
Comment:	Integration of separate individual enterprise's records enables faster decision making for operative decisions about conduction of business operations e.g. about the need to renew insurance, to contact cooperator and/or supplier, to direct materials and/or workers and/or vehicles towards construction sites, and similar, which consequently leads to reduction of idle time.	
Number:	6	
Expectation:	Improvement of business process transparency	
Grade:	5	
Comment:	All users have access to all data in real time and they can be updated timely. Such improved transparency enables a higher degree of users' participation in i.e. improvement of operative decision making.	
Number:	7	
Expectation:	Increase in accuracy of determining the length of business operations	
Grade:	4,5	
Comment:	Time accuracy of recording individual business operations and/or events (by years, months, days) was increased e.g. start and end date of vehicle allocation, number of workers at construction sites in a specific month.	
Recommendation:	The apparent increase of time accuracy of recording individual business operations and/or events (by everything aforementioned + by hours + by minutes).	
Number:	8	
Expectation:	Increase in productivity	
Grade:	3	
Comment:	Currently, labor productivity is tracked in a somewhat limited fashion via collective schedule (of workers) for construction sites, while capital productivity is tracked implicitly via orders of materials for individual construction site without data who, individually, are planning to consume it.	
Recommendation:	List of individual workers would enable more detailed tracking of and increase in labor productivity (e.g. via hours of labor) and capital productivity (e. g. via individual material consumption).	
Number:	9	
Expectation:	Increase in data and information availability	
Grade:	4	
Comment:	Increased availability of data is important for management and for its strategic decision making on the allocation of resources, but also for data users/workers in various departments, especially in the Production department and Procurement department.	
Number:	10	
Expectation:	Increase in data and information transparency	
Grade:	4,5	
Comment:	Data that describe the enterprise's value creation process are completely enveloped by this database and they are transparently available to all users. Currently, differentiation by permissions is, intentionally, avoided, so that it may potentially lead to the improvement of communication flow between enterprise's departments that are involved in the value creation process at the central location of value creation i.e. construction sites.	
Number:	11	
Expectation:	Improvement of operative decision-making	

Grade:	4	
Comment:	Improved operative decisions to order materials, to allocate vehicles and/or workers on construction sites, that are related to insurance, by taking into consideration data centralization, can be made much more quickly and correctly, in view of evident integration of enterprise's information flow by means of this database.	
Number:	12	
Expectation:	Increase in employee satisfaction regarding data availability	
Grade:	4,5	
Comment:	Employees can be more satisfied, due to availability of all data via a single interface that is easy use, yet it has capabilities to filter and/or mine numerous and various data by many different criteria.	
Number:	13	
Expectation:	Increase in employee efficiency regarding data availability	
Grade:	4	
Comment:	Employee efficiency is increased due to the timely availability of all data regarding core activities of value creation processes, relatively easy filtering and/or mining of these data and consequent quicker and data-based decision making.	
Number:	14	
Expectation:	Increase in employee efficiency vis-à-vis data presentation	
Grade:	4,5	
Comment:	By created a main menu, data presentation is optimized according to employees' needs and certain specifics of doing business within the enterprise. Mentioned main menu and routine work in the database were simplified to the maximum. In contrast, overall data presentation was carefully and studiously created, to reduce the possibility of employee error to the minimum. To further increase employee efficiency, this database also enables easier data filtering and/or mining by many different criteria.	

Source: Created by the authors

Noteworthy is the fact, that all grades of expectations within Table 2 were given, by considering 5 objective limitations that were elaborated in the 4th part of this paper. Even though all therein anticipated and listed limitations, have had more or less apparent effects on the creation of this business database, all things considered, the authors regard enclosed grades, comments and recommendations as maximally bias-less and reliable.

6. CONCLUSION

In today's modern, globalized as well as economically interconnected world, and increasingly digitalized economies, even SMEs have the necessity to properly store, efficiently organize, functionally relate and closely integrate their data. What

is more, successful SMEs have proven to be a vital asset to most economies worldwide? Yet, one of the characteristics that differentiate successful SMEs from non-successful ones is the awareness of advantages, those business-informatics-related solutions can provide them.

Besides, data (-related capabilities, -associated operations and -specialized features), that are featured on virtually all software lists related to e.g. big data and data mining, are becoming increasingly interesting, even to SMEs, primarily because there are numerous functionalities that only business databases can provide.

One of such, business-data-aware, SMEs, is the Međimurje graditeljstvo Ltd., carefully chosen and consent-to-research, Croatian medium-sized enterprise, that authors have researched for the purpose of this paper. In relation to that, during research, the authors have found that this enterprise does actively work with business data and that it possesses various specialized applications for that purpose. However, the authors have managed to identify some major disadvantages of the current situation within this enterprise in terms of data and applications. These disadvantages can be summarised in this manner: non-integrated data, non-integrated applications and lack of structured electronic versions of enterprise's valuable business data.

So, aforementioned disadvantages have motivated the authors to consider the creation of a business database that will, in the given situation i.e. 2nd author's work on master thesis and 1st author's supervision of it, attempt to overcome those advantages, to the greatest possible extent. For that reason, the authors have prepared 14 expectations along with 5 limitations before business database's creation. In accordance with them, the database created by the 2nd author was to be fully aligned with 5 DBMS-related selection criteria that were established by the 1st author. Plus, many DBMS functionalities had to be consequently utilized in this database. All of this was done in the preparation for grading of the authors' business database according to its fulfillment of expectations after its creation. Whereas, grades, comments, and recommendations for improvements (related to authors' business database) have, as a whole, indicated that (despite some room for improvements, which were primarily related to limitations that were anticipated by the authors) the created business database has properly fulfilled 14 expectations that were formed before its creation.

Finally, when everything is taken into account, all objectives that were outlined in the Introduction were totally achieved. That will definitely serve authors as

the incentive for future research into similar, related and new SME-centered topics. In the final line, a brave new world of big data is out there, thus SMEs, especially small and micro ones, throughout the world, (will) need every possible help to unlock its great potentials.

EMERGING FOCUS ON FAKE NEWS ISSUES IN SCIENTIFIC RESEARCH: A PRELIMINARY META-ANALYSIS APPROACH

Antun BILOŠ, Ph. D.

J. J. Strossmayer University of Osijek,
Faculty of Economics in Osijek

E-mail: abilos@efos.hr

Abstract

The Internet medium has dramatically changed the possibilities of information access globally; digitally savvy internet users worldwide continuously rely on arguably one of the biggest inventions for information dissemination in modern history. Moreover, one of the biggest issues of internet information space of the 21st century is actually the information overload as the internet medium keeps growing in information volume at a fascinating blistering pace. Every minute several millions of search queries occur on search engines, several million videos watched on popular video sharing networks, few hundred million emails sent and almost a million US dollars spent online - all in 60 seconds of every hour, all day, every day. However, there are more than a few growing concerns and challenges of the internet medium and one of the most alarming ones is popularly acclaimed as fake news (phenomenon). The term is often defined as the intentional presentation of false or misleading claims in order to manipulate the audience's cognitive processes. It has undoubtedly fanned the flames of scientific curiosity and academic responsibility in many different fields of study worldwide but also raised many concerns of public figures and organizations alike. The paper is based on a topic meta-analysis approach in order to describe the historical academic interest development and current status of scientific studies of the fake news phenomenon in the context of internet misinformation activities. Meta-analysis is based on 393 articles in Clarivate Analytics database (Web of Science) utilizing its categorization and filtering functionality. An overview of academic research is provided with a focus on the scientific field, time scope and country of origin.

Keywords: internet information space, fake news, misinformation, meta-analysis

JEL Classification: D83, L82

1. INTRODUCTION

One of the biggest issues of internet information space of the 21st century is information overload as the internet medium keeps growing in its information volume at a fascinating blistering pace. Every minute several millions of search queries occur on popular search engines, several million videos watched on video sharing networks, few hundred million emails sent and almost a million US dollars spent online (Desjardins, 2019). All of these activities (and many more) occur in 60 seconds of every hour, all day, every day.

Public media misinformation and deception issues are unfortunately not new occurrences in the modern age of social-economic environment, yet the public and academic attention towards these topics have grown exponentially in recent times. It has undoubtedly fanned the flames of scientific curiosity and academic responsibility in many different fields of study worldwide. One of most cited triggers for the stirring up the interest around the fake news issue is most likely the American presidential election in 2016 (Farkas & Schou, 2018; Vargo et al., 2017) inducing large amounts of news reports and related commentary. Furthermore, some authors have gone even further in describing the media environment as a post-truth or post-factual era (Corner, 2017; Mihailidis & Viotty, 2017; Rochlin, 2017; Speed & Mannion, 2017) with a truly fascinating indication of its proportions: the Oxford Dictionary selected the term “post-truth” as the 2016 international word of the year (Berghel, 2017).

So far, fake news stories have misinformed, misled and even engaged tens of millions of individuals around the world. Namely, only the top 50 fake news stories on Facebook in 2018 generated about 22 million shares, reactions and comments in total (Silverman & Pham, 2018; Alexander, 2018; Berghel, 2017). Social media platforms, in general, have been taken a major role in disseminating fake news, alternate facts and pseudoscience (McClain, 2017; Shu, 2017). Due to the extent and implications of the trend, fake news has been labeled as “powerful and sinister force” in the online media environment while some authors even refer to the issue as fake news crisis (Nelson & Taneja, 2018) of larger proportions.

While many individuals can recognize fake news and ignore the deceptive articles they encounter, many cases of fake news consumption lead to significant consequences. Scholars have examined many ways in which fake news articles have affected individuals: from confusing and misleading readers (Tandoc et al., 2018;), influencing opinions (Uberti, 2017; Michell et al, 2016), potentially affecting political elections (Farkas & Schou, 2018; Allcott & Gentzkow, 2017), to endangering the safety of people (Speed & Mannion, 2017; Lopez, 2016) and many others. All the mentioned challenges of internet information space have contributed to an online media environment where sensational headlines are significantly easier to find than they are to verify (Nelson & Taneja, 2018).

Lewandowsky et al. (2017) argued that fake news phenomenon is a result of larger political, economic, and societal trends: “a decline in social capital, growing economic inequality, increased polarization, declining trust in science, and an increasingly fractionated media landscape”.

Fake news phenomenon is clearly a widely discussed topic, primarily as an issue of information literacy (Rochlin, 2017) or perhaps more aligned version with the paper topic - information illiteracy. Mihailidis & Viotty (2017) concluded that developing information (and media) literacy is the response mechanism to enable the empowerment of critical media consumers in the “era of distrust”.

2. FAKE NEWS PHENOMENON

Even though the term fake news has been made dramatically popular in the last decade, it is not a new phenomenon (Allcott & Gentzkow, 2017; Vargo et al., 2017) but in fact closely related to a long history of hoaxes, mass manipulation, algorithmic biases and propaganda (Cooke, 2017), among others.

Up until 2012, both academics and professionals usually described fake news as a term that referred to news satire or news parody, content created for comedic purposes and mainly for entertainment (Berkowitz & Schwartz, 2016). In fact, news parody as a tool for political, cultural and social satire has a very strong tradition in many countries such as USA, Canada, Australia (Baym & Jones, 2012; Harrington, 2012) and others. Many authors explored the popularity of fake news or mock news programs such as *The Daily Show*, *The Colbert Report* and several others (Amarasingam, 2014; Baym & Jones, 2012; Brewer & Marquardt, 2007; Baym, 2005). Moreover, several studies ex-

explored the relationship between satirical news parody and perception of various topics. Brewer et al. (2013) suggested that exposure to satirical news coverage can affect knowledge, opinion and even political trust. Viewers exposed to news coverage about the issues highlighted in satire programming may experience stronger effects on opinion.

More recently, the term has been related to false or misleading information fabricated to appear like a fact-based story (Nelson & Taneja, 2018). Furthermore, the term fake news is often defined as intentional presentation of false or misleading claims (Tandoc et al., 2018) with financial or ideological objectives, a deliberately “fraudulent media product” (Corner, 2017) or articles that are “intentionally and verifiably false” (Allcott & Gentzkow, 2017). The misinformation is created by design in order to manipulate the target audience’s cognitive processes (Gelfert, 2018). Lazer et al. (2018) conclude that fake news overlaps with other “information disorders”, namely misinformation (false or misleading information) and disinformation (false information spread to deceive people). In contrast, Rochlin (2017) argues that fake news no longer stands for “factless or slanderous” information piece, but a claim to attack an individuals’ pre-existing beliefs. However, in combination with online analytical capabilities, behavioral tracking and segmentation opportunities of social media platforms it clearly forms a powerful tool for audience-specific manipulation (Gelfert, 2018)

Within the realm of scientific literature on the fake news phenomenon, the large majority of research is focused on two issues: how and why is fabricated content created, disseminated and potentially legitimized (Farkas & Schou, 2018).

Some studies suggest that not only the media environment within internet information space is changing but the various segments of media consumers and internet users in general. Marchi (2013) examined the news related attitudes and behavior of teenagers and found evidence of specific ways the information is being accessed, new attitudes about the concept of being informed and, interestingly enough, a preference for opinionated rather than objective news articles. However, the author also pointed out that the latter is related to teenagers’ preference of authentic renderings of news articles and not to their lack of understanding of objective journalism significance.

The fake news phenomenon is directly linked with the control of (online) information space and as such considered as a potential threat to democratic societies. Many scholars focus on the political significance of information fabri-

cation and intentional misinformation where fake news approach is utilized by various political individuals and organizations as means of “discrediting, attacking and delegitimizing political opponents” (Farkas & Schou, 2018).

Tandoc et al. (2018) examined 34 academic articles related to fake news published between 2003 and 2017 and suggested categorization of fake news into six types: news satire, news parody, fabrication, manipulation, advertising, and propaganda. The typology is based on 2 dimensions: levels of facticity and deception. In addition, authors suggest that not all of the identified fake news types are equally malicious and some types even might not be considered fake news based on more recent term perception. In another research paper, Tandoc et al. (2017) proposed a conceptual framework to understand how individuals confirm the authenticity of the information found on social media platforms. The study based on a sample of 2501 Singaporeans suggested that social media users rely on their own judgment of the source and the message and also turn to external resources when necessary. Lefevre et al. (2012) conducted an internet-based experiment on effects of intentionally created fake television news items as stimuli and concluded that these exemplars had a significant impact on viewers even though preexisting attitudes have a substantial influence. Somewhat similar conclusions were drawn in another large-scale online experiment with embedded fake television news items regarding political issues in Belgium (Walgrave, 2009).

A study by Vargo et al. (2017) showed that content generated from specific fake news sites is growing in size while possessing the power to boost the topic popularity in the online information space. In addition, Bakir and McStay (2017) linked the tern’s fake news and economy of emotions while emphasizing the use of personal and emotionally targeted articles along with the unlocked potential of highly-segmented digital advertising.

However, Nelson and Taneja (2018) found that the online fake news target audience comprises a small and disloyal segment of heavy internet users while the majority continue to utilize the most well-known news sources. It should also be mentioned that even the most popular and established news sources have been (most likely) unintentionally reporting on and sharing fake news articles (Alexander, 2018) or fabricated photographs (Carlson, 2009). In addition, various social networks play an enormous role in generating traffic to fake news sites and sharing fake news articles in general.

A number of authors examined methods and models for detecting deceptive information and locating fake news. Haigh et al. (2018) studied online tools for fact-checking which are used for locating fabricated information and exposing the truth. The study focused on an online tool called StopFake which evaluates news articles for signs of falsified evidence, such as manipulated, misrepresented or misleading imagery and/or quotes. The authors demonstrated its use and documented the work practices as well as analyzed its analytical possibilities. Khaldarova and Pantti (2016) examined a similar topic and also focused on Ukrainian fake news crisis and related use of StopFake tool.

Conroy et al. (2016) examined the potential of a hybrid approach that combines linguistic cue approaches with machine learning, enabled with network-based behavioral data in order to create a “fake news detector”.

Several interesting research efforts focused dominantly on image analysis within internet information space. Jin et al. (2017) examined the key role of image content in the news verification on microblogs. Interestingly enough, the authors found that fake and real news articles have different image distribution patterns and therefore have proposed several visual and statistical features to characterize the patterns visually and statistically in order to detect fake news.

3. META-ANALYSIS OF SELECTED TERM RELATED SCIENTIFIC PAPERS

The paper is based on a topic meta-analysis approach in order to describe the historical academic interest development and current status of scientific studies of the fake news phenomenon in the context of internet misinformation activities. Clarivate Analytics database was chosen as the main source of scientific papers due to its popularity and rank as well as the fact that it's highly respected among scholars worldwide. Li et al. (2018) argued that it is the “world's leading scientific citation search and analytical information platform”.

Meta-analysis is based on 393 articles in Web of Science Core Collection database utilizing its categorization and filtering functionality. Data was collected from the database during March 2019. A database query returns a total of 682 results (articles, proceeding papers, editorial materials, book reviews, and others) but the analysis was primarily based on 393 scientific articles while other document types were omitted from the analysis. An overview of the selected

scientific articles is provided with a focus on the scientific field, time scope and country of origin.

Table 1. Distribution of articles in Web of Science categories

WEB OF SCIENCE CATEGORIES	RECORDS	% OF 393
Communication	101	25,70%
Information Science Library Science	37	9,42%
Education Educational Research	24	6,11%
Political Science	20	5,09%
Computer Science Information Systems	18	4,58%
Humanities Multidisciplinary	16	4,07%
Law	15	3,82%
Social Sciences Interdisciplinary	15	3,82%
Sociology	14	3,56%
Folklore	13	3,31%
Multidisciplinary Sciences	11	2,80%
Psychology Experimental	11	2,80%
Computer Science Software Engineering	10	2,55%
Philosophy	10	2,55%
Psychology Multidisciplinary	8	2,04%
Engineering Electrical Electronic	7	1,78%
International Relations	7	1,78%
Religion	7	1,78%
Computer Science Interdisciplinary Applications	6	1,53%
History	6	1,53%
Language Linguistics	6	1,53%
Social Issues	6	1,53%
Business	5	1,27%
Computer Science Artificial Intelligence	5	1,27%
Literature	5	1,27%

(69 Web of Science Categories value(s) outside display options.)

Source: Authors' analysis based on Clarivate Analytics database

Based on the Web of Science database categorization, the articles were published in 94 different scientific categories. However, the vast majority of almost 70% of the articles fit into 10 major categories: Communication (25,70%), Information Science Library Science (9,42%), Education Educational Research (6,11%), Political Science (5,09%), Computer Science Information Systems (4,58%), Humanities Multidisciplinary (4,07%), Law (3,82%), Social Sciences Interdisciplinary (3,82%), Sociology (3,56%), and Folklore (3,31%). Detailed

category distribution is provided below (Table 1) as well as tree-map visualization of the 10 most represented categories (Figure 1).

Figure 1. Tree map visualization of 10 most represented categories

Source: Authors' analysis based on Clarivate Analytics database

Another important indication of the growing scientific interest in the topic of fake news phenomenon is the article publication year. Web of Science Core Collection database provides publication information since 1998. Even though there are several articles published earlier, more than 88% was published in the last 5 years (2015-2019) with a fascination share of over 55% being published in 2018 (Figure 2).

Figure 2. Distribution of articles based on publication year

Source: Authors' analysis based on Clarivate Analytics database

It is also very important to consider that: a) the data was collected for only the first quarter of 2019, and b) the process of publishing a scientific article in Web of Science Core Collection is extremely time-consuming and may influence the discrepancy between the time the article is written and the publication time.

According to the collected data, the topic of fake news phenomenon has been recognized globally as the selected 393 articles have been published in (or from) 57 countries/regions around the world. However, English speaking countries clearly dominate with the top 5 countries (accounting for over 68%) being: USA (39,19%), England (9,42%), Spain (7,63%), Australia (6,36%), and Canada (5,85%). Top countries/regions are presented in more detail below (Figure 3).

Figure 3. Distribution of articles based on country/region

Source: Authors' analysis based on Clarivate Analytics database

4. CONCLUSION

The paper is based on a topic meta-analysis approach in order to describe the historical academic interest development and current status of scientific studies of the fake news phenomenon in the context of internet misinformation activities. Meta-analysis is based on 393 articles in Clarivate Analytics database (Web of Science) utilizing its categorization and filtering functionality. An overview of academic research is provided with a focus on the scientific field, time scope and country of origin. Based on the Web of Science database categorization, the articles were published in 94 different scientific categories. However, the vast

majority is categorized in Communication, Information Science Library Science, Education Educational Research, Political Science and Computer Science Information Systems. More than 88% of articles were published in the last 5 years (2015-2019) with a fascinating share of over 55% being published in 2018. The topic of fake news phenomenon has been recognized scientifically on a global scale as the selected 393 articles have been published in 57 countries/regions around the world. However, English speaking countries clearly dominate.

This paper suffers from a number of limitations due to its scope and meta-analytical approach. Future research efforts may build on the arguments presented in this paper and examine selected scientific papers in more detail. Furthermore, additional studies may focus on methods and models of distinguishing real news from fabricated fake news stories as well as examining their main motivation. Scholars may also explore the role of the target audience in perceiving fake news and sharing it online and what in fact makes a fabricated story more or less successful. These unexplored areas and related questions “beg” for further research as would Vargo et al. (2017) put it.

Abstract

Recently, in media is often told about the migration of unemployed persons from the territory of Slavonia to the Western European countries due to their inability to find a work place. Unemployment is the leading problem in today's economy. In addition to the negative economic effects, unemployment also has detrimental sociological and psychological effects. The general rate of activity in one area is also determined by the use of demographic determinants. The goal of this paper is focused on the demographic structure analysis of unemployed persons from the five Slavonian counties: Virovitica-Podravina, Brod-Posavina, Požega-Slavonia, Osijek-Baranja, and Vukovar-Srijem County. In this paper are presented general information's on unemployment in these counties. The demographic structure of the unemployed is presented in this paper in accordance with the following characteristics of the examinees: gender, age, level of education and occupation. Practical work application can be referred to the adoption of targeted measures and employment policies in accordance with the demographic structure of the unemployed in order to stop migration from Slavonia. Proposals for the further research can be a demographic analysis of unemployed persons in the Republic of Croatia that will be preceded also in other counties, and the analysis for the purpose of compliance of the employment measures set with the demographic structure of the unemployed individuals.

Keywords: unemployment, demographic structure, migration, Slavonia

JEL Classification: E24, J64

1. INTRODUCTION

The problem of high unemployment is recently the urgent macroeconomic problem. In the course of the last two decades, Croatian society has gone through in depth structural transformations, which were ultimately reflected on the economic and the social sphere. Today, the Croatian economy is characterized by an extremely low level of inclusion of population in the labour market, whereby Croatia is ranked third among the EU countries with a high unemployment rate of individuals younger than 26 years of age (45% in 2016). Because of such negative economic trends, recent years have been marked by the increased emigration of young, labour-intensive and productive population. In addition, we should also take into account many other factors that characterize the high emigration flows from the Republic of Croatia, including social, educational, and political and many other reasons. Although at first glance it may seem that such very high emigration flows as a short-term consequence can have a reduction in the unemployment rate, however, long-term migration flows cause drastic labour market disturbances as well as complete destabilization of the system that was caused by the excessive losses.

In the Republic of Croatia, in 2018 was noted the significant drop in unemployment in a total of 21,5% when compared to the previous year, what indicates a stabilization of unemployment, which according to the ILO methodology during the last quarter of 2018 accounted for 8,5% (Croatian Chamber of Economy, 2018). Although overall unemployment rate does not point towards the “alarming” situation in the Republic of Croatia, disproportion of individual regions (which today dominates) and expansive emigration flows of the population have opened the question of further survival and sustainability. Available data suggest that during the last five years, more than 200 000 people have left the Republic of Croatia; with nearly one quarter of the Croat population living in the east of the country proceed by the lowest official employment rate.

The area which will be described in detail and include in this paper is the eastern part of Croatia - Slavonia, which administratively encompasses five Slavic counties: Vukovar-Srijem, Osijek-Baranja, Požega-Slavonia, Brod-Posavina, and Virovitica- Podravina. For the purpose of this paper were used data of the Central Bureau of Statistics and the Croatian Employment Service. Data on population are taken from the 2011 Population Census. Data were analysed on registered unemployed persons that were reported to the Croatian Employ-

ment Service with regard to demographic characteristics such as gender, age, level of education and occupation. Numerous issues related to regional differences, emigration, and the problem of unemployment in the labour market have been insufficiently explored.

2. CROATIAN LABOUR MARKET

Long-term unemployment leaves a number of consequences: social, family, psychological, economic and health. It also has an implication for the individual career development. Long-term unemployment is considered (according to American standards) if individuals are unemployed for 27 consecutive weeks and longer (Kimberly, 2017, 11). Employers today seek for the employees with two key features: job expertise and for them to retain and improve such expertise during employment. The long-term unemployed person most often cannot fulfil this other request. They cannot achieve continuity when acquiring new knowledge and skills (Weddle, 2017, 18).

The disparity of the education system and the market needs is a structural problem of the Croatian economy, which has additionally contributed to unfavourable processes in the natural population movement during the last decade. The former analysis that was conducted by the Croatian Employment Service on the Croatian labour market is characterized as a market with an obvious contingency of disproportions between labour market needs and labour supply, which will be more pronounced in the coming years. The division of labour will have a profound social effect that imposes an increased demand for more complex knowledge and more intensive and longer education (Inglehart, 1997; Samuelson, Nordhaus, 2001). Deep effects of globalization that reach the peak, specialized knowledge and experience rank at the “must have” scale of the highly developed economies, therefore, such needs become more and more complex, which means that the older population is considered inadequately qualified to deal with the deep structural problems (Obadić, 2003, 3).

There is no doubt that the multiannual incompatibility of the educational system and the labour market is characterized by direct negative effects, which experienced its peak during the deep economic crisis when the level of economic activity was lowered at a record low level of 12,6 % (Croatian Chamber of Economy, 2017, 8). Besides, with a high unemployment rate and low rates of economic activity of the population, at the same time a problem exist pertained

to long-term unemployment and also a high structural mismatch between job supply and job demand exists. Such negative trends have also contributed to the development of the so-called informal economy, which results in relatively large differences between the administrative and survey recordings on the labour market (Obadić, 2011, 108). The available data suggest that the largest quotient of measurements was attained in the last quarter of 2013 when among the EU28 countries in front of Croatia was only Spain and Greece, where the lowest employment rate was recorded at 52%. Under the influence of a sharp decrease in the number of unemployed and stagnant number of employed persons; during 2016 the average annual unemployment rate was reduced by 2,2 percentage points, i.e. from 17,0% in 2015 to 14,8% in 2016. Positive economic trends continued for the third consecutive year and are reflected in a significant reduction in the number of unemployed persons and a slight increase in the employment rate. "The annual average of registered number of employees in 2017 amounted to 1,405,498 persons with the on-year increase of 15,079 persons (or 1,1%), with the increased number of employees in the sector of legal entities by 1,4%, which makes 84,9% of the total registered employed persons, while the number of employees in the sector of crafts and free professions decreased by 0,7% and in sector of the "individual" farmers by 1,6%" (Croatian Employment Service, 2017, 11).

In accordance with the different methodology of measuring employment and unemployment conditions with regard to the Labour Force Survey and administrative sources, significant differences are noticed in the absolute number of employed persons (that 220 thousand persons more were registered in the survey when compared to administrative sources), and thus smaller deviations in the average number of unemployed (11,000). Comparative analysis of the collected data has shown a higher employment growth (2,2% versus 1,1%), but also a lower fall in unemployment (14,6% versus 19,8%), in accordance to the survey data. Table 1 shows different movements of economic activity and unemployment in the Republic of Croatia collected using two different methods of data measurement.

Table 1. Different indicators of unemployment with regard to the measurement methodology

DESCRIPTION	REGISTERED DATA			SURVEY DATA		
	2014	2015	2016	2014	2015	2016
Active population	1 670 336	1 676 908	1 632 279	1 893 000	1 891 000	1 830 000
Employed	1 342 149	1 391 002	1 390 419	1 566 000	1 585 000	1 590 000
Unemployed	328 187	285 906	241 860	327 000	306 000	240 000
%	19.6	17.0	14.8	17.3	16.2	13.1

The presented statistical data are undoubtedly necessary to properly define and rank the initiatives and policies of employment, but also to monitor and realize the effectiveness of certain labour market programs (Goldfarb, 1993, 24). However, despite the importance of the presented data, their analysis suggests a somewhat confusing picture of the actual situation and the movement of unemployment on the market. Therefore, the real question is about data, but also which have been attempted to explain by many authors - which data are relevant and actual in relation to the collected and registered data (Kerovec, 1998, 301). Before a few years, the Republic of Croatia has joined the most developed countries that publish data on unemployment based on two sources, namely on the two measurement methods: the administrative source and the data collected and based on the workforce survey (Chernyshev, 1994). Very often the data obtained from two different sources do not produce the same results. The difference between these two ways of measuring data is very important. Although each of these methods is implemented according to the predefined regulations, registered unemployment as a measure is subject to legal changes and is not internationally recognized and comparable. However, the unemployment rate (ARS) is recognized as a measure and it's conducted by the Central Bureau of Statistics (CBS) in accordance with the recommendations of the International Labour Organization. It is about the measurement of unemployment which is accepted as an international standard (Mrnjavac, 1996).

Generally, highly-developed economies are most dominant in their administrative data versus survey data, i.e., the administrative unemployment is always higher than the one gathered by the survey. By contrast, the transition countries have a much higher unemployment rate on the basis of data collected by the Survey Methodology (ARS), as it's the case in the Republic of Croatia.

Although the data obtained by the ARS methodology fully complies with the international standards, very often analyzes that were carried out on this topic also include administrative data. So the problem is not just inertia of the user, but the frequency of implementation and data collection. Today, the market increasingly demands more promptly monitoring of movement of unemployment and employment, which according to the survey methodology is almost impossible to do, because it is carried out two to three times a year. Also, such a measurement method most often includes all working-age population in the defined age group, including students and retirees, housewives and pupils, regardless of whether they were registered in the Croatian Employment Service register. It is worth adding that the survey method is the basic instrument for obtaining accurate and relevant data that can “cover” almost the entire population, regardless of their economic activity, sector, age, gender structure, employment or unemployment status.

In the Republic of Croatia, unemployment is largely the result of structural changes in the economy, liquidation, and bankruptcy of companies, dismissals of employees and privatization in the industry sector. The industrial sector in the Republic of Croatia during the economic crisis and the early transition process was the most affected, and it has recorded a significant drop in production, which eventually led to an increase in unemployment during the course of the economic crisis. According to the Croatian Employment Service data, which in accordance to the Act on Employment Mediation and Unemployment Rights (OG16/17) empowered since 2002, maintains its duty to collect data and proceed with the analysis of unemployed persons in economy activity: in recent years it has been noticed significant improvement and growth rate of employment. According to the National Classification of Economic Activities (NKDD), the decrease in unemployment was recorded during fourteen areas of activity, with the largest percentage in the manufacturing industry, 17,1%.

When compared to 2016, the number of employees has increased in the administrative and service sector (3,8%), construction building (3,0%), arts, entertainment and recreation (2,4%) and transport and storage (2,0%), as it is shown in Table 2. In accordance to the sector of activity (agricultural, non-agricultural and service sector), the structure of employed persons in 2017 shows that 69,6% of employed persons were employed in the service sector, 26,8% in non-agricultural and 3,6% in the agriculture sector (Croatian Employment Service, 2018, 2017).

Source: Authors work by Croatian Employment Service, 2018, 14 and Croatian Employment Service, 2017, 16.

Over the last few years, the economic situation in Croatia has indicated the uneven distribution of economic resources and incomes within the country, which, as a consequence, causes uneven distribution and development of individual regions. The overall unemployment rate for Croatia has been significantly declining over the last few years, but the problem that is still high is the underdevelopment of some regions where unemployment is at a very high level. The research and analysis that has been continuously carried out by the EU have shown that in the Republic of Croatia is present a long-term drastic growth of unemployment in certain regions that from the period of the '90s of the last century has not been significantly reduced. Huber (2007) notes in his research that long-term regional differences are more significant in regions that are geographically closer to more developed markets i.e. that are bordering with EU member states. Average lower unemployment rates also have regions that have been less industrialized, as it's the case with the transition economies, because there has been a sharp decline in industries activities and, consequently, a sharp decline in employment.

In all counties, the unemployment rate has fallen in the course of the last two years, and in Krapina-Zagorje, Karlovac, Varaždin and Zadar counties during the last three years. As a result, the decline in rates in all observed counties was affected by the higher fall in the number of unemployed individuals (which is partly related to demographic and migration trends). The largest share of the total number of persons employed is in the counties with the highest concentration of population, in the close vicinity of urban centres and the largest cities. Despite this, the insights into employment rates in the Croatian counties confirm the leading developmental position of the three continental counties: Međimurje, Krapina-Zagorje and Bjelovar-Bilogora counties, which suggest the conclusion that resource allocation is optimized in relation to social struc-

ture. Available data suggest that the average number of unemployed persons during 2017 has decreased in almost all of the counties, but the counties that lag behind well below the average are Slavonia and Baranja counties. So, “it’s about a dynamic process, it’s not the condition that can result in personal exclusion at the personal level” (Šućur, 2001, 17) of the entire region. The most significant decrease in the percentage of the number of unemployed was recorded in Krapina-Zagorje (28,6%), Varaždin (28,3%), Koprivnica-Križevci (27,6%) and Zagreb County (27,5%). In accordance with the gender structure, there is a noticeable increase in employed women in the Brod-Posavina, Osijek-Baranja, Vukovar-Srijem, Primorje-Gorski Kotar and Split-Dalmatia counties (58,5% to 60,9%). The lowest proportion of women in the total number of unemployed were in Šibenik-Knin, Bjelovar-Bilogora, Varaždin County and Lika-Senj County (52,2% to 52,5%) (Croatian Employment Service, 2017, 2018).

Over the past few years, more than 200 000 people have left the Republic of Croatia, among which prevail the younger and the most productive populations. A special problem poses youth unemployment.

Youth unemployment affects both the individual and the community. It carries with it negative economic (poverty, lack of income, reduced purchasing power), social (mental state of the individual, negative attitudes, alcohol consumption) and political implications (bad demographic image, brain drain) that are manifested throughout the society (Bilić, Jukić, 2014, 493). Independent of the state in question, youth policy, and youth employment policy must be a political priority of all at the level of European and national consensus (Bedeniković, 2017, 1). In addition, given the large and not developed dimension between the individual regions at the present time, less developed regions suffer significant loss of the necessary working population. The county with the relatively largest positive migration balance is the Zagreb County, followed by the Zadar and Istria counties. The initial assumption of the motives of relocating and migration to another county would be to the counties with relatively more dynamic labour markets and a relatively higher demand for workers, i.e. that they have a lower unemployment rate. The largest relative negative internal migration balance was recorded in Vukovar-Srijem and in Brod-Posavina counties, followed by Virovitica-Podravina and Požega-Slavonia counties as shown in Table 3. In the aforementioned counties, the high unemployment rates were recorded.

Table 3. Emigration balance in Slavonia

COUNTY	YEAR				
	2013	2014	2015	2016	2017
Virovitica - Podravina County	236	443	804	941	1 322

TOTAL	3 172	4 950	7 582	10 784	16 342
TOTAL RH	15 262	20 858	29 651	36 436	47 352

Source: Authors work by Central Bureau of Statistics (2018).

In the Republic of Croatia, disparities among regional unemployment rates are present, but their causes and mechanisms that could affect their growth or reduction have not been sufficiently explored. Large and persistent regional differences can lead to recurrent subvention of the regions that lag behind during long-term (Huber, 2007). To reduce unemployment, it is not enough to increase demand in certain industries, but it is necessary that this increase will be higher than the increase in the number of bids, i.e. the number of unemployed individuals.

3. UNEMPLOYED PERSONS BY SLAVONIA COUNTIES IN ACCORDANCE TO DEMOGRAPHIC FORMS

In December 2018 a total of 43,245 unemployed persons were registered in Slavonia. From Table 4 is visible the number of unemployed by counties in Slavonia.

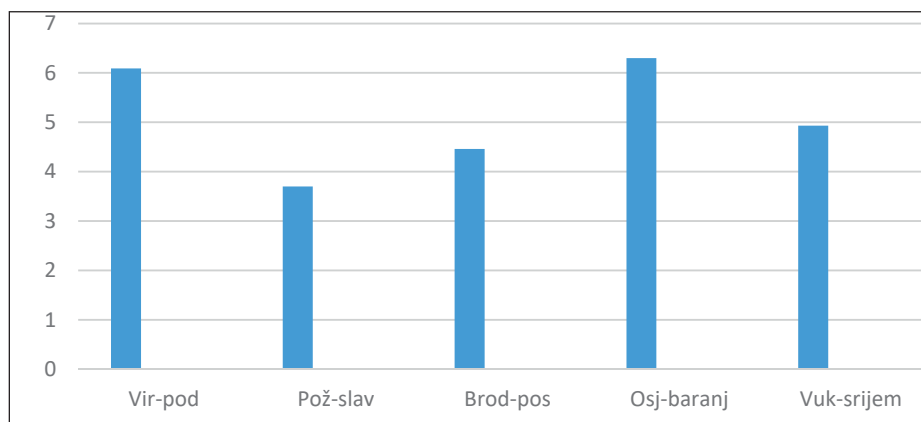

Table 4. Registered unemployed persons by the Slavonian counties in 2018

County	Total population	Registered unemployment in 2018	% of unemployed persons in the total population of the county
Virovitica-Podravina	84 836	5 171	6.09
Požega-Slavonia	78 034	2 893	3.7
Brod-Posavina	158 575	7 077	4.46
Osijek-Baranja	305 032	19 238	6.3
Vukovar-Srijem	179 521	8 866	4.93

Source: Authors work by the Central Bureau of Statistics, Population Census 2011; Croatian Employment Service, 2018

The largest number of registered unemployed persons were recorded in Osijek-Baranja and Virovitica-Podravina County, and the smallest number of registered unemployed persons in the total number of inhabitants is in Požega-Slavonia County.

Figure 1. Percentage of registered unemployed persons in the total population by counties in 2018

Source: Authors work, according to Table 4.

From Table 5 is visible the number of registered unemployed persons per Slavonian counties in accordance with gender.

Table 5. Registered unemployed persons per Slavonian counties in accordance with gender in 2018

County	Registered unemployment in 2018	Female gender	Male gender	% Women
Virovitica-Podravina	5 171	2 989	2 181	57.8
Požega-Slavonia	2 893	1 713	1 179	59.2
Brod-Posavina	7 077	4 255	2 822	60.1
Osijek-Baranja	19 238	11 495	7 743	59.7
Vukovar-Srijem	8 866	5 219	3 647	58.8

Source: Authors work by the Croatian Employment Service, 2018

In all analyzed counties, women account for more than half of registered unemployed persons. The greatest number of unemployed women is in Brod-Posavina, Osijek-Baranja and Požega-Slavonia counties. In the Republic of Croatia, in the year 2018, 56,3% of the total number of registered unemployed individuals were women (of 146 912 registered unemployed persons, 82 735

were women). Therefore, the data obtained by the counties are levelled with the Republic average. From Table 6 it's visible the number of registered unemployed persons in Slavonian counties by age.

Table 6. Registered unemployed persons in Slavonian counties by 2018

County	Registered unemployment in 2018	15-19	20-29	30-39	40-49	50-59	60 and over
Virovitica-Podravina	5 171	273	1 110	957	1 023	1 431	378
Požega-Slavonia	2 893	172	756	576	566	650	173
Brod-Posavina	7 077	411	1 573	1 266	1 483	1 824	519
Osijek-Baranja	19 238	934	4 316	3 685	3 671	4 960	1 672
Vukovar-Srijem	8 866	484	2 140	1 774	1 909	2 093	465

Source: Authors work by the Croatian Employment Service, 2018

In Virovitica-Podravina, Brod-Posavina and Osijek-Baranja County, the largest number of unemployed are from the age group 50-59 and that; 27,7% in Virovitica-Podravina, 25,8% in Brod-Posavina, and 25,8% in Osijek-Baranja County. In Požega-Slavonia and Vukovar-Srijem counties, the largest number of unemployed belong to the age group 20-29 years, i.e. in Požega-Slavonia 26,1%, and in Vukovar-Srijem 24,2%. From Table 7 is visible the number of registered unemployed persons by Slavonian counties in accordance to the level of education.

Table 7. Registered unemployed persons by Slavonian counties in accordance to the level of education in 2018

County	No school	With elementary school	With high school	With the first degree of college, vocational study, high school	With a college degree, academy, master's degree, doctorate
Virovitica-Podravina	362	1 476	2 947	216	170
Požega-Slavonia	228	579	1 744	184	158
Brod-Posavina	823	1 572	4 051	340	291
Osijek-Baranja	1 720	4 246	11 122	796	1 354
Vukovar-Srijem	242	2 300	5 437	455	433

Source: Authors work by the Croatian Employment Service, 2018

In all Slavonian counties, the highest number of registered unemployed persons has completed high school, therefore, in Virovitica-Podravina County they accounted for 56,9% from the total number of unemployed, in Požega-Slavonia 60,3%, in Brod-Posavina County 57,3%, Osijek-Baranja, 57,8% and in Vukovar-Srijem 61,3%. In all these counties, except for the Osijek-Baranja

County, the lowest number of registered unemployed persons is highly educated with a completed university, academy, master or doctorate degree; in Virovitica-Podravina 3,3%, in Požega-Slavonia 5,5%, in Brod-Posavina 4,1%, and in Vukovar-Srijem 4,9% of the total number of registered unemployed persons. In the Osijek-Baranja County, 7% of registered unemployed persons have completed a university, academy, master's degree or doctorate study. From Table 8 is visible the number of registered unemployed persons per Slavonian counties is in accordance to their occupation.

Table 8. Registered, unemployed persons by Slavonian counties by profession in 2018

County	Military	Legislators, Officials, directors	Scientists Engineers Experts	Technicians Expert associates	Officials	Service and commercial jobs	Farmers foresters hunters fishermen	Craft jobs	Machine operators, industrial producers	Simple occupations
ViroviticaPodravina	1	0	260	560	483	896	66	573	216	2 098
Požega-Slavonia	0	1	248	491	276	427	61	355	124	891
Brod-Posavina	0	0	430	813	556	1 297	35	1009	258	2 629
Osijek-Baranja	1	5	1 670	2 220	2 137	3 342	146	1836	834	6 923
Vukovar-Srijem	1	1	643	1 154	873	1 774	124	1064	438	2 709

Source: Authors work by the Croatian Employment Service, 2018

In all analyzed counties, the highest number of registered unemployed persons comes from the domain of simple occupations, i.e. the occupations which requires the lowest level of education. In Virovitica-Podravina County, registered unemployed persons from simple occupations were 40,6%, in Požega-Slavonia 30,8%, in Brod-Posavina 37,1%, in Osijek-Baranja 36% and in Vukovar-Srijem 30,6 %. Common to all counties is the smallest percentage of registered unemployed persons in agricultural professions, forestry, hunting and fishery due to natural resources and traditions in agricultural production (except for military occupations, legislators, officials and directors who do not count as registered unemployed persons). A large percentage of registered unemployed persons come from commercial and service professions; in Virovitica-Podravina County 17,3%, in Požega-Slavonia 14,7%, Brod-Posavina 18,3%, Osijek-Baranja 17,4%, and in Vukovar-Srijem 20%.

4. CONCLUSION

Unemployment is one of the major problems facing the Croatian economy and society. Apart from having economic consequences, unemployment can have consequences for the health and the life of an individual. In the course of the previous years, indicators of unemployment are in decline and the reasons for that may be the emigration of the population, differences in unemployment between regions and registered unemployment, and all the unemployed do not have to be registered by the Croatian Employment Service. In recent years, media often refer to emigration from Slavonia as a result of unemployment in the area.

For the purposes of this paper, the demographic structure of the unemployed was analyzed in five Slavonian counties. The largest number of registered unemployed persons in relation to the total population of the county exists in Osijek-Baranja County. Women in all Slavonian counties make up for more than half of registered unemployed, and the largest number of unemployed women is in Brod-Posavina and Osijek-Baranja counties. The largest number of unemployed persons belongs to the age group of 50-59 and to the age group of 20-29 years of life, i.e. the mature age person before their retirement age and the young people at the beginning of their working life. In all Slavonian counties, the largest number of registered unemployed persons has completed secondary education, and the least registered unemployed are highly educated with a graduate degree, academy, master's degree or finished doctorate study (with the exception of Osijek-Baranja County).

The employment policy for the Slavonia area should be aligned with the demographic structure of the unemployed, so special incentives should be given for the employment of women, the elderly individuals and to proceed with the re-training and further, additional education of the unemployed with simple occupations.

Abstract

The unbalanced economic growth of Croatia over the years points to the need for an analysis of certain aspects of its economic performance. Among other things, it would be interesting to focus on the relationship between key macroeconomic indicators and foreign direct investment (FDI) as a growth-enhancing component, which is the subject of this paper. The analysis is conducted empirically, using the nonparametric method of data envelopment analysis (DEA). Since this is a single-country study, a time-series of Croatia's performance data is reported and the performing system of each sub-period (i.e., year) represents a different decision-making unit (DMU). Based on FDI, exports, unemployment rate and gross domestic product (GDP) and covering the period from 2003 to 2016, the analysis results in an efficiency index for each year, also identifying and quantifying inefficiency sources together with improvement directions. The obtained relative efficiency results confirmed two hypotheses: first, that there are significant differences in Croatia's macroeconomic efficiency across the years, and second, that FDI is the most prominent inefficiency source among the selected indicators. A potential limitation of this research is a general guideline of DEA

that the number of variables should be less than one-third of the number of DMUs (in this case, years). Since data on some of the selected indicators are not available for a longer period, the set of variables could be broadened by using data at the quarterly level. This could also make the conclusions to be drawn in this study more accurate, which is left for future research. The results should serve the economic policymakers in the efforts to improve decisions affecting the macroeconomic performance of the country.

Keywords: macroeconomic performance, foreign direct investment, (in)efficiency, Croatia, data envelopment analysis

JEL Classification: E00, E01,

1. INTRODUCTION

Numerous empirical studies have demonstrated the complexity of economic growth as a macroeconomic phenomenon. Consequently, so far it has not been fully explained which determinants contribute to the growth, to what extent and in what way. Different theories point to different determinants as key ones for economic growth – from natural resources and labor, through capital and technology, to human potentials. Growth theories assign an important role also to research and development, innovations, political and governmental factors, equipment investment, international trade and export capacity, foreign direct investment etc. Therefore, governments should pursue economic policies that foster open markets of goods and service, protection of private property rights, promotion of liberal capital market, reasonable government spending, incentives for entrepreneurial activity, the efficiency of tax systems, incentives for investment in human capital through active labor market policies, as well as macroeconomic stability. Do these policies affect the macroeconomic performance of a country sufficiently and what direction needs to be taken for their further improvement? It is obvious that measuring and comparing the (in)efficiency of macroeconomic performance, which involves the selection of relevant indicators and appropriate methodology, will be of crucial importance for answering the posed question.

GDP is the single most important measure of the health of the macroeconomy and the most widely reported statistic in every developed economy (Mankiw, 2014). In dynamic analyses, it is generally recommended to use real GDP to exclude the impact of inflation on its changes and thus to provide a more reliable

assessment of relative macroeconomic performance. However, theoretical and empirical research and discussions of a large number of economists have shown that to create a deeper and more comprehensive view of macroeconomic performance trends, it is not enough to observe only the gross domestic product, but it is necessary to put it in relation to a number of other indicators.¹ Deciding which indicators – economic, social and/or demographic – need to be considered in the analysis together with GDP, depends on the subject of research to be conducted. The subject of this particular study is to scrutinize certain aspects of Croatia's macroeconomic performance, with the focus on the relationship between key macroeconomic indicators and FDI. The aim is to present the results of the analysis of the selected indicators' influence on the relative efficiency of Croatia. The analysis is carried out using the nonparametric method of data envelopment analysis as an alternative to the approaches used so far in related domestic studies. Concerning the goal of this paper, two hypotheses emerge and will be examined. The first hypothesis presumes that there are significant differences in Croatia's macroeconomic performance across the years. The second hypothesis points to FDI as the most prominent inefficiency source among the selected indicators.

The paper is organized as follows. After the introduction, the second section provides a brief overview of up-to-date research on relative macroeconomic efficiency of Croatia using DEA. A description of the selected indicators and the methodology used to create a methodological framework for the analysis is provided in the third section, while the fourth section presents the model application in an empirical analysis and relative efficiency evaluation. The research results and their possible implications for economic policymakers are summarized in the last section of the paper.

2. CROATIA IN EMPIRICAL LITERATURE ON THE MACROECONOMIC EFFICIENCY BASED ON DEA

As it relates to an assessment of how well a country is doing in reaching improvement in the real standard of living of the population, the macroeconomic

¹ In support of this reasoning, there are some cases in which the exclusive use of GDP can result in misleading estimates. Thus, for example, the high GDP levels over a given period do not have to be the result of the country's objective economic power, but primarily of the significant public sector investment in infrastructure.

performance of countries has been the subject of numerous studies. However, regardless of the aspect under consideration, the empirical approach is of utmost importance. A survey of literature related to the macroeconomic efficiency of Croatia and based on the use of different DEA-inspired approaches is summarized in Table 1.

Source: Authors' survey.

All the above-mentioned papers use DEA approaches to measure and analyze macroeconomic efficiency of the countries, including Croatia, based on their mutual comparison. Except for Škuflić et al. (2013), none of the studies in Table 1 employs window analysis – the dynamic extension of the basic DEA models that allows a country's performance to be assessed not only in relation to other countries within the same sub-period but also with regard to other countries' outcomes, including own, from another sub-period. For that reason, if one aims to shift the focus on a single country and to further understand its macroeconomic trends, it would be valuable to observe its time-series macroeconomic performance data in a way that each sub-period is considered a different entity. This approach has already been utilized by numerous authors, many of them on the case of Croatia² but none of them using DEA method, which at this moment makes this study unique. The comparative advantage of this approach over the more traditional ones is that the analysis results in an ef-

² Dritsaki and Stiakakis (2014) investigate the relationship between FDI, exports and economic growth in Croatia using annual time-series data for the period 1994-2012. Due to these facts, this paper seems remarkably similar to ours. However, although analysing partially overlapping periods and employing similar indicators, these two studies differ in a number of aspects, including their aims and methods used, which has consequently led to a different kind of results and findings.

efficiency index for each sub-period, simultaneously identifying and quantifying inefficiency sources together with improvement directions.

3. MACROECONOMIC EFFICIENCY ASSESSMENT OF CROATIA – INDICATORS, DATA AND METHODOLOGY

A different selection of input and output variables results in different efficiency scores that are further influenced by model selection. Therefore, the selection of indicators and the design of the model suitable for application in the analysis of a particular process, in particular, the assumptions of its orientation and returns-to-scale, are among the most significant and most sensitive steps in building an appropriate DEA model for assessing the comparative or relative efficiency of the country. Attention should also be paid to what data are collected and available.

3.1. INDICATORS

The uneven macroeconomic performance of Croatia is present over the years. As an omnipresent reminder of the necessity of maintaining macroeconomic stability, it imposes an obligation to investigate the macroeconomic trends in terms of relative efficiency. This phenomenon should be addressed, among others, by proper selection of indicators.

After considering a wide range of relevant indicators and ranking them according to their relevance, four of them were selected for this study. Besides FDI, these are exports, unemployment rate³ and GDP. The reasons behind their selection are briefly the following. The role of FDI as a compound collection of capital stocks, know-how, and technology is a growth-enhancing component in Central and Eastern Europe countries (Popescu, 2014). The importance of exports for economic growth was seen to be constantly reconfirmed and various studies, including Dritsaki and Stiakakis (2014), point exports as the catalyst for the economic growth of Croatia. The role of employment in economic development has long been recognized and increasing employment (i.e., reducing

³ Since Croatia is the only country in this analysis, the drawbacks due to which registered unemployment rate is not utilized in international comparisons are here irrelevant, which makes the use of this rate justified for this study.

unemployment that has manifold adverse effects on both individuals and the economy as a whole) constantly remains one of the key priorities in achieving sustainable growth and development (Borozan et al., 2008). The importance of GDP as the most widely used single indicator in macroeconomic efficiency evaluation is already explained in the Introduction.

It should be noted that the degree of the government's influence on each of the selected indicators varies, which should be considered when drawing up guidelines based on results obtained by the empirical analysis. In addition, to make the analysis more reliable and the results' interpretation easier, some preliminary adjustments of selected indicators are needed. Since the purpose of this study is to make dynamic comparisons, the effect of the price increases is eliminated by taking FDI, exports, and GDP at constant prices of 2010. Thus adjusted four indicators will be integrated into a unique performance measure.

To build a model suitable for analyzing the dynamic relationship between GDP as a standard measure of national economic performance and other selected indicators, only GDP is considered output, while the other three indicators are considered as inputs.

3.2. DATA COLLECTION

The nature of the selected indicators enables comparison on an annual basis. The data on them, as well as the auxiliary variables⁴ necessary for their calculation, were collected from the official web pages of the Croatian Bureau of Statistics, the Croatian Employment Service and the Croatian National Bank, and then adjusted in accordance with the above requirements. The unavailability of data on some of the indicators for the period before 2003 and after 2016 determined the time frame of the research which, for the purpose of time series analysis, includes the data for the period 2003-2016. Table 2 presents the summary statistics for the adjusted data of each variable employed in the analysis.

⁴ This is the consumer price index as a variable to which the government cannot directly influence.

Table 2. Data summary statistics, 2003-2016

Variable	Mean	Median	SD	Min.	Max.	CV (%)	
Inputs	FDI in mil EUR	1,841.28	1,698.13	1,082.71	183.83	3,787.54	58.80
	Exports in mil EUR	9,012.54	8,965.43	1,226.27	6,724.49	11,484.05	13.61
	Unemployment rate	17.19	17.60	2.08	13.20	20.20	12.08
Output	GDP in mil EUR	44,012.69	43,673.34	2,842.53	39,085.71	49,886.26	6.46

Note: SD = standard deviation; CV = coefficient of variation;

Source: Authors' calculations based on data from the Croatian Bureau of Statistics, the Croatian Employment Service and the Croatian National Bank.

Since in this study FDI and exports are specified as inputs but, in practice, preferred to have larger amounts, in the model calculation their reciprocals are taken. This at the same time preserves the relationship between inputs and output and enables the assessment of the performance regarding the government's capability to maximize all selected variables. Consequently, recalculation of the obtained results and an additional caution in their interpretation should be exercised.

3.3. METHODOLOGICAL FRAMEWORK

DEA is a non-parametric performance measurement technique commonly employed to estimate the relative efficiency of a group of entities/decision-making units (DMUs) that are homogenous in the sense of using the same set of inputs and produce the same set of outputs. The empirical data on the selected inputs and outputs of the observed entities are incorporated into a linear program that represents the DEA model and provides a single relative performance efficiency index. Based on this data, an efficient frontier is formed by the best performing units that are therefore classified as efficient (i.e., benchmarks). At the same time, this empirically generated 'best practice' frontier envelops the input and output data of all the other DMUs that are consequently considered inefficient. The efficient ones are assigned an efficiency measure of 1 (or 100%), while the inefficient ones are scored between 0 and 1 depending on their distance from the frontier. This inefficiency is the result of using excessive inputs at a given output level and/or producing poor output at a given input level and can be removed by reaching a model-calculated efficient projection point on the efficient frontier. Since empirically constructed, this frontier appears as an objectively attainable goal for each inefficient DMU and, at the same time, serves as the basis for recognizing and quantifying its inefficiency sources and

their amounts, improvement directions and reference DMUs for most direct comparison.

Due to its robust properties, DEA has been applied across the spectrum of both profit and non-profit domains, and at both micro and macro-economic levels. The concept of the method is based on the seminal work of M. J. Farrell (1957). Since its initial introduction by Charnes, Cooper, and Rhodes in 1978 up to the year 2016 approximately 10,300 DEA-related articles of theoretical and practical interest have been published (Emrouznejad and Yang, 2018), a great deal of which in ISI Web of Science database (Liu et al., 2016). A considerable number of DEA models has been developed, primarily differing in the returns-to-scale assumption (constant or variable) and orientation (to input minimization or to output maximization) and consequently in the type of efficiency being calculated. Besides, there are numerous advanced models, built upon the basic ones, that are mutually distinguished by various extensions. Therefore, this approach has been internationally and academically recognized and proven as a decision support tool.

The determining factor in choosing this method over traditional benchmarking techniques was its ability of dynamic efficiency measurement, with inputs and outputs scaled in different and often incompatible units of measurement, and with no need for predetermining variable weights nor for explicit specification of the functional form connecting inputs and outputs. Moreover, the weights are assigned by the model itself, in a manner that maximizes the efficiency rating for each assessed entity, thus eliminating the subjectivity in the evaluation of each weight's significance.

However, it would be unfair to omit to mention that, despite the advantages, the DEA also has several shortcomings regarding empirical applications. One of the major is a commonly suggested rule of thumb, according to which the number of DMUs should be at least three times the number of indicators (for a more detailed discussion see Sarkis, 2007). The reason for this request is an attempt to assure that the basic productivity models are more discriminatory thus achieving greater reliability of the efficiency results. Also, unlike general application of multi-criteria approaches to ex-ante problems where data are not available at the moment, especially if referring to a discussion of future technologies that do not yet exist, DEA provides an ex-post analysis of the past from which to learn (Adler et al., 2002).

The first step an analyst should perform after selecting indicators is to determine the type of returns to scale in accordance with which the production frontier is estimated. In this respect, two basic models most widely used in DEA applications are CCR (Charnes, Cooper and Rhodes, 1978) and BCC (Banker, Charnes and Cooper, 1984), named after the initials of their authors. The first model assumes that the production function shows constant returns to scale, while the second model, with the assumption of variable returns to scale, is one of its numerous theoretical extensions. A preliminary investigation of the process to be analyzed and the testing of its properties can result in the indication of returns-to-scale type. Despite that, the production frontier characteristics, as in the case of this research, are sometimes hard to identify with certainty. In such cases, it is not justifiable to rely on a single model. One of the possible solutions is to run models under both constant and variable returns-to-scale assumptions, compare their results and, based on the significance of their differences and using expert knowledge of the problem, find the most appropriate type of assumption for the analysis. The preliminary phase of the here presented study showed the similarity among the results derived from the mentioned models (Table 3). It can, therefore, be assumed that the return effect with respect to the range of activities does not play a significant role in this case, which makes the CCR model more relevant to describe the examined process and is the reason for choosing that model for further analysis. This is additionally supported by the fact that 11 out of 14 years are characterized by constant returns to scale.

Table 3. Summary statistics for the input-oriented CCR and BCC models

Results ⁵ of the pre-analysis	CCR model	BCC model
Number of efficient years	2	2
Number of inefficient years	12	12
Average efficiency score	0.8032	0.8610
Standard deviation	0.1322	0.1011
Minimum efficiency score	0.5416	0.6912
Number (%) of years with below average efficiency	8 (57%)	7 (50%)

Source: Authors' work based on DEA-Solver-Pro calculations.

⁵ In differently oriented models with the same returns-to-scale assumption, the number of efficient entities is unchanged. At the same time, the efficiency scores can differ significantly, but only in the case of the BCC model. Also, due to different production frontiers' characteristics, BCC efficiency scores are never lower than CCR estimates.

The next problem the analyst has to cope with is the choice of model orientation. Namely, depending on whether management is predominantly focused on input reduction or output augmentation, DEA models are oriented toward inputs or outputs. Different model orientations result in different projection directions onto efficient frontier and consequently in different projection points for each inefficient DMU. The distances from these points to the correspondent inefficient DMU evidently differ, which is why the efficient frontiers in differently oriented models unequally attainable. As GDP is the only variable taken as output among the four chosen indicators, the input orientation was selected as more adequate since it offers an assessment of the extent to which inputs should be improved, without reducing the actual output amounts, to make the DMU relatively efficient. The following brief description of the model is based on Cooper et al. (2006, pp. 87-89). Accordingly, it is the relative efficiency assessment of n DMUs ($DMU_j, j=1,2,\dots,n$), each of which uses m inputs to generate s outputs. The input-oriented CCR model evaluates the efficiency of DO_o by solving the following linear program:

$$\begin{aligned} & \min_{\theta, \lambda} \theta \\ \text{subject to} & \quad \theta x_o - X\lambda \geq 0 & (1) \\ & \quad Y\lambda \geq y_o & (2) \\ & \quad \lambda \geq 0 & (3) \end{aligned}$$

where $X = (x_j) \in \mathbb{R}^{m \times n}$ denotes the matrix of inputs and $Y = (y_j) \in \mathbb{R}^{s \times n}$ denotes the matrix of outputs, $\lambda \in \mathbb{R}^n$. Therefore, the conditions (1), (2) and (3) consist of m , s and n constraints, respectively. In the case that is analysed here, n is 14, m is 3 and s is 1. Vector λ indicates the proportions in which efficient entities contribute to the projection of inefficient DO_o on efficient frontier. The optimal objective value θ represents the efficiency score for DO_o and, in the case of its inefficiency, also the input reduction rate ($0 \leq \theta^* \leq 1$).

This first phase minimizes θ , and the first two constraints of the corresponding linear program show that $(X\lambda, Y\lambda)$ outperforms (θ^*x_o, y_o) when $\theta^* < 1$. In this context, the input surpluses and the output shortfalls (i.e., slack DO_o values) are calculated by the formulas:

$$s^- = \theta x_o - X\lambda, \quad s^+ = Y\lambda - y_o,$$

where $s^- \in \mathbb{R}^m, s^- \geq 0$ and $s^+ \in \mathbb{R}^s, s^+ \geq 0$ for any feasible solution (θ, λ) .

In the second phase, possible remaining input surpluses and output shortfalls will be detected by maximizing their sum while keeping $\theta = \theta^*$.

Definition 1 (CCR-efficiency):

If an optimal solution $(\theta^*, \lambda^*, s^{-*}, s^{+*})$ of the CCR model (obtained in this two-phase solution procedure) satisfies $\theta^* = 1$ and has no slack ($s^{-*} = 0, s^{+*} = 0$), then the DO_o is called CCR-efficient, otherwise it is CC,R-inefficient.

The provided information can be used as a basis for goal setting for the DMU being evaluated as inefficient. A first step in identifying its targets is to compare it with the efficient DMUs that constitute its reference set.

Definition 2 (Reference Set):

For a CCR-inefficient DO_o , its reference set is defined based on an optimal solution λ^* by

$$E_o = \{j \mid \lambda_j^* > 0\} \quad (j \in \{1, 2, \dots, n\}).$$

Any of the eventually multiple optimal solutions is expressed as:

$$\begin{aligned} \theta^* x_o &= \sum_{j \in E_o} x_j \lambda_j^* + s^{-*}, \\ y_o &= \sum_{j \in E_o} y_j \lambda_j^* - s^{+*}. \end{aligned}$$

These relationships suggest that the efficiency of (x_o, y_o) for DO_o can be improved if the input values are reduced radially by the ratio θ^* and the input surpluses recorded in s^{-*} are then removed, and if the output values are augmented by the output shortfalls recorded in s^{+*} . The described improvement can be represented by the following formula (i.e., CCR-projection):

$$\begin{aligned} \hat{x}_o &= \theta^* x_o - s^{-*}, \\ \hat{y}_o &= y_o + s^{+*}. \end{aligned}$$

This type of studies usually includes more than one entity and/or involve more than one sub-period. It is therefore common to calculate average efficiencies – either by the entity in a particular sub-period or by the sub-period for a particular entity. But, apart from the usual calculation of mean value, in which all observed units are equally represented, there are weighted means where weighting can be made according to different criteria. Among them is the progressive time-weighted means – PTWM (Kumar and Vincent, 2011) as the method for computing a sort of weighted average of a non-empty set of numbers that assigns more weight to recent data points and makes it more responsive to the

new information. For the period 1 to T , a set of relative efficiency values, say e_t , $t = 1, \dots, T$ is considered. The progressive time-weighted mean is defined as

$$PTWM = \sum_{t=1}^T w_t e_t$$

where $w_t = 2t/(T^2 + T)$, $t = 1, \dots, T$ are associated non-negative normalized weights.

In the case that is analyzed here, the period spans from 1 (2003) to 14 (2016).

4. APPLICATION OF THE MODEL IN AN EMPIRICAL ASSESSMENT OF THE MACROECONOMIC EFFICIENCY OF CROATIA

The relative macroeconomic efficiency of Croatia, presented below, was obtained by authors' calculations using DEA-Solver-Pro software, based on the input-oriented model with constant returns-to-scale assumption. The efficiency scores, rankings, total proposed input, and output improvements and referential years (i.e., reference sets) are shown in Table 4 for each of the observed years. This spectrum of results enables a meaningful analysis of Croatia's efficiency based on the comparisons of its macroeconomic performance over the entire period under consideration.

Table 4. Relative macroeconomic efficiency results of Croatia, 2003-2016

Year	Efficiency score	Rank	Total input and output improvements (%)				Referential year(s)
			Inputs			Output	
			FDI	Exp.	Un. rate	GDP	
2003	0.5416	14	138.32	84.64	-45.84	0.00	2008, 2016
2004	0.6396	13	162.88	56.35	-36.04	0.00	2008, 2016
2005	0.7116	12	52.72	40.53	-28.84	0.00	2008, 2016
2006	0.8619	5	16.02	16.02	-24.67	0.00	2008, 2016
2007	0.9569	3	4.50	4.50	-13.85	0.00	2008, 2016
2008	1	1	0.00	0.00	0.00	0.00	/
2009	0.8083	6	82.45	38.75	-19.17	0.00	2008
2010	0.7975	8	99.44	25.39	-20.25	0.00	2008, 2016
2011	0.7831	9	96.58	27.70	-21.69	0.00	2008, 2016
2012	0.7356	10	65.29	35.94	-26.44	0.00	2008, 2016
2013	0.7203	11	154.65	38.83	-31.64	0.00	2016
2014	0.8010	7	24.84	24.84	-37.62	0.00	2008, 2016

2015	0.8872	4	865.25	12.71	-18.71	0.00	2016	
2016	1	1	0.00	0.00	0.00	0.00		/
Mean	0.8032		125.92	29.02	-23.17	0.00

Croatia was relatively efficient in the years 2008 and 2016. The lowest efficiency score (0.5416) was recorded in the initial year of the analysis. By observing the efficiency trend shown in Figure 1, three sub-periods can be recognized. The first sub-period was 2003-2008, with steady and continuous efficiency increase. After a sudden decrease in 2009, most likely due to the beginning of the Great Recession in Croatia, relative efficiency continued to decline slowly by the end of the second sub-period in 2013. Similar to the first one, the third sub-period (2014-2016) was characterized by sustained efficiency growth. Compared to a year earlier, the highest efficiency improvement was achieved in 2006 (+0.1503), while the most significant efficiency decrease was recorded in 2009 (-0.1917). The overall average efficiency of approximately 0.8 indicates that Croatia was on average 20% inefficient.

Figure 1. Relative macroeconomic efficiency trend, 2003-2016

Source: Authors' work based on DEA-Solver-Pro calculations.

None of the results were classified as an outlier since all were within two standard deviations of the mean value. At the same time, 5 out of 14 scores did not fall within one standard deviation of the mean value, indicating that between-scores variability was not insignificant. This fact, together with the considerable difference between the highest and lowest achieved scores (0.4584), proves our first hypothesis that there are significant differences in Croatia's macroeconomic efficiency across the years.

Observing the selected input and output variable movements (Figure 2), it can be noted that exports and GDP have trends very similar to the efficiency trend, while FDI is characterized by significantly larger fluctuations. The rates of unemployment, expectedly, move in the opposite direction. These claims are mutually supportive, also revealing the causes of such efficiency trend. As a further confirmation of these conclusions, Table 5 shows coefficients of correlation between efficiency scores and performance indicators.

Input surpluses and output shortfalls, i.e. differences between initial and projected values, are calculated in each variable, considering the above-mentioned adjustment of the actual data. These differences were then averaged over the whole sample and presented in Table 4 as percentages of the corresponding initial values, thus representing the necessary improvements that can be achieved by using the previously explained two-phase procedure⁶. In 2009, for example, the most pronounced is the shortfall of 82.45% of FDI, 19.17%⁷ of which can be ascribed to radial inefficiency and removed in the first phase, while the remaining 63.28% is a result of mixed inefficiency that is being removed in the second phase. In the same year, the shortfall of exports is 38.75%, which corresponds to 19.17% of radial and 19.58% of mix inefficiency. In the case of the unemployment rate, all technical inefficiency is radial, and slacks do not occur.

It is understandable that behind significant average required changes in input and output quantities stand major required improvements of Croatia's efficiency in particular years, as a result of an imbalance in its macroeconomic performance of the analyzed period. As can be seen from Table 4, all three inputs contribute to inefficiency, to a greater or lesser extent, in every single year, demonstrating the relevance of their selection for this research. GDP, as the only

⁶ Since the model always tends to require input reductions, particular attention should be given to FDI and exports. Namely, as explained earlier, for these two inputs reciprocal values are taken, so the required reduction of, for example, 20% actually means the required increase of 25%. Specifically, the reduction of the reciprocal value of $\frac{1}{X}$ to $0,8 \cdot \frac{1}{X}$ is equivalent to increasing the value of X to $\frac{1}{0,8 \cdot \frac{1}{X}} = 1,25 \cdot X$ to .

⁷ $19.17 = (1 - 0.8083) \cdot 100$, where 0.8083 is the efficiency achieved in the year 2009.

output variable, is not a source of inefficiency, which should be attributed to the selection of model orientation. With an average requested increase of 29.02%, exports are not the most prominent inefficiency source in either one of the observed years. On the other side, the unemployment rate, although relatively the least influential source of inefficiency with an average required a decrease of 23.17%, affects efficiency the most in 3 out of 12 inefficient years (2006, 2007 and 2014). Overall, the FDI has by far the greatest average impact on efficiency and its average increase demanded in order to attain efficiency is 125.92%. Such a result is largely caused by a sudden drop in FDI levels in 2015⁸. These findings support our second hypothesis that FDI is the most prominent inefficiency source among the selected indicators. Given the relative contribution of each indicator to inefficiency presented in Figure 3, FDI and unemployment rate apparently have the highest (71%) and lowest (13%) shares, respectively.

Figure 3. Input and output contribution to inefficiency

Source: Authors' work based on DEA-Solver-Pro calculations.

The efficiency scores of inefficient DMUs allow their direct ranking according to efficiency scores, while efficient DMUs cannot be ranked immediately because of the maximum efficiency score achieved. Since the reference set of an inefficient DMU is composed of efficient ones, one among many approaches proposed by researchers for ranking an efficient DMU is to sum the frequencies of its appearance in individual reference sets. As a consequence, the higher the

⁸ The biggest share amongst activities in FDI inflows in this year was caused by the acquisition of Tvrnica Duhana Rovinj by the British American Tobacco. However, this positive contribution was more than reversed by the effect of the write off of a part of the principal of CHF loans due to their conversion to euro.

frequency, the more robust the DMU is. In our case, Croatia's performance in the year that has been declared efficient occurs as a reference to performances in inefficient years. As can be seen from Table 4, both efficient years are referential to the great majority of inefficient years. The only exceptions are the years 2009, 2013 and 2015. The year 2008 serves thus as a reference in 10, and the year 2016 in 11 cases, resulting in fairly equal success.

5. CONCLUDING REMARKS

The relative macroeconomic efficiency of Croatia is empirically assessed based on the comparison of key macroeconomic indicators, using the input-oriented data envelopment analysis model with the assumption of constant returns to scale. The analysis covered 14-years period (2003-2016), thus enabling monitoring of Croatia's efficiency dynamics.

The empirical results suggest several important findings. Firstly, the efficiency scores averaged across all 14 years of data collection witness serious fluctuations in Croatia's macroeconomic efficiency, thus indicating the empirical foundation of accepting our first hypothesis. As a result, the year 2003 is ranked as the worst, while the years 2008 and 2016 are ranked as the best. Secondly, based on the magnitude of inefficiency in each year, the average inefficiency for the whole period under consideration is calculated, suggesting that there is a definite possibility of increasing efficiency levels. The average overall inefficiency could thus be reduced by nearly 20%. Thirdly, as a general conclusion, the main inefficiency source is FDI, which empirically confirms our second hypothesis. At the same time, the unemployment rate is most commonly the least significant source of inefficiency.

The conclusions of this study, based on the empirical cross-year comparison, should be of interest to analysts and should assist policymakers in recognizing the strengths and weaknesses of Croatian macroeconomic environment and its impact on further growth and development, and thus in shaping a targeted macroeconomic policy. They offer an insight into relative efficiency levels and trends and result in guidelines for creating new or re-examining existing macroeconomic conditions in the Republic of Croatia.

To make this insight more comprehensive, the study should be conducted using data at the quarterly level and should include more indicators that would

reflect some other important aspects of macroeconomic performance. Thus, for example, foreign debt and/or gross salaries could be incorporated as variables with which the robustness of the results obtained here could be additionally checked. The analysis based on the indicators employed herein may also be performed using output-orientation. It would be interesting to compare the results and conclusions thus obtained with those based on input-orientation, including different types of efficiency (technical, pure technical and scale). Similar research can also be carried out on a sample that would involve more countries, in which case a time-series cross-country analysis should be conducted. All these possibilities are left open for future research.

Abstract

Measurement of efficiency (production, cost or profit efficiency) has become a very popular field in applied economics in recent decades. The aim of this paper is to explain the measurement of technical efficiency from a theoretical point of view. Technical efficiency relates actual output to the maximum possible and is defined as the ratio of the actual output to the maximum potential output. The potential output for given inputs and technology is the maximum possible output that defines the frontier. We can say that the firm due to technical inefficiency produces under the defined frontier. In this paper, we give a theoretical approach on how to estimate the frontier function so that efficiency can be estimated. The frontier is often viewed as stochastic, so we use stochastic frontier analysis (SFA) to estimate efficiency. We relate these developments to Harvey Leibenstein's original 1966 insight into his x-efficiency.

Keywords: *technical efficiency, stochastic frontier analysis, the production function*

JEL Classification: D24, L23

1. INTRODUCTION

The study of the production, cost, and profit functions have a long history and practical applications based on these models are very broad. Studying all three functions would be too complex for a single paper, even a thorough study of just one of the previously mentioned functions and its influence on the business activities of a company would be too complex. Therefore, this paper is based on the study of the production function and its role in determining the technical efficiency of a company.

The production function shows the relationship between inputs (resources) and outputs (products and/or services), i.e. it describes the physical relationship between the input as an independent variable and the output as the dependent variable. It defines the maximum amount of outputs that a company can produce for every set quantity of inputs. In economic theory, the function is most commonly analyzed as production with one variable factor and production with two variable factors. Therefore, the production function is a purely technical relationship that connects the input investments with the output quantities. It describes the laws of proportion or the transformation of inputs into finished or semi-finished products (outputs) in each individual time period. The production function represents the technology in the company or in the entire economy, and it includes all technically efficient production methods.

In practice, it is almost impossible to produce the output quantity defined by the production function of a company. This paper presents a basic theoretical overview of the method for the calculation of technical efficiency by applying the appropriate econometric model, popularly called the *stochastic frontier analysis*. The terminology of this model says that we will be engaged in measuring the frontier resulting from the traditional econometric premise about the presence of a random statistical error. The frontier we will be measuring is consistent with neoclassical microeconomic theory, i.e. with the neoclassical production theory, and it represents the maximum potential quantity of outputs, as explained previously.

In order to understand the paper better, the basic premises of the production function must be analyzed from the theoretical aspect first, after which we will begin with the explanation of the econometric model for the purpose of measuring technical inefficiency. The theoretical prerequisites mentioned at the start of this paper are crucial for understanding the model that is analyzed

in the second part of the paper. This is important for the researchers, so they would know which calculation model is suitable for which situation, i.e. which model should be applied in which situation.

2. FUNDAMENTS OF THE PRODUCTION FUNCTION

2.1. PRODUCTION FUNCTION WITH ONE VARIABLE FACTOR

The production function discussed here is a short term function, because it explains the relationship between outputs and a single variable input, and treats all the other inputs as fixed. Under these conditions, the relationship between the inputs and outputs is variable. At lower levels of resource usability, the outputs are growing at an increasing rate (progressive function), while at higher levels of resource usability, the outputs are growing at a decreasing rate (degressive function), after which the production function begins to drop (see Figure 1). The reason why the total production begins to reduce even though we are adding new resources must be found in the Law of Diminishing Returns. Under those conditions, the marginal product is dropping and its direction is explained by the technological law (Law of Diminishing Returns), which states that with each additional increase of a resource a point will be reached after which any additional outputs will begin reducing (after the quantity of x_2 resources in Figure 1), under the condition that the quantity of other inputs remains unchanged.

Figure 1. Total, average and marginal product

The total product (TP) curve in Figure 1 shows the level of production with various quantities of input X. The average product (AP) and the marginal product can be calculated from the total product (TP) curve. The marginal product is equal to the slope of the tangent to the total product curve for the provided quantity of the input X:

$$\frac{\partial y}{\partial x} \geq 0 \quad (1)$$

Therefore, the direction of the marginal product tells us about the slope of the total product (TP) curve. When the marginal product (MP) is growing, the total product (TP) is growing at an increasing rate, and vice versa. After the marginal product (MP) becomes negative, the total product (TP) will begin to decrease, even though the company is using the additional quantity of the input X.

So, in the short term (one input is variable, the other inputs are fixed), every company will face the production function shown in Figure 1, which defines its maximum potential input that can be reached for the provided level of resources. A company that operates on the production function curve is considered technically efficient because it produces the maximum possible amount of output with a set amount of input (Pindyck & Rubinfeld, 2005). Therefore, if a company produces any amount of outputs below the TP curve it means that it is technically inefficient because the resource X has not been utilized at maximum efficiency. Under normal conditions, i.e. in practice, it is almost impossible for a company to operate at the level of technical efficiency due to the uncertainty on the market.

2.2. PRODUCTION FUNCTION WITH TWO VARIABLE FACTORS

The relationship between inputs and outputs is determined by the production function. If we simplify reality, we can assume that there are only two inputs: labor (L) and capital (K), and their interaction creates a certain amount of output (Q). Therefore, the output (Q) is a dependent variable, while the inputs are the independent variable. The production function defined this way can be written in the following manner:

$$Q = f(K, L) \quad (2)$$

This equation defines equal, or maximum levels of production that can be produced from the various combinations of the two variable inputs. Such a production function is defined by curves called isoquants. They show the maxi-

imum, i.e. technically efficient level of production for each combination of labor and capital (two different variable resources). Therefore, the isoquant is a curve that connects all the possible input combinations for which the level of production is equal, accordingly, they are also called equal quantity curves.

Figure 2. The Map of isoquants

Production isoquants connect the various combinations of inputs required to achieve a certain level of production, while the isoquant map describes the production function of a company. The production level grows as we move from the isoquant Q_1 toward the isoquant Q_4 (see Figure 2). We must consider that in order to have a higher level of production, we must employ a higher quantity of input if the quantity of the other input remains unchanged. This is visible from Figure 2 when going from point A to point B and then to point C, and further to point D. In this situation, the input K remains unchanged, but if we want to increase production we must employ a higher quantity of the input L. The reason for this condition is that the isoquant represents the maximum output that can be provided by these two variable resources. The isoquants show the flexibility of companies in making production decisions because the same amount of production can be achieved with different combinations of two variable resources available to the company. Considering this fact, more flexible

companies may choose input combinations that minimize production costs and maximize company profits.

Company flexibility, or the option to simply exchange one input for another input at the set level of production, can be measured with the marginal rate of technical substitution (MRTS). This marginal value shows a hypothetical situation, e.g. if the quantity of an input reduces (e.g. capital) what is the required amount for which the use of the other input (e.g. labor) must increase in order to maintain the same level of production. Considering the above description, the marginal rate of technical substitution can be calculated in the following manner:

$$MRST = - \Delta K / \Delta L \quad (3)$$

Considering that the isoquants are convex and that they have a negative slope, then the MRTS is dropping, which tells us that the productivity of input is limited. The production process requires a balanced combination of the two variable inputs. Now we must explain how the additional production generated by adding the labor input is equal to the increase of production per unit of the added labor input (MP_L) multiplied with the additional labor units. Vice versa is also true for the other input. Reduction in the production level caused by the reduction in the capital input is equal to the loss of production per unit of capital reduction (MP_K) multiplied with the number of subtracted capital units. Considering that we are moving along the same isoquant in this example (reduction of the production level caused by capital and the increase in the production level caused by labor) the level of production remains unchanged, or it equals zero. Consequently, we can write the following:

$$(MP_L)(\Delta L) + (MP_K)(\Delta K) = 0 \quad (4)$$

$$\frac{MP_L}{MP_K} = - \frac{\Delta K}{\Delta L} = MRST$$

The concept of x-efficiency indicates the ability of companies to allocate resources efficiently, i.e. to use the appropriate combination of resources that will result in the maximum output with the set level of production technology, while maintaining costs as low as possible. The company that wants to achieve these conditions (almost impossible in practice) should strive to even out the marginal rate of technical substitution (MRTS) and the ratio of the resource prices:

$$MRST = \frac{P_L}{P_K} \quad (5)$$

2.3. THE CURVE OF INCREASING OPPORTUNITY COSTS

The scarcity of resources that a company or an economy is facing can best be described using a curve of production possibilities. It represents the frontier between the possible and the impossible production, i.e. it defines the maximum combination of two goods that a company can produce with the resources at their disposal, with the achieved level of technology. The company that faces the production of two goods X and Y (like in Figure 3) its maximum production quantities are defined by the shown curve, i.e. by the points located on the curve (like points A, B, D). Accordingly, the company cannot produce the combinations of the two goods above the curve (e.g. point E) with the set technology, while the combinations of the two goods below the curve (e.g. point C) can be produced, but these resources are obviously not used to their maximum efficiency, which means that the company is technically inefficient.

Figure 3. Production possibilities curve

The production possibilities curve is decreasing (it has a negative slope) and it is concave relative to the origin point. Its form is defined by the variable efficiency of the resources as they move from the production of one good to the production of another good (Karić, 2006). Due to the different abilities of the

resources for the production of a certain combination of two goods, the relationship between the goods is variable (the slope changes as we move along the curve).

If we assume that the company is technically efficient, i.e. when it is operating on the curve of production possibilities, it must stop with the production of one of the goods (e.g. good X) if it wants to increase the production of the good Y. This is the result of resource scarcity and for this reason, the company must choose the quantity of each of the goods it wants to produce. Considering that the company is abandoning a certain quantity of one of the goods to produce the other good, it abandons the next best alternative available to it, we call that opportunity costs. As we move along the production possibilities curve, the company is abandoning an increasing quantity of one of the goods in order to produce an additional unit of the other good, i.e. the opportunity costs are increasing. For that reason, the production possibilities curve is also called the increasing opportunity costs curve.

2.4. THE COBB-DOUGLAS PRODUCTION FUNCTION

The Cobb-Douglas production¹ function is one of the most commonly used functions in empirical research. This production function is applied along two variable inputs, the labor input (L) and the capital input (K). This is also its main advantage because real production functions are primarily dependant on two inputs. Its general form is:

$$Q = AK^{\alpha}L^{\beta} \quad (6)$$

where Q – quantity of output, A, α , and β are the parameters that must be calculated, K is the quantity of the capital input, while L is the quantity of the labor input. In order for the function from equation 6 to be in linear form, its logarithm must be taken, which results in the following expression:

$$\ln Q = \ln A + \alpha \ln K + \beta \ln L \quad (7)$$

The coefficients α and β represent production elasticity in relation to capital and labor, and their sum measures yield to the range. Therefore, if $\alpha + \beta = 1$ the company is facing constant yields to the production range, if $\alpha + \beta < 1$ the

¹ Designed by Charles W. Cobb and Paul H. Douglas in their paper "A Theory of Production"

company has reducing yields to the range, while if $\alpha + \beta > 1$ the company is facing increasing yields to the range.

This production function can be widely applied in empirical research. It can be evaluated from the information for a specific time period, whether for one company, for several companies, or for an entire branch of production (panel information). It can also be evaluated from the information for one point in time for one company, for several companies, or for an entire branch of production (cross-sectional information).

3. MEASURING TECHNICAL EFFICIENCY

3.1. VARIOUS APPROACHES TO MEASURING

Production is technically inefficient if it is possible to produce larger quantities of outputs from the existing inputs (output-oriented measure) or if the observed level of outputs can be produced with a lower quantity of inputs (input-oriented measure).

Figure 4 shows technical inefficiency in point A, while the TP curve shows the production function, i.e. the maximum possible production for the set inputs. There are two ways to make sure that point A shows technical inefficiency. The first way is the output-oriented (OO) technical inefficiency. For the set quantity of the input x (defined by point A) a higher quantity of outputs can be produced. The length AB shows the loss of outputs due to technical inefficiency, it is the basis for measuring the OO technical inefficiency. If we use the first example, we can reach the conclusion that defines the second approach to measuring technical inefficiency in a similar way. If we look at point A again, we can conclude that an equal amount of inputs can be produced with a lower amount of outputs. Therefore, if we want to operate on the frontier that defines the total product curve, we can do that by employing a lower amount of inputs, without changing the amount of outputs in relation to point A. In this case, the length represents the quantity of inputs that can be reduced without reducing the quantity of outputs. Considering that this approach is related to reducing inputs, this approach to measuring technical inefficiency is called input-oriented (IO) technical inefficiency.

Figure 4. Technical Inefficiency: Input-output and Output-Output oriented measures

Calculating technical inefficiency is closely related to the production technology used in the production process. Input-output measurements may not be suitable for one technology, while they are suitable for other technology. For empirical analyses in which different companies are compared to each other, it is important to consider the appropriate production technology. For example, a farmer in the Republic of Croatia and a farmer in the Netherlands do not have the same production technology available. If we took their information and attempted to calculate a common production function which could then be used to measure technical efficiency, the results would be difficult or even impossible to compare. Therefore, when measuring technical efficiency, we can only consider the companies or individuals that use the same or similar production technology.

3.2. ESTIMATION METHODS FOR OUTPUT-ORIENTED TECHNICAL EFFICIENCY

Output-Oriented technical efficiency is the most common method of measuring the production possibility frontier, i.e. the frontier that defines technical efficiency. It can be measured by applying the stochastic production frontier model, which is in the following form for OO technical efficiency:

$$\ln y_i = \ln y_i^* - u_i \quad u_i \geq 0 \quad (8)$$

$$\ln y_i^* = f(x_i; \beta) + v_i \quad (9)$$

where i is the number of observations (e.g. a company), y_i is the observed quantity of outputs, y_i^* is the maximum amount of outputs, x_i is the input variable, β is the coefficient that defines the variable, x_i , v_i is the standard error, and u_i is the production inefficiency of the company. The equation 9 defines the stochastic production frontier function. The set x that defines the frontier, or the maximum possible outputs, is stochastic just because of the variable v_i . Accordingly, $u_i \geq 0$ for the observed output y_i is located below the production frontier y_i^* . Figure 5 shows that point z_i is located below the frontier defined by the production function y_i^* . Therefore, the difference between y_i^* and y_i is the value of the technical inefficiency of the company, or the amount for which the company could increase its output, but it has not, due to certain objective or subjective reasons.

The previous model is appropriate to write in the following form:

$$\ln y_i = f(x_i; \beta) + \epsilon_i \quad (10)$$

$$\epsilon_i = v_i - u_i \quad (11)$$

where ϵ_i is the stochastic variable that represents the non-systemic effects on the dependent variable.

Figure 5. Production Frontier Model

The variable u_i from equation 8 is the difference between the maximum and the actual output ($u_i = \ln y_i^* - \ln y_i$), therefore, $u_i \times 100\%$ is the percentage value of the amount for which actual output can be increased, while maintaining the

set input, in order for the company to reach the maximum level of production defined by the production function. The previous statement can also be explained in the following manner: The expression represents the percentage of output that the company has not achieved due to technical inefficiency. The calculated value for u_i represents output-oriented technical efficiency. Its value equals zero if the company is completely technically efficient.

According to equation 8, the expression:

$$\exp(-u_i) = \frac{y_i}{y_i^*} \quad (12)$$

represents the ratio between the actual output and the maximum possible output defined by the production function of the company. The ratio is equated to the technical efficiency of company i , i.e. it is called the company technical efficiency ratio. Its value is in the range of 0 to 1, where 1 is a company that is fully technically efficient. The value $\exp(-u_i) \times 100\%$ is the percentage of the maximum possible output produced by the company i (e.g. if $\exp(-u_i) \times 100\% = 75\%$; then the company is producing only 75% of the maximum possible output).

The previous paragraph indicates that u_i represents the measure of technical inefficiency, while $\exp(-u_i)$ is the measure of the technical efficiency of a company.

3.3. ESTIMATION METHODS FOR INPUT-ORIENTED TECHNICAL EFFICIENCY

Measuring technical efficiency by applying Input-Oriented (IO) technical efficiency is similar to measuring the Output-Oriented (OO) technical efficiency. In the application of the OO measurements, we were interested in the vertical difference (see Figure 5) between the maximum output and the actual output (see title 3.1 and Figure 4). So, now we are interested in whether the company is using excessive inputs, i.e. is it possible for them to produce an equal amount of outputs with the same amount of inputs. The measuring approach is very similar and it is based on OO measuring, so it is not necessary to repeat the explanation about the basis of the model, we will instead explain the difference and the similarities between these two approaches in short.

The OO approach is defined in the following manner:

$$y = f(x)e^{-u} \quad (13)$$

The IO approach is defined:

$$y = f(xe^{-\eta}) \quad (14)$$

Furthermore, the Cobb-Douglas formulation of the IO model can be defined in the following manner:

$$\ln y = \beta_0 + \sum \beta_j \ln x_j - \left(\sum \beta_j \right) \eta \quad (15)$$

which is actually the same as the OO approach to measuring technical efficiency if we consider the expression:

$$u = \eta \sum \beta_j \quad (16)$$

In order to calculate technical efficiency using the IO approach, it is not necessary to calculate η . The approach can be based on calculating the OO model, in which we determine the values of u and β , then it is very simple to calculate η from equation 16.

4. CONCLUSION

In order for a company to operate according to its production function that defines its maximum “potential” outputs, it must utilize all of its resources with maximum efficiency. It is almost impossible for a company to produce the number of outputs defined by the production curve (frontier) due to a series of objective (e.g. employee sick leave) and subjective (e.g. interpersonal relationships) difficulties that arise in the course of company operation. That is why the evaluation of technical inefficiency stands out as an excellent tool for the management of a company in recognizing the general condition of production, which directly affects the expenses and revenue of the company.

Measuring technical efficiency is based on two approaches. The first approach, and maybe the most represented one, is the Output-Oriented technical efficiency. It measures the vertical deviation of actual outputs from the frontier defined by the production function. It represents the loss of outputs that could be produced with a set amount of inputs. The other approach to measuring is the Input-Oriented technical efficiency, which on the other hand measures the horizontal deviation of actual outputs from the maximum outputs defined by the production function. It represents the excess resources used for the set

produced a quantity of outputs. A researcher may decide on one of the two approaches, depending on their intended goals. However, it bears pointing out, as we already emphasized in this paper, that the best course of action is to first measure using the OO method, and then use that to measure technical efficiency with the IO method.

Stochastic frontier analysis (SFA) can be applied to any problem in which the observed output is different than the potential output, regardless of whether it is higher or lower than the potential output. In that context, the potential maximum outputs for the set technology and the quantity of inputs is the maximum quantity of outputs that define the frontier, and the actual outputs below that frontier are considered as technical inefficiency. Following this example, we could talk about cost efficiency or profit efficiency in the same context.

NEW EXTERNAL TRADE EXCHANGE RATE OF THE REPUBLIC OF SERBIA IN SUSTAINABLE DEVELOPMENT FUNCTION

Sofija ADŽIĆ, Ph. D.

University of Novi Sad, Faculty of Economics in Subotica

E-mail: sofija.adzic@gmail.com

Abstract

Conducted including investigation confirmed that the main condition for the successful future of sustainable development, above all, internationalization of business cooperation between the countries in the constant creative integration of the region. The need for the innovative working environment and a new model of business management within Serbia requires creative and functional business cooperation to be carried out between the region. New reform processes should enable the country to constantly lie about a more structural development phase and thereby avoid the pitfalls of the development processes that are practiced by foreign investors building investment drives instead of the complete plant within the geopolitical restructuring. With the economic policy-makers and actors' transitional legs, macro management is required functional changes in economic and institutional re of infrastructure that will be a real cornerstone of the transformation of the existing consumer society in the high cumulative economy. After successful structural reforms, Serbia has huge comparative advantages for successful sustainable development. Given the number of potential natural resources, tradition different production structure and proximity to key segments of the relevant markets, it is realistic to expect when output and exports. Therefore, the new flows of foreign trade in the function of sustainable development must be established by an intensive increase in exports with a significant reduction in imports.

Keywords: *Functional business cooperation, Export of higher processing phases, The function of higher production of new values, Sustainable development.*

JEL Classification: F31, Q01

1. INTRODUCTION

Considering the natural potential of numerous resources, the diverse production structure and the proximity of the key segments of the European and global market, it is realistic to expect a further increase of production, revenue, and exports. By observing gross added value, the number of employees and exports the agro-industrial sector is a key segment of the Serbian economy. Serbia has very favorable natural conditions (land and climate) for a diverse agricultural production (both plants and cattle), experienced producers, top experts and scientists and worldwide recognizes selections of plant products.

Successful development of the business cooperation requires the definition of realistic operational ideas which are of interest to the overall socio-economic development. One of the approaches to this matter could be within the processing industry, which must include the implementation of future opportunities in the business sphere and with recognition of the capacity of potential resources of the regions. It is, therefore, necessary for the development of the regions that all available resources are put into operation of sustainable innovative development of the agro-processing sector. Cooperation must be based on the available production and human capital in the interaction with the social capital. Available creative capital is there of great importance because it defines the level of skills to overcome new challenges and provide entrepreneurial culture and the ability to resolve existing problems in an innovative way. Given this conception, policymakers should define development priorities for each region, which should ensure successful and creative cooperation. Development must become visible, with export potentials with the creation of numerous new business alliances and networks.

2. CREATIVE BUSINESS COOPERATION WITHIN THE FOREIGN TRADE

Creating conditions for sustainable spatial and economic development within new economic reforms make advocates of the neo-liberal concept plan national development on the proclaimed development strategy based on direct foreign investment, changing business conditions to the strategic orientation of large capital. Based upon the data from the republican statistical office, with given the state of the economy and foreign trade, the main task of the reform

strategy should be: 1) solving the issue of higher labor and capital employment in accordance with the defined development that is in line with the available resources and capacities, 2) modernization and the construction of production and business infrastructure and creation of an educational basis for the needs of the industrial development process 4.o. The state, with its measures and instruments, should resist the sole satisfaction of the interests of foreign capital and focus on the development of productive activities and by doing so, it contributes to the development of the economy and society as well, with the adequate coordination of public and private activities. In order to intensify future foreign trade, the production concept must be based on systemic integration of the paradigm: learning and cooperation, which is defined as mass and informal communication between individuals, economic and non-economic entities within a general and open market competition.

During the implementation of structural reforms in 2018, the total foreign trade of Serbia amounted (Republic Statistical Office, 2019):

- ✦ 22.476,8 million USD – which is 23.0% increase compared to the same period of the previous year;
- ✦ 18.560,0 million EUR – which is 9.9% increase compared to the same period of the previous year.

The total value of exported goods was 9,725.1 mill. USD, which is an increase of 20.4% compared to the same period of the previous year, while goods worth 12,751.7 million USD were imported, which is 25.0% more than in the same period of the previous year. The export of goods, expressed in Euros, amounted to 8,033.0 million, an increase of 7.6% compared to the same period of the previous year. Imports of goods amounted to 10,527.0 million, an increase of 11.7% compared to the same period last year. Deficit is 3.026,5 USD million, which is an increase of 42.7% compared to the same period of the previous year. Expressed in Euros, the deficit is 2,494.0 million, an increase of 27.2% compared to the same period of the previous year. Import coverage by export is 76.3% and it is lower than coverage in the same period of the previous year when it was 79.2%.

Observing the regions, the largest share of Serbian export was from the Vojvodina region (33.7%); followed by the Belgrade (26.6%), then Šumadija and Western Serbia (23.8%), the South and East Serbia (15.8%), and about 0.1% of the export was territorially unclassified.

The largest part of the Serbian import had the Belgrade region (46.0%); followed by Vojvodina (28.5%), Šumadija and Western Serbia (15.8%), South and East Serbia (9.2%), and about 0.5% of imports were unclassified. There is no data available for the Region of Kosovo and Metohija.

Regional share of export and import is determined by the location of the owner of the goods at the moment of the customs declaration acceptance. This means that the owners of goods, defined by the customs law, may be producers, users, exporters or importers of goods. This fact should be noted when interpreting data by regions. For example, imports of oil and gas are mainly in the Region of Vojvodina and the Belgrade region, but these regions are providing energy for the entire territory of Serbia. 58.0% (\$ 5,635.8 million) are the most represented products in the structure of exports by product purpose (prevalence principle), followed by consumer goods, 31.3% (3,046.4) and equipment, 10, 7% (1,042.4). Non-classified goods by purpose are 0.0% (USD 0.5 million). In the structure of imports, according to the purpose of the product, the most represented products are reproduction goods, 57.3% (\$ 7,303.6 million), followed by consumer goods, 18.7% (2382.7) and equipment, 12.6% (1612.2). Non-classified goods by purpose are 11.4% (USD 1,453.2 million). Foreign trade was the largest with the countries that Serbia has signed free trade agreements. The Member States of the European Union had 64.7% of the total exchange.

Table 1. Main foreign trade partners

Export	million USD	million EUR	Import	million USD	million EUR
Italy	1344.1	1109.4	Germany	1736.1	1434.4
Germany	1187.3	980.5	Italy	1259.4	1039.7
Bosnia and Hercegovina	762.3	629.6	China	1026.0	846.3
Russian Federation	546.6	451.3	Russian Federation	983.9	810.8
Romania	512.0	424.2	Hungary	654.3	539.9

Source: <http://webrzs.stat.gov.rs> i <http://www.pks.rs/>

Other important partners are CEFTA countries, where we have a surplus of 1,122.8 million of dollars, resulting mostly from the exports of agricultural products (cereals and their products, various types of beverages), iron and steel, road vehicles, oil and petroleum products. Export of Serbia was 1,635.7 and

import was 512.9 million of dollars for the observed period. Import coverage by exports is 318.9%. Expressed in Euros, exports amounted to 1351.5 and imports 424.0 mils. Euro (the surplus is EUR 927.5 million, while the coverage of import by exports is 318.8%).

By observing each country individually, the largest trade surplus derives from the countries within the environment: Bosnia and Herzegovina (products mostly exported are gas oils and maize where coke and semi-coke coal, iron, and steel wires are imported), Montenegro (medicine, ore, and concentrates are exported products, while mostly imported are aluminum, raw and electric energy) and Macedonia (export of hot-rolled bands in coils and electricity, and medicines for retail and rolled plastic products are imported). Among other countries, there is a surplus with Romania, Bulgaria, Italy, Slovakia, Croatia, Sweden, Great Britain, and Slovenia. The biggest deficit occurs in a trade with China (due to imports of cell phones and laptops) and Germany. There are also deficits with: the Russian Federation (due to imports of energy, primarily oil and gas), Turkey, Hungary, Poland (import of parts for motor vehicles), Iraq, Belgium, Ukraine (imports of iron ore and concentrates), Korea, France, USA, etc.

Table 2. The most important foreign trade

Export	million USD	million USD	Import	million USD	million USD
Electrical machines and appliances	1033.5	853.6	Road vehicles	967.2	798.2
Road vehicles	795.0	656.5	Oil and petroleum products	815.4	674.7
Iron and steel	579.4	478.4	Electrical machines and appliances	766.7	632.9
Painted metals	457.2	377.5	Industrial machines for general use	510.2	421.1
Rubber products	457.0	376.8	Medical and pharmaceutical products	432.9	357.5

Source: <http://webrzs.stat.gov.rs> and <http://www.pks.rs/>

Goods worth \$ 1,739.9 million were exported, an increase of 14.0% compared to the previous year. Imports amounted to \$ 2,196.5 million, an increase of 16.6% over the previous year. Expressed in euros, goods worth EUR 1,491.2 million were exported, an increase of 9.3% from the previous year. Imports amounted to EUR 1,881.2 million, an increase of 11.7% from the previous year. Calculated in dollars, the seasonally adjusted index for 2018 / May 2018 shows a drop in export by 0.4% and an increase in imports by 4.9%. Calculated in eu-

ros, the seasonally adjusted index in 2018 shows an increase in exports by 1.0% and an increase in imports by 4.5%.

According to the Nomenclature of Foreign Trade Statistics: at the list of the top 5 most exported products, the first place is taken by conductors sets for airplanes, vehicles and ships (\$ 100 million), second place belongs to the hot-rolled products (iron and non-alloy steel) in coils (51 million dollars), in third place are cars, spark ignition, over 1000, but below 1500 cm³ with 44 million dollars, followed by the export of new tires for cars was \$ 40 million and at the last place is refined copper with value of 31 million dollars. The list of the top 5 imported products shows that crude oil (\$ 122 million) is our top imported product. At the second place are parts and accessories for motor vehicles (\$ 72 million). In the third place are medicines for retail (\$ 56 million), followed by natural gas import (37 million dollars). The last place is the import of other electric conductors, for a voltage <1000V valued 28 million dollars.

The total foreign trade of Serbia for the previous year was:

- USD 18,465.1 million - an increase of 9.6% compared to the same period of the previous year;
- EUR 17,067.9 million - an increase of 13.2% compared to the same period of the previous year.

Creating conditions for a sustainable and balanced economic development during constant economic reforms is not an easy task and there is no unique recipe with safe instruments and enforcement mechanisms determined by the professional ethics of the creators and executors themselves.

The new production-organizational structure with established relevant sectors becomes an innovative-creative environment for new investments within the needs of geo-economic determinations of consumer societies. They require changes in business, technical, technological and human resources within economically sustainable development, where work is motivated by the need for a new concept of national economic policy in order to respond to internal and external challenges, such as:

1. The need to change the structure and design of the entire production program in the context of innovative changes;
2. The necessity of increasing the functionality and competitiveness of the entire economy and society;

3. Ensuring stable income and business environment for all entrepreneurs, businessmen, and civil population;
4. Realization of social, economic and ecological goals of sustainable development;
5. Ability to respond to all challenges within geo-economics and geopolitical flows.

3. COMMODITY EXCHANGE IN THE REGION

The commodity exchange in the regional economy (the municipalities of Ada, Bačka Topola, Mali Idoš, Kanjiža, Senta and Subotica) was realized through integral economic space which has enormous development potential for entire Serbia. Nowadays, Serbia has enormous development potential of an innovative digital process.

During 2018, the region achieved the total foreign trade of USD 878.0 million, which is an increase of 24.6% compared to the same period of the previous year and represents 3.9% of the Serbian trade. In the observed period of the current year, the region realized exports worth \$ 438.6 million, which is an increase of 23.2% compared to the same period of the previous year and has a share of 4.5% in the total export of the Republic of Serbia.

Imports of the Region in the observed period amounted 439.4 million dollars, which is an increase of 26.1% compared to the same period of the previous year and has a share in the total import of the Republic of Serbia of 3.4%. The trade deficit amounted USD 0.8 million, while the coverage of imports by region's exports in the observed period of the current year was 99.8%. The data for the Region for the observed period is better than the coverage of imports by the exports of the Republic of Serbia, which was 75.9%, which points to the exceptional development of the economy with great innovative intentions.

3.1. COMMODITY EXCHANGE BETWEEN REGION AND COUNTRIES

The total export of the Region is steadily increasing. It was USD 438.6 million for 2018 and included 81 countries. These are top 5 countries (in million USD) table 3.

Table 3. Top 5 countries

Country	Million USD
Germany	87,1
Hungary	77,5
Austria	44,3
Italy	30,1
Bosnia and Herzegovina	28,7

Source: <http://webrzs.stat.gov.rs> i <http://www.pks.rs/>

These five countries with exports of \$ 267.7 million make up 61.0% of the total exports of the Region, while in the countries of the European Union Regional exports was USD 346.2 million, or 78.9% of total exports, indicating the development of business cooperation with the intensification of higher processing phases showing a significant increase in the newly created value.

The total import of the Region in the observed period of the current year was 439.4 million dollars and it was realized through purchase with 87 countries. The order of the top five countries is (in million USD). (Table 4)

Table 4. Top 5 countries – import

Country	Million USD
Germany	106,6
Hungary	54,8
Austria	46,4
China	38,3
Italy	35,4

Source: <http://webrzs.stat.gov.rs> i <http://www.pks.rs/>

Altogether, these five countries with imports value of 281.5 million dollars were 64.1% of the total imports of the Region, while from the countries of the European Union Region had imports worth of \$ 348.9 million, or 79.4% of total imports. However, it should be noted that the total commodity exchange of the Region amounted to \$ 878.0 million and it was realized with 103 countries.

Table 5. Top five countries in million USD

Country	Million USD
Germany	193,7
Hungary	132,3
Austria	90,7
Italy	65,5
France	40,4

Source: <http://webrzs.stat.gov.rs> i <http://www.pks.rs/>

The table shows the positive effects of these five countries with the value of the trade exchange of 522.6 million dollars, which was 59.5% of the total commodity exchange of the Region, while the countries of the European Union had total commodity exchange with the Region in the amount of 695.1 million USD, which makes 79.2% of the commodity exchange of the Region.

It should be noted that commodity exchange with the EU, CEFTA and major markets such as Germany and the Russian Federation is also interesting. Below is a tabular presentation of the commodity exchange between the Region and the EU, CEFTA and two strategically important markets. (Table 6)

Table 6. Exchange with EU and CEFTA

	EXPORT	%	IMPORT	%	TOTAL	%	D/S	E/I (%)
EU	346,2	78,9	348,9	79,4	695,1	79,2	-2,7	99,2
CEFTA	51,0	11,6	4,3	1,0	55,3	6,3	46,7	1.186,0
Germany	87,1	19,9	106,6	24,3	193,7	22,1	-19,5	81,7
Russian F.	16,1	3,7	10,9	2,5	27,0	3,1	5,2	147,7

Source: <http://webrzs.stat.gov.rs> i <http://www.pks.rs/>

From the data presented in the table, we can see that the region achieved most of the exchange total of 79.2% with the EU member states, where export is covered by import with 99.2%. Commodity exchange with the EU is for 26.6% higher than last year. The exchange of the Region with the largest markets is shown in the following chart:

Figure 1. The exchange between companies from the region and big markets (given in %)

Source: <http://webrzs.stat.gov.rs> i <http://www.pks.rs/>

There is a tendency for the region to export much more to the CEFTA countries than it imported from them, which is why the import export coverage was 1,186.0%. Compared to the same period of last year trade with CEFTA countries has increased by 4.1%. A negative balance of trade with Germany was recorded, as the coverage of import by export was 81.7%. Compared to the January-June 2017 period, foreign trade grew by 32.4%. Regarding the exchange with the Russian Federation, the coverage of import by export was 147.7%, and the exchange decrease was 2.4%, compared to January-June of 2017. The largest export of the Region was into Germany, valued USD 87.1 million, or 19.9% of total exports, however, it should be noted that the region was also mostly imported from Germany - the value of imports was 106.6 million dollars, representing 24.3% of total imports.

The trend of the largest foreign trade with Germany continued, followed by an exchange with Hungary, Austria, and Italy. The volume of goods exchange from these four countries is \$ 481.8 million and represents 54.9% of the total commodity Region`s exchange. Below is presented an overview of foreign trade with the countries of the Customs Union (Russian Federation, Belarus, and Kazakhstan). (Table 7)

Table 7. Exchange with Russian Federation, Belarus and Kazakhstan

	EXPORT	%	IMPORT	%	TOTAL	%	D/S	E/I (%)
Russian Federeation	16,1	3,7	10,9	2,5	27,0	3,1	5,2	147,7
Belarus	1,0	0,2	0,4	0,1	1,4	0,2	0,6	250,0
Kazakhstan	0,6	0,1	0,9	0,2	1,5	0,2	-0,3	66,7
TOTAL	17,7	4,0	12,2	2,8	29,9	3,4	5,5	145,1

Source: <http://webrzs.stat.gov.rs> i <http://www.pks.rs/>

The exchange with the Russian Federation shows that the coverage of imports by exports is 147.7% and the trade deficit decreased by 2.4% compared to 2017, indicating that the trend of positive foreign trade has continued. Thus, the trade with Belarus was 1.4 million USD, with the coverage of imports by the export of 250.0%, while the deficit with Kazakhstan amounted to about 0.3 million dollars.

Exports to the countries of the Customs Union amounted to \$ 17.7 million, which represents 4.0% of the total export of the Region. Imports from these countries amounted to \$ 12.2 million, and within the total imports of the Region has a share of 2.4%. The total foreign trade amounted to USD 29.9 million or 3.4% of the total exchange of the Region. Import coverage by export is 145.1%.

The following table shows the commodity exchange with the countries of the NAFTA agreement. The region achieved a positive balance of foreign trade with those countries. (Table 8)

Table 8. Exchange with NAFTA countries

	EXPORT	%	IMPORT	%	TOTAL	%	D/S	E/I (%)
USA	5,3	1,2	7,2	1,6	12,5	1,4	-1,9	73,6
Canda	0,0	0,0	0,1	0,0	0,1	0,0	-0,1	0,0
Mexico	2,7	0,6	1,8	0,4	4,5	0,5	0,9	150,0
TOTAL	8,0	1,8	9,1	2,1	17,1	1,9	-1,1	87,9

Source: <http://webrzs.stat.gov.rs> i <http://www.pks.rs/>

Exports to the USA has a share of 1.2% of the total region's exports, while imports are 1.6% of the total imports of the Region. Foreign trade, in the ob-

served period, with the USA, amounts to 12.5 million dollars and represents 1.4% of the total exchange of our region.

As far as cooperation with EFTA countries is concerned, it is getting intensified and as such is presented in the following table 9.

Table 9. Exchange with EFTA

	EXPORT	%	IMPORT	%	TOTAL	%	D/S	E/I (%)
Switzerland	1,8	0,4	3,9	0,9	5,7	0,6	-2,1	46,2
Norway	0,0	0,0	0,0	0,0	0,0	0,0	0,0	0
Liechtenstein	0,0	0,0	0,0	0,0	0,0	0,0	0,0	0
Island	0,0	0,0	0,0	0,0	0,0	0,0	0,0	0
TOTAL	1,8	0,4	3,9	0,9	5,7	0,6	-2,1	46,2

Source: <http://webrzs.stat.gov.rs> i <http://www.pks.rs/>

It is evident that in the commodity exchange with the countries of the EFTA agreement, our region has higher imports than exports. Import coverage by export is around 46.2%.

Table 10. Exchange with MEDA countries

	EXPORT	%	IMPORT	%	TOTAL	%	D/S	E/I (%)
Israel	0,8	0,2	10,8	2,5	11,6	1,3	-10,0	7,4
Turkey	2,1	0,5	1,1	0,3	3,2	0,4	1,0	190,9
Jordan	0,0	0,0	0,0	0,0	0,0	0,0	0,0	0,0
Morocco	0,1	0,0	0,1	0,0	0,2	0,0	0,0	100,0
Egypt	0,0	0,0	0,0	0,0	0,0	0,0	0,0	0
Lebanon	0,2	0,0	0,0	0,0	0,2	0,0	0,2	0,0
Tunisia	0,0	0,0	0,0	0,0	0,0	0,0	0,0	0,0
TOTAL	3,2	0,7	12,0	2,7	15,2	1,7	-8,8	26,7

Source: <http://webrzs.stat.gov.rs> i <http://www.pks.rs/>

Regarding the cooperation of the Region with other countries, it is necessary to mention the cooperation with the members of the Association of Mediterranean Countries - MEDA (table 10). Export to these countries was \$ 3.2 million

(0.7% of the total region's export), while import from these countries valued \$ 12.0 million providing intensive innovative business cooperation.

The most important products on the commodity market are the first five export products (in million USD). (Table 11)

Table 11. Top five export commodity products

Products	Million USD
Ignition wire sets, other vehicle sets	53,3
Parts and accessories for motor vehicles (8701-8705), other	36,6
Pipes and hoses, rigid, of other plastics	31,9
Other glass products, other	13,3
Parts for machines (8501 and 8502), other	13,1

Source: <http://webzrs.stat.gov.rs> i <http://www.pks.rs/>

The value of exports of these five groups of products amounts to USD 148.2 million and has a share of 33.8% in the total export of the Region.

According to the customs tariff group, table 12 shows top five import products (in millions of USD).

Table 12. Top five import products

Products	Million USD
Unclassified goods by CT-goods in the free zone	63,6
Unclassified goods by CT-goods in storage	32,3
Cars, diesel, from 1500-2500cm ³ , used	25,6
Plastic isolation parts	11,4
Ignition wire sets, other vehicle sets	8,9

Source: <http://webzrs.stat.gov.rs> i <http://www.pks.rs/>

Imports of these five groups of products amounted to \$ 141.8 million with a share of 32.3% in total imports of the region. Table 13 shows the amounts of different municipalities in 2018. (Table 13)

Table 13. Export import amount by municipalities in 2018

Municipality/city	Export	Import	Total	Surplus/Deficit	Export/Import
Ada	25,4	17,4	42,8	8,0	146,0
B. Topola	34,2	28,6	62,8	5,6	119,6
Kanjiža	21,4	26,0	47,4	-4,6	82,3
Mali Idoš	2,7	3,7	6,4	-1,0	73,0
Senta	78,7	64,5	143,2	14,2	122,0
Subotica	276,2	299,2	575,4	-23,0	92,3
Region	438,6	439,4	878,0	-0,8	99,8

Source: <http://webrzs.stat.gov.rs> i <http://www.pks.rs/>

The total commodity exchange for each municipality in the region is shown in Figure 2.

Figure 2. Commodity exchange for municipalities

Source: <http://webrzs.stat.gov.rs> i <http://www.pks.rs/>

The table shows that imports are covered by exports to 99.8%. In the region, foreign trade deficit amounted to \$ 0.8 million. It should be noted that the stock exchange is constantly changing its structure in favor of products of higher processing phases with much more embedded new value. A higher level of newly created value enables higher profits, and therefore a higher gross domestic product and a higher standard of living, which is the goal of any macroeconomic policy in the context of ever-increasing employment.

4. CONCLUSION

However, the reality is completely different. The economic sector faces several structural problems, a lack of qualified labor, corruption and several internal and external disadvantages caused by geopolitical factors.

There are problems that are becoming more and more complex for public regulation and macroeconomic policy. Sustainable development strategies always have operational and functional meanings, but today they often create retrograde effects, especially in less developed countries such as Serbia. This leads to the creation of an irregular market in all segments with a large number of imports of cheap goods with an inadequate production structure. The fact that increased production activity with positive effects of foreign trade creates various opportunities for business cooperation when geo-economics interests become more visible, economic goals become more and more functional. Future sustainable development in the region requires the export of products with a higher percentage of newly created value and greater functionality, which must be achieved by future reforms. The development content of reforms must be based on the creation of funds in the coming period for financing development from own accumulation, not through lending and taking loans from banks, the IMF and the World Bank. Own accumulation should be ensured by a steady increase in production and exports with a higher share of newly created value with a continuous reduction in the foreign trade deficit.

An increase in exports always requires the harmonization of the production structure with international standards and standards that must ensure coordinated and sustainable development in the future based on the systemic integration of paradigm and co-operation, defined as mass and informal communication between individuals and economic and non-commercial entities that support a wider division of labor into within a general market game. The effects of reforms are visible in the intensification of competitive business and technical cooperation in the constitution of geo-economics flows on the new geopolitical scene within modern and innovative business trends.

AN ASSESSMENT OF RESERVE ADEQUACY IN THE REPUBLIC OF CROATIA

Dražen KOŠKI, Ph. D.

J.J. Strossmayer University of Osijek,
Faculty of Economics in Osijek

E-mail: dkoski@efos.hr

Abstract

In 2017, international reserves of the Republic of Croatia amounted to approximately 19 billion US dollars, which was about 32% of Croatia's gross domestic product. The two main reasons for holding international reserves are maintaining foreign currency liquidity and an exchange rate level or volatility management. Maintaining foreign currency liquidity means to achieve availability and liquidity of international reserves for the potential balance of payments needs. In the case of financial crises, a country with adequate reserve holdings will suffer smaller gross domestic product decline. Likewise, the Republic of Croatia uses international reserves to maintain a managed floating exchange rate regime, that is, for intervening in the foreign exchange market in order to reduce exchange rate fluctuations.

The goal of this paper is to assess international reserve adequacy of the Republic of Croatia in the period from 2013 to 2017. In the paper, for an assessment of reserve adequacy, both traditional and combination metrics are used. With respect to combination metrics, among several approaches, the following two are applied: the one proposed by the International Monetary Fund [IMF] (2011a, 2011b, 2013a, 2013b, 2015) and the other suggested by Mwase (2012).

The research results indicate that the level of international reserves of the Republic of Croatia is adequate only in 2017 according to the metric proposed by the IMF (2011a, 2011b, 2013a, 2013b, 2015). However, according to the metric suggested by Mwase (2012), the level of international reserves is inadequate over the whole observed period.

Keywords: reserves, reserve adequacy, traditional metric, combination metric, foreign currency liquidity;

JEL Classification: F31, O24

1. INTRODUCTION

A series of financial crises at the end of the 90s and the global financial crisis 2007-2008 highlighted the importance of international reserves. In the event of a crisis, the countries with higher reserve holdings were less vulnerable to capital outflows and more able to protect the stability of the financial system (Wijnholds and Kapteyn, 2001; IMF 2013a). In other words, the countries that had a higher level of reserves suffered smaller gross domestic product decline in relation to the countries that had a lower level of reserves. The majority of countries hold reserves for two main reasons. The first reason is maintaining foreign currency liquidity. Contrary to the concept of international liquidity that is related only to nonresidents, the concept of foreign currency liquidity is related to both residents and nonresidents. The second reason is maintaining a certain level of exchange rate or managing exchange rate fluctuations.

Certainly, the question could be raised on what indicators can show how high the international reserves should be. The three main indicators or traditional metrics are the ratios of international reserves to imports of goods and services, the ratio of international reserves to short term external debt and the international reserves to broad money. However, traditional metrics have advantages and disadvantages. In fact, these metrics “certainly have relevance and the attraction of simplicity, but are by their nature arbitrary, focus only on a particular aspect of vulnerability and give disparate results” (IMF, 2011, p. 4). In order to avoid the disadvantages of traditional metrics, in the last 15 years, combination metrics have been developed. Combination or composite metrics are the indicators calculated mainly as a weighted average of selected traditional metrics, sometimes in conjunction with other macroeconomic variables such as exports or the country risk index. The various types of combination metrics are proposed, for example, in Wijnholds and Kapteyn (2001), Mwase (2012), the IMF (2011a, 2011b, 2013a, 2013b, 2015) and Makarenko and Gordieieva (2015).

The goal of this paper is to assess international reserve adequacy of the Republic of Croatia in the period from 2013 to 2017. An assessment is done using

both the aforementioned traditional and two combination metrics. The first combination metric is based on the methodology proposed by the IMF (2011a, 2011b; 2013a, 2013b, 2015), and the second one is suggested by Mwase (2012).

The structure of the paper is as follows. After the introduction, in the second section, there is a definition of the concept of international reserves. The reasons for holding international reserves are explained in the third section. The selected traditional and combination metrics are described in the fourth section. In the fifth section, an assessment of reserve adequacy in the Republic of Croatia is conducted. Finally, the sixth section concludes the paper.

2. THE CONCEPT OF INTERNATIONAL RESERVES

The concept of international reserves of a country that is a member of the International Monetary Fund is defined in the Balance of Payments and International Investment Position Manual (IMF, 2009). According to the Manual, international reserves are:

Those external assets that are readily available to and controlled by monetary authorities for meeting balance of payments financing needs, for intervention in exchange markets to affect the currency exchange rate, and for other related purposes (such as maintaining confidence in the currency and the economy, and serving as a basis for foreign borrowing) (IMF, 2009, p.111).

The terms “readily available to” and “controlled by” are crucial to the concept of international reserves. Assets that do not fulfill these criteria cannot be considered international reserves (IMF, 2013, p. 3). Furthermore, from the definition, it is apparent that international reserves represent a gross concept in the sense that they exclude external liabilities of the monetary authorities (IMF, 2013, p. 3). It is important to point out that international reserves must be foreign currency assets, assets that actually exist (potential assets are excluded) and claims of the monetary authorities (other than gold bullion) on nonresidents¹ (IMF, 2009, p.111).

¹ In the Balance of Payments and International Investment Position Manual, the concept of residency is based on the center of economic interest and not on nationality or legal criteria. (IMF, 2009, p. 50-80, IMF, 2013, p. 3).

Likewise, in the Manual, it is determined what types of assets can be counted in international reserves (IMF, 2009, p. 112). These are as follows: 1) monetary gold; 2) reserve position in the International Monetary Fund; 3) Special Drawing Rights holdings; 4) currency and deposits; 5) securities; 6) financial derivatives; 7) other claims (e.g. loans to non-resident non-deposit-taking corporations).

3. THE REASONS FOR HOLDING INTERNATIONAL RESERVES

The monetary authorities hold international reserves for various reasons. The main reasons could include:

1. foreign currency liquidity
2. mitigating exchange rate volatility
3. exchange rate level management
4. currency boards
5. savings for future generations
6. savings against macroeconomic shocks.

Still, the most often reasons are foreign currency liquidity and exchange rate level or volatility management (IMF, 2011, p. 9). According to the International Monetary Fund, (IMF, 2013, p. 5), foreign currency liquidity encompasses foreign currency resources and foreign currency drains. Foreign currency resources include reserve assets in other foreign currency assets, and foreign currency drains include predetermined net drains and contingent net drains. Predetermined net drains are known or scheduled inflows and outflows while contingent net drains are potential inflows and outflows. Furthermore, as opposed to the concept of international reserves, the concept of foreign currency liquidity is related not only to (IMF, 2013, p. 4)

1. the monetary authorities but also to the central government,
2. claims on nonresidents but also to obligations to nonresidents and claims on and obligations to residents,
3. claims based on the balance-sheet framework but also to off-balance-sheet activities of the authorities.

Mitigating exchange rate volatility and exchange rate level management is achieved by interventions on the foreign exchange market. In other words, the monetary authorities that do not have freely floating exchange rate regime use

international reserves to smoothen the exchange rate fluctuations and to maintain the exchange rate at a certain level. However, even in the circumstances of a freely floating exchange rate regime, the monetary authorities may use international reserves to mitigate the exchange rate volatility.

Countries with currency board arrangements must cover the entire monetary base by international reserves. Hence, the currency board arrangement is a clear reason for holding international reserves.

Likewise, some countries use international reserves as savings for future generations in order to ensure intergenerational equity. For example, those could be countries that are exporters of nonrenewable resources (IMF, 2011, p. 5) Savings can also be used against macroeconomic shocks in the future such as income or commodity price shocks.

Like the majority of other monetary authorities in the world, the monetary authorities in the Republic of Croatia hold the international reserves mainly for two reasons. The first reason is maintaining foreign currency liquidity, and the second one, given that the Republic of Croatia has the managed floating exchange rate regime, is exchange rate level and volatility management². Both the maintaining foreign currency liquidity and mitigating exchange rate fluctuations contribute to the stability of Croatia's financial system.

4. THE TRADITIONAL AND COMBINATION METRICS

It has already been mentioned that three traditional metrics and two combination metrics are applied in the paper. The traditional metrics used in the paper are the ratio of international reserves to imports of goods and services, the ratio of international reserves to short term external debt and the ratio of international reserves to broad money. The selected combination metrics applied in the paper are the metric proposed by the IMF (2011a, 2011b, 2013a, 2013b, 2015) and the metric suggested by Mwase (2012).

The ratio of international reserves to imports of goods and services shows the sufficiency of international reserves to cover imports of goods and services

² Koški (2018) has shown that foreign exchange interventions have been effective in the Republic of Croatia.

in the absence of foreign exchange inflows (such as export revenue and external financing). International reserves that cover three months of imports are considered minimal although there is little empirical support for this critical value (IMF, 2011, p. 13). This metric is especially important in countries where shocks could arise from the current account and where the probability of shocks from the capital and financial account is small. In countries that are opened up financially, the applicability of this metric is less relevant (IMF, 2016, p. 23).

The ratio of international reserves and short-term external debt indicates the ability of a country to repay short term external debt. Put another way, this metric shows the liquidity of the country in a case that all foreign exchange inflows cease. The rule that international reserves need to cover 100% of short-term external debt is often called the Greenspan-Guidotti rule after Greenspan (1999) and Guidotti (1999) who proposed it almost simultaneously. Although the rule is pretty intuitive because it is based on debt that is due in one year, it loses its relevance if the financial crisis lasts much longer or shorter (IMF, 2011, p. 13).

The ratio of international reserves and broad money is important in countries with a more open capital and financial account, weak banking system and without the confidence in the value of local currency. In such countries, there is a relatively higher risk of capital flight. If such a country maintains the fixed exchange rate regime, the smaller this indicator, the higher the potential for capital flight. (Maier, 2006, p. 31). In fact, all money supply of that country could be seen as a potential drain on international reserves (Lipschitz and Schadler, 2019, p. 263). The critical value of this metric is 5-20%.

The combination metric proposed by the IMF (2011a, 2011b, 2013a, 2013b, 2015) is derived in the following way: distributions of annual percentage losses of four variables in the event of exchange market pressure are estimated. These four variables are exports of goods and services, short-term external debt (on a remaining maturity basis), other liabilities³ and broad money. Exchange market pressure is defined as an event in which an exchange market pressure index⁴ exceeds its average by more than 1.5 times its standard deviation. The distributions are estimated for the period from 1980 to 2008 and separately for the

³ Other liabilities are calculated as sum of other investment liabilities and portfolio investment liabilities less short-term external debt on a remaining maturity basis (IMF, 2011b, p. 2).

⁴ The index is calculated following Eichengreen et al. (1997).

fixed and floating exchange rate regimes of emerging market economies. For each distribution, the 10th percentile is calculated. A round number of the 10th percentile represents the risk weight for each related variable. The metric consists of the sum of weighted variables and is as follows (IMF, 2011a, 2011b):

Fixed: 30% of short-term external debt + 15% of other liabilities +
+ 10% of broad money + 10% of exports,

Floating: 30% of short-term external debt + 10% of other liabilities +
+ 5% of broad money + 5% of exports.

However, in order to better capture the risks associated with other liabilities, the IMF (2013a, 2013b) refined the metric⁵, by increasing the weight of other liabilities by five percentage points:

Fixed: 30% of short-term external debt + 20% of other liabilities +
+ 10% of broad money⁶ + 10% of exports,

Floating: 30% of short-term external debt + 15% of other liabilities +
+ 5% of broad money⁷ + 5% of exports.

Furthermore, the ratio of international reserves to the metric in the region of 100-150% is considered adequate. Countries with such the coverage have a smaller probability of a crisis and, in the crisis, they have smaller consumption drops and reserve losses than countries with ratios below this level (IMF, 2011a, p. 27).

The combination metric proposed by Mwase (2012) is constructed in a similar way with some differences. The metric encompasses the following three

⁵ This metric is applied in the paper.

⁶ In the case of capital controls, this value should be adjusted to 5% (IMF, 2016, p. 15).

⁷ In the case of capital controls, this value should be adjusted to 2.5% (IMF, 2016, p. 15).

variables: exports of goods and services, broad money and short-term external debt. The estimation of distributions is conducted for the period from 1999 to 2010. That is done separately for the fixed and floating exchange regimes but also for currency unions of emerging markets and small islands. Furthermore, exchange market pressure is defined as a situation in which the exchange market pressure index exceeds its average by more than one times of its standard deviation. The metric is as follows (Mwase, 2012):

Fixed: 95% of short-term external debt + 10% of broad money +
+ 35% of exports,

Floating: 40% of short-term external debt + 30% of broad money +
+ 10% of exports,

Currency union: 80% of short-term external debt + 20% of broad money +
+ 20% of exports,

The ratio of international reserves to the metric in the amount of 75-100% is regarded as adequate. In countries whose international reserves are about 75% of the metric, the probability of a crisis is less than two percent (Mwase, 2012, p. 19).

5. ASSESSING RESERVE ADEQUACY IN THE REPUBLIC OF CROATIA

International reserves of the Republic of Croatia in the period from 2013 to 2017 are evident from Table 1. In 2017, reserves amounted to approximately 19 billion US dollars, which was about 32% of Croatia's gross domestic product⁸.

⁸ In 2017, Croatian gross domestic product was 58,319.06 million US dollars (Croatian National Bank, 2019).

Table 1. International reserves of the Republic of Croatia (millions of US dollars: end of the period)

Year	Total	Special Drawing Rights	Reserve position in the Fund	Gold	Foreign exchange		
					Total	Currency and deposits	Bonds and notes
2013	17,765.9	468.8	0.2	-	17,296.8	5,117.3	12,179.5
2014	15,424.4	442.6	0.3	-	14,981.6	4,130.7	10,850.8
2015	14,967.6	423.3	0.3	-	14,544.1	5,294.0	9,250.1
2016	14,247.9	413.4	0.3	-	13,834.2	3,764.8	10,069.4
2017	18,822.3	438.0	0.4	-	18,383.9	6,547.7	11,836.2

Source: CNB, [available at: <https://www.hnb.hr/statistics/statistical-data/financial-sector/central-bank-cnb/international-reserves>, accessed March 15, 2019].

In order to assess the international reserve adequacy, it is necessary to calculate main traditional metrics, namely the ratio of international reserves to imports of goods and services, the ratio of international reserves to short term external debt (on a remaining maturity basis) and the international reserves to broad money. These metrics are based on the selected macroeconomic aggregates that are presented in Table 2.

Table 2. Selected macroeconomic aggregates in the Republic of Croatia (millions of US dollars)

Indicator	2013	2014	2015	2016	2017
Short-term external debt	14,256.52	14,351.28	12,510.02	13,032.67	14,407.14
Broad money	47,727.65	43,358.29	41,095.05	41,974.71	49,004.29
Goods and services, debit	24,713.93	25,038.67	22,692.74	23,722.92	27,028.50
Goods and services, credit	24,916.80	26,134.82	23,837.72	25,206.55	28,319.79
Other liabilities	41,830.00	35,390.00	31,980.00	25,590.00	26,620.00

Source: IMF, [available at: <https://www.imf.org/external/np/spr/ara/>, accessed March 15, 2019].

In Table 3, the three aforementioned traditional metrics are presented. The ratio of international reserves to short-term external debt amounts to over 100%, which exceeds the critical value. Furthermore, the ratio of international reserves to imports indicates that the reserves are sufficient to cover 7-8 months

of imports, which is acceptable as well. Finally, the ratio of international reserves to broad money is above the critical value and exceeds 30%.

Table 3. Traditional metrics in the Republic of Croatia

Traditional metric	2013	2014	2015	2016	2017
Reserves to short term external debt (%)	124.62	107.48	119.64	109.32	130.65
Reserves to imports (%)	71.89	61.60	65.96	60.06	69.64
Reserves to broad money (%)	37.22	35.57	36.42	33.94	38.41

Source: Author's calculation.

In Tables 4 and 5, two combination reserve adequacy metrics are calculated – the first one is proposed by the IMF (2011a, 2011b, 2013a, 2013b, 2015) and the second one is proposed by Mwase (2012), respectively. The metrics are calculated for both floating and fixed exchange rate system. It has already been pointed out that the Republic of Croatia implements the managed floating exchange rate regime. However, for the assessment of international reserve adequacy, the International Monetary Fund classifies the countries into two groups: those with a floating exchange rate regime and others. Hence, the data on the metrics calculated for the fixed exchange rate regime is more relevant to the Republic of Croatia.

Table 4. The reserve adequacy metric proposed by the International Monetary Fund

Proposed metric	2013	2014	2015	2016	2017
Floating exchange rate regime (millions of US dollars)	14,183.68	13,088.54	11,796.65	11,107.37	12,181.35
Fixed exchange rate regime (millions of US dollars)	19,907.40	18,332.70	16,642.28	15,745.93	17,378.55
Reserve coverage against the metric - floating exchange rate regime (%)	125.26	117.85	126.88	128.27	154.52
Reserve coverage against the metric - fixed exchange rate regime (%)	89.24	84.14	89.94	90.49	108.31

Source: Author's calculation.

From Table 4 it is apparent that international reserve coverage against the metric for fixed exchange rate regime is within the critical values (100-150%) only in 2017 while in previous years it is below these values. Table 5 shows international reserve coverage against the metric for a fixed exchange rate regime, which is below the critical values (75-100%) over the whole observed period.

Table 5. The reserve adequacy metric proposed by Mwase

Proposed metric	2013	2014	2015	2016	2017
Floating exchange rate regime (millions of US dollars)	22,512.58	21,361.48	19,716.30	20,326.14	23,296.12
Fixed exchange rate regime (millions of US dollars)	27,037.34	27,116.74	24,337.23	25,400.80	28,499.14
Reserve coverage against the metric - floating exchange rate regime (%)	78.92	72.21	75.91	70.10	80.80
Reserve coverage against the metric - fixed exchange rate regime (%)	65.71	56.88	61.50	56.09	66.05

Source: Author's calculation.

Deficits and surpluses that stem from the reserve adequacy metrics are evident from Table 6. For calculating them, the minimum critical values of both reserve adequacy metrics are used. In other words, the minimum critical values of 100% and 75% are used for the metric proposed by the IMF (2011a, 2011b, 2013a, 2013b, 2015) and the metric proposed by Mwase (2012), respectively. Likewise, they are calculated only for the fixed exchange rate regime. Considering the entire observed period and according to the metric proposed by Mwase (2012), the Republic of Croatia needed in average 3,613.09 million US dollars in order for its reserves to be considered adequate.

Table 6. Deficit or surplus in international reserves

Proposed metric	2013	2014	2015	2016	2017
The metric proposed by the IMF (millions of US dollars)	-2,141.50	-2,908.32	-1,674.67	-1,498.07	1,443.71
The metric proposed by Mwase (millions of US dollars)	-2,512.10	-4,913.18	-3,285.31	-4,802.74	-2,552.09

Source: Author's calculation.

In Figure 1, the comparison of international reserve coverages against the metrics proposed by the IMF (2011a, 2011b, 2013a, 2013b, 2015) and Mwase (2012), for both floating and fixed exchange rate regime, is depicted.

Figure 1. The comparison of international reserve coverages against the metrics.

Source: Author's drawing based on data from Table 4 and Table 5.

Over the observed period, a very mild increase of international reserve coverages against the metrics for both floating and fixed exchange rate regime is evident. If the increase continues, international reserves will also become adequate, according to the metric proposed by Mwase (2012).

6. CONCLUSION

In 2017, Croatia's international reserves amounted to approximately 19 billion US dollars, that is, about 32% of Croatia's gross domestic product. The monetary authorities of the Republic of Croatia hold international reserves for the two main reasons. The first reason is maintaining foreign currency liquidity. The second reason is, given that the Republic of Croatia implements the managed floating exchange rate regime, the maintaining certain level of exchange rate or managing exchange rate fluctuations. In this way, the monetary authorities protect the stability of the financial system in the country and maintain confidence in the value of local currency.

In this paper, the adequacy of Croatia's international reserves is assessed. Assessment of reserve adequacy is conducted in the period from 2013 to 2017 using selected traditional and combination metrics. The traditional metrics, namely, the ratio of international reserves to imports of goods and services, the ratio of international reserves to short term external debt and the international reserves to broad money indicated that the level of international reserves is adequate, that is, above the critical values. More precisely, the ratio of international reserves to imports of goods and services shows that international reserves are sufficient to cover 7-8 months of imports. Likewise, the ratio of international reserves to short-term external debt exceeds 100% and the ratio of international reserves to broad money amounts to over 30%.

Among the combination metrics, the following two are applied: the metric proposed by the IMF (2011a, 2011b, 2013a, 2013b, 2015) and the metric proposed by Mwase (2012). The metric proposed by the IMF (2011a, 2011b, 2013a, 2013b, 2015) indicated that the Republic of Croatia has an adequate level of international reserves only in 2017. According to the other metric, the metric proposed by Mwase (2012), the Republic of Croatia does not have the acceptable level of international reserves. In average, over the entire observed period, the level of Croatia's international reserves should be 3,613.09 million US dollars higher.

Still, a very mild increase in international reserve coverages against the metrics is evident. If the increase continues in the future, the level of international reserves will also become acceptable, according to the metric proposed by Mwase (2012).

EU LESSONS AFTER THE CRISIS AND... BEFORE THE RECESSION

Mladen VEDRIŠ, Ph. D.¹

University of Zagreb, Law Faculty Zagreb

E-mail: mladen.vedris@pravo.hr

Abstract

The changes that have occurred in the last decade - on one hand, the new major crisis and its consequences, and on the other hand, the exponential growth and development and the applications of new technologies and the changes that that has wrought, have changed the world as a whole and specific parts of it and individual countries.

The basic theme of this work is to examine how those changes have been reflected in the conduct of economic policies globally and fragmentarily (US and EU). The outbreak of the crisis, and then the surprising renewal of protectionism confronted the EU, and then each individual country itself, with the need to find adequate responses to these challenges.

It is interesting to observe how the economic ideas and behavioral models from previous times have appeared in this new era and under new circumstances - neoliberalism, protectionism, industrial strategy and policy, the role of the state - and how they have become the reality in the present day.

It is necessary to take a position in regard to the recent past - which is to say, more recent (economic) history - and at the same time to confront pronouncements of a coming recession. The basic theme of this paper is to discuss what we should do so that its economic effects cause the lowest level of social problems and tensions, the forms of which are industrial (development) strategy and policy, especially at the EU level.

Keywords: economic crisis, recession, protectionism, industrial policy, industrial strategy, EU, economic of the Republic of Croatia.

JEL Classification: E69, H12

¹ Prof.dr.sc. Mladen Vedriš is a full professor and head of the Department of Economics at the University of Zagreb. His contribution of this work arose through a project of the Faculty of Law of the University of Zagreb, "The New Croatian Legal System". The sub-project is "The Economic Position of Croatia in the Context of the New EU Economic and Development Policy".

1. INTRODUCTION

The period of recovery from the Great Recession began in some developed countries earlier (2012-2013) than it did in Croatia (2015) because of the fact that the decline in the level of GDP in that period was considerably deeper than in the EU 10. Therefore, the economic recovery that began in 2015 was a turning point not only in economic terms but also in political and social terms; and it was an essential point in the overall life of the country.

The new geopolitical circumstances, soon to be followed by practical economic ones, characterized by each country turning to its own national priorities, which began with the new paradigm of AMERICA FIRST, caused expectations of economic growth, especially based on a trend of strong growth in international trade, to be drastically reduced, considered both globally and at the level of specific regions of the world: the US, the Far East and then also at the level of the EU and at the national level. The new framework of events (re)affirmed the position of defense of (economic) interests as a legitimate basis for creating a concept of protectionism, suitable to these circumstances and the current time.

The theme and interest of the work are to analyze the degree and character of the changes that have been achieved, but also to consider the medium and long-term responses that are prerequisites for creating the essential structural platform for effective behavior within the framework of such (expected) conjunctural-cyclical movements. This is primarily a matter of a modern/new conception of industrial policy that is a real foundation for achieving long-term, sustainable economic growth. At the same time, such a concept of economic policy, which was applied in different countries in accordance with their socio-economic traditions, and with limits, has achieved very successful results, beginning in the Far East and including the old and new members of the EU.

What these examples and models are and how they can be recognized and applied in order to: a) leave behind the consequences of the 2009-2014 crisis and b) await the coming recession more prepared with their own framework of behavior are fundamental questions that this scientific-research work wishes to address.

2. NEW CHALLENGES - PROTECTIONISM

The current economic era began with the announcement by the new US administration (after the 2016 elections) that foreign trade deficits are not just a financial-capital issue because that are deeply affecting vital economic aggregates - the degree of (un)employment of the working age population within a national economy - it is also a question of the sustainability of the quality of the structure of industry that has significantly declined, quantitatively and qualitatively, by the removal of a large number of jobs to the Far East, primarily to China. This shift was initially a subject only in academic and theoretical discussions, but it was soon followed by concrete forms of action. "Shifting the economy into a higher gear is a critical first step. The United States has to jumpstart growth and move forward on long-recognized priorities such as restoring business dynamism, investing in infrastructure, improving productivity, and revamping education and training. And the nation will have to do a better job of executing on these fast-growing firms that create jobs. To accelerate productivity growth, more companies need to be encouraged to adopt the technologies and best practices of frontier firms. Small enterprises need assistance to seek out global market opportunities and foreign capital. US companies and investors need to recognize the long-term value of creating training pathways and better-quality jobs—not just out of social responsibility but to protect their own long-term interests (Making it in America, 2017: 3-4). The same text also states: But economic growth alone may not be enough; growth also has to be more inclusive. We see four priority areas: reinvesting, retraining, removing barriers, and reimagining work. First, communities in distress need targeted investment from public, private, and foreign sources to bounce back. Second, continuous technological change means that mid-career workers need systems of lifelong learning to adapt—and currently the United States spends far less than other countries on helping displaced workers transition into new roles. Third, we can remove barriers that keep workers from seeking out better opportunities, such as non-compete agreements, excessive occupational licensing requirements, inadequate child and family support, and affordable housing shortages in booming job markets. Finally, we need to reimagine work with more flexible models, a more sustainable version of the gig economy, and more creative options for older workers". (Making it in America, 2017: 3-4)

How the indicated position looks in a comparative sense, observed in a wider time period, can be seen in Table 1.

Table 1. The US ranks second in the world in manufacturing value added

Top 15 manufacturers by share of global manufacturing gross value added (nominal)

Rank	1985	1995	2005	2015	2015 value added \$ billion
1	United States	United States	United States	China	3,166
2	Japan	Japan	Japan	United States	2,207
3	Germany	Germany	China	Japan	768
4	Italy	France	Germany	Germany	688

15	South Korea	Mexico	Taiwan	Russia	155

Sourcing: Making It in America - Research Preview, Executive Summary, McKinsey Global Institute, A Special Initiative for the 2017 Aspen Ideas Festival, June 2017, p. 9.

The position of the United States in the last three decades in creating new value was unquestioned. At the start of the period of accelerating global processes (the mid-1980s), the US was by far the leading country in that ranking, followed by Japan, Germany, Italy, and France. Two decades later (2005), China entered the rankings and a decade later it topped the list, and South Korea was fifth, while Italy fell to ninth. In 2015, France was ranked 10th, followed immediately by Mexico and Indonesia.

It is evident that the development of these events is also creating (from a theoretical political evaluation) a framework for practical activity. The basis for the introduction of a new economic concept was created at the beginning of the mandate of the new US administration and is reflected in the document *Scoring the Trump Economic Plan*. “Donald Trump’s economic plan proposes tax cuts, reduced regulation, lower energy costs, and eliminating America’s chronic trade

deficit. Trump's goal is to significantly increase America's real GDP growth rate and thereby create millions of additional new jobs and trillions of dollars of additional income and tax revenues." (Navarro, 2016: 2)

That same document provided ratings and established the theoretical positions that would be the basis for the practical and concrete activity of the US government.

BOX: US ECONOMIC POLICY - PAST AND PRESENT

China's 2001 entry into the WTO, negotiated by President Bill Clinton, opened America's markets to a flood of illegally subsidized Chinese imports, thereby creating massive and chronic trade deficits. China's accession to the WTO also rapidly accelerated the offshoring of America's factories and a concomitant decline in US domestic business investment as a percentage of our economy.

As David Dollar of Brookings notes, US direct investment flows to China were "fairly stable at about \$1.6 billion per year in the period 1999-2003" but "jumped in the period 2004-2008 to an annual average of \$6.4 billion."

Justin Pierce of the Federal Reserve Board of Governors staff and Yale School of Management's Peter Schott attribute most of the decline in US manufacturing jobs from 2001 to 2007 to the China deal. David Autor of MIT, David Dorn of the University of Zurich, and Gordon Hanson of UC-San Diego have described a "China trade shock" that has raised the unemployment rate, depressed wages, and the labor participation rate, and reduced the lifetime income of workers in American manufacturing most "exposed" to the shock.

Most recently, the 2012 South Korea trade deal was negotiated by Secretary of State Hillary Clinton – she called it "cutting edge." It was sold to the American public by President Obama with the promise it would create 70,000 jobs. Instead, it has led to the loss of 95,000 jobs and roughly doubled America's trade deficit with South Korea. Corporate America does not oppose these deals. They both allow and encourage corporations to put their factories anywhere. However, Mr. and Ms. America are left back home without high-paying jobs.

There is nothing inevitable about poorly negotiated trade deals, over-regulation, and an excessive tax burden – this is a politician-made malaise. Therefore, nothing about the "new normal" is permanent.

Donald Trump's tax, trade, regulatory, and energy policy reforms deal with the root causes of this problem. Trump understands that our economic problems are long run and structural in nature and can only be addressed by fundamental structural reforms.

Source: Navarro, P., Scoring the Trump Economic Plan: Trade, Regulatory & Energy Policy Impacts, September 29, 2016, p. 9

In the foregoing text regarding the US-China relationship, and in a wider context, in the above matrix of events, the conditions have been created for a new, current dominant form of behavior - protectionism as a form of confrontation or defense against the trend of events, especially, but not wholly confined to, the economic sphere. To reiterate, these areas are environmental protection, sustainable growth, and development, large-scale migration, ongoing geopolitical conflicts in certain parts of the world, with old and new partnerships adopting the appropriate positions according to new circumstances.

3. NEW REGIONAL RESPONSES - EU INDUSTRIAL POLICY AS DEVELOPMENT POLICY

During its existence and development, the European Union substantively and organizationally followed the basic (economic) imperative that led to its founding: to respond more effectively to overall global challenges at the national level using increasingly sophisticated and complex forms of interconnection, thereby achieving positive synergistic effects. The period of accelerated processes of global networking, crisis and recession have fully confirmed the reality and inevitability of such association. Throughout the observed period, a variety of forms of industrial policy (both in their substance and priorities) were strongly present.

The beginning can be located in the period of more than 50 years ago. The literature states, "In the second half of the 1960s, the EU's industrial policy began to take on more serious outlines and to develop in parallel with national policies. In the 1970s, there was a crisis caused by the "oil shock," and during that period the countries were primarily concerned with their own economies. After the recovery from the "oil shock," in the mid-1980s, there was a revival of the need to apply a common industrial policy in the EU. In 1987, a key document was adopted that marked the overall economic policy of the EU of the late 1980s, the Single European Act. That act represented a turning point for the EU's industrial policy. It meant a transition from the model of centralized state intervention to the EU, in which the European Commission became the central bureaucratic body, according to a new model based on the cooperation of various national and local administrations, each of which has the ability to adopt and implement measures, but those measures had to be in accordance with those measures implemented by other levels of administration. The new approach to EU industrial policy, which stressed the importance of the regions,

was, in fact, regional development policy. Thus, the new approach to industrial policy meant abandoning old practices in which national governments were providing assistance to individual enterprises to minimize structural imbalances." (Obadić, 2001: 657)

The course of the events further reinforced the need to realize industrial policy, giving it a new role, as shown by the following quote. "In the 1990s, the industrial policy of the EU took on entirely new characteristics. There was a widely accepted view that isolation of an economy leads to stagnation and that market liberalization helps entrepreneurs to become competitive in the conditions of the increased globalization of markets. Thus, in recent years competitiveness has become a basic characteristic of EU industrial policy. It is also why in 1991 the European Commission adopted the document "Industrial Policy in an Open and Competitive Environment," which presented a new approach to industrial policy in a competitive environment (European Commission, 1991). That document, which provided the principles for a new European approach to industrial policy is known as "Bangeman's Proposal" (Walser, 1999, p. 109). It sets out the basic principles of modern EU industrial policy, emphasizing that on the basis of a horizontal approach to industrial policy (i.e. by the use of measures that aid the development of key inputs - labor, capital, infrastructure, research and development) government authorities must create a stable environment as a prerequisite for an active industrial policy, to facilitate the required structural changes, and to ensure full functioning of the market." (Obadić, 2001: 657)

Significant qualitative changes in the concept of industrial policy were achieved in a period of important transformations - economic and political, including the fall of the Berlin Wall - and the opening of new markets and investment platforms in the countries of the new Europe began an accelerated connection with the economies of old Europe. The stated concept of industrial policy as a complex platform of development in already developed countries was achieved in parallel with theoretical-pragmatic ideas (efforts) that the countries of the new Europe apply the Washington consensus model, which started from other initial premises and limited the role and responsibility of the state in managing active economic policies, starting with all the expectations of the activities of a free market and its legitimacy. Such expectations were soon shown by their results to be unrealistic, which meant (re)turning to the search for more complex solutions that included more complex and accountable engagement by the government and its institutions.

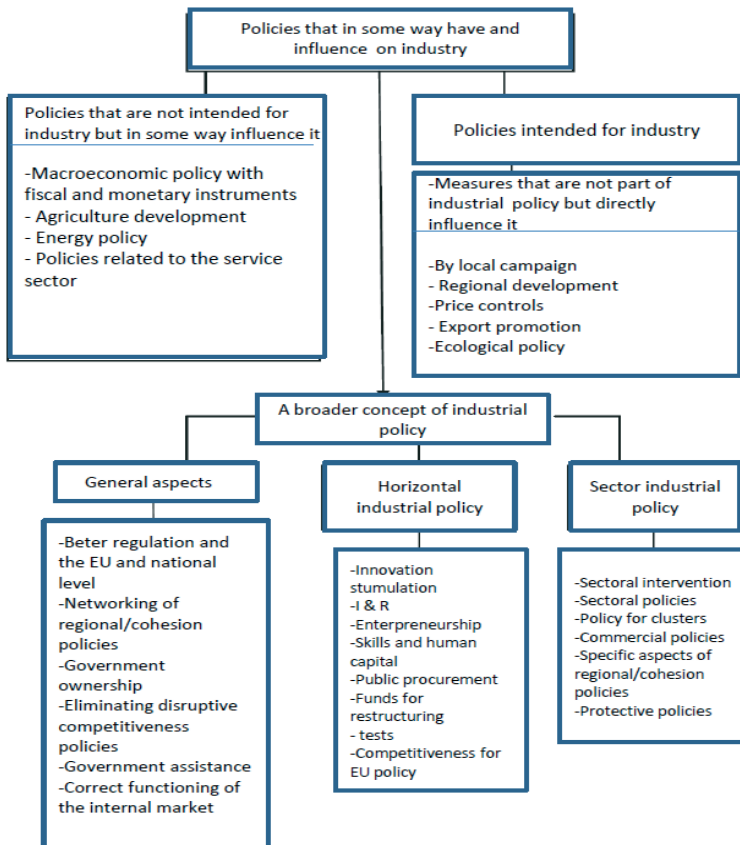

An understanding of the importance of and the need for constructing or formulating an adequate concept of industrial policy within the EU in the circumstances of globalization developed gradually, but continuously, which is apparent from the quotation: “A new approach to industrial policy began in March 2000 in Lisbon with the enactment of a comprehensive reform package entitled ‘Employment, Economic Reform and Social Cohesion - the Road to Europe Based on Information and Knowledge,’ known as the Lisbon Strategy.” In this document, the EU set a goal that by 2010 “the European Union will become the most competitive economy in the world, based on knowledge, innovation, and entrepreneurship.” The main task of industrial policy under the Lisbon Strategy was defined as an increase in the competitiveness of the industry, oriented to the growth of the standard of living, and with high long-term employment rates. This new approach to development implied a turn to structural reforms, a knowledge-based economy, investment in R & D, wider and more efficient use of information technologies, modernizing the European social model, and better social cohesion based on employment promotion, while maintaining healthy economic prospects and favorable growth. The Lisbon Strategy clearly showed that the efficient development of industry has positive external effects on an entire economy. (Savić and Ljutovac, 2017) Halfway through the implementation of the Lisbon Agenda, there came an awareness based on an analysis of the results that had been achieved that some effort should be made to fix several key goals and, at the same time, to enhance the monitoring of its implementation. The Wim Kok report, *Facing the Challenge, The Lisbon Strategy for Growth and Employment* was adopted in 2004. Its main recommendations were:

- ♦ By spring 2005, the European Council should make a priority of revitalizing the Lisbon strategy, sending a clear message to engage national governments and citizens. It must also ensure that sufficient time and attention are dedicated to assessing the progress made in achieving the Lisbon goals. The meeting should also focus on the progress that has been made in establishing “partnerships for reform”, which were called for at the spring 2004 European Council.
- ♦ A key focus for the EU and member states should be growth and employment, which will underpin social cohesion and sustainable development.
- ♦ The President of the Commission should focus on driving the Lisbon Strategy forward.

- ✦ By the end of 2005, national governments should draw up a national action program on delivering the reforms agreed as part of the Lisbon Strategy.
- ✦ The European Parliament should establish a standing committee on the Lisbon strategy,
- ✦ The EU budget should, as far as possible, be reshaped to reflect the Lisbon priorities, so as to encourage member states to achieve the Lisbon targets. (Eurofound, 2004)

Theoretically, the pragmatic turnaround recommended by the Kok report also received a new conceptual framework, which is summarized in the following way:

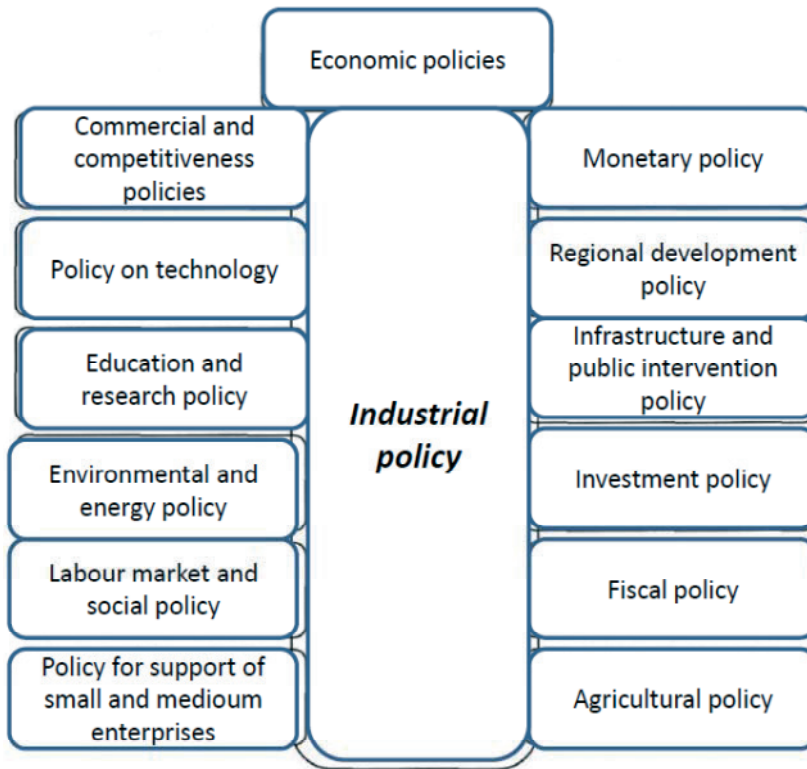

Graph 2. Industrial Policy at the EU and National Level

Source: Savić, Lj., Lutovac, M.: *Novi koncept industrijske politike u Evropskoj uniji* (A New Concept of Industrial Policy in the European Union), *Ekonomске ideje i praksa*, No. 25, Beograd, June 2017, p. 14.

It distinguished the division of policies that directly influence what can be considered incentives to industrial growth, from a broad concept that is closer to an understanding of industrial policy as development policy at the national level, when considered in the aggregate. Stated more directly, such a model, which considers the industrial policy as an important framework for the achievement of economic policy as a development policy, can be established in economic literature in the broader theoretical considerations of that timeframe.

Graph 3. Industrial Policy as Part of Overlapping Areas of Economic Policy

Source: Obadić, A.: *Industrijska politika kao dio ekonomske politike* (Industrial Policy as a Part of Economic Policy), *Ekonomski pregled*, 52/5-6/, 645-666, 2001, p. 650.

The above graph shows the aggregate character of industrial policy as the basis for the overall development policy. Thus, the author states, "There is an opinion that emphasizes that overall economic policy is industrial policy because in reality all economic decisions made by a government affect the state of

the industry. For example, changes in taxes, interest rates or customs duties will have a larger or smaller influence on the industry.” (Obadić, 2001: 651)

The sudden onset of the Great Recession (2007-2008, USA), which soon spread globally, halted theoretical discussions about whether industrial policy is necessary or not; and if the answer is yes, what type: structuralist (direct intervention of the state) or neoliberal (horizontal measures that help everyone equally). From that moment until today, industrial policy, depending on the particular country, has actually been shaped as an appropriate combination of these two approaches (Savić and Ljutovac, 2017). Such a new reality, theoretical and practical, also continued when, at the end of the Lisbon Agenda implementation period (2010), the EU continued to stimulate growth with the Europe 2020 strategy, or more specifically “Europe 2020 - A Smart, Sustainable and Inclusive Growth Strategy.”

Such is a new reality: theoretical and practical, and continued when, at the end of the Lisbon Agenda Implementation Period (2010), the EU model continued to stimulate growth in Europe 2020 strategy, or more specifically “Europe 2020 - A Smart, Sustainable and Inclusive Growth Strategy”.

Box: EUROPA 2020 - A SMART, INCLUSIVE AND SUSTAINABLE GROWTH STRATEGY NEW INITIATIVES

The new strategy proposes seven guiding initiatives, including:

- an “Innovation Union” to improve framework conditions and access to finance for research and innovation so as to ensure that innovative ideas can be turned into products and services that create growth and jobs.
- “Youth on the Move” to enhance the performance of education systems and to facilitate the entry of young people to the labor market. EN 6 EN
- a “Digital Agenda for Europe” to speed up the roll-out of high-speed internet and reap the benefits of a digital single market for households and firms.
- a “Resource Efficient Europe” to help decouple economic growth from the use of resources, support the shift towards a low carbon economy, increase the use of renewable energy sources, modernize our transport sector and promote energy efficiency.
- An “Industrial Policy for the Globalization Era” to improve the business environment, notably for SMEs, and to support the development of a strong and sustainable industrial base able to compete globally.

- An “Agenda for New Skills and Jobs” to modernize labor markets and empower people by developing their skills throughout the lifecycle with a view to increasing labor participation and better match labor supply and demand, including through labor mobility.
- The “European Platform against Poverty” to ensure social and territorial cohesion such that the benefits of growth and jobs are widely shared and people experiencing poverty and social exclusion are enabled to live in dignity and take an active part in society (European Commission, 2010).

The document *Industrial Policy: Strengthening Competitiveness* (14 November 2011) calls for the implementation of structural reforms and the adoption of concrete and harmonized policies in member states to increase EU economic and industrial competitiveness and to stimulate sustainable growth. The economic crisis, which then dominated the thinking and practical actions of each EU member state, made this issue and this concept an absolute priority for deliberation and action. The document lays out the priority areas of action: (1) structural changes in the economy; (2) innovativeness of industries; (3) sustainability and resource efficiency; (4) business environment; (5) a single market; and (6) small and medium-sized enterprises (European Commission, 2011).

Such orientation and engagement continued into the next period as an expression of new realities in the creation and implementation of economic policy at the EU level. In this context, the European Central Bank has taken more control over the implementation of monetary policy, overseeing the implementation of fiscal policy, and in a wider context, it became the task and responsibility of the macroeconomic framework called the European Semester, so that overall development policy is increasingly directed by and implemented through industrial strategy. Accordingly, at the beginning of 2014, the European Commission published the document “For a European Industrial Renaissance.”

BOX: FOR A EUROPEAN INDUSTRIAL RENAISSANCE: ESSENTIAL GOALS

- Continue to deepen industrial competitiveness orientation in other policy areas to maintain the competitiveness of the EU economy, taking into account the importance of the contribution of industrial competitiveness to the overall competitiveness of the EU. For example, special attention should be paid to increasing the productivity of business services to increase the industrial competitiveness and the competitiveness of the EU economy in general.

- Maximizing the capabilities of the internal market by developing the necessary infrastructure, providing a stable, simplified and predictable regulatory framework favorable to entrepreneurship and innovation, integrating capital markets, improving the capacity for the training and mobility of citizens, and complementing the internal market for services as a major contributing factor to industrial competitiveness.

Decisive implementation of regional development instruments with national and European instruments as support for innovation, skills, and entrepreneurship leading to changes in the industry and raising the competitiveness of EU economies.

In order to encourage investment, businesses need access to key inputs, especially energy and raw materials at affordable prices reflecting international pricing conditions. The draft and implementation of policy instruments for different goals at both the EU and national levels should not result in a distortion of prices implying a disproportionately higher relative price for those inputs. Activities should also be undertaken on the internal market and in international activities to ensure an adequate supply of these inputs, as well as increasing the efficiency of resources and energy and reducing waste.

Do everything to facilitate the integration of EU companies into global value chains to increase their competitiveness and ensure access to global markets under more favorable market conditions.

Finally, the goal of revitalizing the EU economy is to accept the efforts of reindustrialization in line with the Commission's aspirations to raise the industry's GDP contribution to 20% by 2020 (European Commission, 2014).

This orientation is constantly evolving and adapting to overall (global) circumstances. After overcoming the consequences of the Great Recession and the beginning of global economic growth, a new era began in 2017 with the theoretical and practical turnaround achieved by the United States - the leading global economic power, referred to above as AMERICA FIRST - and the rest of the world, and the EU, were placed in the position of reflecting on the sustainability of their own positions in the new circumstances and new rules of the game. In the context of these events, the EU adopted the document, *Investing in Smart, Innovative and Sustainable Industry - The Renewal of EU Industrial Policy Strategy* which states: "... We need to strengthen our industry's ability to constantly adapt and innovate by making it easier to invest in new technologies and take advantage of the ever-changing digitalization and transition to a low-carbon and ever-more circular economy. Businesses need to be involved by upgrading their technology base, using future-oriented business models, incorporating sustainable development principles and embracing innovation. The opportunities offered by the industrial transformation are enormous, but to use them, they will need to invest heavily in advanced production, human talent and

skills, and non-material resources, such as research and innovation. For a speedy transformation, it will be necessary to have a more functional unified market. With technology as the torchbearer, modern industrial policy can revive the EU region and build up its resistance in order to adapt to changes in the global environment.” (European Commission, 2017: 4) The current position of industry within the EU economy is depicted in the following graphs.

Graph 4.

Source: Communication, Commission of the European Parliament, Council, European Economic and Social Committee, Committee for the Regions and the European Investment Bank: Investment in Smart, Innovative, and Sustainable Industry - A Revised Strategy of EU Industrial Policy, European Commission, Brussels, 13 September 2017, COM (2017) 479, Final, p. 3.

The document states that a downward trend in employment in the industry is evident. From 2009 to 2013, the number of jobs in the industry within the EU 27 fell by 1.8 million (5.4%), but from 2013, more than 1.5 million new jobs were created. The number of jobs in production grew even faster, especially in better-paid engineering, professional and managerial jobs. Employment growth in industry and its added value is also reflected in the annual growth rate of labor productivity in EU industries, averaging 2.7% between 2009 and 2016. The increase in work productivity in the EU is higher than in other major economies (for example, 0.7% per year in the US between 2009 and 2015, 3.4% in Japan, and 2.3% in South Korea). The added value of production itself increased by 25% in the EU 27 (23% in the EU 28) in real terms since 2009, and its share in the economy increased from 15.5% (14.7% in the EU 28) to 17.1% (16.1% in the EU 28) (European Commission, 2017: 3).

At the end of the same year, at the EU level, a new document called the *New Industrial Policy Strategy* was adopted that established:

Box. THE MAIN NEW ELEMENTS OF THE EU INDUSTRIAL POLICY STRATEGY INCLUDE:

✦ A comprehensive package to reinforce our industry's cybersecurity. It includes the creation of a European Cybersecurity Research and Competence Centre to support the development of technology and industrial capabilities in cybersecurity, as well as an EU-wide certification scheme for products and services, recognized in all Member States (adopted on 13 September 2017).

✦ A proposal for a Regulation on the free flow of non-personal data that will enable data to circulate freely across borders, helping to modernize industry and create a truly common European data space (adopted on 13 September 2017).

✦ A new series of actions on Circular Economy, including a strategy on plastics and measures to improve the production of renewable biological resources and their conversion into bio-based products and bio-energy (autumn 2017).

✦ A revised list of critical raw materials where the Commission will continue to help ensure the secure, sustainable and affordable supply for the EU manufacturing industry (adopted on 13 September 2017).

✦ New proposals for clean, competitive and connected mobility, including tightened CO2 emissions standards for cars and vans, an Alternative Fuels Infrastructure Action Plan to support the deployment of charging infrastructure, and actions to foster autonomous driving (autumn 2017).

✦ A set of initiatives to modernize the Intellectual Property Framework, including a report on the functioning of the Directive on the enforcement of intellectual property rights and a Communication on a balanced, clear and predictable European licensing framework for Standard Essential Patents (autumn 2017).

✦ An initiative to improve the functioning of public procurement in the EU, including a voluntary mechanism to provide clarity and guidance to authorities planning large infrastructure projects (autumn 2017).

✦ Extension of the Skills Agenda to new key industry sectors, such as construction, steel, paper, green technologies, and renewable energies, manufacturing and maritime shipping (autumn 2017).

✦ A strategy on sustainable finance to better orient private capital flows to more sustainable investments (early 2018).

✦ Initiatives for balanced and progressive trade policy and a European framework for the screening of foreign direct investments that may pose a threat to security or public order (adopted on 13 September 2017).

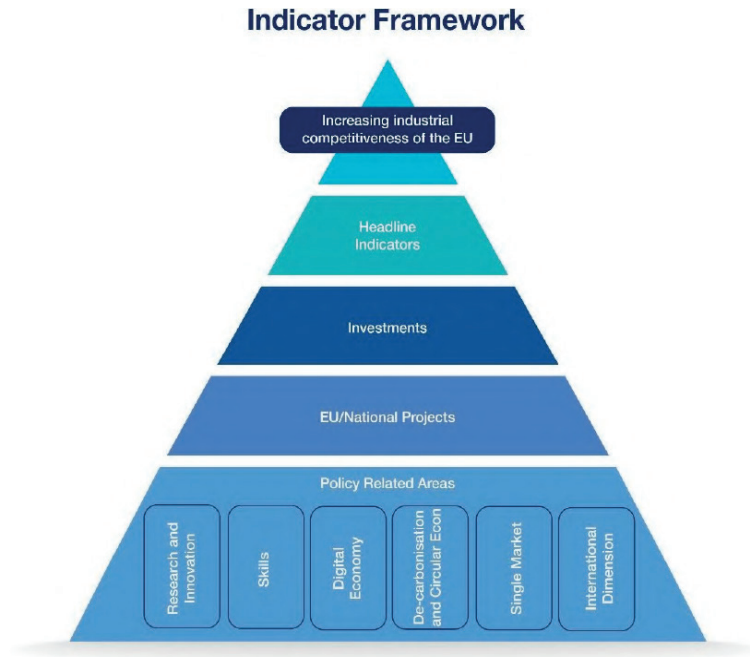

Putting this holistic strategy into practice is a shared responsibility. Its success depends on the efforts and cooperation of the EU institutions, Member States, regions and most importantly on the active role of the industry itself (European Commission, 2017).

The constant and continuous engagement of the European Commission (the EU as a whole) is reflected in the EU Council's demands that encourage further engagement on the continuous development of the industrial strategy. The conclusions call for the development of a comprehensive industrial policy that will make the best use of the opportunities arising from the transition to safe and sustainable technologies, and a low-carbon and circular economy that will be in line with consistent European climate and energy policies, with the aim of creating strong, resource-efficient and competitive European industrial foundations. That engagement EMPHASIZES that this comprehensive policy should take into account the sustainable supply of raw materials and the external dimension of EU climate policy while paying particular attention to addressing the issue of high energy costs and preventing significant difficulties in international competition, particularly for energy-intensive industries (Council of the European Union, 2018).

It also reiterates that issues of industry's competitiveness should be systematically included in all EU policy areas and repeats the call for the Commission to assess the impact of incorporating industrial policy into EU strategic initiatives and to propose ways in which inclusion could make it more effective; EMPHASIZES that estimates of cumulative costs and the reduction of unnecessary regulatory burdens are an indispensable part of overall efforts to support the global competitiveness of EU industries, and in this regard, STRESSES the importance of concrete targets for reducing unnecessary regulatory burdens, while respecting existing standards of protection and without prejudice to the main purpose of legislation; EMPHASIZES that systematic EU-level steps could effectively improve the measures at the national and regional levels and thus improve alignment and synergy between EU policy and member state policies; and INVITES the Commission to ensure a more thorough application of impact testing of small and medium-sized enterprises legislation in the preparation of initiatives (Council of the European Union, 2018).

What will be the process of monitoring the implementation of the future EU Industrial Policy Strategy, which is an indispensable prerequisite for its achievement, and thus achieving the established goals, is apparent from the graph below.

Graph 5. Multi-Layered Structure of Indicators

Source: Presidency Report on Industrial Policy - Governance and Mainstreaming /Annex, European Commission, Brussels, 13 November 2018, COMPET 764, ND 338, MI 825, p. 8.

The “Indicator Framework” model fully corroborates the (current) thesis on industrial policy and on policy as a framework for the concept of overall economic development, i.e. to stimulate growth under the conditions of globalization and the present globally competitive environment.

The stated multilateral EU level approach and all of the cited and analyzed documents emphasize the responsibility of member states and their economic policies in achieving jointly established goals - notably the EU 2020 document on industrial policy and strategy implementation.

In this context, a recent document prepared for (internal/external) debate in the Republic of Germany entitled The National Industrial Strategy 2030, was released for political, professional and public discussion prior to the government’s adoption of the final text and implementation. Right at the beginning, the document states: “Without its large share of industrial jobs, Germany could not maintain its high level of income and its high level of education, en-

vironmental protection, social security, healthcare, and infrastructure. This is why strengthening the country's industrial base is in the national interest and a task of national importance for which the state needs suitable instruments and means. A debate is required in this context and on the requirements and limits of their use that must be conducted frankly, without prejudice and in a results-oriented manner." (Altmaier, 2019: 5)

Undoubtedly, discussions of the same or similar character will follow or are already taking place in other EU member states, each analyzing in their own way the possibilities of their positioning in the newly created configuration of the global economy. The outcome of the EU parliamentary elections (May 2019) is certain to significantly shape future relations within the EU, well as the forms of response to the open challenges, both global and in relation to the world's leading economies - especially the US and China.

However, it is equally certain that such (joint) efforts cannot but reduce the intensity of deliberation on the national level, including in the Republic of Croatia. This commitment and effort cannot be replaced by any basic theoretical point of view, and even less by any policy of delaying the confrontation with reality.

4. CONCLUSION

Through time - for centuries and decades - on the national, European and global economic scenes, periods of economic growth and conjuncture have been followed by periods of economic stagnation, recession, and even crisis. In the contemporary (macro) economic theory of the Great Depression and the appearance of J.M. Keynes, nothing is the same. The politics of government passivity and a reliance on a *laissez-faire* concept has been abandoned, theoretically and practically, as the only or best possible solution. The role of the state in creating the conditions for stable and sustainable economic growth has become dominant, again, theoretically and practically.

In this context, and in specific times and circumstances it has become clear that at certain times and in a certain way it is necessary to direct and stimulate economic growth by a wide range of instruments and measures commonly referred to as industrial strategy or industrial policy. Therefore, considering the circumstances of the recovery from the Great Recession, and also considering

what to do so that a (possible) recession is more simply amortized and anticipated, the issue is what and how to implement the measures and instruments of government direction, or more broadly stated, the (reintroduction) of the concept of industrial strategy and politics.

An understanding not only the responsibility of each state in itself but also the inevitability of its engagement in creating a framework for the successful implementation of economic activities in the past period, has been confirmed both theoretically and practically.

This paper has presented a statement of general events on the economic and geopolitical scene over the past decade, as well as in the latest period of globalization, characterized by the emergence of protectionism inspired by the world's leading economic and geopolitical forces. Such a theoretical shift, and practical behavior, especially by the United States, has led to fundamental changes in the behavior of other actors on the international scene.

In such circumstances and having a priority research interest in events at the EU level, particular attention was focused on an evaluation of the theoretical concept of industrial policy, and then its development within that community, to which the Republic of Croatia, from an economic standpoint, continually referred to even before acquiring the status of a full member. Since 2013, Croatia's new status has provided opportunities and possibilities for further and more consistent use of all of the tools, knowledge, and another potential in the EU, still universally considered the world's most powerful economic entity.

Finally, the paper states that the experience and lessons in managing economic policy during the period of overcoming the Great Recession, and then coping with the policy of protectionism that was a reaction to the changes that the process of globalization in economic relations had created, are important and valuable warnings, and even obligations, to now consider what to do to prepare for the announced (and trendily expected major) recession, at both the EU and national levels.

Abstract

This paper expounds the concept and aspects of Basic Income (BI) using historical and contemporary examples. It also deals with the Philosophy of BI in a way to ask whether this is (or will be) a new human economic right? What are the ideas behind the proposition to introduce BI? We hope to answer these questions by using the „mixed“ approach in other words by using the economic and legal history, contemporary public and social economics and political Philosophy to answer these questions? Historical examples like BI in ancient Rome and early modern England (Poor Laws) are analyzed by showing which political, social and economic circumstances lead to the need for such a form of social benefit. In the present time, authors try to investigate the contemporary examples of BI in Alaska and limited experiments in Kenya and Finland with references to the results of these experiments (why were they introduced how did they fare). Problems, critique, and benefits or lack of them of introducing BI are discussed.

Keywords: Basic Income, the historical development of BI, critique, and benefits of BI

JEL Classification: D31, P64

1. INTRODUCTION

Basic income (BI) is a relatively new concept in economics and has been around since 1980s and is closely related to negative tax. Is it a substitute for all existing social programs (such as social welfare, unemployment insurance, public health insurance, child allowance, etc.) or is it there to provide the individual with certain security in revenue together with existing programs? Because of the diversity of individuals' needs and the difference in wealth between states, there is no single answer, but it can be said that all theorists agree that basic income should provide a standard of living at least above the poverty line. In this work, we hope to show the Philosophy of BI and the reasons for and against it by using historical and present-day examples.

2. BASIC INCOME GENERAL INTRODUCTION

The BI can be defined as a social system whose purpose is to redistribute social wealth to guarantee a certain level of living standards for all the inhabitants in a society. The more common definition of BI would be "a periodic, cash income paid individually to all members of a political community without means test or work requirement (Widerquist, 2012: 15). BI is paid directly from the state budget to individuals and the right to the benefit is acquired by the very fact of living (legally) in that society (Fitzpatrick, 1999). This giving is unconditional and is manifested in the absence of any prerequisites for the acquisition of rights or control over the use of funds.

BI in the narrow sense is defined as the right of an individual to a periodic cash grant that is unconditionally paid to an individual irrespective of her income or employment (Birnbaum, 2016: 2). This type of income is not precluding individuals to acquire income from other sources (Van Parjis & Vanderbrought, 2017: 10).

In theory, there are many divisions of social systems with their distinct features, through which we can more thoroughly expound the basic income and point to its differences as a special system (Ravnić, 2004: 247). Regarding the general division, the system of BI represents a form of the general social system, i.e. the right to grant is realized by all individuals in a country.

From these characteristics of BI as a system, two specific issues arise in the literature. First, what level of living standards should such a system provide for

recipients, i.e. what is meant by “basic” income. The response is conditioned by many circumstances like social values and economic situation of the country in which the introduction of such a system is proposed. Theorists disagree about this problem and, on the one hand, certain authors such as Patemann believe that such income should allow a “modest but worthy life” (Pateman in Dowding et al, 2003: 130) or, like Wright, stand for a level that would be enough to meet the basic needs (Wright, 2010). On the other hand, there are those like van Parijs who think that this income should be set to be the highest sustainable level (Van Parijs, 1995: 30). Differences in theories are the result of dogmatic disagreements such as which function the basic income should have in society? The second question we must answer is one about the controversial features related to determining the recipient, or how to determine the affiliation of the individual to the society? Discussions on this issue are reduced to whether persons who are foreigners but live or find themselves in a country have the right to BI? Most of the authors agree that recipients should be members of a certain territorially defined community. Such an understanding is logical because this system redistributes wealth created in a country to reduce inequality among members of society. Parjjs and Vanderborgh argue that the recipient needs to be a tax resident of a specific country regardless of his/her nationality (Van Parijs, 2017: 9-10). In their opinion tourists and other travelers, unregistered migrants, diplomats, and officials of international organizations whose incomes are not taxable should not have the right to basic income. They also exclude prisoners who would only exercise this right at the time of release because the costs of their support in institutions exceed the amount of BI. Ferry, for example, claims only citizens of the specific country have the right to BI (Ferry, 1995).

Regarding the financing of the system, given the difference between the insurance system, the tax system and the social security system (Ravnić, 2004: 284), the system of BI is not dependent on liquid payments but is financed by the system of tax assignment i.e. the funding system is collected from different sources. This makes it easier to achieve the long-term stability of individual income due to relative resistance to changes in the economy.

Depending on the tax system and the tax forms which are used for the financing of the system the burden can be divided to all taxpayers which would reveal the purpose of BI as a measure of redistribution of social wealth, because no doubt the burden is borne more heavily by those who generate higher in-

comes or can be financed by tax certain perpetual sources of income (e.g. natural resources).

Given the non-linkage of the right to contribute, the system of BI is considered a non-binding system i.e. there is no obligation to pay contributions to obtain the right to grant. Acquired right is not a counterbalance to the contributions paid by individual person but is considered as fulfilling the duty of the state to take care of its citizens or residents. Unlike, for example, the pension insurance system where not only the right to benefit depends on whether the user has paid contributions but also the amount of the allowance is determined by the contributions paid (Ravnić, 2004), the BI is not conditioned by the earlier payment of the contribution and its value doesn't decrease or increase depending on previous payments.

Given that there is no linkage between the obligation to contribute and the rights that are obtained the system of BI is considered a non-binding system (Ravnić, 2004: 280) i.e. there is no obligation to pay contributions to obtain the right to BI. Acquired right is not balanced with the contributions paid by a specific person but is considered as fulfilling the duty of the state to take care of its citizens or residents (Ravnić, 2004: 250). Unlike, for example, the pension insurance system where not only the right to benefit depends on whether the user has paid contributions but also the amount of the allowance is determined by the contributions paid, the basic income is not conditioned by the earlier payment of the contribution or its height decreases or increases depending on it.

One of the essential features of BI is the payment of cash benefits that would make this system part of income support system (Ravnić, 2004: 237) which is aimed at keeping the recipient's income at a certain level. While existing income systems are conditioned by certain circumstances that have led to income loss (e.g. unemployment or disability), the BI system is not conditioned by the occurrence of any circumstances and the individual's income is determined in advance and independent of other factors.

The system of BI has certain similarities with the social welfare system. The social welfare system does not secure the individual from some future, potential and harmful dangers but aims to meet an existing and present social need of an individual (unemployment) (Ravnić, 2004: 239), which can also be fulfilled by BI. The most important difference in relation to the social welfare system is that the system of basic income is not related to the occurrence and termination of

some specific needs or circumstances but exists as a constant and unconditional income of an individual. There is also a difference in the guarantee that is given to the individual, i.e. the BI guarantees the individual not to fall below a certain standard of living which would still be higher than the standard guaranteed by the social welfare system. It can be understood as a system whose aim is, among other things, the elimination of poverty in society.

3. BASIC INCOME AS INDIVIDUAL'S RIGHT

There is a consensus among the proponents of BI about the main features of the system namely: a) payments in money; b) payments on an individual basis; c) unconditionality; d) regularity of payments and long-term stability (Parjis, 2017: 12-40).

a) Payment in cash

The reasons for the payment of BI in money follow from the desire to allow the individual free disposal of such funds. Donations in goods generally impose certain limits on the recipient (Ravnić, 2004; 279). Food, accommodation, and clothing can provide the recipient with necessities but are not tailored to her specific needs. The essence of BI is to enable the individual's preferences to be achieved, and in the market, economy money is considered the most appropriate means to achieve this goal. Cash payments have smaller administrative costs than attempting the equitable distribution of donations such as food or lodging arrangements (Parjis; 2017, 13). The costs of public procurement, transportation, food storage, salaries to persons responsible for distributing food to recipients as well as salaries of persons in charge of controlling the entire procedure greatly contribute to the costs of these programs. Other costs to society, such as corruption, clientelism, and lobbying, may arise from state-run benefits. Political actors who make decisions about these donations are particularly exposed to corruptive influence. Perhaps the most important argument in favor of cash payments is the increase in the purchasing power of the recipient, which contributes to the strengthening of the local economy (Parjis, 2017). The arguments about corruption and clientelism are quite important in developing countries where humanitarian aid flows make the economy of these countries dependent on foreign aid in the long run and local officials are often corrupt. All the arguments for cash payments should be understood in the sense that they imply the existence of an effective and transparent market free of discrimination.

b) Payments on an individual basis

BI is paid exclusively to an individual and its value is set and transferred independently of the household's level of income (Parjis, 14). It is individual because it is not paid to say *pater familias* who represents household and who would then dispose of it for the benefit of others. Every member of the household has the right to dispose of with their BI as they see fit (Guy, 2017, 17). Unlike BI certain social benefits may vary depending on the marital status, age, ability to work, etc. based on the understanding that households with more members make significant savings due to the fact of a common household. BI does not make such distinctions.

Some authors believe that only adults would be eligible for disbursement, while others include minors in the circle of beneficiaries. If minors were given BI they would get a smaller amount of income, and this would be paid to their parents or guardians (Parjis, 2017, 14).

c) Unconditionality

BI is given unconditionally to every member of society. Everyone has the right to BI and realizes it in the same amount regardless of their property or income from other sources (Raventos; 2007, 9). It seems ineffective to give BI to individuals who *de facto* fund the system. In the literature such criticisms are rejected for several reasons: it is primarily criticized for the inability of such systems to efficiently identify the needy because of the many bureaucratic obstacles, while at the same time some members of society appear to be parasitizing at the burden of the system (Parjis; 2017, 19). Also, when assigning the right to BI in correlation to the amount of earned income, the recipient is deferred to increase his/her income due to the so-called "unemployment trap" (Mankiw; 2006; 444). Another aspect of unconditionality is manifested in the absence of limitation or control over the spending of BI, the recipient is free to dispose of his/her income in whichever way he/she thinks fit (Standing, 2017; 17). The recipient is not obliged to undertake any activity, i.e. more specifically his right is not conditioned by employment, job search, volunteering, etc.

d) Regularity and stability

BI is given as a payout at regular intervals and is most often envisioned as a monthly income, but it is also possible to set it at longer or shorter time intervals (Standing, 2017: 16). Also, its amount must be stable enough for a longer

time, but this stability does not mean the need for fixing it to a certain amount, yet it may be linked to the GDP or the consumer price index (Parjis, 2017: 9). They should be paid automatically, without the need for any claim or other administrative barriers that would make the payment dependent on an individual's initiative.

4. DEVELOPMENT OF BI THEORY

The real beginning of building up the contemporary concept of BI is mainly associated with the American Philosopher Thomas Paine (1737-1809) and his work "Agrarian Justice" in 1797. In it, Paine puts the idea of "creating a fund that would pay every person turning 21 15 pounds as a partial compensation for the loss of his/her natural heritage for the introduction of land ownership" (Pain, 1999: 17) He also suggests that "this fund" should pay a lifetime of £ 10 per year to every person who is 55 years old".

In his proposal, we can identify the characteristics that we associate with basic income such as unconditionality and individual payment in money while it differs from the modern concepts of BI that such payments were intended for young men as a one-time payment, and only for older ones as a continuous giving.

English teacher Thomas Spence was critical of Paine's proposal. In his work "The rights of infants" in 1797, he suggested creating universal payments, i.e. all individuals unrelated to age, gender or property status would receive regular payments, versus Paine's partial payments based on age (Spence, 1797). He also considers the land to be the basis for funding such a grant, while Paine only proposed to use the value of uncultivated land as the common good of mankind while he viewed the improvements of it as private property (Paine, 1999:17-18). Given that personal property was a product of society, owners had an enforceable obligation to contribute to the costs of the system that had made their accumulation possible (Cunliffe & Erreygers, 2004: XIV). Spence, on the other hand, believed that all the land and all its upgrades are common good from which everyone should benefit (Spence,1797). Spence's proposal was territorial since the organization of the system would be based on separate local units (ibid; Cunliffe & Erreygers: 2004).

The next step in the development of modern understanding of BI was made by the Belgian author Joseph Chalier in 1848 in his book *Solution du Problème Social*. It contains a more radical version of Paine's and Spence's proposals namely it extends the application of basic income to the national level. Chalier advocated the right of all individuals to a permanent income that would not be conditioned by work or any other fact and which would be high enough to allow the individual's basic needs to be met. That was the design of the idea of basic income as we understand it today (Cunliffe & Erreygers, 2001: 459– 484).

The French philosopher Francois Huet in his book *Le Règne Social du Christianisme* (1853) argued for “scheme for inheritance taxation of natural resources and produced assets that would subject goods to a zero-tax rate on the first intergenerational transfer but a 100 percent tax on the second. The proceeds would be disbursed through an equal basic capital grant (‘dotation’) to every maturing adult” (Cunliffe & Erreygers, 2004: XVIII).

A re-discovery of the BI theory began in the early 20th century England. The discussion was opened in 1918 by the English philosopher Bertrand Russell in his book “The road to freedom” (Parjis, 2017: 78) in which he advocates a social model that connects socialism and anarchism, and whose essential element is basic income. It differentiates between two variants of income, the first form being the one to which everyone would be entitled regardless of their employment and who would be big enough to meet the basic needs of the individual. The other form of income would be set to a higher amount and would be intended for those who would be prepared to do some work that society considers useful (Russell, 1966: 81-82).

Milton Friedman also gave his contribution to the understanding of BI. In his book “Capitalism and freedom” in 1962, he proposed a negative income tax, i.e. tax form that would be based on the taxation of high-income households and the transfer of funds to households with a low income (Friedman, 1992). This is strictly speaking not BI but negative income tax. The main difference is that BI is paid to all (and to those with higher incomes and lower income) while negative income tax has the form of tax refund only for low-income households. Key components of his proposal were: the income transfer that should give the recipients enough incentives to want to get out of the program and the price of the program that should be the lowest possible that the public would want to pay (Parjis, 2017:85; Friedman, 1992). This proposal in various interpretations

was accepted by many respectable economists such as Paul Samuelson, John K. Galbraith, and Robert Solow, as well as political activists such as Martin Luther King. The importance of Friedman's proposal is that he has been able to win advocates of different ideologies with his persuasiveness, as evidenced by the fact that American President Richard Nixon in his 1969 "Family Assistance Plan" (Birnbaum, 2016: 4) advocated a very broad grant that would be based on a negative income tax, which would effectively enable a broader circle of recipients material security similar to what is meant by BI. At the US presidential election in 1972 Nixon's adversary and Democratic Party candidate George McGovern in his program advocated an even more ambitious proposal called a "national income grant" (Parjjs, 2017: 91) that we could consider to be a BI. The failure of Nixon's proposal to win the majority in the Senate and McGovern defeat in the elections stalled for some time in a serious US debate on introducing basic income at the national level. It should also be mentioned that in 1982 Alaska's "Alaskan permanent dividend" was introduced, a modest but stable system of basic income.

An important year for the idea of BI was 1986 when the Basic Income European Network (BIEN) was established. The urge to convene the congress in which this network was founded came from the "Charles Fourier Collective", a group of scientists and researchers who published the article entitled "L'allocation universelle" for which they received a Belgian prize (Raventos, 2007). At the conference held in 2004, the network was renamed into the Basic income Earth network to encourage members of non-European countries to encourage greater global involvement. BIEN's aim is to "serve as a link between all individuals and groups interested in basic income and encourage informed discussions about it throughout the world" (BIEN, 2018). The importance of BIEN's work is largely in the standardization of the notion and its clear definition, but also as an important compendium of contemporary research into the introduction of basic income around the world that has been or is currently being carried out. The popularization of the idea of BI through the work of BIEN, as well as by numerous authors, led to the expansion of idea beyond the developed countries and today many research and experiments in basic income are being carried out in Africa and South America (Murray & Pateman, 2012: 33-58).

5. EXAMPLES OF BI

We will now turn to examples of BI in history and modern times. In the history, we can highlight three models of “primitive” BI which may not include all the features of BI in the modern understanding but are very close to it, namely Athens, Rome, and England.

5.1. ATHENS

The first rudimentary idea of a BI as something that would be disturbed to all members of society can be found in ancient Athens where the discovery of silver mines encouraged the Athenians to discuss whether they would use the mining income to pay each of the Athenian citizens certain amount of it or to use the money to strengthen the navy during the 480s BC (Plutarh, 2009). We can see here that only Athenian citizens who were adult males were eligible for this payment

After the Peloponnesian war, Athens lost its primacy and was weakened socially and economically. Respecting the place Athens had until then Xenophon proposed in his essay *Ways and Means* a plan of reconstruction. One of the suggested measures was the establishment of the financial fund which would (among others) provide for 3 obols of sustenance as daily wage. The income of the silver mines in Laurion would ensure the income as should taxes and voluntary payments. Xenophon’s attitude to the fact that it was a certain sum that every Athenian would receive was clear (Xenophon, 1925). This measure, Xenophon thought, would prevent poverty and would contribute to the growing popularity of the city.

5.2. ROME

The expression *panem et circenses* was used by the Roman poet Juvenal in his Satire to criticize the people who are uninterested in political and social problems but who are completely resigned to life and dependence on state food and entertainment. Juvenal’s criticism was expressed on the part of the population who was the most numerous and worst of. In his time (2nd century AD) it seemed it was better to be a rich man’s slave than poor freeman (Carcopino, 1964: 78).

The sale of grain as a measure to help the poor in the city of Rome began in 123 B.C with Gaius Gracchus, or by passing the first in a series of wheat laws known as *lex Sempronia Frumentaria*, which determined the monthly sale of a certain amount of grain to the citizens of Rome at a low and fixed price of 6 aces per modius as well as the construction of state granaries, thereby guaranteeing the fundamental right of every Roman citizen to buy cheap grain. Grain shortages and starvations were not a rarity in the ancient times and for this reason, the authorities were often forced to introduce a certain temporary form of relief or to help the area affected by shortage (Rickman, 1980). The novelty in Gaius Gracchus political activity was that he made provisional measure permanent. The need for such a procedure was due to several reasons: the growth of the population of Rome from about 180,000 in 270 B.C to 375,000 in 130 B.C (Rostoftzeff, 1998). Buying grain by law was unconditional, so anyone who wanted to stand in front of the state granary could earn the right to buy such grain, and according to some estimates, the price of grain was half the market price. Initially, there was no fixed place where citizens could buy grain under these favorable conditions only that the place and time of grain sale had to be announced in advance by authorities. There was no property census so rich and poor could have used this right. The *pater familias* as used this right in the name of the household. In the beginning, some 50,000 citizens came to use the right to cheap grain, but that number increased over time. There was a monthly limit on purchasing up to 5 movies per family (Garsey, 1993). As far as finance is concerned, a smaller share of the costs was born by richer Romans and most of it was collected by taxing provinces, forcible grain sales or even confiscation (Haskell, 1947). Immediately after the assassination of Gaius Gracchus the senatorial class did not dare to abolish this measure because of the pressure of the entire society that began to rely on it. It was shortly abolished by Sulla in his effort to balance the state finances, but it was reestablished later.

An important change in the system was in the 58 B.C. with the adoption of the *lex Clodia Frumentaria* which introduced free grain giveaways instead of the current system of sale at a more favorable price. One of the most important consequences of the Clodius Act was the increased immigration of people to Rome, which further financially burdened the sustainability of grain handouts (Haskell, 1947). Even though poorer peasants have moved to Rome before this law, the free division of grain has caused a great acceleration of this process. Another consequence was the increase in the number of liberated slaves because

the slave owners wanted to shift the burden of caring for the slaves on the state. Finally, from August to the end of the Roman state, free grain yield remained the privilege of the city of Rome. It could be said that citizens of Rome after the insecurity of Civil Wars in First Century B.C gladly gave up their freedom in exchange for stability which was provided by August and which included free grain (Watts, 2018).

5.3. EARLY MODERN ENGLAND

Given the number of the poor in 16th century England and fees that parishes had given to various types of poor these fees may be considered as a certain form of basic income. To clarify, the costs of wars with France and Scotland, inflation and the price increase of products, further burdened the English population in the 16th century, which is why the number of the poor was increasing. Because of the abolition of the monasteries and the lack of charitable funds the situation further aggravated. The state assistance was reserved for the impotent poor. The able-bodied poor who could work were treated like vagabonds and severely punished. In 1563 for the first time, the social assistance for socially vulnerable was arranged. Taxes for the poor were introduced in 1572 followed by a series of other laws that should aid the poor. But only with the law in 1601. begins the era of the state taking care of those less well off (Handel, 2009). The “poor law” implied the so-called “outdoor relief” and “indoor relief” and in 1830 the “indoor relief” as a permanent allowance for the poor was 2 % of national income which wasn’t enough to support the poor (Boyer, 1990).

5.4. ALASKA

Alaska is currently the only place in the World that has introduced a national BI system. Its emergence began in 1956 with the ratification of the constitution of the state of Alaska, which established joint ownership of all land and natural resources in Alaska (Widerquist & Howard, 2012: 3). Later with the discovery of large oilfields in 1967, there emerged ideas to establish a common fund which would be financed from oil-harvesting. This was done in 1976. The next step was made in 1982 when the decision was made to pay part of the fund’s earnings as an annual dividend to each resident of Alaska (Widerquist & Howard, 2012: 3).

Regarding the legal arrangement of this system, it consists of two components: Alaska Permanent Fund (APF) and Alaska Permanent Dividend (APD). APF is a state-funded investment fund established by a constitutional amendment that makes this component politically more stable due to the political majority needed to amend the constitution, while APD has been established by Statute and therefore subject to more frequent changes (determining the annual dividends) (Basic Income News, 2018). Fund management is entrusted to the Alaska Permanent Fund Corporation (APFC) a state corporation which has the task of investing fund assets on the capital market to achieve long-term financial sustainability. APFC is also tasked with paying dividends to Alaska residents.

The dividend is seen as a means of distributing the wealth generated by the exploitation of oil resources so that every Alaskan resident can participate in its profits. Implementing this idea required solving a series of dilemmas. Concerning the definition of the recipient at the beginning of the program in 1982, it was decided that the right to a dividend would be realized by persons with residence with a minimum duration of 6 months, and in 2010 that period was extended to a period of 12 months (Widerquist & Howard, 2012: 44). The question of whether the minors have the right to a dividend was also raised together with the question if dividend should be paid to them or to their parents or guardians? Or should the money be put into a special fund and the minors would be able to dispose of it after they came of age? The Alaskan assembly decided that minors were entitled to a dividend and that it will be paid to their parents or guardians. Also, death dividend was introduced in 2010 allowing the heirs to acquire the right to an undistributed dividend if death in the current year (Widerquist, & Howard, 2012: 44). Regarding the periodicity of disbursement, it is intended as an annual grant, i.e. the full amount for the previous year will be paid in October.

Certain observations of change in the economic behavior of the recipients of the BI in Alaska can be made. In the first period when they did not know whether the dividend would last or not, the recipients treated these additional funds as being temporary and used them to repay debts, purchase durable or luxury goods or save them (Knapp et al, 1984) which is in accordance with the theory of money windfall (Arkes et al, 1994: 331-347). However, as dividend became more permanent recipients began to treat it as part of their regular income. By changing perceptions, recipients began to spend dividends in a way

that does not differ from spending other income, which is reflected in the same level of consumption at the time of dividend payment and the rest of the year, and the unchanged structure of that spending (Hsieh, 2003: 397-405). Perhaps the biggest influence of the dividend was on the economy of Alaska. Regardless of how recipients spent money, dividends increased aggregate consumption and increased government tax revenue, and increased spending led to new jobs, primarily in the commercial and service sectors, which led to increased labor demand (Widerquist & Howard, 2012: 52).

5.5. KENYA

The 36 million people living in Kenya are severely hit by poverty and as many as 46 % of the population lives below the poverty line (Unicef, 2018). The Kenyan economy is based on sustenance agriculture. During the last few years, the rural population has been severely affected by climate changes which jeopardize food production and increase poverty.

It is in Kenya that NGO GiveDirectly (GD) decided to conduct research into the impact of unconditional money transfer on household behavior during the 2011-2013 period. Randomly selected households in western Kenya were given a minimum of \$ 404 per month which is more than twice the monthly average spending in this area. The aim of the research was to determine how such transfer affects the behavior of participants in making economic decisions and would it be a good tool to combat poverty. An advantage of this research was that a large amount of money was transferred over a short period of time, as opposed to existing programs that either transferred a large amount of money over a longer period or smaller amounts over a shorter period. The key factor was that the GD just started working in Kenya and therefore the participants did not expect to receive any money transfers (Haushofer & Shapiro, 2016: 2).

Households eligible for participation were selected according to the poverty criteria established by the type of roof of the house, namely GD found correlation between the type of roof and poverty with roofs made of straw and other natural materials were sign of poverty while metal roofs were associated with affluent households (Haushofer & Shapiro, 2016: 5). The money transfer was unconditional, it was not related to the obligation to work and the agency did not control the spending of it. The money was paid either in one payment or in nine monthly installments. There were two categories of recipients, the first one

receiving a larger sum of \$ 1,500 in the survey period, and the other group receiving a total of \$ 404 (Haushofer & Shapiro, 2016, 7). The recipients received a SIM card with which they had to register to the mobile payment service m-Pesa through which they received the money.

The research results were surprising. The opponents of this form of aid believed that it would increase the consumption of tobacco and alcohol which would lead to more criminal activities and more sexually transmitted diseases. Even the positive aspects of such money transfer were considered defective as they increased dependence on foreign aid (Burbidge et al; 1988: 123–127). By the end of the research, the opposite happened. The money was spent on food and the purchase of livestock and other durable goods (Haushofer & Shapiro, 2016: 36). The transfer increased savings and self-employment investments e.g. one of the participants bought a motorcycle that transported people as a taxi driver (Bregman, 2016: 56). Regarding the payment modalities, monthly payments proved to be more conducive to positive effects than a onetime payment, and variations in the amount seem to have no noticeable effect (Haushofer & Shapiro, 2016: 36).

5.6. FINLAND

In 2017 the Finnish government launched a pilot project by which 2000 randomly chosen unemployed persons aged 25-58 would get a monthly payment of 560 euros unconditionally and without any testing. The experiment ended on 31st of December 2018 and it will not be continued (Kela, 2019). In its study of BI effects Kela found out that “experiment did not increase the employment level of the participants in the first year of the experiment” but “according to a survey, at the end of the experiment the recipients of a basic income perceived their wellbeing as being better than did those in the control group. The recipients of a basic income had fewer stress symptoms as well as fewer difficulties to concentrate and fewer health problems than the control group” (Kela, 2019).

6. CONCLUSION

Is BI the future of Welfare State and solution to the problems of the social security system? As Nell in her analysis of Austrian economics stance on BI pointed out “all individuals can never be given a completely equal start, nor can

any government know the needs of all individuals, and differences in earning potential cannot be erased. However, a policy that offers all individuals a safety net and a head start could help to ensure opportunity for all those who can work, and subsistence for all those who cannot. Charitable and volunteer work would then more easily thrive and help to raise living standards for the least advantaged” (Nell, 2013: 34). As we have seen, the Finnish pilot revealed that BI and other forms of social security did not produce different results regarding the ability and motivation of the recipients to find work, but the BI was administratively easier for recipients. Our examples show that BI had much more impact on welfare in poorer countries like Kenya than in richer countries like the USA and Finland. The Alaskan example is a good example of how the resource management could financially benefit all the members of the community unlike unfortunately the mismanagement of oil resources in many countries.

Rudimentary systems of BI in Athens, Rome, and early modern England show that system of BI can function in economically less developed societies. Different conditions led to the establishment of these systems. As we have seen Romans were more than glad to exchange their political freedoms for stability which included free grain (Watts; 2018). It is not unimaginable that Western liberal democracies could come under pressure of populist parties promising the voters one or the other type of BI in exchange for the loss of political and human rights which are bound to follow the introduction of one or the other form of the populist authoritarian regimes.

Technological change with more automatization in production and more informatization and digitalization in the service sector is bound to increase the unemployment in the very long run (Frey and Osborne; 2013; Manyika et al, 2017) and the BI system might become the solution to these problems.

The BI in our opinion would make social security less bureaucratic and more manageable since it could replace the unnecessary duplications and administrative jungle in the social security system.

Abstract

The tax burden on income from employment is a very important issue in the economy of the Republic of Croatia. In the last three years, a lot has been done by the legislature to relieve the citizens of various tax burdens. The tax reforms which were, among other changes, aimed at changes in the taxation of the income from employment, were the following: the basic personal allowance of the workers was increased, the number of tax rates was decreased with the extension of the tax rate for the application of the lowest tax rate, the deduction of income tax based on the residence of workers was abolished under special regulations and, with the last tax reform, some of the contributions paid on workers' salaries were abolished as well. For this very reason, the aim of this paper is to determine how these changes have reflected on the overall satisfaction of individuals and how reform measures of taxation of the income from employment have influenced the individuals' consumption and savings. In the

first part of the paper, an analysis of the taxation of the income from employment for the period from 2016 to 2019 was made, while the second part of the paper examined the attitudes of individuals about the changes in the system of taxation on the income from employment and the influence of taxation on their consumption and savings based on the executed research.

Keywords: *tax burden, income from employment, savings, consumption*

JEL Classification: D14, H24

1. INTRODUCTION

The tax system of the Republic of Croatia is a pluralistic tax system that was established upon the independence of the country in 1991. It developed in several phases and is considered modern and in coordination with the guidelines of the European Union (Bibić, 2016). The Republic of Croatia saw the need for an additional alignment of fiscal policy measures, as well as the need for coordination with the legal *acquis* of the European Union along with accomplishing welfare for the Croatian economy (Šimović, 2006). The tax system of a certain state, thus also the tax system of the Republic of Croatia is neither permanent nor everlasting, i.e. every tax system is susceptible to amendments that strive to accomplish a greater efficacy and simplicity upon collecting taxes. The Republic of Croatia saw a great number of legislature and bylaw amendments during the last two decades and more of its existence, but the tax system reforms that came into force on January 1, 2017, are considered the most complete and most comprehensive reforms by far. Vlaić (2017) states that the total of eight legislatures was amended or complemented, while seven of them saw as many changes as to be considered new. If we add bylaws to the equation, the reform can be considered even more comprehensive and extensive.

The tax burden on employment is a significant part of the economic policy that can have a great impact on the level of individual consumption as well as on employment. It is unattainable to expect that the tax policy would lead to the resolution of economic instability. However, it can be expected that the tax policy will contribute to the establishment of stability (Šimović and Deskar-Škrbić, 2015). In accordance with the Income Tax Act (Act 20, Official Gazette 115/16), the income from employment represents the difference between the receipt and the expenditure that emerged in a certain tax period. Kesner-Škreb and Kuliš (2010) emphasize that salaries, pensions and benefits in kind that a

worker receives during the calendar year can be treated as sources of the income from employment, while Urban (2009) concludes that too high a tax burden can have consequences such as cessation of labor by the workforce, as well as their relying on state aid, which then leads to the demand for additional taxation.

2. ANALYSIS OF TAXATION ON INCOME FROM EMPLOYMENT FOR THE PERIOD FROM 2016 TO 2019

Large income tax rates have a discouraging impact on the most competent and creative young people, as well as on the corporate capital. The aftermath of such a condition is the emigration of individuals to areas with lower income tax rates (Roller, 2009). The mentioned aftermath is indeed evident in the past few years in the Republic of Croatia. The question of how to keep the workforce within the national borders is being raised, however, there exists no singular solution to this increasingly significant problem. One proposal imposes a reduction in tax rates, i.e. lowering the tax burden on the income from employment along with reducing the rigidity of the Croatian labor market. This process is, namely, considered to be apt to lead to higher supply and demand for labor, which would result in an increase in employment and, consequently, to a reduction in the emigration of the working-age population (Dragija and Pavlinec, 2016). According to the data of the Croatian Bureau of Statistics (2018), the number of relocated persons from the Republic of Croatia is increasing each year. If we compare the total number of relocated persons in 2016 and 2017, in 2016 the total number was 36,436 and by 2017 this number increased to 47,352 which is 10,916 more than in 2016 – and these numbers are increasing yearly.

2.1 THE LEGAL FRAMEWORK FOR TAXATION ON INCOME FROM EMPLOYMENT

For the purpose of this work, Table 1 presents the summarized data referring to new amendments and reforms that were based on recent legislative amendments which regulate the taxation of the income from employment. These data refer to the conceptual definition of the income from employment, the determination of the annual tax base, the determination of the basic personal tax relief, i.e. the non-taxable part of the income and the tax rate at which the income is taxed.

Table 1. The legal framework for taxation on income from employment

Income Tax Act (Official Gazette 115/2016), Act on Amendments to the Income Tax Act (106/2018)
In accordance with Art. 20, the income from employment is the difference between the receipt received in the tax period and the expenditure incurred in the same tax period. (OG 115 / 16).
According to Art. 18, the annual income tax base makes the total amount of the income from employment, self-employment, and other income which is not considered final but is reduced for the amount of personal allowance. (OG115 / 16).
Article 18, p.3 calculates the advance of the income from employment at the rate of 24% of the monthly tax base below HRK 30,000.00 and the rate of 36% of the monthly tax base above HRK 30,000.00. (OG 106/2018).
According to Art. 14, the basic personal tax allowance of the taxpayer amounts to HRK 3,800.00 (obtained as the coefficient 1.5 of the personal allowance base referred to in paragraph 1 of Article 14), increased for the parts and the amount of personal allowance to which the taxpayer exercises the right. The basic personal allowance under Article 14 p.1 amounts to HRK 2,500.00 (OG 115 / 16).
According to Art. 19, paragraph 1, the annual income tax is paid at the rate of 24% on the tax base below the amount of HRK 360,000.00 and at the rate of 36% on the part of the tax base above the amount of HRK 360,000.00. (OG 106/2018).

Source: Adjusted according to the Income Tax Act (OG 115/2016) and the Act on Amendments to the Income Tax Act (OG 106/2018)

It is also important to mention that the recent Act on Amendments to the Contribution Act (OG 106/2018, p.1) considers the compulsory pension insurance based on generational solidarity, the compulsory retirement pension insurance based on individual capitalized savings and the compulsory health insurance in case of occupational injury or occupational disease as mandatory insurances in accordance with this Act. Depending on the status of the insured person in relation to compulsory insurance, there is an obligation to calculate and compensate the contributions.

According to the Pension Insurance Act (O.G. 115/18), the pension system of the Republic of Croatia is based on the 1st and 2nd pillar of the mandatory pension insurance, as well as on the voluntary pension insurance based on individual capital savings (3rd pillar). In accordance with the Act on Contributions (O.G. 84/08), the insured person's pension insurance based on generational solidarity (1st pillar) is calculated and compensated by the employer by 20% if the person is insured solely in the system of the pension insurance based on generational solidarity. Provided that the person is also insured in the system of

the pension insurance based on individual capital savings, the contribution for the 1st pillar is then calculated in the amount of 15% based on the employee's gross salary. The assets paid from the basis of contributions for the 1st pillar of the mandatory pension insurance are used for the settlement of pensions of currently retired persons.

In relation to savings, what is of special interest for each insured person are the assets paid into the 2nd pillar of the mandatory pension insurance, as well as the assets paid into the 3rd pillar of the voluntary pension insurance. For the persons insured in the 2nd pillar of the mandatory pension insurance, the Act on Contributions (O.G. 84/08, Act 21) prescribes the monthly base for the calculation of contributions, which is the salary, i.e. the income from employment (gross salary), with the contribution calculated at the rate of 5%. The basis for the calculation of contributions and the number of contributions is determined and calculated by the employer. According to the Act on Mandatory Pension Funds (O.G. 19/14), the assets which were raised based on individual capital savings are arranged into pension funds by the Central Registry of Insured Persons (REGOS) and the insured person becomes a member of the selected pension fund. The paid assets of each member of the pension fund are their personal property. However, the insured person can manage the mentioned assets only after retirement and the accumulated assets are the subjects of inheritance. Based on the conducted research, Latković and Liker (2009:460) have concluded that it is unfavorable to plan savings for shorter periods of time in the system of capitalized pension insurance due to an exceptionally high sensitivity for the duration of the saving itself. In addition to that, the authors have emphasized that the amount of capitalized assets is also influenced by the duration of the savings themselves, the yield of the fund in which the capital is found—which also has the greatest impact on the amount of capitalized assets—as well as by the gross salary growth rate. Each insured person who decides to make fund payments into the voluntary pension insurance (3rd pillar) can personally decide on the dynamics and the amount of the assets that they wish to pay. The insured person can also attain a special benefit over the accumulated assets, i.e. the benefit of state incentives distributed from the state budget. 15% of the annual payment amount of up to the maximum of HRK 5,000 enables, namely, a state incentive of up to a maximum of HRK 750.00. The capitalized assets are inherited together with state incentives (Act on Voluntary Pension Funds, O.G. 19/14). Employers who make payments of their employees' premiums into the

3rd pillar of the voluntary pension funds are eligible for tax incentives for the amounts of up to HRK 500.00 per employee per month, i.e. HRK 6,000.00 per year, since they are not obliged to compensate for the income tax on these receipts (Income Tax Act, O.G. 115/16). In other words, the employees' premiums paid into the system of the voluntary pension insurance are considered to be the business expenditures of the employer (Act on the Amendments to the Profit Tax Act, O.G. 80/2010). According to the data of the Ministry of Finance (2017), the total amount of state incentives paid to members of voluntary pension funds amounted to HRK 65.6 million for the year of 2017.

2.2. TAXATION PARAMETERS BEFORE AND UPON THE TAX REFORM

The laws and bylaws and their subsequent amendments led to the definition of the parameters for calculating the contributions and income taxes on employment, as well as the definition of the income surtax. Table 2 shows the parameters that emerged as the result of the tax reforms in the period from 2016 to 2019. In 2016, three tax brackets and three tax rates (12%, 25%, and 40%) were in use for the taxation of the income from employment, while the basic personal allowance amounted to HRK 2,600.00. With the tax reform in 2017, the basic personal allowance increased by HRK 1,200.00 and now amounts to HRK 3,800.00. In 2016, the income from employment was taxed at the rates of 12%, 25% and 40% according to tax brackets, while the year of 2017 saw the changes of tax brackets and tax rates. Three tax categories were no longer in use – there were now two tax categories with the tax rates of 24% and 36%. The same taxation regulations for the taxation of the income from employment were valid in 2018 (Income Tax Act, OG 115/16). Moreover, the year of 2019 brought about changes related to the taxation of the income from employment – an increase in the tax base of the first taxation class below HRK 30,000 compared to 2018 (Act on Amendments to the Income Tax Act, OG 106/2018) with an unaltered tax rate of 24%. A novelty that was brought about in legal regulations and is valid as of 1.1.2019 is that the contributions for occupational health (0.5%) and employment subsidies (1.7%) were abolished, but compulsory health insurance contribution increased from 15% to 16.5%. (Act on Amendments to the Contribution Act, OG 106/2018). Total salary contributions decreased by 0.7% in comparison to previous years, and hence the total cost of employers based on calculation and payment on the income from employment was lowered.

Table 2. Legislative changes to the parameters for calculating the income from employment for the period from 2016 to 2019 the amounts are shown in HRK

Tax rates and tax brackets							
2016		2017		2018		2019	
12%	0.00-2,200.00	24%	0.00-17,500.00	24%	0.00-17,500.00	24%	0.00-30,000.00
25%	2,220.01-13,200.00	36%	17,500.01-...	36%	17,500.01-...	36%	30,000.01-...
40%	13,200.01-...						
Basic personal allowance							
2016		2017		2018		2019	
2,600.00		3,800.00		3,800.00		3,800.00	

Source: Adjusted according to the Income Tax Act (OG 115/16) and the Act on Amendments to the Income Tax Act (OG106/2018)

According to the research by Nadoveza et al. (2016, p.11), “lower taxes on labor have a positive effect on the price of labor and negative effect on the price of capital” although the labor tax is lower, which implies lower government tax revenues, government consumption of all goods increases due to higher consumption and household income”.

Table 3. shows the taxation of the income from employment on the example of a certain taxpayer for the period from 2016 to 2019, i.e. it shows the taxation of the income from employment before and upon the tax reforms in question. The calculation was made on the assumption that the taxpayer resides in a town with the tax rate of 10%, the assumption that the taxpayer has no dependent family members and the assumption that his monthly gross salary level amounts to HRK 10,000.00. Contributions from salaries are calculated at the same rates in the four-year period as there were no legal changes in that part of the observed period that would affect the calculation of the sample. For this reason, the calculated contributions from salaries on the example of this taxpayer are equal for all four years. The observed period saw an increase in the amount of the basic personal allowance – the basic personal allowance in 2016 amounted to HRK 2,600.00 and with the tax reform of 2017, it was increased to HRK 3,800.00 in order to increase the existential minimum of the taxpayer. By increasing the basic personal tax allowance of the taxpayer in question, the tax base decreases, which for this taxpayer signifies a decrease in the tax base by HRK 1,200.00. In

the example given, total salary allowances were reduced by HRK 70.00, due to legislative amendments compared to previous years. In recent years, tax reforms have been aimed at increasing the net salaries of taxpayers for them to keep higher available amounts of capital for the improvement of living standards, i.e. for additional consumption or savings. Kesner-Škreb (1999, p. 67) emphasizes that a more progressive income tax puts a burden on savings more than a less progressive income tax, although the research made by Musgrave and Musgrave (1988) indicates that the impact of the taxation progressiveness is less significant for the level of savings than expected. Apart from the income tax, the consumption taxes also have an impact on savings, but ultimately, they put a higher burden on total consumption compared to savings. Savings represent a deferred consumption that will eventually still be taxed with a value-added tax.

Table 3. Calculation of the income from employment of a taxpayer before and upon the tax reform the amounts are shown in HRK

No.	Description	(2016)	(2017)	(2018)	(2019)
1	Gross salary	10,000.00	10,000.00	10,000.00	10,000.00
2	Contributions from salaries				
	1st pillar - contributions for pension insurance based on generational solidarity (15%)	1,500.00	1,500.00	1,500.00	1,500.00
	2nd pillar - contributions for pension insurance based on individual capitalized savings (5%)	500.00	500.00	500.00	500.00
	Total amount	2,000.00	2,000.00	2,000.00	2,000.00
3	Income (1st-2nd)	8,000.00	8,000.00	8,000.00	8,000.00
4	Basic personal allowance	2,600.00	3,800.00	3,800.00	3,800.00
5	Tax base (3rd-4th)	5,400.00	4,200.00	4,200.00	4,200.00
6	Income from employment tax	1,064.00	1,008.00	1,008.00	1,008.00
7	Subtax on income tax (10%)	106.40	100.80	100.80	100.80
8	Total amount of tax and subtax	1,170.40	1,108.80	1,108.80	1,108.80
9	Net salary (3rd-8th)	6,829.60	6,891.20	6,891.20	6,891.20
10	Income contributions				
	Contribution for health insurance (15%)	1,500.00	1,500.00	1,500.00	(new tax rate 16.5%) 1,650.00
	Contribution for occupational health (0.5%)	50.00	50.00	50.00	(revoked)
	Contribution for employment (1.7%)	170.00	170.00	170.00	(revoked)
	Total amount	1,720.00	1,720.00	1,720.00	1,650.00
11	Total cost for the employer	11,720.00	11,720.00	11,720.00	11,650.00

Source: Calculations made by authors according to the Income Tax Act (OG 115/16) Act on Amendments to the Income Tax Act (OG 106/2018), and the Pension Insurance Act (OG 115/18),

Table 4 shows the amounts of average monthly salaries for the period of five years, from 2013 to 2017, according to the Croatian Bureau of Statistics (2018). In 2013, the average net salary amounted to HRK 5,515 and it increased over the following years. In 2017, the net amount was HRK 5,985.00, which presents an increase of HRK 470.00 compared to 2013.

Table 4 Average monthly net and gross salary per employee in the legal entity

Average monthly salary	Net amount (HRK)	Gross amount (HRK)
Year		
2013	5,515.00	7,939.00
2014	5,533.00	7,953.00
2015	5,711.00	8,055.00
2016	5,685.00	7,752.00
2017	5,985.00	8,055.00

Source: Adjusted according to the Croatian Bureau of Statistics (2018): Croatia in numbers 2018, Zagreb, 2018

The tax reform of 1 January 2017, which is considered the most complete and comprehensive reform by far, sought to achieve a simple and more stable tax system (with lower tax rates), which is less penalizing than the current tax system. Such a tax system leads, first and foremost, to a surplus of funds in the accounts of the citizens and increases the probability of additional citizens' consumption. Personal consumption is of crucial importance in the European Union since it constitutes somewhat less than 60% of the total GDP (Croatian Chamber of Economy, 2017). According to the data of the Government of the Republic of Croatia (2017), the European Commission has projected the growth of the Croatian economy by 2.6% for 2016, 2.5% for 2017, and an increase of 2.4% for the year 2018. In 2016, the economic recovery increased and was by 1.7% higher than anticipated. Moreover, the Chamber anticipated a consumption growth of 3.4% for the year 2017, which was particularly influenced by the decrease in the taxation of the citizens. Consumption growth was also anticipated for the year 2018, although somewhat more modest (The Government of the Republic of Croatia, 2017). With a per capita consumption of 62% of the European average (EU average = 100) in 2017, Croatia took the penultimate place with respect to other members of the European Union. The level of personal consumption in 2016 amounted to 61%. The consumption grew by 1% in 2017. If we compare the years 2017 and 2015, the situation is somewhat different – the consumption grew from 59% to 62% and the total consumption growth amounts to 3%. Moreover, when the years 2017 and 2016 are taken

into consideration, Croatia finds itself above the regression line, i.e. the personal consumption for this area is higher than anticipated (Levaj, 2018). On the other hand, citizens' deposits also recorded a certain growth and exceeded the amount of HRK 200 billion. Taking the annual growth rate into consideration we can see that it amounts to HRK 7.5 billion, i.e. almost 4% (Croatian National Bank, 2018).

3. METHODOLOGY AND RESEARCH RESULTS

Primary research was conducted on a selected sample of $N = 128$ subjects. The research was conducted by means of a survey questionnaire via social media, as well as by means of individual interviews with the respondents. Out of the total number of respondents, $N = 103$ responded to the survey questionnaire. Out of the total number of respondents, 76% responded via social networks, while the rest responded by means of individual interviews. The research was conducted over the last two weeks of January 2019, and the total time needed to prepare the research, to collect responses from the respondents and to process the obtained data amounted to about one month. The survey questionnaire included 12 questions structured in such a way that they included questions of a closed type as well as combined questions with responses offered. A total of 4 questions referred to the sociodemographic characteristics of the respondents. Taxpayers' views on the latest changes in the taxation system of the income from employment were examined based on the remaining 8 questions, while the respondents' views on the impact of taxation on their consumption and savings were examined by means of the Lickert scale with 7 statements and intensity levels of a claim. The respondents rated their attitudes with grades from 1 to 5 – with grade 1 corresponding to the attitude “I completely disagree with the stated claim”, while the grade 5 corresponded to the attitude “I completely agree with the stated claim”.

Out of the total number of respondents, 60.2% were male, while 39.8% of respondents were female. According to their place of residence, the greatest number of respondents (36.9%) came from Virovitica-Podravina county, followed by the respondents from Zagreb county (13.6%) and the respondents from Bjelovar-Bilogora and Koprivnica-Križevci counties (both with 10.7% of respondents). Other counties were represented by less than 10% in this research. According to the age structure, the majority of respondents (37.8%)

were of age 35-44, 22.3% of them were of age 18-24 and 18.4% of respondents were 45-54 years old. Other age groups included the age group 25-34 (14.5%), while the least represented were the respondents between the ages 50 and more (7%). According to the level of education, the most represented group of respondents were the respondents with a grammar school or a vocational school diploma (44.7%), followed by the respondents with a college or university diploma (30.1%), the respondents with master and doctoral degrees (8.7%), while the remainder of respondents have completed a three-year vocational school (16.5%).

Out of the total number of respondents, 93.2% were employed in the period of the research, while the rest 6.8% were unemployed. The number of net salaries among the majority of respondents (39.8%) ranged between HRK 5,000.01 and 8,000.00. 13.6% of respondents received a salary higher than HRK 8,000.00, while 28.1% of respondents received a salary of between HRK 3,000.00 and 5,000.00. Since they were unemployed, the remaining 6.8% of respondents did not state their claims on the question of the range of their net salaries. Out of the total number of respondents, 11.7% received a net salary of up to HRK 3,000.00, which signifies that they received the amount of the minimum net salary¹ and were thus not obliged to pay the income tax on their employment. When asked whether they are familiar with current tax reforms, 59.2% of respondents answered yes, but superficially, while 23.3% of them answered that they were completely familiar with current tax reforms. The remaining number of respondents (17.5%) answered that they do not have any knowledge of tax reforms. Regarding the change of legal regulations in a part of the taxation of the income from employment, 76.7% of respondents were familiar with legal changes. When asked about the tax rate for the income from employment, 71.9% responded correctly (tax rates of 24% and 36%), and 79.6% of respondents were informed of the amount of basic personal allowance (HRK 3,800.00) – the amount by which the tax base for taxing the income from employment is reduced. Since the respondents could answer the question of *how do you spend your disposable income from employment* in more than one way (consumption, savings, utilities, loan repayments, other), the research has indicated that 88.3% of respondents spent a part of their disposable income

¹ According to the Regulation on Minimum Salary for 2018 (OG 122/17), the amount of the minimum net salary for 2018 was HRK 2,751.84 and in accordance with the Regulation on Minimum Salary for 2019 (OG 109/18), the minimum net salary amounts to HRK 3,000.00, or a gross amount of HRK 3,750.00.

mostly on consumption, 85.4% on the utilities, 61.2% on loan repayments, and 62.1% of respondents redirected a part of their disposable income to savings. Out of the total number of respondents in the sample, 98.1% of them received their salaries regularly.

In the part of the research which examined the respondents' attitudes towards the impact of the taxation of consumption and savings, the respondents were asked to evaluate the stated claims from 1 to 5 according to intensity levels. Out of the total number of respondents, 90.3% stated the view that they fully agree that *frequent changes to tax regulations are puzzling for the taxpayers*. Chart 1 shows the respondents' intensity levels for the claim that *The taxation of the income from employment affects the respondents' decisions about consumption and savings*. The total number of 42.7% of respondents did not agree with the stated claim, while only 4.8% completely agreed with the stated claim.

Chart 1 Attitudes of respondents on the claim that the taxation of the income from employment affects their decisions about consumption and savings

Source: Calculations made by authors

68.9% of respondents neither agreed nor disagreed with the claim that *tax reforms affect consumption, but not savings*, while 20.4% of respondents did not agree with the mentioned statement. Chart 2 shows the respondents' attitudes towards the claim that they *put a certain amount of money on savings on a monthly basis regardless of the tax burden*. According to the obtained data, 66.1% of respondents save money on a monthly basis regardless of the tax burden on the income from employment.

Chart 2 Attitudes of respondents on the claim that they put a certain amount of money on savings on a monthly basis regardless of the tax burden on the income from employment

Source: Calculations made by authors

Moreover, 57.2% of respondents stated that they agree with the claim that *they save money because they are afraid of uncertainty in the future*, and 82.5% of respondents make their savings from other sources of income (labor contract, income from capital, income from property, authoring fee) and not from the income from employment. A total of 52.5% of respondents agreed with the claim that they do not intend to change their consumption-related habits regardless of the taxation of the income from employment, while 27.1% completely disagree with the mentioned claim.

4. CONCLUSION

Frequent amendments to laws and regulations have a puzzling impact not only on taxpayers but also on the experts dealing with the issue of taxation. Each amendment to tax regulations leads to certain disapproval by the ones affected by the amendment. The recent tax reform, which came into force in early 2019, increased the income tax scale in which a lower tax rate of 24% was applied, which ultimately allows every taxpayer to earn more income from his employment while his tax burden does not increase. What is more, higher incomes result in higher consumption or savings, depending on the preferences of taxpayers. Based on the conducted analysis and research made on a selected

sample of respondents for the purpose of this work, it was observed that certain taxpayers earn a minimum salary or a salary slightly higher than the minimum. Therefore, the amount of the taxation on the income from employment does not play too much a role on their deciding on consumption and savings since they are not obliged to pay taxes on the income from employment when using their basic personal allowances as the opportunity to lower their tax base. Although the likelihood of savings changes over the life cycle, research has shown that, despite the high cost of living, most of the respondents still put a part of their earned income on savings regardless of the tax burden on the income in question. What is also interesting is the fact that more than a half of all respondents in the survey claimed that they do not intend to change their consumption-related habits, regardless of the taxation of the income from their employment.

Abstract

The study explores the nexus between the quality of governance and entrepreneurship in the 28-member states of the European Union between 2000 and 2017. In order to achieve the estimation results in terms of the correlation between quality of governance and entrepreneurial activity, we define quality of governance as public policies measured through Worldwide Governance Indicators (WGIs), published by the World Bank, namely Government Ef-

fectiveness (GE), Regulatory Quality (RQ) and Control of Corruption (CC). In terms of entrepreneurial activity, the following indicators were considered: Fear of Failure Rate (FFR), Entrepreneurial Intention (EI) and Total Early-Stage Entrepreneurial Activity (TEA) from the Global Entrepreneurship Monitor (GEM) database. Data processing was performed using the Pearson test and the ordinary least squares (OLS) method of estimation. The correlations established between the public policy indicators and the entrepreneurial activity indicators highlight an indirect relationship.

Keywords: *Worldwide Governance Indicators, Entrepreneurial activity, Public policy, EU countries.*

JEL Classification: L26, H00

1. INTRODUCTION

The paper investigates the correlation between public policies, defined in terms of governmental efficiency, quality of regulation and control of corruption, and entrepreneurial activity, defined on distinct levels, such as fear of failure rate, entrepreneurial intention, and total early-stage entrepreneurial activity. It is well known that economic development is influenced by both, the entrepreneurial activity and the implementation of public policies, which are a stimulating process for economic growth and quality of life. Entrepreneurial activity is based on technological progress and the provision of balanced social relationships.

Within the European Union, entrepreneurial activity is based on a single market that, although regulated by unique standards, is specific to every member state depending on the social, economic and national policy environment. Due to this situation, there is an inequality of opportunities and outcomes across the European Union. EU policies promote entrepreneurial activity through development, education and information activities, creating an appropriate business environment through the involvement of specific economic agents.

The quality of public policies has an impact on entrepreneurial activity, influencing the economic environment by developing infrastructure while stimulating research and development and fostering labor and private initiative. Entrepreneurial activity can provide a basis for public policy implementation, ensuring institutional development.

The elaboration of public policies materializes in two ways: an analytical process, which consists in effectively solving a problem by identifying solutions and a political process that involves controlling the decision-making process in solving conflicts and disagreements, following the interest of the group initiated the process.

The study presents the correlation between public policies (Government Effectiveness, Regulatory Quality, and Control of Corruption) and entrepreneurial activity (Fear of Failure Rate, Entrepreneurial Intention, and Total Early-Stage Entrepreneurial Activity).

The paper is structured in five sections: the first and second ones consider the state of art in the field of public policies and entrepreneurial activity in order to highlight the interdependence relationships between them; the third section of the paper presents the research methodology and describes the data for the 28 EU members. Finally, the empirical results are presented, followed by the conclusions section.

2. LITERATURE REVIEW

Public policy can directly stimulate the business environment by developing regulations in the economy, thereby enhancing competition opportunities. Alternatively, the government can indirectly increase entrepreneurship by relaxing administrative and legislative burdens, allowing entrepreneurs to dedicate more of their time, money and efforts to productive activities (Storey, 1994). The process of data collection from 60 countries, that have been the subject of the Global Monitoring for Entrepreneurship (GEM) project, highlights the importance of the quality of public institutions and entrepreneurial activity (Amoros, 2009, p. 5). Public authorities must be involved in a complex and pragmatic decision-making process in order to materialize some previously established economic and social objectives. Entrepreneurial activity implies the involvement of modern technologies that ensure the progress and welfare of society. As regard to entrepreneurial activity within the European Union, it is known that it can be stimulated through competition and quality of regulation, based on appropriate fiscal policy. Some researches have established a positive link between good governance and good economic performance (Chong & Calderón, 2000, p. 69-81). Studies on the importance of decision-makers on entrepreneurial activity demonstrate that this is the solution for determining economic growth

based on skills, business environment opportunities and social norms (Beach et al., 2011, quoted by Dima et al., 2016, p. 427). Some hypotheses refer to differences in attitudes towards entrepreneurial activity and trends, thus reference is made to the need for entrepreneurial activity in less developed areas, increasing the capacity to become an entrepreneur and different types of entrepreneurship. The formal and informal norms and a set of values that trigger economic and social changes are developed by a number of institutions, with an important role in the rate and nature of the entrepreneurial activity (Todd et al., 2007, p. 467-493). A series of results related to entrepreneurial activity estimates its dependence on the quality of policies and institutions and on the general government efficiency. (Dima et al., 2016, p. 425-429). Some studies have revealed a significant positive link to government efficiency and joint projects in the form of public-private partnerships. Political stability and democratic positions play an essential role in entrepreneurial activity.

The Global Entrepreneurship Monitor (GEM) is a project on which differences in attitudes, aspirations and entrepreneurial activity are established considering a set of principles (Reynolds et al., 2005, p. 205-231): *i*) the spirit of entrepreneurial activity that is based on necessity is usually observed in regions with less economic development; *ii*) a company that stimulates the capacity and motivation to develop an entrepreneurial activity is favorable to entrepreneurship; *iii*) in an economy, an important role is represented by the high-aspirations of entrepreneurship, with a role in creation and innovation.

Developing business by entrepreneurs is of particular macroeconomic importance for decision-makers. Identifying institutional barriers in the business start-up process can be an advantage for developing a number of policy measures to maintain entrepreneurial activity in those countries under the conditions of proper economic development.

A series of literature studies reveal differences in entrepreneurial activity between different countries (Gedeon, 2010, p. 16-35). On the basis of an analysis performed by Bettignies and Brander (2007, p. 808-832) it has been concluded that a number of factors such as the economy or the specific conditions have an influence on the level of prosperity of entrepreneurship. The start-up activity (Department of Economic Social Affairs, 2007) is highlighted in terms of entrepreneurship in the Global Annual Monitor (GEM). This report refers to a total of 34 countries with a workforce of 784 million people within 6 years.

The studies were carried out by a number of 150 academics. Their research refers to the development of entrepreneurial activity in the national income of the respective countries and, depending on them, correlates the income of the population with the standard of living.

A number of studies highlight that government intervention can favorably influence entrepreneurial activity while stimulating economic activity. Government interventions are necessary in case of failures in the market. The causes of market failure are related to market structure, company size, capital market imperfections, information asymmetry, institutions, regulations, etc. (Baumol, 2002, p. 1-12). There are a number of arguments that confirm the positive relationship between firm size and innovation in entrepreneurial activity. In this case, the fixed costs of these actions are high, while also favoring large firms to invest in new projects on entrepreneurship. For small companies, there is a problem of limited strategic resources, with a major risk of loss of information.

The entrepreneurial policy is a public design program created to determine the level of entrepreneurial activity in society (Audretsch, 2004, p. 167-194). Another problem of market failure is the imperfection of the capital market. In the case of large firms, there is a possibility that they can finance their entrepreneurial activity from domestic sources, providing them with better stability, compared to small firms that need external finance (Moldovan et al., 2016). However, lending to small firms by foreign companies is difficult due to the lack of information on their work and agency issues, moral hazard and adverse selection (Cohen & Levinthal, 1989, pp. 569-596).

Government intervention is beneficial if it is correctly implemented. Important policy measures can be considered, such as industrial policy, innovation policy, and entrepreneurial policy. Although a definition of entrepreneurship has not been set, there is a small agreement on entrepreneurial policy. In addition, there are some theories specifying that entrepreneurial policy is based on different aspects, with several types of public programs (Hart, 2003, p. 69-76).

Entrepreneurial policy refers to the following (Quittainah, 2015, p. 1-5): *i*) entrepreneurship policy to stimulate a new entrepreneurial potential; *ii*) entrepreneurial activity policy refers to organization and analysis from individual, team, firm, industry and nationwide. The entrepreneurial policy encompasses global trade policy and policy on immigration, innovation policy, antitrust policy, property rights regulations on a national scale, and tax policy at an entre-

preneurial scale (Acs, et al., 2004, p.). The entrepreneurial policy is treated at the federal or state level, but the tendency is to address local businesses, farms or even individuals. In this sense, there is a focus on personalized policies to respond to individual differences as best as possible (Quittainah, 2015, p. 1-5). The entrepreneurial development process includes a number of components that influence one another: market information, opportunities, vigilance, entrepreneurial thinking, innovation, technical knowledge, creativity, and ultimately ensure income (Burgelman & Hitt, 2007, p. 349-352).

A number of policies implemented in a different context, of monetary stability, competition, or quality of infrastructure, can produce favorable results compared to a situation of financial instability, lack of rights and poor education. From this point of view, it is necessary to implement policies in the specific conditions of the respective country. The set of governance indicators called global governance indicators (Kaufmann et al., 2010, p. 1-31) is available for approximately 200 countries and refers to the following dimensions of government: voice and responsibility, political stability and absence of violence or terrorism, government effectiveness, quality of regulation, rule of law and corruption control. A series of studies aimed at creating the Corruption Perceptions Index (CPI) believe that the public sector is influenced not only by corruption but also by the quality of governance (Lambsdorff, 2005, p. 1-35).

The quality of public policies has a direct influence on entrepreneurial activity and its components (Dima et al., 2016, p. 428). Good governance in Asian countries has an important role to play in the development of entrepreneurship (Amorós & Bosma, 2013, p. 1-105). However, stimulating the development of entrepreneurship implies the government effectiveness to be sustained over the long run. (Gugler & Chaisse, 2009). Governments can implement a series of measures to foster entrepreneurial activity by increasing the quality of governance. However, in economically weak countries, measures that stimulate people with entrepreneurial activities by raising the quality of government cannot be achieved (Thai & Turkina, 2014, p. 490-510).

To highlight a country's overall performance from a sustainable economic growth perspective, the Institute for Management Development (IMD) has developed the Annual Competitiveness Analysis (WCY) indicator. This was realized by aggregating twenty sub-indicators in four important areas, namely: a) economic performance, b) governmental efficiency, c) business efficiency and

d) infrastructure. Data from the literature is contradictory, as there are different ways of considering concepts and methods of analysis that cause differences. Consequently, new approaches must be addressed for this issue. The literature studied highlights the strong influence of public policies on the business environment.

3. DATA AND METHODOLOGY

The dataset performed in this study refers to the public policies descriptors, namely Government Effectiveness, Regulatory Quality, and Control of Corruption and indicators of entrepreneurial activity, namely Fear of Failure Rate, Entrepreneurial Intention, Total Early-Stage Entrepreneurial Activity for the 28 countries of the European Union between 2000 and 2017. The public policy indicators were collected from the World Bank database, and the entrepreneurship indicators were centralized from Global Monitor Entrepreneurship database.

Entrepreneurial activity is reflected by the following indicators: Fear of Failure Rate (FFR), (*“Percentage of 18-64 population with positive perceived opportunities who indicate that fear of failure would prevent them from setting up a business”*), Entrepreneurial Intention (EI) (*“Percentage of 18-64 population (individuals involved in any stage of entrepreneurial activity excluded)”*) who intend to start a business within three years) and Total Early-Stage Entrepreneurial Activity (TEA) (*“percentage of 18 – 64 population who are either a nascent entrepreneur or owner-manager of a new business”*) as this is provided by The Global Entrepreneurship Monitor (GEM) database.

The dimension of public policies is described by the following indicators: Government Effectiveness (*“capturing perceptions of the quality of public services, the quality of the civil service and the degree of its independence from political pressures, the quality of policy formulation and implementation, and the credibility of the government’s commitment to such policies”*), Regulatory Quality (*“capturing perceptions of the ability of the government to formulate and implement sound policies and regulations that permit and promote private sector development”*), set by Dima et al., 2010, p. 429 and Control of Corruption (*“capturing perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption, as well as “capture” of the state by elites and private*

interests”) which is specific to public institutions and quality of a nation public policies, set by Kaufmann et al. (2010, p.1-31).

It should be specified that worldwide governance indicators (WGIs) are aggregates based on unobserved components. The aggregate measure is reported in standard normal units, ranging from -2.5 to 2.5, with a mean zero and a standard deviation unit in each period.

The relationship between the variables was done using the Pearson test. The correlation coefficient was determined with the following equation (Pearson, 1908):

$$r_{yx} = \frac{n \sum xy - \sum x \sum y}{\sqrt{[n \sum x^2 - (\sum x)^2] \cdot [n \sum y^2 - (\sum y)^2]}} \quad (1)$$

where: y – dependent variable
 x – independent variable
 n – sample size

The Pearson correlation coefficient has values between -1 and +1, passing through the value 0, indicating a non-correlation between the two variables x and y. A value of r close to -1 indicates a strong negative correlation, ie the trend of a variable to decrease significantly when the other variable increases, while the r value close to + 1 indicates a strong positive correlation, respectively, the significant increasing trend of a variable when the other variable increases.

Another approach applied to determine the influence of public policies indicators on entrepreneurial activity indicators is the ordinary least squares method (OLS). The form of the multiple linear regression model is the following: (Granger & Newbold, 1974, p. 111-120).

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_n X_n + \varepsilon \quad (2)$$

where: y – dependent variable;
 x_1, \dots, x_n – independent variables;
 β_0 - is the value of y when the independent variables are equal to zero;
 β_1, \dots, β_n – estimated coefficients of regression;
 ε – the residual variable.

Multiple linear regression through the least squares method highlights the relationship between a dependent variable and a set of independent variables. In the best basic way, the linear regression model provides the best linear approximation of a variable from a set of other variables. The linear regression model realizes the best linear approximation of a variable in a set of other variables. Under these conditions, this model is a way of synthesizing data describing economic behavior.

4. RESULTS AND DISCUSSIONS

The results obtained by using Person correlation are presented as follows: Table 1 presents the descriptive statistics of Worldwide Governance Indicators representative for public policies and the representative indicators for Entrepreneurial Activity such are Fear of Failure, Entrepreneurial Intention, and Total Early-stage Entrepreneurial Activity.

Table 1. Descriptive Statistics

Variables	N	Minimum	Maximum	Mean	Std. Deviation
Fear of Failure Rate (FFR)	298	15.12	61.58	36.9498	7.49818
Entrepreneurial Intention (EI)	298	1.55	31.70	10.0454	5.22105
Total early-stage Entrepreneurial Activity (TEA)	298	1.63	19.38	6.7097	2.68915
Government Effectiveness (GE)	298	-0.36	2.35	1.2140	0.60976
Regulatory Quality (RQ)	298	0.15	2.05	1.2302	0.45866
Control of Corruption (CC)	298	-0.26	2.47	1.1393	0.81001
Valid N (listwise)	298				

Source: Author’s calculations

Table 2 presents the correlation coefficients between the public policies indicators, namely, Government Effectiveness (GE), Regulatory Quality (RQ) and Control of Corruption (CC) and indicators of entrepreneurial activity: Fear of Failure Rate (FFR), Entrepreneurial Intention (EI) and Total Early Stage Entrepreneurial Activity (TEA).

** . Correlation is significant at the 0.01 level (2-tailed).

Source: Author's estimations

Between the public policies indicators (Government Effectiveness, Regulatory Quality and Control of Corruption.) and entrepreneurship indicators (Fear of Failure Rate, Entrepreneurial Intention and Total Early-Stage Entrepreneurial Activity), there were reverse, weak and medium correlations, but significant. The linear correlation between Fear of Failure Rate and Government Effectiveness is $r = -0.304^{**}$ ($p = 0.000$). Between Fear of Failure Rate and Regulatory Quality was obtained $r = -0.223^{**}$ ($p = 0.000$) and between Fear of Failure Rate and Control of Corruption the linear correlation is $r = -0.281^{**}$ ($p = 0.000$). The correlations between Entrepreneurial Intention and Government Effectiveness, Regulatory Quality respectively Control of Corruption are $r = -0.430^{**}$ ($p = 0.000$), $r = -0.382^{**}$ ($p = 0.000$), $r = -0.433^{**}$ ($p = 0.000$).

Between Total Early-Stage Entrepreneurial Activity (TEA) and Government Effectiveness the correlation coefficient resulted is $r = -0.208^{**}$ ($p = 0.000$) and between Total Early-Stage Entrepreneurial Activity (TEA) and Control of Corruption is $r = -0.212^{**}$ ($p = 0.000$). There is a negative correlation between the Fear of the Failure Rate and the Government Effectiveness, ie the fear of failure is influenced by governmental efficiency. Therefore, the better

the government effectiveness, the less fear of failure. The Fear of the Failure Rate is influenced by the quality of the regulations, namely the good quality of regulation determines the decrease of this indicator.

There is also a significant influence between the Fear of Failure Rate and the Control of Corruption, in the sense that better control of corruption will induce less fear of developing an entrepreneurial activity. There is a negative influence between Entrepreneurial Intention and Government Effectiveness, therefore the intention to develop a business is highly dependent on Government Effectiveness. Entrepreneurial Intention is dependent on the quality of regulations and also on the control of corruption. Total Early-Stage Entrepreneurial Activity is in a dependence relation between government effectiveness and corruption control.

There is a positive linear correlation between Fear of Failure Rate and Entrepreneurial Intention, in this case, the correlation coefficient $r = 0.298^{**}$ is significant, and between Fear of Failure Rate and Total Early-Stage Entrepreneurial Activity, $r = 0.184^{**}$ is also significant. The linear correlation is significant as well between Entrepreneurial Intention and Total Early Stage Entrepreneurial Activity, $r = 0.621^{**}$. Based on this result, it is obvious that Fear of Failure Rate influences the intention to develop an entrepreneurial activity. It is also observed that there is significant influence between Fear of Failure Rate and Total Early-Stage Entrepreneurial Activity, and the business development is carried out in stages in order to control the various risks that may arise. There is a close relationship between Entrepreneurial Intention and Total Early-Stage Entrepreneurial Activity, which demonstrates that the intention to develop an entrepreneurial activity is carried out in several stages. By doing so, it becomes possible to control the risks that may arise during the entrepreneurial process.

Analyzing the relations between Governmental Effectiveness and the Quality of Regulations, a significant positive correlation is observed with a correlation coefficient $r = 0.859^{**}$. Between the Governmental Effectiveness and Corruption Control, there is also a significant positive correlation, $r = 0.946^{**}$. The correlation between Quality of Regulations and Corruption Control is significant with a coefficient $r = 0.900^{**}$. The results between Quality of Regulations and Governmental Effectiveness prove a strong dependence relation that demonstrates that government effectiveness is achieved under appropriate regulations suitable to the entrepreneurial environment. There is a strong, significant link between the Government Effectiveness and Corruption Control

which proves that government effectiveness is achieved in good conditions if there is control over corruption. The proper quality of the regulations and their correct application can keep corruption under control.

There is a negative correlation between Fear of Failure Rate and Government Effectiveness, and the fear of failure is influenced by governmental effectiveness. Therefore, the better the government's effectiveness is, the less fear of failure will be registered. Fear of failure is influenced by the quality of regulation, that is why the good quality of regulations leads to a decrease in this indicator.

There is also a significant influence between the fear of failure and the control of corruption, therefore the better the corruption control, the less the fear of developing an entrepreneurial activity. There is a negative influence between Entrepreneurial Intention and Government Effectiveness, so the intention to develop a business is highly dependent on government effectiveness. Entrepreneurial Intention is dependent on the quality of regulations and also on corruption control.

Total Early-Stage Entrepreneurial Activity is in a dependence relation to government effectiveness and corruption control. Based on this analysis, there is a strong influence between the public policy indicators and the indicators of the entrepreneurial activity. A series of governmental measures determine the stimulation of entrepreneurial activity, as noted by other authors in their published papers.

In table 3 is presented the regression results between Fear of Failure Rate and Government Effectiveness, Regulatory Quality and Control of Corruption using the ordinary least squares method (OLS).

The estimated equation of the multiple regression method is . Results indicate a statistically significant influence from Government Effectiveness (GE). The regression coefficient indicates that an increase in government effectiveness would lead to a decrease in Fear of Failure Rate. The R-squared for this model suggests that these public policy proxies explain approximately 10% of the variance in Fear of Failure Rate, which means that the model could be improved by adding other variables with potential impact on the entrepreneurs' fear of failure.

The multiple regression results between Entrepreneurial Intention and Government Effectiveness, Regulatory Quality and Control of Corruption is indicated in table 4.

By using the ordinary least squares method the following equation is obtained: According to second OLS model, the Worldwide Governance Indicators are not the best factors to explain the variance in the Entrepreneurial Intention, as regression coefficients are not statistically significant for any of the explanatory variables considered.

Table 5 indicates the multiple regression results between Total Early-Stage Entrepreneurial Activity and Government Effectiveness, Regulatory Quality, and Control of Corruption.

Source: Author's estimations

The equation obtained by using ordinary least squares method is the following: . The linear regression results prove that the Regulatory Quality and Control of Corruption have an important influence on the Total Early-Stage Entrepreneurial Activity entrepreneurship proxy. According to its results, a higher regulatory quality would induce an increase in the percentage of the population who are either an entrepreneur or owner-manager of a new business. The control of corruption has the opposite effect, as the negative value of the coefficient is expressing. Accordingly, for countries where the public power is exercised for private gains, the Total Early-Stage Entrepreneurial Activity would have lower scores. The level of TEA variance explained through the world governance indicators considered is rather low (17%), and therefore there are other influential factors for the Total Early-Stage Entrepreneurial Activity which should be considered in the analysis.

5. CONCLUSIONS

The study analyzes the relationship between public policies and entrepreneurship for the 28-member states of the European Union, between 2000 and 2017. Entrepreneurship within the European Union is stimulated by public policies materialized through development, information and education activities and the creation of an appropriate business environment. Entrepreneurship is a support for the implementation of public policies. Government interventions in the economy are necessary for the event of disturbances in the functioning of the market. There is a significant positive relationship between government efficiency and the realization of projects in the form of public-private partner-

ships. Some studies have expressed a significant positive link with governmental efficiency and joint projects in the form of public-private partnerships.

Fear of failure is determined by the quality of the regulations, namely, a better regulation quality will lead to a decrease in this indicator and will encourage people to set up a business. A significant dependence is also set between the intention to develop a business and its development. There is also a relationship between public policies and those of entrepreneurial activity. The research results of OLS estimation outline an indirect relationship between Fear of Failure Rate, Entrepreneurial Intention, Total Early-Stage Entrepreneurial Activity and public policy indicators (Government Effectiveness, Regulatory Quality, and Control of Corruption). The development of entrepreneurial activity is influenced by the correct implementation of public policies, namely by legislative stability, coherent decision-making, monitoring, and evaluation.

Abstract

This paper aims to bring together both theoretical and empirical academic research on public sector performance (PSP). In order to achieve the research objective, a systematic literature review was applied. To best-achieve the purposes of a systematic review were collected and analyzed articles published in scholarly literature between 2008 and 2018 on public sector performance research area. The systematic review was focused on four directions, namely (1)

definition of public sector performance, (2) methodologies for measurement of public sector performance, (3) impact factors and difficulties in measuring public sector performance, (4) theories and paradigms in public sector performance. Our results reveal that PSP is still confusing, because on one the hand, the public sector has unique proprieties, and on the other hand, can emanate in paradox, which refers to a weak correlation between performance indicators and performance itself. However, it remains necessary to consider appropriate public sector measurements, since PSP bears the primary social responsibilities and obligations, both at an institutional level and as a means for sustainable economic growth.

Keywords: *public sector, performance measurement, systematic review*

JEL Classification: H00, P43

1. INTRODUCTION

This paper analyses the state of the art on public sector performance research area. For a long time, the public sector has been exposed to allegations of wastefulness and inefficiency (Modell, 2005, 64). Because nowadays organizations of the public sector are forced to operate in a dynamical environment, they need to adjust constantly to changing environmental conditions, so performance measurement is now considered an indispensable element in modernizing local government entities (Bouckaert & Peters, 2002, 362). Since the beginning, the measurement of an organization's performance has been view as one of the management functions, but nowadays it is analyzed as the independently developing branch of science. The organizations of the public sector have as a primary goal the satisfaction of public needs, to provide qualitative and accessible services, therefore is very important to apply suitable methods to measure it at all levels of government.

The global economy has struggled under the most significant recession in decades, so the public sector all over the world was facing significant revenue deficits. Furthermore, citizens started to notice and complain about the poor quality of the services offered by the public sector. Facing these challenges, the public sector needed to become more creative and to explore more options in order to resolve the problem. Thus, in a quest to improve the public sector, public managers perceive performance measurement as an indispensable element

to achieve a better result. Usually, the economic crisis provides some insights on the role of measurement systems in societies (Van Doreen et al. 2012, 489).

In this paper, we identify the role of public sector performance measurement in the past, in a period of recovery for all countries, after 2008 and until 2018, in studies published in scholarly literature. This research, related to public sector performance (PSP), brings added value to literature because explore the subject from different perspectives, namely conceptual understanding of PSP, methods, and methodologies for measurement, impact factors and theories or paradigms specific for the public sector.

This paper is structured as follows: In the first part, we begin with a general situation and some definitions that help us to understand the framework better. In the second part, we present the methodology used, followed by some findings and discussion in part three. We conclude with the conclusion and future roles and perspective in measuring public sector performance.

2. LITERATURE REVIEW

Unlike in the private sector, the aim of the public sector is not to motivate by profit. Public sector operates and control by the government and provides services, like healthcare, police and military services, public transportation, education, infrastructure, that benefit the general public. New Public Management has spread in the last decades and comes like an alternative to a traditional public sector. It has tried to change the function of the public organization, to be as those of the private sector through decentralization and less bureaucratization, and to be more accountable.

The term of performance in a general context can be defined from two angles: the first perspective is the focus on all the action that a performing actor is carrying out for completion of a task, and from a different angle incorporate a value comprehension. Performance has an attribute that can be either high or low.

Establishing performance is not easy, notably in the public sector, because it is needed to explain the concept of performance, to identify performance indicators and then to find ways of obtaining performance. A relationship between objectives, results, and means has to exist, or in other words an approach is needed in terms of effectiveness, efficiency and budgeting (Profiroiu, 2001, 8).

Performance measurement is defined as the process of quantifying the efficiency and effectiveness of actions (Neely et. al.1995, 1229).

Critics talk about the fact that public sector organizations did not focus on measuring the right amount of the things that matter (Atkinson et al., 1997, 26) and they need to identify and combine strategies, long-term issues of mission and objectives (Chow et al., 1998, 278). Although performance measurement has been included in the public sector to ensure transparency, some academic defend the idea that it only generates speculative and perverse behaviors (Hans de Bruijn 2002, 20).

Ideally, government performances identify and measure the things that governments are supposed to accomplish (Grenwood 2008, 56).

For most countries, the purpose of performance measurement is clear and straightforward (Gao, 2009, 27). A report from Organisation for Economic Cooperation and Development (OECD) pointed out that in its member countries performance measurement is used to support better decision making and to heightened awareness of the cost of the goods and services provided, obtaining a more efficient and effective public services that answer citizen requirements and consistent with government objectives (OECD, 1994, 18).

In the complex multi-governance and networking system that involves stakeholders in different policies, as well as in different stages of policy cycle information is provided with the help of performance indicators. Many authors and international organization reckon public sector performance indicators for the entire sector, as well as for various parts and its core function, the appraisal considering different output and input data. Trying to determine the relevant subsector of the public sector and public sector performance indicators Afonso et al. (2003, 2006, 2013) define seven significant sub-indicators, four "opportunity"/"process" indicators namely: administration (corruption, red tape, quality of judiciary, shadow economy), education(Secondary school enrolment, education achievement) , health (infant mortality, life expectancy), public infrastructure (quality communication & transport infrastructure) and three "Musgravian": economic stability (income, stability of GDP growth), distribution (income share of households) and economic performance (unemployment, GDP growth, GDP per capita).

Taking into consideration that pinpointing several indicators to measure public sector performance has been a concern both for academics and several

international bodies, is needed a robust framework for comparison between countries, in terms of quality of public policies, institutional and decision-making perspective. On this subject, we consider the perspective offered by Kaufmann et al. (1999, 260) which considers three dimensions of bureaucratic quality, the rule of law graft necessary for the assessment of governance, to be representative.

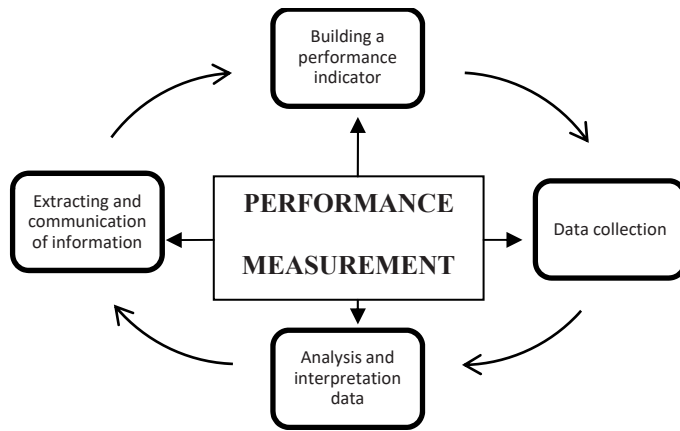

In 2010 Kaufmann et al. developed a set of indicators named The World-wide Governance Indicators and reveal six governance dimensions: (1) voice and accountability, (2) political stability and absence of violence or terrorism, (3) government effectiveness, (4) regulatory quality, (5) control of corruption and (6) rule of law. The OECD (2007) supports the development of a necessary comparison framework by dividing the data inputs, outcomes, process and outputs. Trough Country Policy and Institutional Assessment index, The Word Bank measures public policies in line whit economic growth and poverty reduction. Corruption and quality of governance are measured trough Corruption Perception Index, created by Transparency International.

Summarizing the full range of possibilities for sizing different dimension of the public sector performance through aggregate indicators, Lobont et al. (2018,142) highlights the importance of differentiating between indices and parameters. Indices of performance measurement are obtained by considering some weighted average parameters, allocating to each other weight of relevance in the index construction.

There are numerous parametric and non-parametric research methods used in the construction of public sector performance indicators. Because non-parametric ones apply to ordinal, nominal or interval data is considered more appropriate for social science, not parametric ones that generally apply to data intervals, whit a Gaussian normal distribution. (Lobont et al., 2018,143).

Performance indicators should respect some essential features: to be measurable, to be adapted to strategic objectives, to be easy to understand and use, to not have dysfunctional consequences, to be adaptability to new requirements, to be active and should not be ambiguous (Marr, 2008, 153). A logical scheme that attempts to represent Marr's definition graphically is presented in figure 1:

Figure 1: The process of measuring performance:

Source: Bernard Marr, (2008), *Managing and delivering performance*, Butterworth-Heinemann imprint of Elsevier, pp. 179

Performance indicators are defined as indices that measure and evaluate the results of the entities; they show how well the entity achieves the stated goals and desired results (Kaplan, 2001).

3. DATA AND METHODOLOGY

We perform a qualitative systematic literature review in order to best respond to the research objectives on the measurement of public sector performance. This method was preferred instead of a non-systematic review due to the attempt to develop following discussions about the existence of real academic interest in the subject.

The review was organized in two steps that are particularly important: the strategy of locating and selecting the potential studies and the setting of inclusion criteria to potentially identifiable literature (Alderson et al. 2004). To this end, only articles focused on the theme of public sector performance measurement have been selected.

The selection has been carried out using EBSCOhost Research Platform. The platform offers high-quality articles licensed from reputable publishers, reliable, peer-reviewed content. The databases used: Academic Search Complete; Academic Search Premier; Alt Health Watch; Business Abstracts with Full Text (H.W. Wilson); Business Source Complete; Business Source Pre-

mier; Central & Eastern European Academic Source; CINAHL Plus with Full Text; Econ Lit; General Science Full Text (H.W. Wilson); Health Source Consumer Edition; Human Resources Abstracts; International Political Science Abstracts; MEDLINE; Middle Eastern & Central Asian Studies; Political Science Complete; Professional Development Collection; Public Administration Abstracts; Public Affairs Index ;Social Sciences Abstracts (H.W. Wilson); Sociological Collection.

As a first step, we used Boolean/Phrase for introducing keywords: (“public sector” or government or federal or “public administration”) AND performance AND (indicator* or measurement or assessment). In doing so, the platform generates 78.600 results.

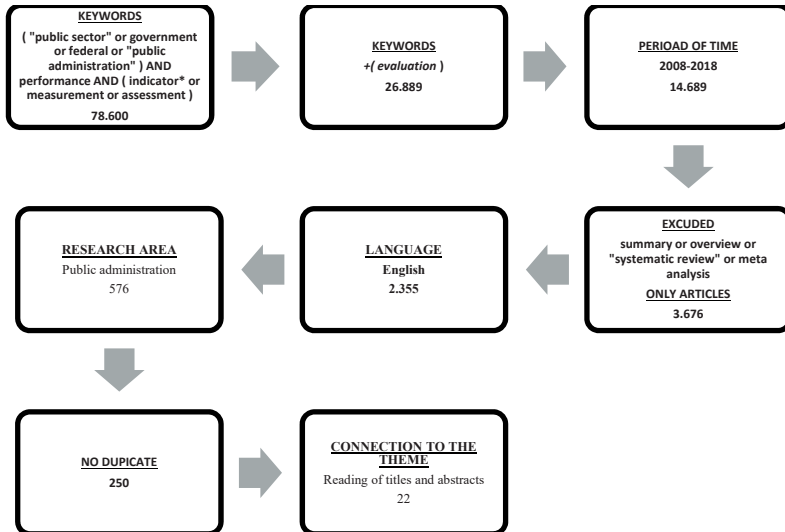

Afterward, the research has been refined by adding the word “evaluation”, giving back 26.889 results. Due to the fact we are interested in a contribution after 2008, we limited only to the contributions published in the period 2008-2018. The contributions published in 2019 have been ignored because the reference period is still ongoing, giving back 14.689 results. We excluded review or summary or overview or “systematic review” or meta-analysis; the attention has been paid only on articles, and no books or book chapter was considered, obtaining 3.676 results.

Also, the only contribution written in English have been selected, to allow the replicability of the review and to ensure an international audience for all the research included in the analyzing. This criterion has reduced the number of contributions previously identified to 2.355. Next, the research has been filtered by limiting it only to the interest areas, “*Public administration*”, “*Public sector*” generating 576 papers. Excluding all the duplicates we remain whit a total of 250 articles.

Finally, based on the title and abstract of identifying articles, the authors, considering only those containing one or more determinants that directly or indirectly affect the scope of our research. The latter selection criteria have induced the inclusion of 22 papers.

The process summarized above in steps is illustrated in the flowchart of systematic literature review (Figure 2).

Figure 2: Flowchart of the review process

4. FINDINGS AND DISCUSSIONS

The content analysis of the 22 selected articles proves that there are different approaches to performance measurement in all levels of public sectors. Phusavat et al. 2009 and Suwit et al., 2011 examine the role of performance measurement in the Thai public sector. Phusavat et al. (2009) through collaboration with the Office of the Public Sector Development Commission of Thai government tries to integrate measures obtain by measuring public sector performance into the management process by applying grounded theory. Using regression equations, Suwit et al. in 2011, used path analysis technique using cross-sectional data. The inspiration for the construction of the questionnaire was translated by a professional academic and use borrowed lessons from developed countries from the west, from studies that exist in the private sector.

In China, the central government also wants to transpose the result of public sector measurement into specific policy objectives, but demonstrate that the way the performance is done is not suitable for the context of the country. Is hard to measure objectively, because the compliance of the persons involves providing sufficient and valid information, governance and social address being ignorant due to the political context that exists in the society. Another threat is that local Party committees may manipulate the results of the performance measurement to make unfair decisions concerning rewards and penalties. Some of the indicators being measured are economic development, party building, public service provision, bureaucratic institution building, and social development. The mentioned author categorized performance target in two groups: common targets (7 common targets and 81 different performance indicators) and functional targets (in the year 2007 were 1143 indicators) (Gao 2009, 30).

Goals and outcomes of educational policy across the USA were shaped by using the observing and testing indicators like minority student population, administrative capacity and achievements gap in public schools across the United States. Instituting performance accountability is view as the best way to improve performance, (Patrick et al. 2011, 361) taking into consideration that developing measure to hold bureaucrats accountable for their action.

Every public sector activity is directed toward the ability of certain prearrange goals. In the public sector of Balochistan is to study the effective and efficient utilization of human resources, studying the appropriate strategy (Muhammad & Farooq, 2011, 66). There is a need for capable and skilled manpower, adequately supervised, that would play an important in the public sector, efficiency and effectiveness increasing, so evaluation of employees is critical.

The use of the 3E principles (Economy, Effectiveness, Efficiency), in measuring performance allows managers to support positive synergy effect that can lead to increase performance but is necessary to set criteria for each particular organization (Pastuszkova & Palka, 2011, 1487). A few years later Mihaiu (2014, 41-46) suggest to add two more variables to make the system 5S, adding Environmental and Equity, because of the fact the previous indicators are mainly financial, so it may result in a failure to measure social and environmental objectives, and so not to measure proper the performance. Based on the 5E principals they categorized the performance measurement models into two main categories: one-dimensional (financial cost-benefit indicators, net economic present value), and multidimensional (Public service value model (PSV), Total Quality Management (TQM) in Public Sector, Performance Prism, Performance pyramid, Balanced Scorecard for the public sector, Benchmarking,).

A survey conducted in public administration in Romania by Profiroiu in 2013, demonstrated that there is a need to increase the awareness of the decisional factors, to clarify, improve and to embrace the utilization of such instruments in order to use them as political and managerial tools at the same time, and to acknowledge the importance of external factors (economic, social, political, international responsibilities, governmental policies and the legal framework).To understand the measurement of performance

Borst et al. 2014 (926) apply a regression to point out the attitudes toward the applicability of performance measurement in Dutch from the perspective of public officials. They adopt variables like applicability of performance measure-

ment, public sector versus private sector, politically steered organization, nature of work, work complexity, experience with performance measurement and quality of functioning of oneself and colleagues.

Wijaya and Akbar 2013 uses Partial Least Square (PLS) and Thematic Content Analysis to evidence that the factors of information, organizational objectives, and targets as well as external pressures determent the adoption of the performance measurement system.

The principal causes of an absence legal system of performance measurement in the case of Bosnia and Herzegovina, are highlight: i) little or no practice of conducting performance audits, ii) the lack of public reaction to the alarming situation in the public sector, iii) indifference of the responsible persons in the public sector to change the existing status quo and iv) inadequate legislation relating to public sector. Applying the Mann-Whitney non-parametric tests reveals that the degree of measuring and reporting performance indicators in the public sector in FB&H has a direct impact on the operational results shown in financial statements (Veledar et al. 2014,75)

The inductive use of performance measures enhances performance when performed a multivariate OLS model. The method used provides public sector managers the opportunity to communicate goals more clearly, to evaluate them and to revise policies. Is difficult for public managers to balance the proper measure for the proper time to use, taking in consideration that different purposes for using performance are associated with the situation. Taking this into consideration is difficult for public policy to improve performance but is also very important. (Spekléa & Verbeeten, 2014,139).

The public sector is view as composing from three dimensions: economic, social and environmental, so the use of only financial indicators does not increase performance but can generate a speculative behavior that is biased for the performance concept. Some difficulties in measuring the performance in the public sector are revealed as i) defining objectives for complex mission, ii) the lack of relevant and measurable, iii) the absence of a correlation between objectives and specific targets, iv) the lack of resources for building the necessary information systems, v) the cost of measuring performance, vi) high bureaucracy, vii) high corruption, viii) the relative inexperience of officials regarding the development and use of performance measures (Mihaiu, 2015, 42).

Even for developed countries, proper and effective performance measurement is challenging, and only benchmarking, and Common Assessment Framework (CAF) produce a real effect when public servant opinion. (Spalkova et al.,2015, 76). After analyzing 18 policy filed and 46 papers, the idea of combining performance indicators and public budgeting, in the case of Latvia, the result after approximative ten years, prove to be a fail, because the indicators lack a clear approach and guideline (Reinholde, 2015,55). Even before joining EU, in Romania were developed a series of measures to promote the adoption of systems and tools of quality management, particularly ISO and CAF (Leoveanu, 2016,34).

In a comparison between two countries, Italy and Malaysia, at a state level using the grounded-theory approach is revealed that although exist different levels of development in PMS, in both jurisdictions exist the same problem. PMS has not matured to measure outcomes and impact. The comparative study revealed that bureaucratic culture can be adjusted to become more performance orientated, with the help of performance management in the public sector. (Bianchi & Xavier, 2016, 10).

Since the tendency is to equate the resource consumption with service quality, by removing the financial aspect and only taking into consideration the human recourses, customer satisfaction, and effects, managers hope that key performance indicators would directly measure outputs and outcomes instead. For example the quality in teaching not to be equaled whit cost per student (Røge Lennon, 2018, 400).

A process for a smooth performance measurement process has started, and it must continue. A universal public sector performance tool applicable to all countries, and it was highlighted the existence of a variety of sizes measuring dimensions, applied at several levels of performance, using a non-parametric method (Lobonț & Bociu, 2017, 25).

Benchmarking exercises are supported to a certain extent since administrations and local governments do not have yet external standards of comparison, so we substitute a real market-based competition with the aim of improving the quality of service, and saving taxpayers' money (Kuhlmann & Bogumil, 2018, 26). The situation of measuring public sector performance is more difficult in less developed countries, countries less favorable cultural and political 'starting conditions' so compulsive benchmarking is more likely to prompt innovation

and learning than voluntary measures as they always encompass the risk of relapsing into old routines, but a certain degree of freedom is needed (Kulmann et al. 2018, p27).

Four measurement approaches can be summaries: standardization, benchmarking, contingency-based and service process-orientated (Jääskeläinen & Laihonen, 2014, 355). The most used instrument, on the opinion of public authorities, is CAF and benchmarking (Spalkova et al.2015, 76).

The bodies of paper gander reveal that measuring public sector performance is essential and necessary for policymakers, as well as academia and citizen of a country. No matter at what level of the state the measurement happened, the gold is the same: to improve the performance.

5. CONCLUSIONS

To best-achieve the purposes of a systematic review were collected and analyzed articles published in scholarly literature between 2008 and 2018 on public sector performance particular research area. The systematic review was focused on four pillars in terms of public sector performance definition, measurement tools and methods, difficulties and other specific paradigms in the field.

Causes of difficulties of defining and measuring performance in the public sector are the multiplicity of the social and economic environment, perception and typologies of the public sector, informational asymmetry and the lack of skills of the users concerning performance, managers low interest in finding a new solution, the influence of the political system.

The future direction on performance measurement in the public sector includes a drive towards good governance, transparency, and accountability, and an integral part of the performance audit and organizational competency/capability. It also has to be taken into consideration the fact that implementing a PMS in the public sector can generate negative consequences such as increasing public expenditure, unjustly, on a higher rank of reported performance indicators that may contain errors in design to obtain more funds.

For future research is it recommend to apply the mixed method because it helps to explore more profoundly and it advances a more various and more productive point of views than one analysis does.

Abstract

Unemployment, along with other negative phenomenon's, over the past few years has been affecting the Republic of Croatia and its inhabitants. Unemployment is one of the biggest problems of today that affects not only the individuals but also their close family and in the end the wider community.

Croatia records a high percentage of youth unemployment. The task of the state is to suppress unemployment and make it easier for young people to enter the labor market because long-term unemployment causes loss of self-confidence and negative consequences for further professional development. At the EU level since 1981, the Youth Guarantee works to guarantee education, training, and employment for young people in line with the goals and needs of the economy. When we talk about the consequences of long-term unemployment, we can divide them into the social and psychological consequences of long-term unemployment that will be elaborated in this paper. Social consequences include changes in work ethics and work values due to long-term unemployment

and aggressive reaction to unemployment, such as criminal acts and delinquent behavior. Long-term unemployment and exclusion from the labor market also lead to the forgetting of previously acquired knowledge and skills, lagging behind the latest trends in the labor market, which makes the job search process even more difficult.

For reducing unemployment, it is necessary to implement measures for mitigation of youth unemployment. The aim of the paper is to analyze the consequences of youth unemployment and to explore the experience in solving this problem of selected European countries: The Republic of Croatia, Austria, Portugal, and the United Kingdom. The role of the state and its institutions must be proactive through active employment policies. According to research, the best solution for reducing youth unemployment is a political and social commitment to full employment.

Keywords: youth unemployment, long-term unemployment, active employment policies, EU countries

JEL Classification: F63, I25, O1

1. INTRODUCTION

Young people are the pillar of every society and the strength at which the future remains, they are the foundation of healthy growth and the basis for the development of the state. The labor market crisis and high unemployment rates are the cause of labor market disturbances in the Republic of Croatia and throughout the European Union. The group most affected by its consequences are young people. Unless serious measures for reducing unemployment will not be undertaken, the population of the Republic of Croatia will face the social, psychological, economic, and political consequences of unemployment, which have a major impact on society as a whole.

Croatia is fighting a high youth unemployment rate and is at the top of the list of priorities to ensure youth employment and their inclusion on the labor market. Youth unemployment is a growing problem that has long-lasting consequences for both society and the economy.

For the purpose of alleviating unemployment, each country carries out the determination of passive and active measures. Under passive measures, it involves the provision of material care during unemployment, relating to various monetary benefits, the right to retirement and health insurance, etc. Active mea-

asures aim to directly recruit or direct unemployed people through retraining to occupations with a workforce deficit.

2. CONSEQUENCES OF LONG-TERM UNEMPLOYMENT

Unemployment, along with other negative phenomenon's, over the past few years has been affecting the Republic of Croatia and its inhabitants. Unemployment is one of the biggest problems of today that affects not only the individuals but also their close family and in the end the wider community. In the case of young unemployed people, the consequences of their long-term unemployment are manifested in a large number of cases on their decision to postpone the establishment of the family because of the unfavorable financial situation in which they are unable to support the family and resolve the issue of buying a home. These reasons lead to the remaining unemployed people in joint households with their parents by the time they should already set up their own family and independent life. Most of them never set up their own family if they come to some later years of life. All of these reasons lead's to the aging of the population, the birth rate is slowly declining, a large number of young families are leaving the Republic of Croatia in a search for a job. All these reasons have great consequences for the whole population and economy of the Republic of Croatia.

When we talk about the consequences of long-term unemployment we can divide them into social, psychological, economic and even political consequences of long-term unemployment that will be addressed in this paper.

“The high unemployment rate in the Republic of Croatia indicates the inefficient use of working-capacity human resources. When employment is high, the outputs are high and they also drop high income. When unemployment is high, output drops income decreases and people's dissatisfaction increases. This leads to multiple negative consequences: economic, political, social and psychological” (Bušelić; 2001, p. 47).

2.1. SOCIAL CONSEQUENCES OF LONG-TERM UNEMPLOYMENT

Social consequences include changes in working ethics and work values due to long-term unemployment and aggressive reaction to unemployment, such as criminal acts and delinquent behavior.

Many authors emphasize the dangers of unemployment for an individual's mental state. According to K. Young (see Miller, Form, 1996), unemployed can express extreme aggressive attitudes towards their situation, escape into the world of fantasy by thoughts and acts, reveal in drinking alcohol and drugs, escape to illness, or seek a solution in criminal behavior. With multiple mental disorders, researchers point out that ones that have social nature, such as a greater degree of poverty, demoralization, and disturbed family relationships (Hawkins, 1979, Daniel, 1981). On the other hand, when it comes to the consequences of unemployment society as a whole, the same authors emphasize the inability to realize a social investment in human capital during the educational process (Štimac, 2002, p. 356).

Long-term unemployment can lead to criminal behavior, and criminal behavior also leads to unemployment, because employers are very careful when recruiting new staff so that their employees have no criminal dossier. Unemployed people often turn to crime as a solution to their current problems and blame the state and the state of the economy as the cause of their problems. The population of working age should be able to be effective and realize themselves on the business plan because the lack of the same potential leaves negative consequences on the psychological health of the person and the social position in society.

Over past few years, there is a trend of emigrating young long-term unemployed people who are in a search for a job, which is called a "brain drain" in the study of social consequences of unemployment. It represents the migration of highly educated experts and scientists from the country they live in.

2.2. PSYCHOLOGICAL CONSEQUENCES OF LONG-TERM UNEMPLOYMENT

Psychological health means a series of "affective, cognitive and behavioral processes, ranging from disrupted to high psychological health. Different aspects of psychological health can represent special measures in the research of psychological consequences of unemployment. Unemployment includes learning new roles and adapting to changed circumstances. All these changes for the individual are a source of stress that retreats specific changes in their perception and behavior. They are called psychological consequences of unemployment" (Milas, 2016, p.65).

Psychological health is a combination of different processes. Situations, when people are left without permanent employment, require new adjustments, creating new competencies and learning, and are a source of stress for an individual that results in changes in the behavior of an unemployed person. An unemployed person remains without monthly income, the realization of herself through work and losing social contacts. These facts increase the stress that leads to psychological consequences of unemployment. Some recent research has shown that there is a higher number of suicides amongst the unemployed, especially during the holiday season. The impact of unemployment on the psychological health of an unemployed person occurs within the first few weeks to three months after the loss of a job. After that time the unemployed person's length of unemployment is a less important fact than the fact that he lost his job and financial security. Psychological consequences of unemployment are most affected by people belonging to the age group of 30 to 59 years. For such persons, it is essential to attend various training and seminars through various programs aimed at unemployed people. Long-term unemployed feel excluded from the labor market and have a sense of helplessness and loss of compass from where to start again. For these reasons, it is necessary to carry out a number of training designed exclusively for them and tailored to their needs.

We can conclude that unemployment really affects people's health, especially psychological and is a major source of everyday stress due to the inability to find a job and to earn the income necessary to meet basic living needs as well as the realization of various social interactions and the impossibility of realization of themselves on a professional level.

2.3. ECONOMIC CONSEQUENCES OF LONG-TERM UNEMPLOYMENT

Looking at the economic consequences of unemployment, we come to the conclusion that it is possible to analyze them from an individual's point of view and from the point of view of the impact on the economy. The consequences of unemployment that are manifested in an individual are the loss of income and financial security of an individual. From a point of view and the impact on the economy, the high unemployment rate represents a loss in production, but also the loss of value of human capital. A long-term unemployed person does not generate income that is the source of taxation, apropos the state does not receive funds from the contribution from work. In addition to this fact, the

state is obliged to pay a fee to unemployed persons under the law, and every unemployed person is a cost to the country in which he lives. Unemployment ultimately makes an enchanted circle that does not bring benefits to either the individual or the economy as a whole.

2.4. POLITICAL CONSEQUENCES OF LONG-TERM UNEMPLOYMENT

A large number of unemployed persons means a reduction of taxpayers, which directly affects the reduction of state revenues. The increase in youth unemployment is causing higher allocations for social benefits. The country is facing a budget deficit that has to be settled by the most frequent increase in taxes, and increases of tax affect the further reduction in purchasing power as well as the greater pressure on employers. (Državni zavod za zaštitu obitelji, materinstva i mladeži, 2002, p. 356)

As a result of unemployment, as mentioned above, states are faced with one of the biggest problems, namely "brain drain". By leaving the experts that are already mentioned, who with their knowledge and skills greatly contribute to the development of the economy and the state, the state loses the prospect for future development. The second fact is that long-term unemployed persons and young families are emigrating from the Republic of Croatia and the demographic picture does not have a bright future.

It is imperative to begin to create conditions that motivate young people to stay and live in the Republic of Croatia. Provide conditions for formal education, and then create measures, projects, and activities for their employment, work, and progress. Accordingly, the level of personal satisfaction, the achievement on the business plan, and the contribution to growth and development of the country in which they live will increase.

To conclude, all the consequences of long-term unemployment, as well as labor market outgoings, lead to the forgetting of previously acquired knowledge and skills, lagging behind the latest trends in the labor market, which makes the job search process more difficult.

Therefore, measures to reduce youth unemployment are necessary in order to reduce unemployment and prevent the emigration of young people.

3. MEASURES TO ALLEVIATE YOUTH UNEMPLOYMENT

Unemployment is a condition in which a part of working-able members of a society cannot be appropriately employed with their abilities and qualifications, with the usual salary (Bejaković, 2003, p. 662).

The Europe 2020 Strategy aims at achieving long-term sustainable growth with high employment, productivity and social cohesion. Within the aforementioned strategy, one of the initiatives is named “Youth on the move”. The initiative was launched in 2010, aimed at achieving greater mobility of young people, lifelong learning, and reducing early school leaving. The biggest remarks by employers related to the lack of skills, expertise, knowledge and work experience of young people. The task of the state is to suppress unemployment and make it easier for young people to enter the labor market because long-term unemployment causes loss of self-confidence and negative consequences for further professional development.

In order to improve the position of young people in the labour market, the Youth Guarantee, first mentioned in 1981, is defined as a social context in which all young people guarantee the chances of education, practice, and employment in accordance with their personal aspirations, opportunities, and interests, as well as the needs and goals of society and economy (Bejaković & Mrnjavac, 2014, p. 34).

The Youth Network of Young Croatian Youth Organizations, which brings together 64 Youth and Youth Associations, has invested several years of efforts in advocating a systematic approach to addressing youth unemployment problems by recognizing the challenges that arise from the complexity of such a comprehensive reform (Bejaković & Mrnjavac, 2014, p. 35).

The Youth Guarantee should ensure that every person under the age of 30 gets a quality job offer (competition, exercise, job training, education or continuation of education within 4 months of the occurrence of unemployment.) Measures include providing a good career counseling counselor to start a new job as well as adjusting the education system, especially vocational, to the real needs of the labor market, by adjusting the enrolment quotas. Measures include empowering the workplace learning system, encouraging continued higher education and increasing the quality of education with as much practical. The

guarantee seeks to cover the broader circle of young unemployed people, with particular attention being paid to young people with lower qualifications and highly educated without work experience (Ministarstvo rada i mirovinskog sustava, 2019).

Part of the funding for the Youth Guarantee Fund comes from the national budgets of each EU country, but the largest source of funds is the European Social Fund. The implementation plan contains a complete description of the reforms and measures to be taken to facilitate the transition from education to employment to youth and establish a Guarantee scheme for young people.

The implementation plan is divided into two basic units:

- The first is reforms and measures to prevent early abandonment of education and the activation of inactive youth (persons not registered as unemployed and not in the education or training system);
- The second part is reforms and measures aimed at activating young people in the labor market by empowering young people to create jobs through subsidies, empowering employers to offer quality workplace training schemes (internships, vocational training), incentives for youth entrepreneurship,

It is a flexible document that changes and adds to changes in circumstances such as funding availability, labor market changes, the efficiency of a particular measure, and the like (Portal Garancija za made, 2019).

For regions affected by the highest rates of unemployment, where Croatia is certainly entering, the Council of the European Union and the European Parliament have launched the Youth Employment Initiative. This initiative is moderate in regions with an unemployment rate of over 25%, which would include youth, unemployed persons up to 30 years of age, who are categorized as NEET. In May 2013, the European Commission published Special Recommendations by the Member States within the so-called “European Semester, in which it published recommendations to each member on what is needed to rebuild growth and jobs. Among other recommendations, the Member States propose to re-examine the gap in the labor market created between older workers who enjoy the contractual privilege of indefinite, favorable working conditions and fixed-term workers (Bilić & Jukić, 2014, p. 497).

The European Learning Association, established by the European Commission in July 2013, aims to improve the quality and supply of apprentices across

the EU and change the way students think about learning. The Alliance leads to co-operation between public bodies, business partners, youth representatives, and other key stakeholders to coordinate and validate various initiatives for successful apprenticeship programs. In response to the establishment of the Alliance, in October 2013, the Council issued a statement in which high-quality education was recognized as an effective tool for improving the transition from education to the labor market. Teaching Reform can be included in the implementation plans of the Youth Guarantee Program. If needed, they can use EU funding and available technical expertise to improve their vocational education and training systems (Bilić & Jukić, 2014, p. 497).

In addition to investing in education and internship programs, labor mobility is one of the solutions to the issue of youth unemployment, so young people, as a result of the inability to find a job in their state, are encouraged to look for it outside its borders, in one of the member states. This is enabled by the establishment of the EURES network of public employment offices of the Member States of the European Economic Area and Switzerland coordinated by the European Commission. The purpose of EURES is to provide information, consultation, and brokerage services to employers and job seekers, as well as to all citizens who consider them to be able to use the principle of free movement of people. With Croatia joining the EU, the Croatian Employment Service became part of the European Network of Public Employment Services and thus became available to Croatian citizens for employment mediation services in other countries (Bilić & Jukić, 2014, p. 497).

For the purpose of alleviating unemployment, each country carries out the determination of passive and active measures. Under passive measures, it involves the provision of material care during unemployment, relating to various monetary benefits, the right to retirement and health insurance, etc. Active measures aim to directly recruit or direct unemployed people through retraining to occupations with a workforce deficit.

The first well-known classification of active labor market policies adopted by the OECD in 1993 is still well illustrated by what active policy work deals with and distinguishes five groups of measures:

1. Public Employment and Administration Institutions - Help unemployed job seekers by providing them with information on vacancies, as well as controlling and implementing unemployment benefits

2. Measures of education - additional education and retraining for unemployed, unempoyed and unempoyed persons
3. Measures for young people - refer to the transition of young people from the education system to the labor market
4. Subsidizing employment - more professional training is available to work without establishing employment relationships by which employers from the private sector reimburse the costs of contributions. Vocational training can last from one to three years, depending on the requirements of each profession
5. Measures for groups with a difficult employment factor - refer to the recruitment of persons with specific problems, eg, defenders, invalids, addicts, former prisoners, etc.
6. Measures of active employment policy of the Croatian Employment Service of the Republic of Croatia (Portal Od mjere do karijere, 2019):
 1. Employment subsidy
 2. Training grants
 3. Self-employment support
 4. Education of the unemployed
 5. Training at the workplace
 6. Measures for acquiring the first work experience/internship
 7. Public Works
 8. Measures to preserve jobs
 9. A permanent season.

Professional training without establishing a working relationship is the measure that has the largest number of users and is, therefore, the most well-known in the public. The duration of vocational training is usually 12 months, and it can be up to 36 months if it is a particular profession where a master's exam is required at the end of the program. During vocational training, participants are paid a fee in the amount of non-taxable scholarships as well as transportation costs, and employers have reimbursed the costs of compulsory contributions. From the aspect of employers, the difference is between employers from the private and public / state sectors. Private sector employers must retain at least 50% of young people who have been trained to work or otherwise in the following year are not entitled to use this measure. On the other hand, this obligation does not bind the employers and the public/state sector, they can take new young people after the expiry of the professional training, while their

participants return to the register of unemployed persons after this completed program without switching to employment.

As much as the positive measures of active employment policies can be - providing additional education and offering the ability to overcome new skills and advancement in the profession, the best means of reducing unemployment can only be to create new jobs, which is only achievable with the help of economic growth. The problem of youth unemployment can't be solved by itself, it can only come as a result of structural economic reforms, not only in Croatia but also in the rest of Europe (Bilić & Jukić, 2014, p. 502).

4. THE YOUTH GUARANTEE INDICATORS

Youth Guarantee was adopted in 2013 by the European Commission. The main reason for adopting Youth Guarantee was to ensure that (European Commission, 2018a, p. 5):

1. Young people need to receive a good-quality offer of a job,
2. Appropriate apprenticeship and traineeship
3. Continued education within 4 months of leaving formal education or becoming unemployed.

European Commission was established *Methodological manual and Indicator Framework for Monitoring the Youth Guarantee*. The main indicator of youth unemployment is the NEET rate. In 2014 were under 7.0 million of young NEETs, and 2017 were over 5.9 million of young NEETs. In the 2014 the Republic of Croatia had over 10 % inactive young NEETs (Greece, Italy, and Cyprus also). The NEET population includes young people who actively looking for a job, also young people who eighter do not seek a job. Some of them are disabled, sick and discouraged in seeking for a job. The total NEET rate shows the size of the youth population for the Youth Guarantee scheme. (European Commission, 2018a, p. 10).

Each EU Member State designing Youth Guarantee scheme according to national circumstances. (European Commission, 2016).

According to the Monitoring Manual, the target population for the Youth Guarantee is „young people under the age of 25 years and NEET population (young people not in employment, education or training).

Figure 1. Young people neither in employment nor in education and training by age and labor status (NEET rates), WSTATUS: Not employed persons, in percentage

Source: Eurostat, 2019b

Figure 1 shows not employed persons at EU-28 level, and the level of selected countries. Austria has the lowest percentage of not employed persons in the period 2012-2017. Croatia has the highest percentage of not employed persons and the increasing percentage in 2017.

Figure 2 shows the movement of NEET's group at the level of the total population of EU-28 and the selected countries. NEET's group is a targeted group for Youth Guarantee measures. Each member state administration should be able to adequately target their needs. These indicators also point to the ability of the administration to recognize the needs of target groups and formulate adequate support measures for young people

Figure 2. Young people neither in employment nor in education and training by age and labor status (NEET rates), WSTATUS: Unemployed persons, in percentage

Source: Eurostat, 2019b

The number of unemployed persons, as figure 2 shows is similar as figure 1 was showed. Based on these data, Croatia has a problem with dealing with this indicator. At EU-28 level a drop-in percentage can be observed in period 2012-2017.

The Austrian example should encourage other EU member states to make more effort in seeking better solutions.

Figure 3. Young people neither in employment nor in education and training by age and labor status (NEET rates), WSTATUS: Inactive persons, in percentage

Source: Eurostat, 2019b

The United Kingdom has a fairly high rate compared to the other selected countries. Group of inactive persons represents the target group for youth initiative schemes in all selected countries.

Figure 4. Young people neither in employment nor in education and training by age and labor status (NEET rates), WSTATUS: Persons would like to work (seeking employment or not), in percentage

Source: Eurostat, 2019b.

5. KEY INDICATORS OF YOUTH GUARANTEE IMPLEMENTATION BY SELECTED COUNTRIES

There are four key indicators for direct monitoring Youth Guarantee by country (European Commission, 2018a, p. 46):

In Youth Guarantee beyond the 4m target. This is the main indicator which explains the proportion of young people in the Youth Guarantee preparatory phase beyond the 4-month target (% annual average stock), this target is 0%.

Timely & positive exits. This is a supplementary indicator Target for Positive and timely exits from the YG preparatory phase is 100% (% total exits).

NEET coverage indicator. This is a supplementary indicator for direct monitoring: stock of young people in the YG preparatory phase (annual average, in percentage) / NEET population (annual average, in percentage), the target is 100%.

Follow-up 6m (positive). This is the main indicator for follow-up monitoring: Situation of young people six months after exiting the Youth Guarantee preparatory phase (percentage of total exits), the target is 100%.

Figure 5. Key indicators of Youth Guarantee implementation by selected countries

Source: European Commission, 2018a, p. 46-47

The United Kingdom does not use a 4-month observation. Instead of 4-month observation, the United Kingdom use 3-month observation. Also, follow-up data are not available for the United Kingdom in 2017. The Republic of Croatia needs to improve the NEET coverage indicator. Austria is a good example of the level of this indicator. Portugal, Croatia and the United Kingdom needs to improve especially NEET coverage indicator, which is targeted to 100 %. Portugal, Croatia and the United Kingdom also needs to improve Timely & positive exits indicator, which is also targeted to 100 %. The overall picture of the implementation of the Youth Guarantee scheme indicates that will be necessary to make an extra effort to improve these indicators, following a good example of Austria.

6. YOUTH UNEMPLOYMENT, AT EU LEVEL AND AT THE LEVEL OF SELECTED MEMBER STATES

Resolving the issue of youth unemployment, at EU level and at the level of individual Member States, has attracted the attention of both politicians and scientists over the last few years. Reducing the youth unemployment rate, therefore, requires efforts at EU level, but also for each of its members. According to data from relevant databases, there is a growing interest of scientists to study this issue.

Young people are particularly vulnerable in the labor market. It is therefore not uncommon to address the issue of employment or youth unemployment as the focus of the researcher. Young people by definition are those aged between 15 and 24. This group of young people is particularly sensitive to the impact of the crisis and the recession as it turned out in 2009. One particularly vulnerable group of young people makes the NEET population. This population includes young people who are not employed and are not currently in education either. Different countries of the European Union have different policies and national circumstances in which this issue of youth unemployment is addressed. According to Eurofound data, some of the biggest risk factors for young people are (Eurofound, 2017):

- Young people with low levels of education have a three times higher chance of falling into the NEET category
- Especially vulnerable young migrants who have as much as 70% chance of falling into a category such as the NEET group.
- Young people with some forms of disability or children of divorced parents or living in low-income households- Young people living in remote areas.

Solving the problems of youth unemployment requires adherence to specific circumstances of each Member State. The results of this issue are different for individual EU member states. For the purposes of this paper, examples of Austria, Portugal, United Kingdom and the Republic of Croatia have been taken. Eurofound has identified three European clusters representing different indicators of young people in the labor market. The first cluster includes the Nordic, Western and Continental countries (Austria and the United Kingdom were selected for this research). The second cluster includes Mediterranean countries (Croatia and Portugal were selected for this research). The third cluster consists of Eastern European countries (Bulgaria, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, and Slovakia) (Eurofound, 2017)

The Austrian example is good for studying. Austria has one of the lowest youth unemployment rates in the EU.

Table 1. Youth labor market indicators in the EU 27, 15-24 years of age

Source: Tamesberger, 2015, according to Eurostat, 2012.

Table 1. shows that Austria has one of the lowest rates of youth unemployment in the European Union, Urate 5.2% NEET ratio of 6.5%, OLF ratio of 40.1% and Youth Employment ratio of 54.6%, which had ranked third in the European Union.

Unlike Austria, the United Kingdom has Uratio 12.4%, NEET ratio 14%, OLF ratio 40.7% youth Employment ratio 46.9%, which ranks fourth in the

European Union, although the United Kingdom is at 24th Place in the EU by Uratio.

Portugal, unlike Austria and the United Kingdom, has Uratio 14.3%, which ranks it at 25th place, NEET ratio 14.1% (18th place), OLF ratio 62.1% (14th place) and youth employment ratio 23.6% (19th place).

According to Table 2. Youth unemployment figures, 2007-2017 (%) (Eurostat, 2018a) it is noticed that EU-28 had a youth unemployment ratio of 6.9% in 2007, while this percentage in 2017 was 7.0%. Croatia had a youth unemployment rate of 9.2% in 2007 and 9.7 % in 2017 years. Austria recorded the youth unemployment ratio in 2007 by 5.6% and in 2017 5,5 %. Similarly had Portugal, 8.6% in 2007 and 8.1% in 2017. The United Kingdom in 2007 had a rate of 8.8% and 7.0% in 2017.

Table 2. Youth unemployment figure 2007-2017

: data not available

* The quarterly youth unemployment rate is seasonally adjusted.

Source: Eurostat, 2019a

The main features that influence youth unemployment in Austria are: (Tamesberger, 2015, p. 36): the higher the adult unemployment rate and the size of the apprenticeship system (vocational) reduce the rate of youth unemployment. What country is investing more in active employment policies for young people is the lower the NEET ratio and the OLF ratio are. (Tamesberger, 2015, p. 36). The youth unemployment survey conducted in Austria indicates that the adult unemployment rate (with a positive sign) and the size of the apprenticeship system (with a negative sign) have become apparent as the main factors affecting all four youth unemployment indicators. Economic policy measures pushing demand and affecting the reduction of the general unemployment rate also affect the reduction of the youth unemployment rate. Therefore, in the research in question, the importance of public investment in active youth employment policies, stimulation of demand and the importance of education, has been noted. Austria is more effective in integrating youth into the labor market, more so than in other EU member states, but less successful in integrating the NEET youth group.

In the Republic of Croatia, the issue of active employment policies is also studied by the professional and scientific public. Results of the research suggest the need for active employment policies to move closer to European contexts (Babić, 2012). According to the evaluation of active employment policies from 2009 and 2010, according to types of measures, they are modest in the funds, but if they are well designed they can help the participants (Matković, 2012, p.95). The research of NEETs population in the EU 28 was conducted by Eurofound (2016) and brought profiles countries that are displayed below.

7. EXPERIENCE IN RESOLVING THE YOUTH UNEMPLOYMENT FROM SELECTED EUROPEAN COUNTRIES

7.1. THE YOUTH GUARANTEE SCHEME IN CROATIA

The NEET rate (16,9 % in 2016) and the youth unemployment rate in Croatia (26,4 % in 2017) were high.

The European Commission from the 2018 country report discussed next achievements in Croatia (European Commission, 2018c, p. 4):

- ✦ „The establishment of a network of Lifelong Career Guidance (LLCG) Centres across Croatia is a step forward in the integration of employment programmes,
- ✦ Active labor market measures are insufficiently targeted at vulnerable groups,
- ✦ Secondary vocational education would benefit from further alignment with labor market needs“.

Croatia has 13 Centres for Lifelong Career Guidance, and by 2020 the plan is to reach at least 22 Centres across the Republic of Croatia. Also, Croatia has established data exchange system between the Croatian Public Employment Service and the Ministry of Labour and Pension System as well as the Ministry of Science, Education and Sports (European Commission, 2018c, p. 4). Active Labour Market Policy’s measures need to be better defined for long term unemployed and low-skilled persons. The Croatian Youth Guarantee scheme is reached 54 % of NEET’s and 68,3 % of participants were in employment in 18 months after leaving the Youth Guarantee scheme. Progress has been made, although efforts are still needed to improve the indicators. In June 2013 the Ministry of Labour and Pension System formed the Youth Guarantee Council and brought the measures for employment policies at the regional and local level through Local Employment Development Initiatives (European Commission, 2018c, p. 6).

7.2. THE YOUTH GUARANTEE SCHEME IN AUSTRIA

Austria has presented a Youth Guarantee Implementation Plan in 2014. This country has established an effective and strong partnership between public authorities and social partners. Some of the main measures are „Education and Training until 18“and supra-company apprenticeship scheme (European Commission, 2018d, p.5). The European Commission from the 2018 country report discussed next achievements in Austria (European Commission, 2018d, p. 4):

- ✦ „On the back of solid economic growth, employment is growing faster than the labor force,
- ✦ Implementation of Austria’s education reform agenda has so far not translated into improved education outcomes,
- ✦ Various policy and legal initiatives seek to help young people with a migrant background, including recognized refugees and people under ‘subsidiary protection’ to integrate into Austrian society“.

Austria has established in 2008 the *Training guarantee*. The aim of this measure was to complete vocational education for young people, and in 2016 has established the Education/Training until 18“(European Commission, 2018d, p. 5).

7.3. THE YOUTH GUARANTEE SCHEME IN PORTUGAL

Portugal is a good example of a country which has been improving the labour market for young people. This country has a network of partnership form implementing the Youth Guarantee and a high level of sustainable integration. The European Commission from the 2018 country report discussed next achievements in Portugal (European Commission, 2018e, p. 4):

- „Labour market conditions keep improving, thanks to the economic recovery but youth unemployment remains a challenge,
- Programmes are being rolled out and reforms implemented in Vocational Education and Training to upgrade the skills of the adult population,
- Employment is fast increasing contributing to a decrease in total unemployment while wage pressure remains low,
- The recent strong increase in job creation has substantially improved the country’s labor market,
- Portugal Social Innovation is an example of an advanced initiative investing in social innovation and entrepreneurship projects“.

7.4. THE YOUTH GUARANTEE SCHEME IN THE UNITED KINGDOM

United Kingdom doesn’t implement the Youth Guarantee but has a strong political commitment for improving labor market indicators for young people in the UK. One of the interesting data is a relatively high rate of inactive young persons.

According to the Commission’s assessments (European Commission, 2018b) some of the recommendations were:

- Improving public and private investments and raise productivity
- Improving labor market progression for most people (in skills, wages, in their qualifications)
- Dissemination of participation in higher education for young people is still a political priority.

United Kingdom's government have The Youth Contract (from 2012 to 2015). This is package support for young people (16-17-year-old NEET's) which included (European Commission, 2018b, p. 6):

- „extra Jobcentre Plus (PES) advisor support, including a referral to the national careers service,
- additional apprenticeship and training places,
- work experience,
- sector based work academies and additional support for NEETS and disengaged 16-17-year-olds to help them get into sustained learning, an apprenticeship or jobs with training“.

The Youth Contract continued to be funded after 2015, until March 2017. Instead, the Youth Contract United Kingdom has introduced the Youth Obligation, after April 2017. Instead of Job Seekers Allowance, the Youth Obligation provides support by a new scheme – Universal Credit. Universal Credit is supporting not only for a youth unemployed person but also for people who cannot work or people who need support in different labor market situations. This support includes assistance for childcare and housing.

According to available data, the share of NEETs population which was covered by the Youth Guarantee and 2016 was only 10.5% and 58.4% of young people were unemployed or inactive. Data for the new universal credit schemes show that population coverage by these measures is still close to 20%, but yet the vast majority of young people in the UK do not get any unemployment related benefit (European Commission, 2018b, p. 7).

8. CONCLUSION

Unemployment caused by a long-term job-search or loss of an existing job causes a great deal of stress to people in the situations mentioned and represents the existential problem of the individual as well as society as a whole. Long-term unemployment leads to negative consequences for a long-term unemployed individual, and ultimately to the state's economy. In order to stop negative trends, the Republic of Croatia must define measures, projects, and activities aimed at the employment of people and setting up detailed investment programs.

Because of the high unemployment rate of the youth, Croatia and some other EU countries have to make great efforts to alleviate such unemployment.

One of the main goals of the Europe 2020 strategy is to carry out a series of measures and projects aimed at facilitating and accelerating the transition of young people from the education system to the labor market.

Among the most famous is the Guarantee for Youth, and also the Youth Employment Initiative and the EURES Network. All of them are being implemented to increase the quality of education, greater mobility of young people and faster employment after the completion of the educational process.

Reducing youth unemployment is of paramount importance for every country because young people are the future of development and survival of every economy.

In the selected countries (Croatia, Austria, the United Kingdom, and Portugal), further improvements can be made in the following indicators: in Youth Guarantee beyond the 4m target, Timely & positive exits, NEET coverage indicator and Follow-up 6m (positive). Each of these countries has its own goals and strategies in addressing youth unemployment issues.

At the EU-28 level, positive trends in the reduction of youth unemployment rates are observed in the ten-year period. Active youth employment policies need to be well designed, generous funding and the results evaluated. In this regard, further research on key indicators of youth labor market activities, employment measures are needed in order to formulate more effective youth employment policies in selected countries.

Abstract

Issuers whose shares are admitted to trading on a regulated market operated by the Zagreb Stock Exchange are obliged to follow Corporate Governance Code recommendations and annually report to the public about their compliance with the respective provisions of the Code. When reporting to the public about their compliance the “comply or explain” principle is applied. Moreover, issuers of shares as public interest entities have an obligation to include their corporate governance statements into management reports when making their annual financial reports available to the public. The main goals of corporate

¹ Andreja Hašček is an employee of the Croatian Financial Services Supervisory Agency (Hanfa). The views expressed in this paper are those of the author and do not necessarily reflect the views of the Croatian Financial Services Supervisory Agency (Hanfa).

governance reporting are to raise awareness of the importance of corporate governance itself for the sustainability of the issuers' performances and to further enhance the transparency of the issuers' business activities. The objective of this paper is to analyze corporate governance compliance reports of respective issuers whose shares are admitted to trading on the Zagreb Stock Exchange in order to determine if there is a linkage between corporate governance compliance degree and the issuers' financial and market performances and to what extent. The aim of this paper is, if possible, to define the next steps in corporate governance improvements as an important determinant towards sustainable growth of the issuers.

Keywords: corporate governance code, corporate governance reporting (“comply or explain”), issuers with securities admitted to trading on a regulated market, financial performance, market performance

JEL Classification: G29, L19

1. INTRODUCTION – THE ROLE OF CORPORATE GOVERNANCE IN TRANSPARENCY REPORTING OF LISTED COMPANIES

The latest financial crises have put into focus corporate governance and the impact of corporate governance on the issuers' competitiveness, their financial success and long-term sustainability.

Good corporate governance ensures to the issuer simpler and more affordable access to capital, reduces the risks of investing in the issuer, reinforces the investors' trust in the capital market and contributes to the community (Korporativno upravljanje: Priručnik, 2016, 14).

In its Action Plan (2012, 6), the European Commission recognizes several activities to be undertaken with the aim of increasing issuers' transparency, among which quality enhancement of corporate governance reporting and explanation in case of any departure from the recommendations of the corporate governance codes of companies whose securities are admitted to trading on a regulated market.

This article analyses the compliance of selected issuers whose shares are admitted to trading on a regulated market operated by the Zagreb Stock Exchange (hereinafter: ZSE) with corporate governance recommendations with

the aim of determining whether there are links between corporate governance reporting and financial and market performances of issuers.

2. CORPORATE GOVERNANCE FRAMEWORK IN CROATIA OF COMPANIES LISTED ON ZAGREB STOCK EXCHANGE

Corporate governance in the Republic of Croatia is regulated by various corporate governance codes, the so-called *soft law*, consisting of principles, standards, and recommendations, compliance to which represents the adoption of the expected corporate governance. The requests for obligatory corporate governance itself stem from the so-called *hard law*, that is, legislation setting out the obligation of reporting on compliance with the corporate governance code, presuming the existence and application of such codes (Ravlić Ivanović & Hašček, 2018, 136).

The main feature of European and Croatian corporate governance is adhering to the “comply or explain” principle. In keeping with this principle, if a company breaches a respective corporate governance code it must provide a public explanation of the parts of the code they are departing from any of the reasons for their non-compliance to the corporate governance good practice recommendations.

Companies whose shares are admitted to trading on a regulated market operated by the ZSE adhere to the Corporate Governance Code (hereinafter: the Code) adopted by the Croatian Financial Services Supervisory Agency (Hanfa) and the ZSE. The Code covers three interest groups, namely: (1) shareholders and investors, (2) management and supervisory bodies and company employees and (3) internal and external company audit. The basic principles aimed at by the Code are as follows: (1) business transparency, (2) clear and elaborated procedures for the operating of a supervisory board, management board and other management structures, (3) avoiding conflict of interest, (4) efficient internal control and (5) efficient company liability system.

3. ANALYSIS OF CORPORATE GOVERNANCE REPORTING AND FINANCIAL AND MARKET PERFORMANCE OF SELECTED COMPANIES LISTED ON ZAGREB STOCK EXCHANGE

3.1. SAMPLE SELECTION AND LIMITATIONS

As on 31 December 2018, the regulated market of the ZSE2 included 132 issuer shares, 4 of which on the Prime Market, 25 on the Official Market and 103 on the Regular Market. Since 6 issuers have both regular and preferred stocks admitted to trading on a regulated market, on 31 December 2018 there were a total of 126 issuers on the regulated market (Pregled trgovine u 2018. godini, available at <https://www.zse.hr/default.aspx?id=178>, access 13 March 2019).

All issuers whose shares are admitted to trading on a regulated market were not the subject of this analysis. Instead, it was conducted on a selected sample of issuers.

The departure point of the analysis was the market component – trading days in 2018. The market component was taken as the starting criterion because liquidity is the basic and crucial indicator of an investor’s “interest” in an issuer and their securities. The sample was created by including, on the one hand, those issuers who had the most trading days in 2018 and, on the other, issuers whose shares have not seen any trading in the selected period. In other words, the sample consisted of issuers representative of two markets “extremes”, with the purpose of clearly identifying the possible linkage between an issuer’s market and financial performances and corporate governance level.

The first group of issuers, the one with the most trading days in 2018, is made up of issuers whose shares, on 31 December 2018, were part of the CROBEX³ ZSE index. They are 19 issuers, namely: Ad Plastik d.d., Adris grupa d.d.

² The regulated market operated by the Zagreb Stock Exchange is divided into three segments – Prime, Official and Regular markets, depending on the level of the admission request and listing maintenance, as well as on the level of issuer reporting request in a particular segment; Prime Market is the most demanding segment, Official Market is somewhat less demanding and Regular Market sets out the basic conditions for the regulated market.

³ The condition for an issuer’s share to be included in CROBEX is 80% trading days. The regular audit of the CROBEX content takes place semi-annually, on each third Friday in March and September. The last CROBEX audit of 2018 was an extraordinary audit conducted on 12 October

(preferred stocks), Arena Hospitality Group d.d., Atlantic grupa d.d., Atlantska plovidba d.d., Đuro Đaković grupa d.d., Dalekovod d.d., Ericsson Nikola Tesla d.d., HT d.d., Ingra d.d., Jadran d.d., Končar-elektroindustrija d.d., Kraš d.d., Maistra d.d., OT-Optima telekom d.d., Podravka d.d., Valamar Riviera d.d., Brodogradilište Viktor Lenac d.d. i Zagrebačka banka d.d. This group of the sampled issuers does not include Jadran d.d. because its shares have been admitted to trading on a regulated market in the course of 2018. Due to the comparability of financial indicators and corporate governance, the sample also does not include Zagrebačka banka d.d., since it was the only financial institution in the sample. The first group of issuers is thus made up of 17 issuers. Of the 17 issues, 4 are on the Prime Market, 5 are on the Official Market and 8 are on the Regular Market.

The second group of issuers consists of issuers whose shares were not traded at all in 2018. These are 21 issuers, namely: 3. maj brodogradilište d.d., Bilokalnik-IPA d.d., Brionka d.d., Čateks d.d., Dalma d.d., Domaća tvornica rublja d.d., Dubrovačko primorje d.d., Elektropromet d.d., Hoteli Baška Voda d.d., Hoteli Vodice d.d., Istra d.d., Jadran film d.d., Jelsa d.d., Kamensko d.d. in receivership, Maraska d.d., Nava banka d.d. in receivership, Plava laguna d.d. (preferred stocks), Pounje d.d. (preferred stocks), Stanovi Jadran d.d., Terra Mediterranea d.d., Vodoprivreda Zagreb d.d. (Pregled trgovine u 2018. godini, available at <https://www.zse.hr/default.aspx?id=178>, accessed March 13, 2019). This group of issuers does not include Dubrovačko primorje d.d., Hoteli Baška Voda d.d., Kamensko d.d. u stečaju and Nava banka d.d. u stečaju since these companies' shares were delisted on the regulated market in the course of 2018. Also, Plava laguna d.d. and Pounje d.d., whose regular shares were traded in the selected period, and Stanovi Jadran d.d., because their shares have been admitted to trading on a regular market in the course of 2018 (available at <https://www.zse.hr/default.aspx?id=191>, access March 13, 2019). The second group is thus made up of 14 issuers. All 14 issuers are admitted to trading on the Regular Market.

For the selected sample issuers' annual Corporate Governance Code questionnaires for 2017 were analyzed (available at <https://www.zse.hr/default.aspx?id=20&tip=novostiIzdavatelja>, access March 13, 2019), with the purpose

2018. [available at: <https://www.zse.hr/default.aspx?id=44101&index=CROBEX>, access March 13, 2019]

of determining the issuers' compliance with corporate governance demands in the selected period. Furthermore, selected financial indicators from annual financial reports for 2017 were analyzed for these issuers with the purpose of determining the issuers' financial performance in the same selected period. The data obtained were then examined with reference to the issuers' market performances in 2018. On the basis of analyzed data, it was determined whether there were links between corporate governance and the issuers' market and financial performances and to what extent. The results of this analysis are as follows in this article.

Apart from the manner of selecting the sample, the limitations of this research were the quality of replies on the application of corporate governance recommendations, the issuers' (lack of) understanding of the concept of compliance with corporate governance recommendations, the quality of presented financial information and failure to monitor data in a longer period of time.

3.2. CORPORATE GOVERNANCE REPORTING ANALYSIS

The Corporate Governance Code (hereinafter: the Code) says that the issuer must fill in a questionnaire (the annual questionnaire which is an integral part of the Code) and state whether they are in compliance with the Code recommendations or not; if the issuer is not in compliance with the Code recommendations he must explain in the annual questionnaire the reasons for failure to apply or not to comply with recommendations (Kodeks korporativnog upravljanja, 2010, 5). The issuer must publish the filled-in annual questionnaire on his web pages and on the ZSE web site.

The annual corporate governance questionnaire comprises of 62 questions divided into five areas, in keeping with the structure of the Code itself: dedication to corporate governance principles (4 questions), shareholders and the general assembly (14 questions), management and supervisory bodies (32 questions), audit and internal control mechanisms (6 questions) and business transparency (6 questions). The questions in the questionnaire require YES or NO answers. Depending on how a question is formulated, the answer indicates whether, in a given question (from the area of corporate governance), the issuer is in compliance with the Code recommendations or not. Every answer indicating a recommendation application in its content is marked as compliance, whereas every answer indicating noncompliance by its content is marked as

noncompliance. For each issuer, in each of the said corporate governance areas, a percentage of compliance for that particular area is established by dividing the number of compliance-indicating answers in the area with the total number of questions for the same area. In addition, total compliance with Code recommendations is established for every issuer by assigning equal weight to every segment of the Code, by adding compliance results for each individual area and then dividing them with the total number of areas. Finally, total compliance for each area, as well as total compliance with Code recommendations, was calculated for the first and the second groups of issuers. The results of the analysis are presented below.

All 17 issuers (100%) from the first group published their annual corporate governance questionnaire for 2017 on the ZSE website. Of the 14 issuers from the second group, 9 (64.23%) published their annual corporate governance questionnaire for 2017, whereas for the remaining 5 (35.71%) the annual questionnaire for 2017 is not available.

In the corporate governance area pertaining to Dedication to Corporate Governance Principles and Social Responsibility, 11 issuers of the first group provided answers indicating 75% compliance, and 5 issuers provided answers indicating 100% compliance. With the second group issuers, 1 issuer provided answers indicating 25% compliance, 2 issuers had 50% compliance, 4 issuers had 75% compliance and 2 issuers had 100% compliance.

In the corporate governance area pertaining to Shareholders and the General Assembly, in the first group, 1 issuer provided answers indicating 71.43% compliance, 2 issuers had 78.57%, 8 issuers had 85.71%, 5 issuers had 92.86% and 1 issuer had 100%. In the second group, 5 issuers provided answers indicating 85.71% compliance and 4 issuers had 92.86%.

In the corporate governance area pertaining to Management and Supervisory Bodies, in the first group, 1 issuer provided answers indicating 65.63% compliance, 2 issuers had 71.88%, 2 issuers had 75%, 2 issuers had 78.13%, 2 issuers had 81.25%, 3 issuers had 84.38%, 2 issuers had 87.50%, 1 issuer had 90.63%, 1 issuer had 93.75% and 1 issuer had 100%. In the second group, 1 issuer provided answers indicating 68.75% compliance, 6 issuers had 71.88%, 1 issuer had 75% and 1 issuer had 84.38%.

In the area of corporate governance pertaining to Audit and Internal Control Mechanisms, in the first group, 6 issuers provided answers indicating 66.67%

compliance, 7 issuers had 83.33% and 4 issuers had 100%. In the second group, 4 issuers provided answers indicating 66.67% compliance, 3 issuers had 83.33% and 2 issuers had 100.00%.

In the area of corporate governance pertaining to Transparency, in the first group 3 issuers provided answers indicating 66.67% compliance, 2 issuers had 83.33% and 12 issuers had 100%. In the second group, 4 issuers provided answers indicating 66.67% and 5 issuers had 83.33%.

The average compliance rate in the first group of issuers was between 71.93% and 96.07%. In this group of issuers, 1 issuer had 71.93%, 1 issuer had 73.18%, 1 issuer had 75.86%, 1 issuer had 77.14%, 1 issuer had 80.48%, 1 issuer had 82.83%, 1 issuer had 85.06%, 1 issuer had 85.92%, 1 issuer had 86.34%, 1 issuer had 86.93%, 1 issuer had 87.11%, 1 issuer had 88.18%, 1 issuer had 91.49%, 1 issuer had 92.32%, 1 issuer had 93.81%, 1 issuer had 94.17% and 1 issuer had 96.07%. The average compliance rate in the second group of issuers was between 68.18% and 90.68%. In this group of issuers, 2 issuers had 68.18%, 1 issuer had 73.99%, 1 issuer had 76.51%, 1 issuer had 77.14%, 2 issuers had 77.95%, 1 issuer had 86.28% and 1 issuer had 90.68%.

Table 1. Compliance with the recommendations of the Corporate Governance Code for 2017

	Dedication to Corporate Governance Principles and Social Responsibility	Shareholders and the General Assembly	Management and Supervisory Bodies	Audit and Internal Control Mechanisms	Transparency	Total
First group of issuers	83.82%	86.97%	81.80%	81.37%	92.16%	85.23%
Second group of issuers	69.44%	88.89%	73.26%	79.63%	75.93%	77.43%

Source: ZSE [available at: <https://www.zse.hr/default.aspx?id=20&tip=novostiIzdavatelja>, access March 13, 2019], authors' calculations

The first group of issuers shows a higher degree of compliance in four out of five areas of corporate governance - Dedication to Corporate Governance Principles and Social Responsibility, Management and Supervisory Bodies, Audit and Internal Control Mechanisms and Transparency. The area of corporate governance in which the second group of issuers have a higher degree of compliance than the first group of issuers is the area of Shareholders and the General

Assembly (first group 86.97%, second group 88.89%). The potential reasons for this result are different degrees of understanding of the complexity of the issuer-investor relationship between the two groups and/or the fact that the second group of issuers has not been faced with the circumstances that could have impacted compliance with recommendations in this area. However, the first group of issuers have demonstrated significantly higher compliance than the second group in Dedication to Corporate Governance Principles and Social Responsibility (first group 83.82%, second group 69.44%), Management and Supervisory Bodies (first group 81.80%, second group 73.26%) and Transparency (first group 92.16%, second group 75.93%). The proposal is, therefore, to use further research to determine the segments in each of these areas that contribute to better compliance with the Code recommendations. As for the total compliance with the Code recommendations, the first group of issuers demonstrated higher total compliance (85.23%) than the second group companies (77.43%).

Considering the manner in which the sample was created, the first group being issuers from CROBEX issuers and the second group of issuers whose shares have not been traded at all in 2018, and based on the results obtained from the analysis of total compliance of issuers with the Code recommendations, the conclusion is that the CROBEX issuers demonstrate a higher total compliance with the Code recommendations than the issuers whose shares have not been traded at all, that is, the companies whose shares have no market performance whatsoever.

3.3. FINANCIAL AND MARKET PERFORMANCE ANALYSIS

3.3.1. Financial Performance Analysis

Financial indicators offer the information required for business management and company development, that is, they are being calculated in order to provide an information background for business decision making (Žager, 2016, 225). Since this analysis focuses on issuers whose shares are admitted to trading on a regulated market, selected financial indicators were calculated for the purposes of this article measuring business success – cost-effectiveness indicators, profitability indicators, and investment indicators. Calculations were made on the basis of the issuers' data for 2017, published in GFI questionnaires (<https://www.zse.hr/default.aspx?id=36774>, access March 13, 2019).

The calculations used in this article are as follows: total business cost-effectiveness = total revenue/total expenses; net profit margin = (net profit+interest)/total revenue; net return on assets = (net profit+interest)/total assets; return on own capital = net income/own capital; income (profit) per share = net profit/number of shares.

Additionally, Altman's synthetic financial stability indicator – Z-score (Altman, 1968) was calculated for issuers, according to the following formula: $1,2 \cdot X1 + 1,4 \cdot X2 + 3,3 \cdot X3 + 0,6 \cdot X4 + 0,999 \cdot X5$, where $X1 = (\text{short-term assets} - \text{short-term liabilities}) / \text{total assets}$, $X2 = \text{retained earnings} / \text{total assets}$, $X3 = (\text{profit before tax} + \text{interest}) / \text{total assets}$, $X4 = \text{market capitalization} / \text{total assets}$ and $X5 = \text{total revenue} / \text{total assets}$. Since the second group of issues is made up of issuers whose shares have not been traded at all (which is why, for the said issuers, there is no market value of their shares or market capitalization), a revised Z-score (Altman, 2000) was additionally calculated where, instead of market capitalization, $X4$ is the book value and the formula for the calculation of the revised Z-score is as follows: $0,717 \cdot X1 + 0,847 \cdot X2 + 3,107 \cdot X3 + 0,42 \cdot X4 + 0,998 \cdot X5$.

The analysis shows that, from the total of 17 issuers in the first group, 2 (11.76%) have seen a loss, whereas 15 issuers in the first group (88.24%) made a profit in 2017. In the second group of issuers, of the 9 issuers who replied to the annual Code questionnaire, 4 issuers (44.44%) have seen a loss and 5 issuers (55.56%) from the second group made a profit. If we consider the entire sample of the second group of issuers, made up of 14 issuers, 8 issuers (57.14%) have seen a loss and 6 issuers (42.86%) made a profit.

As net profit is used when calculating selected financial indicators – net profit margin, the net return on assets, net own capital return on assets and income (profit) per share, the above results are reflected in these financial indicators as well.

If we analyze Z-score and revised Z-score, the results are as follows. Of a total of 17 issuers in the first group, not one issuer has the Z-score higher than 3, 9 issuers (52.94%) has the Z-score between 1 and 3, and 8 issuers (47.06%) have the Z-score of less than 1. In the second group of issuers, of the 9 issuers who have replied to the annual Code questionnaire, 4 issuers (44.44%) have the Z-score between 1 and 3, and 5 issuers (55.56%) have the Z-score less than 1; also, 3 issuers (33.33%) have a negative Z-score. As for revised Z-score in

the first group of issuers, 1 issuer (5.88%) has the revised Z-score higher than 3, 8 issuers (47.06%) has the revised Z-score between 1 and 3, and 8 issuers (47.06%) has the revised Z-score of less than 1. In the second group of issuers, 5 issuers (55.55%) have the revised Z-score between 1 and 3, and 4 issuers (44.44%) have the revised Z-score less than 1; also, 1 issuer (11.11%) has a negative revised Z-score.

Table 2. Average compliance with the Corporate Governance Code with reference to Z-score and revised Z-score

	Z-score 1-3	Z score > 1	revised Z-score < 3	revised Z-score 1-3	revised Z-score > 1
First group of issuers	89.78%	80.10%	92.32%	89.46%	80.10%
Second group of issuers	79.78%	75.54%	0.00%	77.46%	77.39%

Source: ZSE [available at: <https://www.zse.hr/default.aspx?id=20&tip=novostiIzdavatelja>, access March 13, 2019], authors' calculations

If we look at the average compliance with the Corporate Governance Code with reference to Z-score and revised Z-score, results show that issuers in the first group have higher average compliance with the Code than the second group of issuers. Also, in both groups of issuers average compliance increases with the increase of Z-score or revised Z-score. For further conclusions on the mutual impact of compliance with Code recommendations and financial performances of the issuer, the suggestion for future research is to expand the sample to include all issuers and conduct an analysis of other financial indicators.

3.3.2. Market Performance Analysis

For the purposes of this article, the following market performances were selected: turnover, volume, transactions made and market capitalization. These are the performances usually used to “position” and establish the issuers’ significance on a market. The data on market performances for shares on a regulated market on 31 December 2018 were taken from the ZSE website.

The issuers’ market performances were seen as on 31 December 2018, in order to establish whether compliance with Code recommendations for 2017 had had an impact on the issuers’ market performances in 2018. Also, the share of market performances of the sampled issuers was analyzed with reference to the totality of market performances of all issuers on the regulated stock market.

Table 3. Overview of market data for shares on 31 December 2018.

	Turnover (in HRK)	%	Volume	%	Trans- actions	%	Market Capitalisation (in HRK)	%
Prime Market	44.171.534	2.80%	57.285	0.19%	778	0.84%	9.025.809.770	6.80%
Official Market	902.501.361	57.15%	18.878.546	62.41%	49.605	53.76%	57.304.941.333	43.17%
Regular Market	632.513.179	40.05%	11.314.491	37.40%	41.886	45.40%	66.417.792.928	50.03%
Total	1.579.186.074		30.250.322		92.269		132.748.544.031	
First group of issuers	1,190,438,475	75.38%	21,870,745	72.30%	59,207	64.17%	36,303,268,265	27.35%
Second group of issuers	0	0.00%	0	0.00%	0	0.00%	0	0.00%
Total	1,190,438,475	75.38%	21,870,745	72.30%	59,207	64.17%	36,303,268,265	27.35%

Source: ZSE [available at: <https://www.zse.hr/default.aspx?id=178>, access March 13, 2019], authors' calculations

Of the 17 issuers in the first group, 4 are on the Prime Market, 5 are on the Official Market and 8 are on the Regular Market of the ZSE. All 14 issuers are on the ZSE Regular Market (including the 9 issuers who have published the annual corporate governance questionnaire for 2017).

Market performance data show that the first group issuers' shares (which is the data for the entire sample because the second group issuers have no market performances) make up 75.38% of the total annual share turnover on the regulated market, with a volume of 72.30% of the total annual share turnover on the regulated market and with 64.17% of the total number of share transactions made on the regulated market. In other words, the 12.88% of shares of the first group of issuers (17 issuers' shares of the total of 132 shares admitted to trading on a regulated market) make up $\frac{3}{4}$ of the total annual turnover and volume and around $\frac{2}{3}$ of all shares transactions made on the regulated market. Looking at market capitalization (calculated as the product of multiplication of the total number of shares issued and the last price), the first group issuers' shares make up 27.35% of the total market capitalization.

Departing from the data on the share of market indicators for the first group of issuers in total market indicators, the recommendation for further research

is to establish compliance with the Code recommendations with other issuers who have not been sampled and the market performances of their shares, with the purpose of finding mutual linkage and impact.

4. CONCLUSION

The subject of this article is to determine whether there is a mutual link between corporate governance and the financial and market performances of the issuer. The analysis was conducted on two groups of issuers representing two markets “extremes” – the first group of issuers sample includes CROBEX issuers and the second group sample includes issuers whose shares have not been traded in the selected period and only the issuers who have made their Code questionnaires publicly available.

Results show that the first group issuers demonstrated on average higher total compliance with corporate governance recommendations (85.23%) than the second group issuers (77.43%). In addition, both groups of issuers show higher total compliance with corporate governance recommendations with the increase of Z-score and revised Z-score. Also, the first group issuers make for 3/4 of the total annual turnover and volume and for around 2/3 of all share transactions made on the regulated market. The analyses conducted gave the conclusion that there is a positive linkage between corporate governance and the financial and market performances of issuers.

However, taking into consideration the above mentioned limitations of this research, the results obtained do not allow any conclusions on the impact of corporate governance compliance on financial and market performances of the issuer or vice versa, nor do they allow any conclusions on the impacting factors of corporate governance or the extent of their impact on the financial and market performances of the issuer. These conclusions will have to be made in future research that will be free from the above-stated limit.

Abstract

Nowadays there are several meanings defining the word cluster. Surely the most familiar one is that of Michael E. Porter to which the majority of other authors refer as well. It is indisputable to agree that clusters, in the context of this scientific paper, are a specific form of concentration of businesses mutually connected to provide better service, greater flow of information and to increase competitiveness. Businesses that form a cluster not only collaborate but also compete among each other at the same time. The conditions of globalization put emphasis on information and capital flow because they spread faster than the flow of products and services and it is inevitable to expect that the development of clusters themselves will in most cases rely on information and capital flow if it is in their interest to think and act globally. More and more businesses

organized into clusters recognize the necessity of interconnecting and presenting at the domestic as well as global market and this is supported by the fact that the main characteristics of clusters are precisely innovation and constant improvement of working processes.

Creativity and innovativeness of small and medium-sized enterprises joined into clusters enable a better placement on the market. Due to their position and numerous other possibilities, insular clusters can contribute to the development of economic operators. By including a local government into strategy development, scientific structures can greatly contribute to reversing negative trends that affect insular communities in particular. Regional clusters are incubators of creating a certain advantage in terms of specialized goods, services, knowledge, education, skills as well as innovations.

The purpose of this paper is to identify the role of insular clusters in promoting autochthonous products, putting emphasis on economic growth and competitiveness towards better performance on the market, creating synergy with the local government and sharing knowledge, novelties, and information between cluster members. Precisely insular clusters and their products are in the scope of this paper.

This scientific paper is divided into a theoretical part offering a description of clusters and explaining their function and a practical part which investigates the problem of clusters on islands. The recommendation of this paper is to encourage research and put clusters into promotional function both on regional as well as the global level of business activities.

Keywords: clusters, products, employment, competitiveness, innovation

JEL Classification: R11

1. INTRODUCTION

Competitiveness and innovation in terms of small and medium-sized entrepreneurship present a certain advantage in today's turbulent environment and globalization trends. However, the question arises as to how this advantage should be observed because small and medium-sized enterprises do not have a big opportunity as opposed to big corporative organizations both in the domestic and global business environment. On the contrary, it has been indicated that small and medium-sized enterprises have an ability to change and adapt very quickly to new situations, unlike big and inert systems. Of course, the said

business entities individually do not have such great opportunities unless they collaborate and present themselves on the market together. The size advantage can be reached by joining into business clusters which initiate development on local as well as regional level. Agglomeration of business entities concentrated on a specific geographical area that is both competitive with each other as well as collaborative fosters the necessity of coordination with representatives of local community and other consulting organizations and financial institutions. Local systems are the ones that should be oriented on the specificity of demands and needs of clusters.

Globalization has imposed on certain locations and regions to appear more inviting and competitive in order to be able to offer successful management to potential business entities. Small and medium-sized business entities that have requirements and prospects of stepping outside the national framework also have a chance to present and prove their competitiveness on the global market. The advantage in terms of innovation and maintaining competitiveness among small and medium-sized entities in a specific area rests on making connections with other branches in the economy.

Business cluster association “Croatian island product” represents one of the most successful examples of the development of regional clusters in the Republic of Croatia. Autochthonous products are a paradigm that should serve as a guiding force towards a successful business to other regions as well. An association that has recognized a potential and thus managed to stop the negative trends like depopulation (brain drain of young people) of people living on islands has already awoken the interest not only on local but also on a national level to cherish the old heritage, that is to produce autochthonous products. The said business cluster states in its statute book that the aim of the association is to strengthen competitiveness and excellence of the carrier of the label “Croatian island product” by connecting all relevant factors from both public and private sectors as well as the scientific and research community. The association was founded to promote the development and improvement of all islands in Croatia (Association’s Statute Book, 2018).

The main object of research in this scientific paper will be regional clusters and in this case the region of Croatian islands. The paper will present the structure of clusters and their beginnings. In the scientific work, the main subject of the study will be regional clusters, in this case, the region of the Croa-

tian islands. The cluster structure and its beginnings will be displayed. Further, SWOT will show the weaknesses, opportunities, threats, and strengths of the business cluster association, thus finding the answer to where the future of the clusters is. In which direction they should turn.

2. THE CONCEPT OF CLUSTERS AND COMPETITIVENESS

It is impossible to start, and maybe even unnatural to write any scientific paper about clusters without including one of the most widely used definitions of clusters in economic circles. According to Michael E. Porter (1985), a cluster is a “geographical proximate group of interconnected companies and associated institutions in a particular field that is complementary”. It is a clear definition that should, next to the word *complementary*, inevitably include words like *compete* and *collaborate*.

Clusters are determined by the interaction between the enterprises. They are not the simple concentration of businesses, as claimed by Garelli (2006, p.54)

Clusters represent an extremely effective policy of the competitiveness development of a certain country. In the beginning, they appear as “islands” of competitiveness, and later their development multiplies the competitiveness on the national level (Garelli, 2006, p.55)

In terms of a new, global trend of development of economic entities, the development of clusters is of great importance for the Republic of Croatia. The emphasis is put on already formed clusters that head outside the national framework, i.e. those that strive to have a good placement on the foreign markets.

One of the key roles in forming clusters, next to the local government, belong to agencies for regional development, scientific and research centers, employment agencies, and trading associations. Inherent characteristic lies in the fact that everybody should collaborate with each other in order to exchange information, knowledge, experience, technical support, development and research.

It must be highlighted that membership does not play such an important role as the relationship based on trust does. Being a member of a cluster is not essential if the foundations are built upon trust. In terms of that, agglomera-

tion into clusters enables greater productivity and innovativeness for the participants, which is more than what they could achieve by working individually.

In today's modern environment one of the main factors of competitiveness is productivity. The equation of productivity is very simple, and it contains the overall amount of produced goods and services over the *input* unit. *Input* refers to work, raw material, and capital. This brings us to the conclusion that competitiveness no longer entirely depends on the factor of the size of industry or the enterprise nor the reach of raw material, but what matters are productivity and ability of fast-changing and adapting.

According to the cluster development strategy in the Republic of Croatia 2011-2020, great importance is given to the development of competitiveness. Cluster policy in Croatia should be observed from the positional point of view, mainly as a small transitional economy. Advantages of clustering rest specifically on the following characteristics (Cluster development strategy in the Republic of Croatia, 2010):

- ♦ strengthening the competitiveness of enterprises
- ♦ strengthening the competitiveness of Croatian regions
- ♦ improving the structure of economic activities (new technologies, restructuring enterprises)
- ♦ networking of public, business and scientific and research sector
- ♦ understanding one's own economy.

2.1. LIFE CYCLE

When talking about clusters, but also about any agglomeration of business entities that have a common vision and a goal, one can say they have a life cycle. In the following, the life cycle is going to refer to clusters. The division of the cluster's life cycle was described in five phases by Andersson (2004, p.30):

- ♦ accumulation (agglomeration) – a region has numerous enterprises and other participants. It should be pointed out that this is one of the more important phases because it is a process of gathering same business entities based on not only common interest but also on the awareness of every single business entity that competes among each other. If the in-

terested parties succeed in overcoming this phase, then vulnerability, i.e. the possibility of cluster collapsing, before it was even set up, reduces;

- formation of clusters- while forming clusters, the participants of the agglomeration start collaborating around main activities and implement joint opportunities using one's own connections;
- development of clusters- the emergence of new participants in activities that bond them into a region, and new connections are developed;
- mature clusters- they reached a specific, critical number of participants. A mature cluster also has developed connections within itself as well as outside with other clusters, activities, and regions;
- transformation- over time, market technology and processes change, and so do clusters. In order to be sustainable, i.e. to overcome stagnation or degradation, a cluster must innovate and adapt to changes. This is done through a transformation into one or several new clusters that concentrate around other activities or simply change in a way products and services are delivered.

Development of clusters also depends on several factors that determine whether its formation will succeed. The concept of the development is not identical, and it is practically impossible to copy it. What is essential is that all phases of development are extremely important. Confidence from business entities, especially in the first phase (agglomeration), reaches the greatest importance. Of course, it must be of equal intensity in all phases. Degradation, but also vulnerability emerge in the beginning phases. Of course, it is clear to all participants and cluster members that collaboration enables greater benefits in relation to what it would be like if they participated in the market alone.

2.2. ADVANTAGES AND DISADVANTAGES OF CLUSTERS,

Every business entity, by which we mean small and medium-sized entrepreneurs, get greater benefits on the market than those who present themselves as individuals. Of course, we need to mention downsides that one cannot avoid, as well as some limitations or obstacles. Advantages are those that encourage clusters to better and more intensive collaboration because an approach to new ideas, information, and technology guarantee benefits that otherwise could not be achieved if one presented itself on the market an individual.

Advantages (Horvat and Kovačević, 2004, p.33) are:

- productivity- a better approach to employees and suppliers, to specialized information, better motivation and taking measures;
- innovation- clusters create an environment that enables innovations and ensure a better approach to a wider source of information, knowledge, contacts, and insight into the market;
- transactional costs- clusters can reduce transactional costs by sharing information with other business entities and by creating a consortium, but also by enabling access to special services (statistical data, market information) and by employing universities and technical faculties.

Disadvantages (Horvat and Kovačević, 2004, p.37) are:

- perceiving a cluster as a panacea (cure-all), i.e. thinking a cluster is a solution to all economic problems
- too narrow specialization within clusters that reduce the diversity of the national economy.

3. REGIONAL DEVELOPMENT OF CLUSTERS

The book “Clusters and cluster development policies” (Dragičević and Obadić, 2013, p.23) states how the importance of the location and its context is becoming more and more important for the interested parties. Observing the global economy, it is precisely the location one of the determinants of the diversity between the competitors that cannot be easily copied. Enterprises around the world are constantly trying to understand the advantages and possibilities of clusters, and many managers are beginning to understand how their active participation in strengthening domestic clusters is becoming an inherent part of their role.

The regional or localized cluster is a spatial association of similar or connected economic activities that shape the foundations of a local area which can facilitate knowledge transfer and encourage different forms of learning and adapting. Stated clusters usually consist of small and medium-sized enterprises, and their success is directed towards the strength of social capital and geographical vicinity. (Andersson, 2004, p.31)

In 2011, the Ministry of Economy, Work, and Entrepreneurship adopted a strategy for cluster development for the period of 2011-2020, which highlights the fact that the world as we know it today is based on specialization. Importance is given to the global market. The global economy is aiming at the development and diversity of regions which then develop a new form of competitiveness. Regions determine competitiveness in the global economy. Competitiveness between regions can be seen in several parameters. Some of them are workforce characterized by quality and mobility, then basic and business infrastructure, entrepreneurial climate, an environment that is encouraging and motivational for innovations, inventions in terms of cluster development, efficiency and effectiveness of local and regional government as well as the attitude towards the environment. Knowledge, which is the foundation upon which to build a region, and an effective partnership between the public and private sector, including scientific and research institutions, demands a platform based on innovations with the purpose of promotion and support in building a cluster.

Furthermore, the strategy states that local and regional cluster initiatives are supported by a “bottom-up” approach. The “bottom-up” approach is often focused on a specific local economy and the (potential) clusters there. The initiative is taken over by the future participants themselves; members of the cluster (Dragičević and Obadić, 2013, p.57).

Cluster initiatives were based on impulses from the companies that were aiming towards a better collaboration and merging with regional partners. Over the years, the Croatian government as well as many public and supporting institutions give support to a great number of cluster initiatives that appeared on the field (Engl. *bottom-up*) and included different forms of collaboration on a local and regional level. A special role in promoting clusters belongs to the local and regional level, particularly the Agency for Regional Development as a key agent in creating and connecting clusters of innovative enterprises, as well as in creating new clusters (Strategy for Cluster Development in Croatia, 2011, p.8).

On the regional scale, the existing clusters create heterogeneity in their own surroundings in that they encourage the growth of innovations thereby enabling the enterprises to create a certain advantage in terms of specialized suppliers, services, knowledge, information, skills, education and today's omnipresent initiative about sustainable development. One of the characteristics of clusters rests precisely on continuous improvement of processes and innovations.

Regions in the Republic of Croatia, each for itself, make up a specific and potential territorial capital, which, basically, means that their diversity comes into picture when attracting investments and providing foundations for one's own development. According to the Strategy for Cluster Development in Croatia (Zagreb, 2011, p.14), "territorial diversity is the basic developmental potential of the European Union and that is why it is necessary to increase the coordination of national sector policies and the policies of territorial cohesion with the purpose of creating a synergy of different programs. The experience of the European Union shows that the best instrument for specialization of regions is forming regional clusters for sectors that have the potential to be competitive both on local as well as on the global market. Regional clusters can be found on geographical area that encompasses an economically logical space unit which emphasizes the entirety of comparative advantage that a cluster needs to exploit. The development of regional clusters enables networking of public, private and scientific and research sector (Triple Helix) and in that way leads to the increase on regional competitiveness.

Figure 2. Triple Helix- networking of public, private and scientific and research sector

4. BUSINESS CLUSTER ASSOCIATION “CROATIAN ISLAND PRODUCT”

The work platform that the Business Cluster Association adopted for the year 2015 states a series of details important to describe and closely explain the beginnings of the Association, but also its vision, mission, and goal.

Business Cluster Association “Croatian Island Product” was founded in Zagreb on 17th October 2014 with the purpose of concentrating producers that carry the label HOP. The value of forming that cluster can be seen in a series of components such as direct advantage over competitors, economic growth and competitiveness due to stronger placement on the market, quality approach to the labor market, constant knowledge transfer between cluster, synergy with the local community, etc. (https://otocniiproizvod.hr/upload_data/site_files/hop-program-rada.docx).

It should be pointed out that the Business Cluster Association “Croatian Island Product” accounts for over 70 crafts enterprises, family farms, associations, enterprises and all that on 20 islands (we will mention only a few of them: Brač, Cres, Korčula, Raby, Silba, Ugljan, and Vis) and one semi-island (Pelješac) (<https://otocniiproizvod.hr/hr/o-hopu/clanovi-klastera/8>).

Furthermore, the platform states that the foundations of clusters lie in the project “Croatian Island Product” (HOP) which was launched at the beginning of 2007 by what used to be the Ministry of Sea, Tourism, Traffic, and Development, after which it was taken over by the Ministry of Regional Development and European Union Funds. The project itself was being prepared through several years and it very much relied on the National programme for the development of islands in Croatia. The basic aim of the project is to identify, distribute and promote autochthonous and quality insular products which will be recognized in Croatia and abroad. These are products that are the result of tradition on islands, developmental-research work, innovation, and invention, whose level of quality must be measurable. They stem from the limited insular locations and are produced in small quantities. Visualization of the project is manifested by a yearly awarded label “Croatian island project” in form of a plaque and breadboard to the producers whose companies are situated on islands and whose nominated products are produced on islands. The basic function of clusters is to ensure certain benefits for the business entities which they cannot be given independently. Such benefits are the result of direct business collaboration with

other business entities and public institutions in the form of research, training, and professional development of the employees or some other specialist services. When talking about clusters and their goals, it should be pointed out that these goals are somewhat different than those of bigger companies considering the fact that they cannot be in conflict of members' interests. We start with the general goals such as (https://otocniproizvod.hr/upload_data/site_files/hop-program-rada.docx):

- + merging of economic entities according to vertical or horizontal principles
- + creating new jobs for the members based on demands
- + increasing competitiveness by professional development and implementation of new knowledge
- + winning new markets by mutual business collaboration
- + developing quality forms of collaboration with suppliers, buyers, distributors, etc.
- + performing different activities in specific parts of the business process
- + faster development of innovations and their implementation in business

5. SWOT ANALYSIS

The aforementioned analysis tends to identify a strategy by which strength is to be identified and utilized, and, on the other hand, weaknesses should be reduced to a minimum. By successful implementation of the previously mentioned, threats shall be minimized, and opportunities capitalized. The SWOT analysis is of great help when planning and evaluating certain business activities.

Analysis of weaknesses, strengths, threats, and opportunities is based on the collected data from the Business Cluster Association "Croatian Island Product". Data were collected through oral interaction. What follows are details supported by the collected data.

The weaknesses are: more difficult exchange of information within a cluster, insufficient awareness within a cluster, dispersion of producers within a cluster, computer literacy, the producers do not any sense in spreading the production, weakened coordination with the local government, inertia.

On the other hand, strength is ecologically preserved environment, rich cultural and natural heritage, old crafts, and traditional production, ecological production, connecting interested producers at one place with the purpose of strengthening their position on Croatian market as well as on the global market, strengthening the competition, autochthonous products, use of traditional tools in production and manufacture of products, etc.

Threats are potential dispersion of clusters, interest loss with the producers, lack of clearly defined view on the national level regarding the development of agriculture on islands.

Opportunities are visible in improving communication, increase in production, and strengthening competitiveness, merging with clusters both on a national and global level Business cluster association “Croatian island alliance” provides information and counseling via workshops and thus tries to point out new possibilities and opportunities to the existing members as well as to potential new members. The importance of such workshops has been recognized by the association thanks to difficulties that the cluster members have encountered.

We will name some of them:

- ♦ shortage of human resources and competence
- ♦ too high costs of business activities
- ♦ weak or undeveloped managerial skills
- ♦ disadvantages in terms of obtaining information about business and developmental policies
- ♦ the inertia of the local government regarding biddings for getting subsidized participation and traveling costs.

According to available data, i.e. notes from financial reports of the Business Cluster Association “Croatian Island Product”, a certain stagnation can be noticed for the time interval 2015, 2016 and 2017. Based on the income of 231.328 HRK from 2015, and expenditures of 229.495 HRK, and income of 186.323 HRK for 2016 and expenditures of 144.022 HRK, one can notice the decrease in the income of 19% (lease and membership are items that showed the most significant fall). Furthermore, the difference lies in the fact that in 2015, as opposed to 2016, a greater amount of money was provided by the local government. According to the experience of clusters on a global scale, the share of support by the local government in the beginnings of the cluster was far

greater than the amounts that follow a few years of cluster's business activities. (https://otocniiproizvod.hr/upload_data/site_files/financijski-izvjestaj-2015.pdf). Data for 2017 show the same indicators as for 2016. This means that nothing was done regarding additional financing resources. Additional resources of financing would surely enable a step forward, but they would also strengthen the cluster regarding joint placement on the market.

In terms of the difficulties that the cluster is facing, an exchange of experience and opinions with similar clusters in the Republic of Croatia, but also abroad can be of great help. There are already similar clusters in Croatia which contain similar links in their basic structure just like the association which is the basis of this work. EUVITA cluster is a cluster which, in its basics, strives toward rural development and traditional and ecological production (Euvita, 03.02.2019). Also, from the information gathered from secondary resources, one can notice, but also compare the amount of information that both clusters provide for each other over their websites. EUVITA cluster provides with information that reaches toward international projects as well, but also innovational. As previously pointed out, recognizing further collaboration with clusters of the same or similar businesses from other areas and regions can contribute to the exchange of information towards an effective, but also a more efficient life cycle of the cluster.

6. CONCLUSION

By reading and comparing definitions related to the word cluster, one can conclude that they differ from each other in details and word order. However, by observing a cluster as a living being that has its beginning when different competitors on a specific area join together as well as visionaries who represent themselves on the market together, one should point out that the functioning of a cluster is not a simple activity at all, and it is even harder to maintain that unit despite the obstacles it faces along the way. In this scientific paper, we have described one cluster that has good grounds for further development, but where a stagnation can lead to its dispersion. Collecting data from different resources, mainly the literature, scientific papers, personal conversations with members of the cluster, but also comparing with other cluster associations on national as well as the international level has brought us to a few conclusions and sug-

gestions for further development of the Business Cluster Association “Croatian Island Product”.

SWOT analysis showed some weaknesses that should be turned into strengths. There are certain things to work on like strengthening communication, a more intensive flow of information between cluster members regarding new possibilities that they can achieve through clusters and on a more aggressive influence on the local and regional government. With the help of institutions of higher education like the Faculty of Agriculture and Faculty of Economics, one should identify new models for production as well as for placement on new markets.

There is an impressive number of clusters, better to say examples in the world, where these clusters, with the help of regional government, were able to achieve great results at the very beginning of their existence. Clusters in Italy serve as a good example, where whole regions were developed in that way. The point of it all is that the awareness about the development of such area like islands, which by their own virtue are individual units, should be encouraged both by local as well as regional government. Daily drain of young people from those areas should be the main guiding force for strengthening collaboration, but also finding exact solutions. Preserving the production of autochthonous products and cultural heritage (which is the primary goal and vision of Business Cluster Association) should be in focus to sustain the development of the region of islands.

The concept of sustainable development, especially in this kind of production, with the emphasis on the autochthony of the products, should not present a problem during implementation. Autochthony of products, ecological production and preserving cultural heritage are the foundations of the Business Cluster Association “Croatian Island Product”. All the above stated indicates that persistence, recognizing strengths and weaknesses, but also opportunities and threats, can be a good starting point for improving the vision of clusters.

According to research, the flow of information among members of clusters, and collecting and comparing information with other clusters both on national as well as on an international level, represent key guidelines in the further development of clusters. Connecting and exchange of experience both on national as well as on an international level, creating new ideas, preventing the drain of young workforce, innovations, and inventions; all this and more is there before

a cluster. It is necessary to create a strategy (mission, vision and a goal) and start with implementation.

In this scientific paper, it was corroborated by the fact that the business cluster association had promising, progressive movements soon, but after gaining entry into the EU initiative, its membership weakened. Instead of taking advantage of the market opening, the business cluster association seemed to be asleep. Looking at the indicators or the movement of the association through figures it is noticeable that the same stagnate, the last two to three years. The hypothesis, therefore, lies in the fact that the engagement of members of the association must focus on cooperation with other clusters both at the national and global level. This will be achieved by branding and revision of the existing members, in which capabilities, each of them will individually guarantee the seriousness of the business cluster association on the global scene

In the end, one of the main issues will be to encourage future discussion of the topic, whether synergies between the primary sector (agriculture) and the tertiary service sector (tourism) develop a creative economy.

Based on the collected data in this scientific paper on island clusters as well as the follow-up of trends in the global market, recommendations for further exploration should first be based on the merging of the existing production of autochthonous products and the tourist season. Knowledge of origin is one of the most important drivers that unites and connects the products and the place. Future research certainly should be focused on tourists. What is the awareness, the need and the desire of tourists for the autochthonous products of the places they visit?

One of the recommendations for further research is to see how many manufacturers in the cluster of business clusters are attending the hotel's gastronomic offer. It is thought how many hotels have developed cooperation with local producers, more specifically a business cluster

Abstract

The Republic of Croatia in the 2014-2018 programming period year from the National Wine Sector Support Program "Wine Envelopes", a total of EUR 11.8 million a year is available. According to Council (EC) no. 1234/2007 of 22 October 2007 establishes a joint organization of the agricultural market. There are three measures available from the program period: Winery and Wine Marketing, Restructuring and Conversion of Vineyards and Promotion on Third Country Markets.

In the region of Istria County, during the period from 2014 to 2018, 45 beneficiaries received support through measures. How many funds have been withdrawn during the financial period and how the winemakers in the region of Istria continue to be leaders in the production of quality wines, the aim of this paper is to prove the need for the possibility of increasing the total allocation through the Investment in Wineries and Wine Marketing.

The number of funds spent in the program period will be presented through secondary research based on data from the Agricultural Payments Agency, Fisheries, and Rural Development, while primary research will be carried out on beneficiaries in the County of Istria.

Keywords: *European funds, Wine Envelope, County of Istria.*

JEL Classification: L66, R58

1. INTRODUCTION

Viticulture and winemaking in the Republic of Croatia have a rich tradition. In order to preserve and enhance the wine sector, the Republic of Croatia has adopted the National Wine Sector Aid Program 2014-2018¹ in line with Commission Implementing Regulation (EU) 2017/256 of 14 February 2017 amending the Commission Implementing Regulation (EU) 2016/1150 on the establishment of rules for the application of Regulation (EU) No. 1308/2013 of the European Parliament and of the Council as regards the national programs in the wine sector², Delegated Commission Regulation (EU) 2016/1149 amending Regulation (EU) No 1308/2013 laying down rules for the application of European Parliament and Council Regulation Wine Sector Support Programs, in relation to Third Country Marketing Promotion, Member States Information, Restructuring and Conversion of Vineyards and Investment.

The goal of the National Program is to increase the quality of wine and the efficiency of production through modernization and new investments in the manufacturing infrastructure and the relocation of vineyards to areas that provide more quality products, all in order to strengthen the competitiveness of wine producers.

By joining the EU, Croatia has received considerable funding to finance the wine sector. The program, popularly known as “Wine Envelope”, amounts to EUR 11.8 million per year for the period 2014 to 2018, and Croatian vintners entering the EU have the opportunity, among other things, to increase wine sales.

¹ National Wine Assistance Program 2014-2018, Ministry of Agriculture, available at: https://poljoprivreda.gov.hr/datstore/filestore/73/Nacionalni_program_pomoci_sektoru_vina_2014_-2018.pdf (07.01.2019.)

² Commission Implementing Regulation (EU) 2017/256 of 14 February 2017, available at: <https://eur-lex.europa.eu/legal-content/HR/TXT/?uri=CELEX%3A32017R0256>, (03.01.2019.)

On the total of 22 competitions from the Wine Envelope announced in the program period from 2014 to 2018, 276 potential beneficiaries were registered, while the largest relative share in that number had the Istrian winemakers but at the same time did not outline the number of withdrawn funds. By applying for a bid, most often in the desire to invest in infrastructure, they encountered numerous administrative obstacles, which caused many of them to quit the project. Also, a large number of small family farms, winemakers from the Istrian region, are under-informed at all about the opportunities provided by the National Wine Sector Aid Program and are involved in tenders are dissatisfied with the financing conditions of projects that prevent them from achieving the goal or "withdrawing" envelopes.

Although the quality of Croatian wines has been confirmed by numerous awards, production has been upgraded, and modern sales trends have been monitored, wine production has not increased as well as no placement in exports.

Within this paper, research will be carried out with the aim of new knowledge of work issues. Population surveys will be conducted on the impact of the use of funds from the EU funds for wine sector development in the area of Istria County.

Furthermore, research within this paper can contribute to a better understanding of the use of funds from the "wine envelope", and thus contribute to the increased utilization of funds in the area of Istria. By analyzing and exploring, we will get answers to the ways in which funds from the European Agricultural Guarantee Fund affect the development of wineries in Istria.

2. MEASURES WITHIN THE NATIONAL WINE PROGRAM

Measures funded under the aforementioned National Program are vineyard restructuring, winery investment, and wine marketing and promotion on the market of third countries. The Ministry of Agriculture is the competent authority for the management of the National Program, and within the budget allocation of the said ministry provides funds for the implementation of the program. The Paying Agency for Agriculture, Fisheries and Rural Development (hereinafter referred to as the Paying Agency) is the body responsible for imple-

menting measures under the National Program, including the implementation of a public tender.

Funds for the implementation of the National Program Wine envelopes are provided within the budget plan of the Ministry of Agriculture of the European Agricultural Guarantee Fund and partly from the funds of the Republic of Croatia. The funds of the European Agricultural Guarantee Fund are financed by direct payments in agriculture and so on. trade measures and aid to the wine sector. "The purpose of market management is to assist in market organization and response to market disturbances by using measures such as intervention buying, export refunds or other exceptional market support."³

The European Agricultural Guarantee Fund provides annual funding of EUR 11.8 million for the first three years, and EUR 10.8 million a year for the last two years. The wine program does not have the capability to spend funds over several years, ie that the unused portion of the funds is transferred to the next year and is spent on the $n + 2$ models, but the unused funds are returned to the EU budget.

Considering the fact that the Republic of Croatia has a large number of small wine producers, old vineyards, low capacity equipment, and insufficient promotion both domestically and on the markets of third countries, the proposed measures of the National Support Program are for the development of the wine sector.

Measure - Restructuring and conversion of vineyards

The main objective of the measure Restructuring, and conversion of vineyards is to increase the competitiveness of wine producers through the modernization of vineyard techniques, the promotion of high-quality vineyards and the production of wine according to the needs and preferences of consumers. Support for this measure may be granted for the activities it covers; replacement of sorghum (including grafting), vineyard relocation, and improvement of vineyard techniques.

Support for restructuring and conversion of vineyards is approved for activities that lead to structural changes in vineyards as a substitute for the variety,

³ European Agricultural Guarantee Fund, available at: https://ec.europa.eu/agriculture/cap-funding/funding-opportunities_en, (3.1.2019)

the relocation of vineyards to more favorable areas and the improvement of vineyard techniques⁴.

The above activities can be carried out independently or in combinations of the aforementioned, and project activities should be carried out and executed in a chronological logical order and must lead to the ultimate goal of the project or to the structural change in the vineyard. The project completion deadline is normally one year, and for justified reasons, it may approve the extension of the deadline for one year, but the final deadline for the project cannot be granted in aggregate over a period of five years⁵.

Measure - Investing in Wineries and Wine Marketing

The measure includes support for investment in wine production and sales. Grants are granted for tangible and intangible investments in wineries, as well as sales and presentation facilities of wine, including warehouses and infrastructure facilities, with a view to improving overall efficiency⁶. Permissible Measures for Investments are construction/reconstruction/ improvement of immovable property, purchase of new machinery and equipment, including computer software, patents, licenses and copyrights, and joint trademark registration and general expenses (architects, engineers, consultants, feasibility studies).

Measure - Promotional activities in third country markets

This measure aims at finding new consumers, increasing the recognition of Croatian wines, enhancing wine competitiveness with a protected designation of origin, a protected geographical indication and wine with a designation of grape variety, with emphasis on high-quality standards from the Union with regard to quality⁷.

⁴ Ordinance on Measures Implementation Restructuring and conversion of vineyards from the National Wine Sector Aid Program 2014-2018 (Official Gazette No. 49/15, 73/17, 39/18)

⁵ Restructuring and conversion of vineyards, available at: <https://eufondovi.hr/natjecaji/najava-otvoreno-zatvoreno/restrukturiranje-i-konverzija-vinograda>, (4.1.2019.)

⁶ Ordinance on Measures Implementation Wines and Wine Marketing from the National Wine Sector Aid Program 2014-2018 (Official Gazette 49/15, 23/16, 73/17, 39/18)

⁷ Ordinance on Measures Implementation Market Promotion in Third Countries from the National Wine Sector Aid Program 2014-2018 (Official Gazette 37/15, 49/15, NN 40/17, 39/18)

Project implementation can take up to three years, with the possibility of extension for another two years. An individual project must relate only to one country from the markets of third countries. If a particular project relates to promotional activities that are not of a general character but are intended solely for a particular product, the brand or only one producer cannot be eligible for state aid for the budget of the Republic of Croatia.

Eligible activities within the scope of this measure include Advertising in third country markets, public relations, promotion and marketing, promotion of third-country marketing materials and their distribution, participation in international fairs and other international events on third-country markets and administrative costs and user staff costs.

2.1. UTILIZATION OF WINE COVERAGE FUND RESOURCES FOR THE PERIOD 2014 – 2018

According to the data available on the pages of the Agency for Payments in Agriculture, Fisheries and Rural Development, the Ministry of Agriculture paid in the period between 2014 and 2018 from the funds of “Wine Envelopes” the total amount of 15,3 million EUR.

Table 1. Amounts of paid aid for the wine envelope for the period 2014-2018.

Year	The total amount of aid paid in EUR
2014.	1.381.484
2015.	1.567.363
2016.	3.278.440
2017.	3.305.789
2018.	5.777.230
TOTAL	15.310.305

Source: Made by authors based on the Agency for Payments in Agriculture, Fisheries and Rural Development and EUROSTAT

Following the above data in Table 1, the utilization of funds increased over the years, so that it was 318% higher in the last observed year than in 2014. During the program period, the largest shift in the funds’ repayments was recorded in 2016 when 109% more funds were paid out than in the previous observed period. By analyzing official data, it is evident that the largest amount of funds was invested in the Measure - Winnings and wine marketing totaling

10,8 million EUR. The total amount of 1,07 million EUR was paid for advertising activities and 3,5 million EUR for Measure - Restructuring and Conversion of Vineyards.

Table 2. Amounts of paid aid for wine envelope by measures in the period 2014-2018. (in EUR)

Year	Promotional activities	Restructuring and conversion of vineyards	Investment in wineries and wine marketing	Total
2014.	139.555	592.845	649.084	1.381.484
2015.	141.023	1.023.587	402.753	1.567.363
2016.	233.926	687.872	2.356.642	3.278.439
2017.	176.551	204.329	2.924.909	3.305.789
2018.	377.302	923.261	4.476.666	5.777.230
TOTAL	1.068.357	3.431.894	10.810.054	15.310.305

Source: Made by authors based on the Agency for Payments in Agriculture, Fisheries and Rural Development and EUROSTAT

Although payments during the program period have increased especially in the last two years, the Republic of Croatia has made use of the minimum resources available from the European Agricultural Guarantee Fund for wine sector assistance. Taking into account that Croatia was available for the first three years at an annual level of EUR 11.8 million, and in the last two years the amount of EUR 10.8 million, it can be seen that only 26% of the total available funds were used. The complexity of the administration, or the required documentation of public tenders, as insufficient promotion of the opportunities available to winemakers and winemakers, is the fact that Croatia is at the mercy of EU countries through the use of wine envelopes. Top of the famous wine country Italy, France, and Spain, and Germany and Romania.

2.2. SUPPORT TO THE WINE SECTOR IN ISTRIA COUNTY

The Istrian county has always been known as the end of vineyards and good wines. The transitional sub Mediterranean climate has a favorable influence on the growth and development of grapevine and the geographical position has very favorable agroecological conditions for the development of vineyards. Rich experience in wine production and great opportunities for wine placement through tourism activities are the main advantages of wine growing and

wine growing in Istria. Istrian winemakers have recognized the possibilities of financing the business from the “Wine Envelopes” funds, and in the period from 2014 to 2018, 45 of them were supported.

The largest number of subsidies from the wine envelope funds for the County of Istria was realized in 2016 when 14 winemakers received total support of 622.162 EUR or 19.4% of the total outstanding funds of that year. By watching the entire program period, only 45 beneficiaries received support from the National Wine Sector Aid Program, which is 14.5% of the total number of beneficiaries receiving support.

Table 3. Aid payments from “wine envelopes” for the Istrian County in the period from 2014 to 2018 in relation to the total disbursement of funds

Year	Number of users of the Istrian county	Istrian County	Total number	Total	The share of funds of the Istrian County in total payments	User share from Istrian County
2014.	3	270.669	8	1.381.484	19,6	37,5
2015.	6	304.629	23	1.567.363	19,4	26,1
2016.	14	635.495	60	3.278.439	19,4	23,3
2017.	13	524.453	65	3.305.789	15,9	20
2018.	9	482.254	38	5.777.230	8,4	23,7
TOTAL	45	2.217.500	194	15.310.305	14,5	23,2

Source: Made by authors based on the Agency for Payments in Agriculture, Fisheries and Rural Development and EUROSTAT

The largest number of users from the Istrian region gained support for Winery and Wine Marketing, with the aim of modernizing wine production through new investments in winery and processing infrastructure. At the same time, this measure is financially and largely in view of the financing of capital investments. According to the data in Graph 1, it is evident that the total amount of 54.164 EUR was paid for the Measure - Promotion Activity in the program period, amounting to 659.308 EUR for Measure Restructuring and Conversion of Vineyards and the amount of 1.504.031 EUR for Winery and Marketing Investment

Chart 1. Remittance aid for beneficiaries from the Region of Istria in the programming period from 2014 to 2018 by Measures (in EUR)

Source: Made by authors based on the Agency for Payments in Agriculture, Fisheries and Rural Development and EUROSTAT

2.3. INVESTMENTS FOR THE AREA OF ISTRIAN COUNTY COMPARED WITH OTHER COUNTIES IN THE REPUBLIC OF CROATIA

The wine sector is very important for Croatian agriculture because of the very high share of the total production but also of the rich traditions of Croatian vineyard production. Wineries are one of the first bright examples of the institutional serious association through the Association of Winegrowers and Wine Producers who have been operating at the Croatian Chamber of Commerce since 2011 and who have been very serious in many different areas. Following the challenges and opportunities of European funds provided to the Republic of Croatia by joining the EU, wineries from all over the country have applied for tenders from the National Wine Sector Aid Program. On the total of 22 competitions from the Wine Envelope in the program period from 2014 to 2018, 276 potential beneficiaries were registered, with the largest relative share in that number being Istrian winemakers and winemakers from five Slavonian counties. Although beneficiaries from the Istrian County prevailed in the number of applications, the most successful withdrawals were beneficiaries from the Požega - Slavonia County.

Table 4. Deposited funds from the Wine Envelope by counties of the Republic of Croatia

County	Number of users	Total funds disbursed
Bjelovarsko-bilogorska	1	32.169,45
Brodsko-posavska	0	0
Dubrovačko-neretvanska	19	1.387.711,90
Grad Zagreb	8	431.988,78

Zadarska	5	127.283,16
Zagrebačka	4	217.253,43

Source: Made by authors based on the Agency for Payments in Agriculture, Fisheries and Rural Development and EUROSTAT

Users from the Slavonia County, 17, in the total programming period, withdrew the total amount of 4,4 million EUR while users from the Istrian County (42) used 2,2 million EUR from the Wine Coverage funds. Thus, although there is no doubt that the wine region of Istria is due to the climatic conditions, beautiful landscapes and exceptional wines produced by Istrian winemakers recognized throughout the world and undoubtedly the more advanced Croatian wine region, it cannot be said that their development is based solely on the means of wine envelopes.

The low utilization of funds, both for the whole of Croatia but also for the territory of the Istrian County, have also contributed to the competition rules, which limit the amount of the advance to 20% of the grant amount, and then allowed the rest of the advance to be credited only after the completion of the

entire investment. Without the possibility of paying in installments, the implementation of projects proved to be financially exhausting for part of the beneficiaries. Also, for wineries investments, some customers were offered significantly lower amounts of the intensity of support than those requested, and so often the investment was often abandoned

Investments made from wine envelopes have certainly contributed to the development of wineries in the Istria area, but financial data indicates that the possibilities for EU funds are far greater. Istria is a region well-known for the development of tourism, and by arranging numerous wine roads and unifying wineries and tourism, it is invested not only in the region but also in the whole country. Highest Istrian wines are the achievements of the last twenty years of intensive development of wine-growing and viticulture in Istria, so it is necessary to strengthen or to edit the administrative system in order to allow further investment in this area.

2.4. MOST IMPORTANT ISTRIAN WINE

Today more than twenty wineries in Istria are competing and are constantly fighting for prestige in the most important category of quality wines. We emphasize the four names that have been breaking in the last couple of years both domestically and internationally, who are also beneficiaries of the National Wine Program.

Kozlović - Gianfranco Kozlović is the largest Croatian small winery, recognized primarily by the production of Malvasia, which he perfected to the extent that he set a universal criterion for this type of wine.

Matošević - Ivica Matošević is one of the Istrian small winegrowers who with their products suffered Croatian restaurants and hotels, and for acquaintances say that his "Antiqua" is one of the best Croatian wines.

Coronica - Moreno Coronica is known for its Gran Terano wine produced from autochthonous varieties, which proved that Istria can be an example of large black wines.

Clai - Giorgio Clai is one of those Istrian winemakers who try to produce wines from classical varieties but in their own way. Their wines are an integral part of every serious wine industry.

The aforementioned winemakers export more than 50% of the produced wine to the Austrian, Italian and German markets, but also to the United States and Japan. Their stories can serve as an inspiration to many future generations of Croatian farmers. In addition to being beneficiaries of the National Wine Sector Aid Program, they also made grants from the European Agricultural Fund for Rural Development, which is also being implemented by the Ministry of Agriculture.

Like other users, they also faced the problem of self-financing and the administration's severity and expect that the changes brought about by the new program period will ensure a simpler withdrawal of EU funds that was the case so far.

2.5. RESULTS OF THE CONDUCTED RESEARCH

For the purpose of this work, a survey was conducted on 173 respondents, all registered companies in the Istrian region dealing with sales and wine production. By analyzing the results of the study, 68% of the respondents believe that the administration's weaknesses, too long processing of documentation, greatly affect the low absorption of media from the wine envelope, while only 10% of respondents do not agree with that opinion.

Graph 2. Impact of administration slowdown on the utilization of wine envelopes according to data from the survey questionnaire

Source: Composed of authors based on the conducted survey

Furthermore, a large number of respondents, 70% of them, are fully aware of the opportunities provided by means of wine envelopes, while 63% of them have all the information on tenders being carried out under the National Wine Support Program. The analysis found that mostly "small" producers are not sufficiently informed about the possibilities of EU funds. They argue that one of the major problems in administering a bank letter of intent as all winemakers is not liquid, so the question is raised as to how to bring the small funds closer to EU funds. Furthermore, crediting through the Croatian Bank for Reconstruction and Development requires a longer period of processing of documentation, which prevents the receipt of letters of intent from banks without which it is impossible to obtain grants.

Apart from the slowness of the administration as one of the major problems, the respondents point to the inability to self-finance or to the small amount of the advance.

Graph 3: Obstacles to the EU's funding for the respondents

Source: Composed of authors based on the conducted survey

A large number of respondents, almost 70% of them believe that Croatian wineries are predominantly oriented to the domestic market and tourism, and that is why five times the import of exports. Croatia spends more wine than it produces. They agree that the problem stems from insufficient investment in the brand of Croatia as a wine destination and relatively expensive production. With this problem, the struggle for water with adaptation to EU rules, where Croatia has only partially implemented necessary changes.

They find that the wine image of Istria is quite colorful. In the area of the Istrian region, there are top quality wines, which are also the best promoters but also operate facilities that offer cheap “domestic” or imported wines whose quality is very controversial, and that is exactly what makes the damage directly to themselves but also to the entire wine region.

Furthermore, respondents state that today they often encounter wineries that import wine, and which attract their customer at low cost to those customers whose price is crucial when making a purchase decision. With imported wines, there is still a “gray” market that occupies a large part of the market with which they cannot compete.

3. SOLUTIONS FROM THE NEW PROGRAMMING PERIOD

Recognizing the disadvantages of the administrative system, which had a low impact on the payment of the wine envelope funds, the Ministry of Agriculture as the competent institution for the implementation of the National Wine Sector Aid Program has revised existing rules. The key change is certainly to increase the advance amount from 20 to 80% of the approved aid amount. Specifically, the return rate for the restructuring of vineyards is 75%, and for the 50% investment in the winery, while in the first two measures related to the information and promotion of the return rate for all projects 80%, with 50% of funds from EU funds, and 30 percent from the state budget of the Republic of Croatia. Additionally, the new Measure “Information in the Member States”⁸ is included in the Program, through which 50% participation in fairs and exhibitions will be co-financed.

Support for this measure can be used by organizations of wine producers and associations, sector organizations and public bodies representing wine producers. Informative activities financed include informing consumers in the Member States regarding responsible wine consumption and risks associated with harmful wine consumption and protected geographical indications of the

⁸ The National Wine Sector Aid Scheme for the period 2019-2023 and the Rulebook on Implementation of the Measures of Information in the Member States from the National Wine Sector Support Program 2019-2023 (NN 08/19) available at: <https://www.apprrr.hr/en/mj-informiranje-u-drzavama-clanovi/>, (08.01.2019.)

Union's geographical origin in respect of particular quality, reputation, or other characteristics of wine due to a particular geographical environment or origin.

Eligible costs within the scope of the new measure are information campaigns, participation in fairs and exhibitions, media advertising, production, and distribution of information materials, making videos, websites, photographs, and staff costs, transportation, hotel accommodation, catering services, etc. Also, in all measures, and for the faster flow of funds into the project, support payments were introduced for each project's implemented activities. The possibility of multiple prolongations of the project will be limited, leading to reduced use of the Envelope financial resources.

In the new period available from the wine envelope is 55 million euros. The wine envelope, unlike other European funds, works in such a way that the funds planned in a particular year have to be spent in the same and there is no possibility of transferring unused funds over the next period. Therefore, the amendment of the rulebook, the reduction of the administration, ie the modification of the terms of the competition, is crucial for increasing the intensity of EU funds.

In addition, in order to break the wine sector, in 2019, the state has the overall control system for which sector has allocated 1,6 million EUR each year, transferred to the burden of the state budget. This opens the possibility for winemakers to use these means to promote wine and the activities of regional wine-growers. Namely, the new law provides for the association of winegrowers and winemakers at the regional level due to their more active role in the marketing activities and marketing of Croatian wines. The Wine Act was adopted for the purpose of consolidating EU regulations with national regulations in the wine and wine sector. In one regulation, nowadays, the areas that have been regulated at the national level by two laws, such as the Wine Act and the Law on the Common Organization of the Agricultural Products Market and the specific measures and rules related to the market for agricultural products, are now linked.

4. CONCLUSION

In recent years, Croatian winemaking and viticulture have undergone major changes. Today, Croatian wine production is focused on quality development,

which is confirmed by the fact that quality wines in total turnover account for more than 70%. Similarly, from the system where wineries prevailed in former agricultural combinations, Croatian winemaking has changed in structure today, and numerous small to medium-sized wine producers are present beside large wineries. The same fact influenced the change of the Croatian wine image, which is now far richer in the diversity of producers, technology and even wine offerings. The rich offer of more than a hundred autochthonous wine varieties and a long tradition of strength are both Croatian and Istrian winemaking. Significant potential lies in the marketing of quality domestic wines through a tourist offer, one of the ways of promoting the quality of Istrian wines on the foreign market.

The National Wine Sector Aid Program is being implemented since 2014, and in the next five years, new wine grapes and winemakers should be able to co-finance winery investments, promotion, and conversion of vineyards with the aim of achieving more competitive production and better positioning of our wines on the world wine map.

Although the new regulations have changed the conditions for removing administrative shortcomings, the question remains as to how small Istrian winegrowers will be able to handle paperwork, particularly with regard to lending through the Croatian Bank for Reconstruction and Development, and whether or not the system upgrade will increase the number of applications to tenders from the new programming period.

Abstract

The Baranja region is suitable for the development of cyclotourism due to the natural resources of Nature Park Kopački rit, which represents a tourist attraction as well as social resources, rich cultural and historical heritage. The perspective of cyclotourism development is recognized in the need to extend the tourist season through the activation of tourist resources that are largely neglected in the continental area of Croatia. The continental temperate climate has a beneficial effect on the tourist product of cyclotourism that can be offered whole year. The precondition for the development of this specific form of tourism is cycling infrastructure and attractive cycling routes EuroVelo 6 Atlantic - Black Sea - Dunav route and EuroVelo 13 Iron Curtain Route - Drava route. At the same time, they link natural and cultural values through the gastronomic and enological offer, tourists can learn about local culture and Baranja tradition. The aim of this paper is to analyse the state of the cycling infrastructure on bicycle routes, the availability of accommodation, catering and service facilities in the offer and to determine the possibilities for improving the tourism product of the cyclotourism in Baranja area. From the secondary data source, it is expected to identify disadvantages in the cycling infrastructure based on which it is possible to suggest improvements in order to intensify development.

Keywords: cyclotourism, cycling infrastructure, Baranja

JEL Classification: L83, Z32

1. INTRODUCTION

Tourism represents a very important system and one of the main developmental priorities in Baranja area. The primary reason for slow tourism development, despite rich cultural and historical heritage, natural resources, rich gastronomical and oenological offer, is especially visible in underdeveloped touristic infrastructure, or in other words, an inadequately designed touristic product which is the fundamental prerequisite for the arrival and stays of tourists.

Cycling has been developed in other countries for many years not only as a means of transport but also as a way of life. The bicycle represents ecologically most acceptable means of transport which provides a cheap alternative to other forms of transport, and at the same time, cycling contributes to health and quality of life.

Cyclotourists lead an active life, preferring rides through the river and rural areas, enjoying natural beauty. Baranja area is rich in attractive natural locations alongside rivers, lakes, swamps, rural areas, and agricultural land. Natural resources of Kopački rit nature park are of particular importance and represent an ideal destination for cyclotourists. Baranja area has mainly lowland relief, which is convenient for the development of cyclotourism because of the ease of driving.

It is estimated that the demand for cyclotourism as a specific form of tourism will rise sharply in the next ten years, and the market segment of the tourists to whom cycling during their vacation is an important additional activity is even more significant. From all the above, it is notable that cyclotourism represents one of the touristic products with the biggest developmental perspective.

This paper aims to perceive the potentials of international and local cycling routes in Baranja area and recommend the ways how to make them attractive for both active and recreational cyclotourists. With that goal in mind, the paper analyzes the condition of cycling routes and recommends the completion of touristic offer on the existing routes that need to be valorized and put to the function of cyclotourism.

2. LEGISLATIVE PROVISIONS FOR THE DEVELOPMENT OF CYCLOTOURISM

Cyclotourism represents an active form of tourism which implies cycling, that is, touring a certain touristic locality or destination riding a personal or rented bicycle. Three ways of using a bicycle during a vacation can be highlighted:

- it is entirely used as a means of transport during the vacation,
- it is used in a destination for the purpose of recreation and sightseeing,
- it is used in mountainous areas of a destination (Galičić; 2014, 135)

The first step in planning cycling infrastructure is the selection of appropriate infrastructure considering the type of cycling road. According to the Regulation on Cycling Infrastructure (NN 28/16), cycling roads are:

- cycling roads,
- cycling paths,
- cycling tracks,
- cycling lanes,
- cycling – pedestrian sidewalks

Cycling road is a road intended for bicycle traffic with built and furnished road construction beyond road profile and marked with corresponding traffic signalization.

Cycling track is a road intended for bicycle traffic, built separately from the road and marked with corresponding traffic signalization.

Cycling path is a road intended for bicycle traffic without built road construction and marked with corresponding traffic signalization.

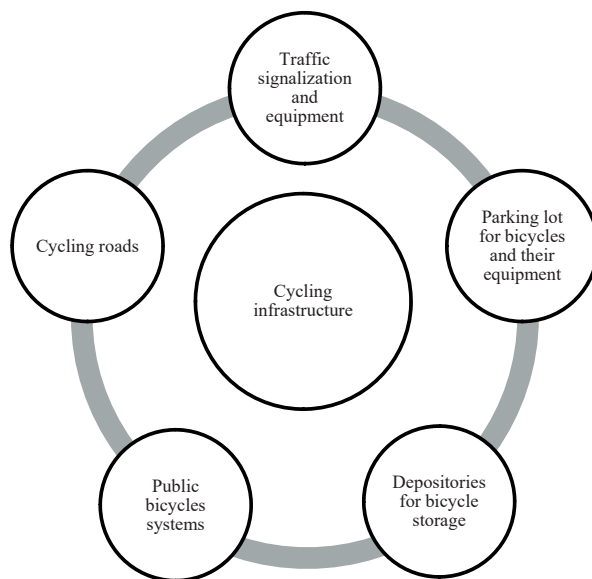

Cycling lane is a part of the road intended for bicycle traffic, marked with corresponding traffic signalization.

Cycling – the pedestrian sidewalk is a traffic area intended for cyclists and pedestrians, built separately from the road and marked with corresponding traffic signalization.

Cycling route is a way where cycling traffic takes place and it is marked with a prescribed traffic sign. Cycling route consists of cycling roads and mixed traffic roads.

Mixed traffic road is a traffic area where cycling and motor traffic take place simultaneously. In accordance with this Regulation, those sections of road have to be additionally marked with traffic signs and road signs that warn drivers of motor vehicles on the occurrence of cyclists in traffic. Figure 1. depicts the components of cycling infrastructure.

Figure 1. Components of cycling infrastructure

Source: made by the authors according to the Regulation on Cycling Infrastructure (NN 28/16)

According to figure 1., cycling infrastructure includes cycling roads with tracks, paths, lanes, cycling – pedestrian sidewalks, routes, and mixed traffic roads. The next component is traffic signalization and equipment, followed by parking lots for bicycles and equipment, depositories for bicycle storage and public bicycles systems.

When planning and projecting cycling infrastructure, it is necessary to apply the principles of:

- safety,
- economy,
- wholeness,
- directness,
- attractiveness.

The safety of cycling infrastructure needs to be secured by projecting, planning and building, taking care that the adopted solutions satisfy the safety requirements. The economy of cycling infrastructure when projecting and building implies selecting the solutions that are justified and economically acceptable. The wholeness of the cycling network is secured by mutually connecting the cycling traffic areas into a cycling network and their integration into the road network. The directness of traveling is secured in the way that cycling roads, including the road network that can be used by cyclists, enable cyclists to choose the optimal route of motion from the starting point to the finish line. The attractiveness of cycling roads is achieved by planning beyond the road profile when it is possible and economically justified, in a way that the route of cycling road is aimed at attractive objects in the area and lead in a way that it provides a clear view between the cyclist and attractive objects in the surroundings. Thus, a regulated infrastructure suitable for safe and unobstructed flow of cyclotourism is provided.

3. CYCLING INFRASTRUCTURE AS A DEVELOPMENTAL ASPECT FOR CYCLOTOURISM

The basis of the perspective of cyclotourism development in Baranja represents the condition of cycling infrastructure or international and local cycling routes. By analyzing the existing cycling routes in the territory of Croatia, a good connection on the national and international level has been found. The network consists of several European cycling routes, and those are:

EuroVelo is a network of cycling routes which connects the entire European continent. It passes through Croatia, particularly through its Pannonian region. EuroVelo network includes 15 European cycling routes with more than 70.000 kilometers. The marked routes can be used by tourists, cyclists, and the local population.

Four cycling routes pass through Croatia, and those are EuroVelo 6 – Danube route, EuroVelo 13 – the Iron Curtain route, EuroVelo 8 – Mediterranean route and EuroVelo 9 – Baltic-Adriatic Sea route.

The Danube route (EV 6) stretches through the easternmost part of Croatia, along with the flows of Drava and Danube. It starts on the entry into Croatia,

from the direction of Hungarian town Mohacs on border crossing Duboševica, and passes through Kneževi Vinogradi, nature park Kopački Rit, and cities Osijek, Vukovar and Ilok where cyclists exit Croatia (138 km).

The Iron Curtain route (EV 13) starts in Croatia from the direction of Hungary, on the border crossing Gola, and stretches through Slavonian and Podravina part along the Drava up to Donji Miholjac where it ends, only to start again on crossing Baranjsko Petrovo Selo. It goes through northern Baranja and exits in Batina on the Danube, in the total length of 240 kilometers (Vrećar Mišćin & Rigo; 2017, 24-25).

The Mediterranean cycling route (EV 8) passes through Croatia from the border crossing Sečovlje – Plovanija in Istria County up to Dubrovnik – Neretva County and border crossing Vitaljina – Njivice in Montenegro, along with the coast and islands of the Adriatic Sea in the length of 1.100 kilometers (<https://cikloturizam.hr/eurovelo/>).

The Baltic – Adriatic route or Amber cycling route (EV 9) goes through six European countries. It starts on the shores of the Baltic Sea and passes through Poland, Czech Republic, Austria, Slovenia, and Italy, and ends in Croatia in the length of 80 kilometers (HT'Z). The following table shows the described cycling routes with a special review on the local routes that pass through the Baranja region.

Table 1. EuroVelo and local routes of Baranja

Route category	Route name/mark	Route length, km	Total length, km
EuroVelo routes	EV6	89.60	194.40
	EV13	104.80	
Local routes	L-Osijek	48.00	184.86
	L-Panonski put Mira	80.97	
	L-Podravlje	18.36	
	L-Popovac	8.57	
	L-Drava alternative	28.96	
Total length			379.26

Source: made by the authors according to data from <https://cikloturizam.hr>

It is visible from the table that two EuroVelo routes EV6 and EV13 stretching through Croatia pass through Baranja in the total length of 194.40 kilome-

ters. At the same time, five local routes in the total length of 185.29 kilometers were built in the area. Accordingly, the total length of cycling routes in the Baranja region is 379.26 kilometers.

The level of development of cycling infrastructure can be perceived on the level of the entire area of Baranja, and on the level of individual town and municipality. On the south and west of Osijek – Baranja County there are no cycling routes and the level of infrastructure construction is weak. Cycling network is more developed in the Baranja region and along the Hungarian border, which is the result of the development of routes which are in the EuroVelo program and paths that gravitate towards Osijek. The sections of the Danube EuroVelo 6 route are properly marked and in accordance with regulations, on the other hand, there are sections that need to be marked and aligned with the standards. Sections of the route are lead by a built cycling infrastructure.

The Iron Curtain route EuroVelo 13 – Drava route in Baranja region is mainly developed through programs of cross-border cooperation with Hungary, but there are few built and marked cycling routes and areas in that area.

The following table shows the presence of cycling tracks in different municipalities of the Baranja region.

Table 2. Lengths of cycling tracks in municipalities in Baranja region

Cycling tracks in Baranja, km			
Municipality	outside Kopački rit	in Kopački rit	Total
Draž	27.54	-	27.54
Kneževi Vinogradi	24.08	6.83	30.91
Petlovac	39.95	-	39.95
Jagodnjak	10.08	-	10.08
Darda	20.03	-	20.03
Bilje	34.48	21.83	56.31
Total	156.19	28.67	184.86

Source: made by the authors according to data from www.obz.hr

According to the data from the table above, it is notable that the highest presence of cycling tracks in Baranja is in the area of Bilje municipality (30%), which is the result of perennial efforts in terms of connection Osijek urban area and Kopački Rit nature park. Cycling has long been in the active touristic offer to tourists who visit Baranja, as a part of the existing international cycling route Panonian peace route and the Danube route (www.obz.hr).

By analyzing international and local cycling routes in Baranja region, good connection and a smaller or bigger presence in certain municipalities has been noted, as well as in the protected area of Kopački Rit nature park.

4. CYCLOTOURISM IN BARANJA REGION – CONDITION AND PERSPECTIVES

The touristic offer has been intensively enriched with specific forms of tourism, and their coherence makes the touristic product of Baranja. Cyclotourism as one of the specific forms of tourism of the Baranja region is present in the touristic offer, but it is relatively underdeveloped and insufficiently recognized on the touristic market.

Sport and recreation are becoming an inevitable stay in modern tourism, and often the main motive for shorter or longer trips to a particular destination. (Bartolucci, Čavlek, 2007, 79)

According to the explanations (Ružić, 2005, 44), the development factors of the touristic offer are natural and social attractions. In accordance with the data provided by the Agency for managing the protected natural resources, in Baranja region there is a large number of natural attractions which are protected by law and divided into five categories: nature park (Kopački Rit), special reserve (zoo reserve of Kopački Rit nature park and Podpanj), regional park (Mura – Drava), monument of park architecture (parks and gardens surrounding the castles – Bilje and Kneževo), and natural monument (grassland area, Bilje cemetery).

As the development factors of the touristic offer, social attractions in the form of different events are very important. Cycling events are occasionally organized in Baranja region. Bike tours and cycling races very often cover the area of Slavonia and Baranja. The most prominent is Tour de Slavonia – bike tour (135 km) which is held in May on the route Donji Miholjac – Našice – Valpovo – Beli Manastir – Donji Miholjac, and the second event is XC MTB race Banovo Brdo – Baranja, which is held in July in Beli Manastir in the presence of both domestic and foreign guests. The following table shows folk and cultural events in the Baranja region.

Table 3. Folk and cultural events as social attractions in Baranja

Ord. Num.	Name	Location	Time
1	Vinceška	Bansko Brdo	January
2	Petaračke Buše	Baranjsko Petrovo Selo	February
3	Carnival horseback riding	Branjih Vrh/Popovac	February
4	Easter in Beli Manastir	Beli Manastir	March
5	Spring Fair	Karanac	March
	Kulin Fair	Jagodnjak	May
	Mountain bike Croatia cup	Banovo brdo/Popovac	May
6	Motorbike Festival	Beli Manastir	June
7	Gatorfest	Banovo brdo/ Kneževi Vinogradi/Batina/Zmajevac	June
8	Beans Festival	Beli Manastir	June
9	Baranja Trail	Bansko brdo	June
10	Mud Academy	Karanac	July
11	Beli Manastir Youth's Summer	Beli Manastir	July and August
12	Plaster Heel	Karanac	August
13	Tarda Festival	Darda	August
14	Our Lady of the Assumption	Popovac	August
15	Diversity is Wealth	Beli Manastir	August
16	Autumn in Baranja	Beli Manastir	September
17	Wine Marathon	Zmajevac	September
18	St. Martin's Day	Bansko brdo	November
19	Čvarakfest and winter fair	Karanac	November
20	Advent in Baranja	Pelovac/ Darda/Kneževi Vinograd/ Beli Manastir	December

Source: made by the authors according to the data from <http://www.tzbaranje.hr/hr/aktivnosti/manifestacije>

From the table above it can be concluded that there is a continuous and diverse touristic offer in form of folk and cultural events throughout the year.

The next group of social attractions is contained in the accommodation and food offer. In Baranja, cyclotouristic offer of accommodation and food is mainly concentrated in the EuroVelo route area. Accommodation offer is adapted to cyclotourists, and it is not significantly different from standards and criteria for bike-friendly objects in other European countries. The most important criteria are: bike rack, bike depository, bike tools for basic repairs, space for washing and drying cycling clothes and travel equipment, diverse breakfast menu or the possibility to use kitchen, information corner with maps and promotional materials and possibility of Wi-Fi connection (Vrećar Mišćin & Rigo, 2017, 19).

Accommodation objects in Pannonian Croatia have the mark – Bike&Bed. In Baranja, none of the objects has Bike&Bed mark and fails to meet the standards from the Regulation on classification, categorization and special standards of hospitality objects from the Hotel category, but numerous objects have the possibility to accommodate cyclotourists and store bikes. At the same time, there are two cycling camps – Camping Suza Baranje, in Suza (<http://camping.suzabaranje.com/>), and Zlatna školjka, in Kopačevo, where it is possible to accommodate cyclotourists. Among the municipalities of Osijek-Baranja County, the most prominent is Bilje with the most developed cyclotouristic offer.

It can be concluded that in the Baranja region, there is a lack of cycling camps, services and equipment stores, bike rental service and hospitality offer designed for cyclotourists. There is a distinct deficit in adequate signalization for cyclists, which would contribute to their safety during the trip. It is extremely important to make quality and reliable cartographical materials in order to merge cyclo-tourism and touristic attractions in cyclotouristic routes. By designing a mobile application as a contemporary and easily accessible form of informing and presenting events all year long, the experience and offer of cyclotourism would be completed.

5. SEGMENTATION OF CYCLOTOURISTS AND TRENDS IN CYCLOTOURISM

Tourist destinations need to divide the market into different market segments of potential tourists who may have the desire and the need for their offer, to choose target groups to directly address and position their products and services in a form that will in the best possible way provide the satisfaction, desire and the needs of the selected target group. (Marušić, Prebežac, Mikulić, 2019, 302)

The modern tourist is becoming more and more curious, becoming a researcher of people, content and processes in the space they visit, his ever-increasing cultural and educational level, defining a different approach to the use of annual vacations and leisure activities, while sport and recreation become more and more important content of tourist movements or the pursuit of free times. (Vukonić, Čavlek, 2001, 365)

Cyclotourism represents an active and/or recreational form of tourism which implies cycling, that is, touring a certain touristic locality or destination riding a personal or rented bicycle. Cyclotourists can be divided into two main groups. The first group is composed of cyclists who use bikes as the primary means of transport during the whole trip and stay, as well as those who travel with other means of transport and bikes serve them on shorter relations within the area where they are staying. During the stay in the destination, they visit and tour as many localities as possible and rarely stay in the same place for a long time. According to Strum (2004, 128), the growth of the leisure industry has far exceeded gross domestic product growth. Between 1987 and 2001 GDP in dollars grew by about 50%, while sales of sports equipment and bicycles more than doubled, ie, the growth of the leisure industry is faster than the total economy.

According to the UNTWO estimates (action plan), there is more than 60 million active cyclists in Europe, 60% men and 40% women, of different age groups. Around 90% of cyclotouristic trips are independently organized, and only 10% are organized by travel agents. According to the data by the European Parliament (2013), cyclotouristic market of the European Union is constantly increasing. The number of one-day visitors who use bikes during their trip is hard to estimate, while the number of tourists who realized at least one overnight stay is estimated at about 20 million. More than one-quarter of European cyclotouristic trips take place in Germany, and around 8% take place in Scandinavian countries. Cyclotourists are in the medium- to high-educated tourist group. Usually, they travel in pair (50%), around 30% come in groups of three to five people, and the remaining 20% are singles. Almost 60% of cyclotourists change the accommodation several times during the trip, while 40% stay in the same place. On average, cyclotourists spend 53 euros a day including the accommodation, whereas one-day visitors spend 16 euros a day on average.

Table 4 shows the segmentation of cyclotourists according to their preferences, target market, and psychographic segmentation.

Table 4. Cyclotourists segmentation

Segmentation of cyclotourists		Target market	Psychographic segmentation	Preferences of cyclotourists
Cycling amateurs	Sporadic cyclotourists	-Croatia -Hungary -Bosnia and Herzegovina	Prefer physically less demanding routes, have a pre-planned and organized itinerary, look for cozy accommodation, mostly mid- and mature-aged (35-60), come with the personal bike. Usually, travel in groups or with family.	-less demanding cycling routes, -ride through preserved nature, -cultural and natural attractions, -thematic events
	Short-track cyclo tourists	-Croatia -Hungary -Bosnia and Herzegovina -Austria		
Active cyclists	Long-track cyclotourists	- Croatia - central-european countries	Usually, don't have an elaborate travel plan, look for simple and acceptably priced accommodation, mostly younger age, from twenty to early thirties. Interested in the challenge and demanding cycling routes. Come with a personal bike.	-longer, demanding routes, -ride through preserved nature, -cultural and natural attractions, -international and national cycling competitions.
	Sports cyclotourists	- Croatia - central- and west-European countries		

Sources: made by the authors according to the data from <https://mint.gov.hr>

As it is notable from the table of described market segments, special groups of cyclotourists can be singled out, depending on their preferences, out of which priorities on infrastructure emerge.

- Sporadic cyclotourists including day holidaymakers and amateurs who prefer relatively shorter cycling routes near their accommodation object. Alongside that, attractive routes with little car traffic are important to them, and additional services offer plays a minor role,
- Short-track cyclotourists choose other locations alongside their place of stay as the itinerary for their trip. They transport their bikes to the location with cars of their own, by railway, or rent them on spot directly or using Bike-sharing system. The attractiveness of routes is more significant to them than to the prior group, as well as diverse hospitality offer and service facilities.
- Long-track cyclotourists prefer longer routes of at least 100 kilometers, well-set and attractive routes with diverse hospitality offer, cyclotourist-adapted accommodation and service facilities in the route.

- ✦ Sports cyclotourists have similar preferences as long-track cyclotourists. To them, the intensity of car traffic is also important, as well as favorable climatic conditions, especially outside the summer season. Since they usually travel in groups, larger hotels are necessary, alongside diverse offer.

Cyclotourism is more or less physically demanding when it comes to the distances, so nutrition has great importance, but at the same time, due to their activities, cyclotourists usually eat in local restaurants in the route. Therefore, restaurants near cycling routes in Baranja should complement their gastronomic and oenologic offer.

According to the Action plan on cyclotourism development in Republic of Croatia (2015-2020), the main motif for cyclotourists' trip is active or recreational participation in cycling, and additional motifs that affect demand are participation in competitive cycling and watching cycling events. Since touristic forms are defined by the duration of the vacation, it is necessary to differentiate:

- ✦ one-day cyclotourism – a most frequent form of cyclotourism, characteristic for domestic tourists, i.e. day holidaymakers
- ✦ vocational cyclotourism – the form of tourism where cycling is one of the activities of the tourist during the vacation
- ✦ active cyclotourism – cycling is the main motif of the trip.

Therefore, it can be concluded that future trends of cyclotourism development in Baranja will be directed at market segments of active and recreational cyclotourists. It will most often be domestic recreational cyclotourists and foreign tourists who visit because of social and cultural events.

Activities during the stay in the destination were ranked according to the most common forms. Out of a total of 30 recognized bicycling as an activity is ranked 16th in rank rankings 12.6% (Tomas's research, 2017, 42).

According to the preferences of recreational cyclotourists, Baranja region enables fewer demanding routes due to lowland relief and the vicinity of inhabited places where local gastronomical and oenological offer exist, as well as diverse cultural and historical heritage.

Simultaneously, active cyclotourists can enjoy long, demanding routes in Baranja which are connected on the international level (EuroVelo routes), as well as hilly routes, with vineyards and wine cellars which contribute to the attrac-

tiveness of the route. The moderate continental climate is a desirable factor that contributes to perennial cyclotourism offer.

6. CONCLUSION

Touristic demand for different forms of active vacation is a growing trend. Cyclotourism is one of the specific forms of tourism that connects other forms of tourism such as gastronomical and oenological tourism, agritourism, cultural-historical, sports-recreational, camping tourism, adventure, and eco-tourism. In order to create the preconditions for intensive development of cyclotourism, cycling infrastructure that relates to local, regional, national and international routes is indispensable. At the same time, the attractiveness of cycling infrastructure is one of the cyclists' basic motifs for visiting, and it is achieved through long-term planning of facilities on the routes and successful realization.

Cyclotourism in Baranja is relatively poorly developed, so it is necessary to recognize and valorize natural and social resources and put them to touristic use. Natural attractions in Baranja are recognized, protected by law, and divided into five categories: nature park (Kopački rit), special reserve (zoo reserve of Kopački Rit nature park and Podpanj), regional park (Mura – Drava), monument of park architecture (parks and gardens surrounding the castles – Bilje and Kneževo), and natural monument (grassland area, Bilje cemetery). Alongside natural attractions, there are numerous social attractions in the form of different events, both cycling and cultural-historical. Since almost 60% of cyclotourists change accommodation several times during the trip, so it is necessary to complete and enrich hospitality and accommodation offer adapted to the needs of cyclotourists.

In the Baranja region, there are only two accommodation objects which cater to cyclotourists' needs. The offer can be completed through accompanying infrastructure – traffic signalization, mobile application, services, and bike equipment stores. Baranja region as a touristic destination has different market segments as potentials for cyclotourism development.

Two groups of cyclotourists have been recognized by market segmentation, and those are cycling amateurs and active cyclists. Cycling amateurs prefer less demanding routes, thematic events, cultural and natural attractions. On the other hand, active cyclists prefer longer and more demanding routes, competi-

tions and ride through preserved nature. Market segmentation is an important part of positioning a touristic destination, which is a long and complex process. That way, the level of quality of touristic product and destination image is maintained and raised. Therefore, long-term planning and short-term organizing of touristic offer for every segment of cyclotourists are indispensable.

Abstract

Managing a university and providing opportunities for development is a hard task that today's university leaders are facing. In an economically and technologically rapidly changing environment that is given today leaders must have a vision for their institutions and detailed plans for the long-term growth are necessary to achieve this goal. Innovation is essential in a university's life considering its role in society. The 4th generation universities have a mission to change or shape society, and the easiest way to do this is to take an important role in its life. Being up-to-date with new technologies, being a rational business partner for companies is inevitable in today's environment. Innovations help universities strengthen this role and make it an important investor in the region. The article encompasses a review about the tender investments provided by European Union sources to the University of Pécs in the last 10 year. The goal of the article is to measure the importance of these tenders and to provide an insight into the role of the university in the region.

Keywords: RDI, 4th generation university, regional economy, Hungary, University of Pecs

JEL Classification: A20, R11

1. INTRODUCTION

In the transformation process of higher education institutions, several factors played an important role, including the restructuring of the educational structure (eg.: the bologna-system in Europe), and the change in the social engagement of universities. In the case of universities, currently 4 generations are separated by the specialized literature, and there is a mission associated with every generation. In Wissema's book (Wissema, 2009) the first 3 generations are discussed in details, and one can find the fourth generation's discussion in Pawlowski's work (Pawlowski, 2009). The first generation is defined as the medieval universities which were founded based on the sample of the ancient Greek and Latin schools, for which the sole purpose was teaching. In the XV. century during humanism, the thinking of the society has changed, and the usual master-disciple relationship was not enough or adequate for more and more students, and institutions came to life where the main aim was to find and comprehend new knowledge, where professional researchers and amateurs worked together. Besides universities, another kind of specialized institutions came to life, where more practical disciplines and sciences were taught. After the cultural revolution, the former universities started to gradually incorporate the recent research methods, for the unofficial universities and other specialized institutions posed as a threat and serious competition to them. At the end of the XVIII. century the Humboldt University arose. The Humboldt University was named after the Prussian diplomat, Wilhelm von Humboldt, who was an enlightened philosopher, neologist, minister of education, and the founder of the University of Berlin (which was later named as the Humboldt University). Researchers started to draw conclusions from objective, systematic and repeatable experiments, which were collectively named as the "modern scientific method" (Wissema, 2009, old.: 13). The process of transition was the longest between the first and the second generations. The role of the second-generation universities besides education was expanded with research, which developed parallel with industrialization and they helped the progression of each other to a great extent. However, the Humboldt-model had several problems: after the

initial boom, the number of students increased so greatly, that the standard of education declined, the duration of the education lengthened, and proportionally fewer students graduated than earlier, and also the governmental restraints on budgets made it more difficult to educate such a huge number of students. Besides, many worldwide changes occurred that fostered the end the era of this type of universities: globalization; the appearance of interdisciplinary research; increase in the cost of cutting-edge research; the appearance of special research centers; universities as the cradles of new economic activity, cooperation with the industry; the rise of entrepreneurship. Along the lines of these changes, the third level university missions appeared: the cooperation with industry partners. Business use of education and research had a great impact on the operation of universities, as these involve students in the industry during their education, complementing the university education with practical know-how. Wissema's book was published in 2009 but comparing his work with later specialized literature one can see, that Wissema forecasted a longer future to the third generation universities but he was mistaken, not long after his book was published, structural changes in the market started to evolve that had an effect on higher education institutions.

Based on Pawlowski (Pawlowski, 2009), the changes in universities in the most developed regions started in 2006, and the "fourth generation university" appeared, the influence of which is starting to unfold these days. Recently the supply and demand regarding universities have shifted from the previous teacher-student angle to the economy-education angle. Based on the knowledge obtainable through researches and practical training it is the role of universities to shape the society around them through investments and innovations and to shepherd it to a future where sustainable economy and way of living is an integral part social thinking. Besides that, another role of universities to foster the competitiveness of their region. Multiculturalism has evolved next to interdisciplinary research, meaning that the regional overlap of the latitude of universities is much more than earlier, which is also a reason of the lower costs of communication and transportation resulting from globalization. When taking internationalisation into mind, one needs to consider the cooperation with international companies and also the exchange programs with foreign universities and other foreign scholarships in the case of the economic impact of universities, as a foreign university coming to a particular university strengthens the economy of that region for one or more semesters with their spendings. Im-

portant to emphasize that as a given time period was needed for the transition between the first and second, and the second and third generations, it will also be needed for the transition from the third to the fourth generation, and currently the higher education system is in this transition phase, but with altering advancement from region to region. The University of Pecs is already fulfilling its third-generation tasks, but to be able to perform its fourth-generation tasks a structural change is needed, and also the university needs to obtain a position through investments, with which it further strengthens the economic roots in the region.

From another aspect but with similar conclusions another theory appears in the work of Etzkowitz and Leydesdorff (Etzkowitz & Leydesdorff, 1997), the Triple-Helix model. After its 1996 creation, the publishers wrote several related articles, and workshops and conferences were held in the topic. The essence of the Triple-Helix model is the interaction and cooperation of the university-economy-government trio in a knowledge-based society. Another grouping of universities appeared in Hrubos' (Hrubos, 2001) and Clark's (Clark, 1998) works, who named the previously mentioned "fourth generation university" as the "entrepreneur" university, which expands the previous self-supporting (managing its own finances) and providing (creating and supplying knowledge, obtaining business partners) concept of the university with the role of shaping and responsibly leading governance the society. Detailed specialized literature analysis and assessment was performed and can be found in the works of Kotosz (Kotosz, 2013) and Kotosz et al (Kotosz et al, 2016), the article does not comprehend a detailed interpretation of these models.

2. IMPORTANCE OF RESEARCH AND DEVELOPMENT IN THE LIFE OF UNIVERSITIES – EUROPEAN UNION SOURCES AT THE UNIVERSITY OF PECS

As it can be seen in the introduction, the tasks of the universities these days include making researches available for economic usability. The prevailing of these researches on the market depends on many factors. Today it is unambiguous that research and development is an integral part of the modern economy (Glaziev & Schneider, 1993). In a transitional economy such as Hungary's, many principles need to be fulfilled: the government needs to support basic

research; financing of applied research and development must be taken over by the private sector (with an exception for the specialized researches that serve governmental purposes); the main problem of the transition period is the lack of demand for researches (this needs to be compensated somehow); the diversity of enterprises is favorable from the viewpoint of investments (demand for business applicability for more lines of research will rise); there is a fundamental dependence of science and technology to the legal and economic environment.

Based on these findings it is not expectable from a university that does not fulfill its fourth-generation roles to finance its RDI projects that require a great amount of capital investment. These investments are usually supported by the government, the private sector or another institution. In the following parts of the article, a university will be analyzed that is important in the south-Transdanubian region.

The University of Pécs (UP) in the last ten years (2008-2017) accumulated a total of € 7 617 004 support from European Union sources. The 1st graph below shows the yearly sum of these supports (a detailed table with the exact amount and the titles of the projects can be found in the first appendix, and in the second appendix a graph shows a yearly distribution of these sources grouped by the four major areas regarding the number of the projects and the amount granted for these projects).

Figure 1. Amount of financial support (€) by the EU to the University of Pecs

Source: European Commission, edited by Abel David Toth

The department responsible for tenders at the University of Pecs underwent a transformation that started in 2015, and in 3 years it nearly tripled its human

workforce. Recently there are less European tenders that are directly targeted by the university, the focus is on the tenders provided by the state (this change is mostly because of the legal and bureaucratic severity of the tenders). The European Commission mainly supported the following areas: research and development, education development, investments aiming the increase of living conditions. The distribution of the tenders shown on the graph are as follows (based on the number of tenders): medical/health: 47%, social: 34%, economic: 13%, IT: 6%, whilst the amount supported distributes as follows: medical/health: 51%, social: 35%, economic: 8% IT: 6%. Medical tenders focused on medical research and development and the implementation of these findings; social tenders mainly focus on the IT socialization of the elderly, religion topics and the presentation of researchers' life to the public, trying to endear this lifestyle with the younger generation. Economic tenders aimed agricultural innovations, reforms regarding economic institutions, the applicability of genetic researches in agriculture. As for the IT tenders' smart technologies were supported, together with those IT technologies and equipment that increase living conditions.

The previously mentioned ratios confirm the assumption that most supports are dedicated to those medical research and development, the applicability of which has a great impact on the increase of European living standards.

3. A SWOT ANALYSIS OF THE SOUTH-TRANS-DANUBIAN REGION'S RDI ENVIRONMENT

If one wants to define the relationship of the university and RDI investments in a complex system, it is necessary to first assess the outer and inner environment, more specifically the arising opportunities and threats, and the weaknesses and strengths (Farkas et al 2015). The second graph represents these factors.

Figure 2. Opportunities and threats, strengths and weaknesses regarding the UP

Source: PTE KTTO, edited by Marcell Farkas

Considering opportunities, it can be said that the potential sources that can support institutions with their RDI investments are the international and national tenders focusing on this field. This means an approximately 700 billion HUF source regarding the current period (2014-2020) for SMEs. The M6-M60 highways are not fully utilized and not integrated into the nation-wide public road system. If these roads could be somehow connected to the Croatian system, then it will be more probable to increase the entrepreneurial activity of the quarter sector in the region. The relations of the university are focusing on Tolna county, mainly Szekszárd and Paks are interested. In this county the research and development related to the expanding of the Paks nuclear plant means the opportunities in the external environment of the UP, with which it cannot live without limits because of the special legal environment, also the UP needs to compete with other higher education institutions, for example the University of Debrecen (nuclear physics specialization). Orders from multinational companies and SMEs – however, they cannot be forecasted – are significant, and henceforth need to be considered as an opportunity. However, these orders in many cases only require basic research, that could not be seen as real RDI investments. The main research areas defined by the Research-utilization and Technology-transfer department (KTTO) and the University of Pecs are

focusing on the medical innovations (3D microscope, intelligent patient tracking systems, biotechnology, genetic engineering) and the engineering developments (intelligent city designing, sustainable urban management, smart cities). The opportunities provided by sponsor action is currently utilized by the Medical Faculty and the Faculty of Business and Economics, and this kind of sources could be a good starting point for the future. The South-Transdanubian Cooperation and Research Center is an initiative that has come to life to be the mediator between the corporate sector and the university, and also has untapped opportunities that could be further utilized, for the results that were achieved in the medical and engineering field are not efficiently available and usable for the economy, and this problem highlights the great distances between the university and the corporate sector. There is another notable initiative with a similar profile, the South-Transdanubian Regional Innovation Agency that serves as a bridge between the knowledge centers and the transfer organizations -such as the Pécs-Baranya Chamber of Commerce and Industry, or the Innovation and Technology-development Center – but only with modest success. Other factors that are mentioned in the RDI strategy of the university can only be considered theoretically or in a longer time period.

As for the threats, it should be mentioned that there is no developed, hierarchic strategy, so in many cases, the harmonization of the (sometimes ad hoc) projects is a difficult task. Legal obstacles mainly come from the different lead time of the governmental and university regulations, in many cases, the latter constricts the former. General legal uncertainty is also typical, meaning that rapid changes in the legal environment are not closely tracked by the institutional regulations. Because of this, and the bureaucratic system of the university and the state, the fundraising could be further hampered. Another potential danger is the decreasing attractiveness of the career of researchers and the low motivation of researchers arising from the overloading of the teachers. Furthermore, the *brain-drain* phenomenon is even more considerable regarding RDI projects. The weak economic impact of the city of Pécs, its relative isolation, the total lack of high tech industry and large investors create an unfavorable investment environment. As another threat, one should mention the strong lobby activity of other rural universities (UD, USZ) as a more important factor compared to the emergence of corporate research centers.

Amongst strengths, the first thing that needs to be mentioned is the national and international fundraising from tenders, as the major proportion of sources

that could be spent for innovations come from this activity. The role and the prestige of the clinics and other health institutions are also important, as the benefit originating from these advantages could be utilized by the university. The KTTO and the Innovation Committee serves as an institutional and corporate background for the innovative activities, which has already partly succeeded in some areas. From the aspect of human resources, the UP stands out regarding the number of certified researchers, and the reinforcements are also ensured by the 20 doctoral schools functioning at the university. InnoPoints and Innovative Researcher Teams were created in a 2009 TÁMOP tender, also a Knowledge map was created to map the innovation potential of the university. On this map, only 50-60% of the researches were shown because either teacher doesn't know about the existence of this map, or the data is insufficient they provide for the system. The reason for the letter is mainly originating from the fact that those project or ideas that could be applied by market characters are "outsourced" to companies, to sell or utilize them privately, thus they are invisible for the institution. We can highlight the advanced state of laboratories, instruments and other institutional infrastructure (research center, knowledge center – library) that could be used for clinical and other researches. The other so-called "soft" factors that were detailed in the strategy and other factors that could only be connected to innovations indirectly, are irrelevant concerning RDI investments.

The University of Pecs has much more weaknesses than strengths. The first and probably most important problem is that the university has no substantial economic relations, so it is rare that the institution has an order for a complex research and development project requested by corporations, most of these orders are limited to basic research. The other essential component of the weakness of the UP is that the main emphasis is rather on publication than on patents, publications serve as the real possibility for academic progression in the institution, and this is the basis for the decisions of research applications (3rd appendix shows the change in the number of patents 2008-2017). Teachers are not forced to execute other types of researches, and they can't bear the risk related to patent, or they cannot be persuaded to work more than the daily requirements because they have no capacities for that.

Figure 3. change in the number of Hungarian and foreign publications. For a change in the statistical methods on the side of the KSH, years 2016-2017 are not comparable with previous years.

Source: KSH, edited by David Toth

The most important reason, besides that there is no previous practical knowledge about industrial research utilization, is that at the University of Pecs there is no tradition of innovation. Additionally, the institution lacks a harmonized application system for the faculties and the institution and there is no cooperation between faculties; efficiency of quality control and monitoring is negligible, and regulations are often inconsequential. Because of the ad hoc projects, the fragmentation and unequal utilization of the modern infrastructure is inherent, and the available equipment are not properly registered, so their potential is often unexploited. Important to mention that due to the financial instability that originates from the institutional and governmental withdrawal of financial sources, unpredictable contribution and the burden for provisioning will cause liquidity problems and drawbacks in competition later on (for example in the case of the clinics). The excessive workload of teachers and the lack of financial motivation plays an important role in slightly efficient research and development works. This way researchers carry out isolated researches, and the possible innovation is managed to bypass the university. This is partly because of the impenetrable institutional bureaucracy, that could lead to distrust and weak supply of data, but only the mutual trust is the pledge of networking and cooperation that could serve as the basis for successful innovation.

4. EVALUATING THE RDI SITUATION OF HUNGARY AND THE SOUTH-TRANSDANUBIAN REGION

The RDI activity in Hungary had been decreasing from 2014 regarding the number of research sites (research institution, universities and corporations) and researchers, but in 2017 this ratio seems to turn around: in that year the number of research sites grew by 14%, and the number of researchers grew by 12%, reaching the level of 2014 regarding the number of employed and the GDP expenditures spent on RDI projects (however, it is still lower than in 2013 in both cases). The proportion of research sites is shown in the graph below.

Figure 4. Sum of all sites and institutions dealing with research and development between 2008 and 2017.

Source: KSH, edited by David Toth

As for the financial expenses, growth was continuous except for the year 2016, and in 10 years, expenses grew by 94% until 2017 compared to 2008. When analyzing this value we found that the expenses of research institutions grew by 4%, that of higher education institutions grew by 17%, and expenses of corporate R&D sites grew by 170% in the mentioned time period. In 2017 the expense-related proportion of higher education institutions were only 13,29%, while that of the corporate sector was 73,11% (the remaining proportion was dedicated to research and development institutions). These numbers can further support the hypothesis that the business applicability of RDI activities of universities is not necessarily preliminary requirements when starting research and that the business relations of the university are not strong enough to effi-

ciently monetize the results of these research results in the industry. The largest proportion of the expenses of higher education research sites come from governmental support (78,19%), the remaining amount is provided by corporate or other national or foreign sectors. In 2017 the funds for tenders exceeded the 2013 level (contrary to the employment rates), and regarding the sum of research sites the country reached the 2014 level (but still behind the 2013 level).

Regarding the proportion of companies that brought out new products as a result of research and development projects, Hungary is at the 22nd place among the 28 EU members, with a proportion of half of the EU average (24%). When Switzerland, Iceland, and Norway are also considered, Hungary is at the 25th place, for this list considers the financially strong large corporations that have R&D projects with the same weight as the SME sector that has the much less financial strength to carry out such researches. Hungary is in the midfield regarding RDI employment data in the EU that indicates the presence of the economic weight of large corporation. The proportion of RDI employees compared to all employees is between 0,7-0,9% on average in the 2008-2017 era, while the proportion of R&D expenditures compared to the GDP is 0,98-1,36% in the same time period, which shows the sector's higher-than-average capital requirement. When analyzing the actual data, we found that the employees of the R&D sector were growing from 2008 until 2013, then it started to decline until 2016, and in 2017 it started to grow again (these changes are shown in the fourth appendix).

Before going into details about the RDI environment of the university, first, we would like to demonstrate the situation in the South-Transdanubian region. As the analysis of the KSH regarding 2017 shows, the region has a huge drawback in the quarter sector compared to other rural regions (all regions except for the one where the capital is placed). This is especially true for the proportion of full-time employees of the RDI sector, and also for the expenditures of the sector in this region. The proportion of R&D employees in the region compared to the national data is only 6%, only two regions have lower values (West-Transdanubian and North-Hungarian regions), but in the West-Transdanubian region the level of RDI expenditures is higher (more than 1,5 times more) and the number of research sites is also higher. The drawback is even more significant if we compare the region with other regions that have similar regional centers, the advantage of Szeged or Debrecen appears to be even larger, as Hajdú-Bihar and Csongrád counties are more relevant in themselves than the whole South-

Transdanubian region. Regarding the number of RDI sites, the region is ahead of the South-Hungarian region and the Middle-Transdanubian region (but the latter doesn't have a large university center).

If one wants to shed light on the reasons behind this situation, it would be interesting to take a glance at the number of publications per employee working in the RDI sector in each region. It is clear that in 2015 the South-Transdanubian region was in the first place amongst the rural regions regarding all types of publications except for the foreign journals. Proportionately the number of publications per 100 million HUF of RDI expenditures shows a similar picture. After analyzing the absolute number of publications, it can be stated that in 2017 the region is the first with respect to books and book chapters, and third with respect to journal articles after South-Plain and North-Plain regions. Based on these we can say that the region relies on the universities and research institutions, and primarily on the University of Pecs, regarding RDI activities. Representatives of the state in the region are mainly the MTA (Center of Regional Research, and the Academic Committee of Pecs) and the FVM Viticultural and Winery Research Institution, which carry out basic researches in most cases.

The researches in the university – as we can see – do not create real employment opportunities for the RDI sector, spend even less on research and development activities from their budget, and realize hardly any profit. Without the necessary entrepreneurial skills and know-how, the publication is much more dominant compared to patenting, as we can see from the demonstrated data.

4. CONCLUSION

Based on the previous chapters in the article it can be seen that the transformation of the social engagement of the university implies the change of the daily tasks of the institution and the correction of the previously determined goals. The international changes always came later to the Middle-European region as to our western neighbors, but for universities to be able to compete with foreign universities it is necessary to change its educational standards, the social engagement of the institution and the attitude towards the economic partners.

In the case of the University of Pecs, the European and national investments that were realized in the last few years had helped the university in its academic

research and development activities especially in the field of medical studies, but the industrial applicability of these findings are hardly visible yet. Besides these investments and researches, however, the region needs the development of the industry and the economy to strengthen. This could not be fulfilled by the university alone in Baranya county and the South-Transdanubian region, for this purpose it would need the help of the local communities and businesses. As the chancellor of the University of Pecs said at one of his speeches, the university stands at the door before an interesting period, where it needs to fulfill and execute unusual and extraordinary tasks, for example getting more involved in business activities and to create a working portfolio with the city management that would help the region rise. According to him one of the possibilities is through RDI activities and tenders, the business applicability of which can be achieved by vitalizing the regional economy and involving local entrepreneurs. But the basis of this all is the change of the approach of the residents and the city management, from the passive or indifferent behavior to the proactive and productive lifestyle with an urge to find solutions is essential. In Pecs, the university has connections with most entrepreneurship directly or indirectly, so the changes in the life of the University of Pecs has a huge impact on the city and the region.

Utilizing governmental investments and attraction of companies to the region that could help with its uprise is a hard task, which requires careful planning and proper work, so the leaders of the city and the university must put huge emphasis on the cooperation with current partners and on the development of new partnerships, and must support such RDI activities that not only serve as a good starting point in the educational/academic area, but also accompanied by the rise of living standards in the region.

Abstract

In the 21st century, the century of megatrends, tourism has been going through a certain structural transformation. Almost every day, the sector of tourism faces certain changes that leave deep and strong implications, both positive and negative. Although mass tourism still remains the leading form of tourism in the global tourism market, it is – so to say – being increasingly opposed to by specific forms of tourism that are based on the platform of meeting the tourist's needs and experiences. However, mass tourism will never be fully replaced by specific forms of tourism – they will only stand as strong alternatives to mass tourism. One such form of tourism is certainly agritourism – the most rapidly growing form of rural tourism worldwide. Precisely agritourism has been of great interest to a growing number of international scientists in the last three decades. In the Republic of Croatia and its academic community, this form of tourism has unjustifiably not gained the place and the significance that it deserves. There is namely a very scarce base of theoretical, as well as empiric research. Therefore, the main goal of this work is to represent the present

knowledge and empirical results of Croatian scientists and experts, which were collected in various Croatian tourist regions, at the theoretical and research level. The collected knowledge will be analyzed by the use of corresponding scientific methods.

Keywords: *specific forms of tourism, agritourism, tourist regions, research.*

JEL Classification: L83, Z39

1. INTRODUCTION

In its essence, the subject of this work presents a rational sequence of the works presented and published in the work collection titled *Interdisciplinary management research* (Bosnić & Tubić; 2012, Tubić & Bosnić, 2013, Tubić et al.; 2014, Tubić et al.; 2015.; Bakan et al.; 2016, Tubić et al.; 2017, Tubić et al.; 2018) from 2012 to 2018. The introductory chapter and the chapter connected to the terminology of rural tourism were mostly taken from the work titled *The marketing activities and barriers of the agritourism economies of the Continental region of the Republic of Croatia: TFF owners perception* by Tubić et al. (2018), but they were also additionally corroborated by the insights of other authors and experts. Tourism has become one of the greatest industries where the concept of borders lost significance since the number of international tourist visits has been growing rapidly (Tubić et al.; 2017, 1231). In accordance with that, there are also many changes in market competition. Modern tourist consumers can no longer be satisfied with the offer of tourism products that are based on the hard3 platform (sun, sea, and sand), but they need to be offered a tourism product that will satisfy their physical, emotional, intellectual and all the other needs of an emancipated consumer of the 21st century. In a concrete sense, that refers to the product based on the soft 6E platform (experience, excitement, escape, education, entertainment, ecology). Precisely this approach will result in the development of the 4M soft tourism (moderate growth, multi diversification, multitasking, mobile), the part of which is surely made of the rural forms of tourism with agritourism as its fastest-growing form in Croatia and worldwide. The holders of agritourist offer, which consists mostly of small economic units, need to have a high level of marketing knowledge and reasoning in order to place the product of rural tourism in the ever more saturated market and to ensure its recognition and competitiveness.

2. RURAL TOURISM: TERMINOLOGY

It is exceptionally hard to write about the terminological definition of rural tourism in the academic jargon, especially due to the great number of controversies among the authors, as well as the perplexities of a terminological nature. Numerous different terms for this type of tourism can be found in the literature (rural tourism, village tourism, agritourism, green tourism, etc.) and they are unjustifiably identified as the same term. Differing criteria for defining rural areas, the differing perception of rural tourism in developed and undeveloped countries, diversity and a great number of phenomena alike are only some of the elements with a confusing defining nature. The following controversial reasons have been mentioned and taken into consideration by the OECD (1994, 8-9) in its publication under the name of *Tourism strategies and Rural Development*:

- urban tourism is not limited only to urban areas – it also includes rural areas;
- rural areas are hard to define since the defining criteria differ from country to country;
- tourism that takes place in rural areas is not strictly “rural” – it can also be “urban” by form when it takes place in a rural area;
- historically, tourism is an urban concept – most of the tourists live in urban areas. In accordance with that, tourism can have an urban impact on a rural area by causing cultural and economic changes and new construction;
- different forms of rural tourism have developed in different regions;
- rural areas by default are found in a complex process of changes. The impact of global markets, of communication and telecommunication, leads to market condition changes, as well as to orientation towards traditional products. Although some rural areas are still facing depopulation, other rural areas are experiencing the influx of people or the development of “untraditional” jobs. A previously clear difference between the urban and the rural has been annulled by suburbanization, better communication and the growing number of weekend-houses in the countryside;
- rural tourism is not only tourism on the agricultural farm but a complex activity. It includes stays on agricultural farms but also special vacation forms such as holidays in nature and eco-tourism, hiking, climbing and horseback riding, adventure, sports, and health tourism, hunting and

fishing, educational travels, art, and culture tourism. All of the mentioned forms imply a growing market interest in less-specialized forms of rural tourism.

Due to all of the mentioned facts, there is still does not exist a single commonly-accepted definition in the international academic scene nor in the praxis, which was corroborated in the work of Tchetchik et al. (2006.), Polo & Frías (2010.), Mili (2012.), Nair et al. (2015.), Tubić (2015.), Tubić et al. (2018a.). Many international and domestic authors such as Lane (1994, 2009), Rátz & Puczko (1998), Roberts and Hall (2001), Thompson (2004), Brščić (2005), Jelinčić (2007), Kušen, (2007), San Martín and Herrero (2007), Ružić (2009), Sznajdera et al. (2009), Irshad (2010), Krajnović et al. (2011), Pesonen et al. (2011), Pröbstl Haider et al. (2014) and many others have tackled the topic of rural tourism in their scientific and professional works. The resolution of terminological perplexities beings with defining the rural area according to the most commonly-implemented criteria which are based on the population density that defines a rural area through two basic approaches:

- ♦ the first – local units (e.g. boroughs) – can be identified as rural if the population density stands below 150 inhabitants per square kilometer.
- ♦ the second criterion classifies the regions according to three categories:
 - ♦ Predominantly Rural Region – PR: if more than 50 percent of the region’s inhabitants live in rural units (with less than 150 inhabitants per square kilometer);
 - ♦ Intermediate Region – IC: if 15 to 50 percent of the region’s inhabitants live in rural local units;
 - ♦ Predominantly Urban Region – PU: if less than 15 percent of the region’s inhabitants live in rural local units (European Commission; 2006, 3).

This approach was implemented by Tubić et al. (2017) in their works “Agritourism: a new power of Croatian tourism”. In a broad specter of definitions of rural tourism, the key definition will be the one created by the OECD from two fundamental reasons. The first reason is that it is the only definition that follows the methodology of defining a rural area and the second reason is that it the most comprehensive in terms of content. The definition by the OECD (1994, 34-35) reads as follows: “Rural tourism fundamentally takes place in rural areas and is primarily in the function of agriculture. It is based firmly on the agricul-

tural world with special features of the open space, the contact with nature, the rural heritage and the society. Rural tourism must be in an agreement with the environment and the social community in which it takes place. The community includes less than 10,000 people and it includes the farms inside that area of work. The focus of rural tourism is oriented towards a whole line of sustainable business subjects and the community inside the rural area. The goal of rural tourism is ensuring long-time sustainability of life in the region where it takes place; it must be a force for the preservation of the rurality and not a force of urbanization.”

With the fundamental purpose of minimizing the unjustified mixing of the three key terms (rural tourism, village tourism and agritourism), Tubić (2015, 68-69) proposes that rural tourism should be terminologically equalized with village tourism since all three forms of tourism are defined by the rural area and, unlike agritourism, they can be primary and/or secondary sources of income without depending on the agricultural activity. In conclusion, rural tourism stands as a synonym for village tourism and conversely, while agritourism stands as a manifestation of rural, i.e. village tourism (Figure 1.)

Due to the subject matter of this work, it is necessary to define the term agritourism in more detail. Although agritourism is not a new phenomenon, a unique consensus in academic circles in terms of the terminological definition of agritourism has still not been reached, which has been confirmed by Hajdaš Dončić et al. (2007), Chesky (2009), Erstić et al. (2011.), Tew & Barbieri, (2012.), Flanigan et al. (2014) and Grgić et al. (2015). Due to a broad spectre of various interpretations of international and national authors, this work defines agritourism as a special form of tourism that takes place on a passive or active agricultural farm, where tourism, as a secondary activity, complements and raises the level of agriculture as the primary activity, where the visitor enjoys the natural and cultural attractions of the farm, consumes and/or buys the agricultural produce, and where the tourist can voluntarily take part in the agrotechnical processes and thus experience the authenticity of the former rural idyll. (Vrsaljko & Viljac; 2015, 204).

Figure 1. A hierarchical division of rural tourism according to the source of income and the dependence on the agricultural activity

Source: adjusted according to Tubić (2015).

In terms of the provided services, Demonja & Ružić (2010) divide tourism into the following forms:

- forms of agritourism that provide only catering services. These forms are intended for tourists who want to try or who like homemade authentic foods and beverages. A characteristic feature of this form of tourism is serving foods and beverages in a specialized facility which is located on the family farm which is decorated and equipped according to the original architecture;
- forms of agritourism that provide only accommodation services. A characteristic feature of this form of agritourism is a great number of facilities that provide accommodation services, some of which are: rural houses of traditional architecture, rural rooms, rural family hotels, traditional and new architecture suites;
- forms of agritourism that provide catering and accommodation services. What is specific for this form of agritourism is the possibility of providing the complete service of accommodation and catering, as well as the full additional vacation program with excursions, farm tours and other contents that are organized in the area and its proximity. Precisely this form presents a complete family farm service package and is considered extremely attractive and thus economically viable.

In term of facilities, there are different forms of vacation agritourism (Ružić 2009, 20).

- rural houses of traditional architecture;

- ♦ rural family hotels;
- ♦ rural rooms and traditional architecture suites;
- ♦ rural rooms and new architecture suites;
- ♦ agricultural farms with an eco-offer.

3. AGRITOURISM IN THE CROATIAN ACADEMIC COMMUNITY

The consideration of agritourism in the Croatian academic community should begin with an analysis of study programmes of the Croatian educational institutions in the area of rural tourism. It is evident that there is only one operating institution of higher education (College for Management in Tourism and Informatics in Virovitica) that deals with the overall rural matter throughout the full study programme of the undergraduate professional studies of Management, course Management of rural tourism. The programme is aligned with the principles of the Croatian Qualifications Framework, i.e. the platform of work market demand, which certainly presents an additional value for the programme. An analysis of the programmes and topics from six educational institutions of the Republic of Croatia in the area of rural tourism made by the authors Smolčić Jurdana & Milohnić (2018) corroborates the aforesaid thesis. Precisely this fact stands as the evidence that rural tourism, along with its fastest-growing basis and form, unjustifiably does not enjoy the deserved place and significance in the Croatian academic community.

By deepening the subject of agritourism at the national level from the aspect of scientific and professional theoretical and empirical research, it is essential to emphasise that there was only one official research (2007) that was conducted in the overall area of the Republic of Croatia by far (2019) by the Croatian Chamber of Economy – Tourism Sector under the name of Current State of Tourism in the Rural Area of Croatia in 2008. The research has incorporated 88 out of the total number of 352 registered tourist rural family economies, i.e. 25%. The primary goal of the research was to show the real state of agritourism in the Republic of Croatia. However, since the questionnaire was of a general type, including questions on operating hours, accommodation capacities, excursion organization, sports and leisure activities, nearby facilities, the methods of promoting the tourist rural family economies – and taking into consideration the content of the research instruments – the question that arises is How well

can the gained response indicate the real state? It is important to emphasize that the research by the Croatian Chamber of Economy was conducted with a goal of composing the first Croatian catalog on tourist rural family economies, which was officially publicized eight years later under the title of Rural Tourism in Croatia – National Catalogue through the cooperation of the Croatian Ministry of Tourism and the Croatian Chamber of Economy. The main advantage of the mentioned catalog was that it encompassed the whole offer of rural tourism, i.e. agritourism for the first time in one place. By critically taking into consideration the past contribution to the theoretical as well as the practical development of agritourism in Croatia, the authors of this paper find it hard to understand the reasoning behind shutting the Community of Rural Tourism at Croatian Chamber of Economy and incorporating it into the Tourism Sector even though the matter of rural tourism and agritourism is notably complex in its nature and is also of a great importance for the development of the year-round tourism in Croatia.

Moreover, it is important to emphasize the role of the Croatian association for tourism and rural development “Klub članova Selo”, also the organizer of the past four International Congresses on Rural Tourism. It should also be indicated that the academic community, as well as the real sector, have continuously been pointing to numerous limiting factors that have been inhibiting the development of rural tourism and agritourism over the period of eleven years. The academic community has also proposed certain recommendations for the improvement in the mentioned limiting factors, however, none of the recommendations have been adopted by far, which is a strong enough indicator of the mutual disconnectedness and misapprehension of the key stakeholders in the process of development. Precisely this is the proof that the mentioned form of tourism has been developing without a clear developmental vision in academic, institutional and practical terms.

Taking into consideration the academic development of agritourism, it is important to state that there is an unjustifiable lack of interest, although there is a small group of academic enthusiasts who continue to examine the phenomenon (Kušen; 2006, Brščić; 2005, Franić & Cunj; 2007, Leko-Šimić & Čarapić; 2007, Ružić; 2009, Demonja & Ružić; 2010, Brščić et al.; 2010, Grgić et al., 2011; Baćac, 2011; Tubić, 2012, 2015; Vrsaljko & Viljac; 2015, Kantar; 2016, Tubić et al.; 2018). As is known to the authors of this work, there exist only two doctoral dissertations (Brščić; 2005, Tubić; 2015) with a strong focus on

the topic of rural tourism and agritourism. It should be clearly stated that the existing research mostly encompasses one county as a territorial unit, i.e. as the empirical research area.

Prior to displaying the key empirical findings of the two most comprehensive research, we should emphasize the contribution of the doyen of rural tourism by Eduard Kušen (1995), who is – by the opinion of Tubić (2015, 65) – one of the first Croatian authors who analysed the terminological issue of rural tourism. In his article *Tourism on farms*, Kušen (1995:130) proposed the term of village tourism be replaced by two names – rural tourism and farm tourism (tourism on farms). It is important to give full credit to Pavao Ružić (2009) – the author who contributed to the better understanding of the complicated topic of rural tourism and agritourism in a systematic and lengthy way, by using an understandable jargon in the extended edition of the book *Rural Tourism*, the first of such works in Croatia. There are a few other authors whose scientific and professional contribution and importance cannot be denied, however, due to the limitations on this article, their credits will be emphasized in the upcoming works of the authors of this article.

When acquiring the highest academic degree in postgraduate doctoral studies in “Management” at the J.J. Strossmayer University in Osijek, the Faculty of Economics, Kristina Brščić, Ph.D., mentored by full professor in tenure Drago Ružić, Ph.D., wrote and defended the doctoral dissertation *Marketing Assumptions of Agrotourism Householdings in the Istrian County* on October 7, 2005. The research was conducted on the sample of 216 respondents, consumers of agritourism products and services, as well as on 43 owners of tourist rural family economies. Upon the analysis of the obtained data, Brščić (2005, 230-232) states the following:

- agritourist economies are held by younger families;
- it is problematic that some registered agritourist economies do not possess or cultivate land and are not engaged in cattle breeding so they cannot be treated as agritourist economies;
- the most common form of capacity sale is carried on only by word reference;
- the promotion of agritourist economies is very scarce and is mostly based on small gifts and group appearance in a catalog or on the Internet;
- there are problems connected to the insufficient organization, legislative regulations, and absence of ongoing educations;

- only a few agritourist economies plan on broadening their offer, 9% of them in the short term and 16% of the economies plan to broaden their offer in the long term;
- tourist rural family economies should fight for their interests, not only individually, but also by forming a joint cluster;
- the future of tourist rural economies depends greatly on the success of the integration of the traditional way of life and new forms of vacation, as well as new economic activities in these areas.

As was stated earlier in this paper, this chapter will serve to interpret the results of the only research in the Republic of Croatia that included the creators and co-creators of the national tourist policy as well as the owners of tourist rural family economies. The empirical research was conducted for the purpose of the doctoral dissertation Model development of Rural Tourism of Continental Croatia by dr.sc. Dejan Tubić. The dissertation was mentored by a full professor in tenure Đula Borozan, Ph.D., and defended on April 13, 2015, at the Faculty of Economics in Osijek. In addition to Professor Borozan, the committee was comprised of the Osijek Faculty of Economics full professor in tenure Mirna Leko-Šimić, Ph.D., the president and Danijela Križman Pavlović, Ph.D., full professor in tenure at the Faculty of Economics and Tourism “Dr. Mijo Mirković” in Pula. Upon the obtained data, Tubić (2015, 302-304) concluded:

- core components of institutional support (legislative regulations, strategy for the development of rural tourism, statistical monitoring, marketing, and interest clusters) present a significant limitation for the development and management of the stakeholders of agritourism;
- the development of a separate strategy for the development of rural tourism is essential for the overall strategic development of rural tourism in Croatia since the current modern era does not allow for an accidental success;
- the majority of rural-tourist resources and potentials are undermined or even completely neglected by the national tourist policy;
- at a confidence level of 95%, it was found that the inadequate legislation regulation stands as one of the crucial limiting factors, but probably not the most important one according to the owners of tourist rural family economies;
- from the standpoint of tourist rural family economy owners, inadequate marketing activities in the local and national level, as well as the poor

level of understanding marketing and interest clusters among the local (rural) inhabitants stand as important limitations to the improvement and development of the tourism management;

- a pronouncedly small percentage of tourist rural family economies (21,50%) recognized the importance and significance of joining a common interest association.

3. FINAL CONSIDERATIONS

The research results imply a lack of understanding of a terminological meaning of rural tourism and agritourism, despite it being the crucial step towards the institutional and practical development. If the well-known – and, unfortunately, persisting problem of the lack of awareness for the need of the joint cooperation of the real, academic and institutional sectors – is added to the equation, it is evident that Croatian agritourism is developing without a clear vision and mission, as a result of certain private initiatives – which is unacceptable. It should also be indicated that by developing the sector of rural-mountain tourism, the country of Austria succeeded in ensuring the country with two tourist seasons and, from the income side, insured itself with almost double the amount of income from tourism than the year-round tourism of the Republic of Croatia. In conclusion, the authors of this paper will repeatedly name the public-political suggestions for the development of rural tourism and agritourism which stem from a scientific basis, put forth by Tubić (2015: 295-297):

- current statistical monitoring, as well as the tourist-statistical terminology, should be adjusted to and correlated with rural tourism;
- the current legislative framework of Croatian rural tourism should be precisely organized and simplified;
- a certain constant educational system should be established;
- the communicational process among the stakeholders of tourism should be promoted;
- a system of marketing affiliation should be established;
- the development of rural tourism should be incited by way of the philosophy (approach) of clusters, i.e. interest affiliation.

Abstract

The research subject of this paper are recommendations given after efficiency audits of the prevention and detection of fraud in companies owned by local and regional self-government units. The data from the efficiency audits performed by the State Audit Office was used. The paper confirms the presumption of correlation between the number of recommendations given and the number of employees in the companies. Recommendations were given to improve the operations and the effectiveness of preventing and detecting fraud was rated. The audit covered 106 companies. Some companies have taken the necessary actions to prevent and detect fraud, others have taken action to prevent and detect fraud, thus requiring certain improvements, while some companies have not undertaken the necessary activities to prevent and detect fraud, and significant improvements are needed. Research has been carried out on companies that have not undertaken the necessary activities to prevent

and detect fraud, requiring significant improvements. Areas were explored in which recommendations were given to all companies and types of recommendations given, and recommendations in a particular area, and then in companies where significant improvements are needed. The number of employees covered by the audit was investigated, as well as the number of employees in companies where significant improvements were needed. An assumption is made that companies that require significant improvements have a greater number of recommendations than the average number of recommendations for all companies, while the average number of employees in these companies is considerably lower than the average number of employees per audited company.

Keywords: auditing, efficiency, recommendations, companies, business

JEL Classification: H83, M42

1. INTRODUCTION

The research is based on data from the efficiency audit reports on the effectiveness of fraud prevention and detection in companies owned by local and regional self-government units. The State Audit Office has compiled 21 individual and bulk reports. Performing audits of the efficiency of these subjects derives from the legal provisions. In the area of each county, the audit covered several companies owned by local and regional self-government units. The subject of efficiency audits were the policies and procedures for preventing and detecting fraud and the activities the company has undertaken to prevent and detect fraud. It is not necessary to emphasize the importance of the problem. The most common forms of fraud include abuses or alienation of property, fraud in financial reporting, the unlawful creation of costs and obligations for the company and corruption (especially in the area of procurement and sales). Fraud needs to be prevented, because prevention is the most cost-effective way of controlling it. Therefore, a system should be established that would reduce the possibility of its occurrence. The consequences of fraud in the public sector are immense, from financial losses, destruction of reputation, loss of public's trust etc. Selection of companies was done on the basis of the amount of income earned, the number of employees, the nature of the activity, the received remonstrance, and the number of announcements in the media. The objectives of the audit were to determine whether the company has established appropriate policies, procedures and controls to prevent fraud, take the necessary actions to increase

the awareness of managers and other employees about the possibility of fraud, to evaluate the effectiveness of the internal control system with regard to the risks of fraud and to determine which company's actions have been established to detect fraud as soon as possible. The methods and procedures for collecting audit evidence are different. Discussions with responsible persons and employees were conducted, with explanations by the responsible persons about certain business events. Direct examinations were carried out in relation to certain areas, relating to treasury operations, calculation of salaries and fees, purchases of goods, works and services, and recruitment and promotion procedures.

In the implemented auditing procedure, irregularities and recommendations were given, the implementation of which would contribute to the establishment of standards of behavior, the application of which would reduce the possibility of fraud, increase the awareness of managers and other employees about the possibility of fraud, their obligation to report suspected fraud and improve the disclosure system irregularities and reporting of suspected fraud. This would contribute to prevention or early detection of fraud, with an aim of better management of public funds and greater transparency and accountability. The audit encompassed 106 companies, majority of which, i.e. 84, were conducting fraud prevention and detection activities, still requiring certain improvements, seven companies took the necessary actions to prevent and detect fraud, while 15 companies did not undertake the necessary activities for prevention and detection of fraud, and significant improvements are needed. The paper explores the areas of the recommendations given, and the companies in which significant improvements are needed.

2. EFFICIENCY AUDITS OF THE PREVENTION AND DETECTION OF FRAUD

2.1. EFFICIENCY AUDITS OF THE PREVENTION AND DETECTION OF FRAUD IN COMPANIES OWNED BY LOCAL AND REGIONAL SELF-GOVERNMENT UNITS

The State Audit Office has performed efficiency audits of the prevention and detection of fraud in companies owned by local and regional self-government units. A total of 21 individual reports were prepared (for 20 counties and Za-

greb Holding Ltd., Zagreb). Based on individual reports, a bulk report was prepared. The consolidated bulk reports that auditing encompassed a total of 106 trading companies that were given recommendations in five areas. According to the areas where the recommendations were given, we conducted an analysis of the recommendations given (Table 1). From the presented data we conclude that the area of internal control is represented the most in regard to the occurrence of fraud (25.0%), followed by policies and procedures for the prevention of fraud (20.26%). The other three areas have an individual representation of up to 20.0%, with a total representation of 54.73%.

Table 1. Areas where recommendations to companies are given

Areas where recommendations were given	The number of companies to whom the recommendation is given	%
Policies and procedures for the prevention of fraud	77	20.26
Responsibility of the manager and other staff to prevent fraud	66	17.37
System of internal controls due to the occurrence of fraud	95	25.00
Analytical and other fraud detection procedures	68	17.89
Other irregularities	74	19.47
TOTAL	380	100

Source: Table drafted by the authors on the basis of data from Izvješće o obavljenoj reviziji učinkovitosti sprječavanje i otkrivanje prijevара kod trgovačkih društava u vlasništvu jedinica lokalne i područne (regionalne) samouprave, skupno izvješće, Državni ured za reviziju, Zagreb, November 2015, p. 13.

The efficiency audit report states that the companies that were the subject of the audit were, among other things, selected due to the amount of revenue earned. We did not have the ability to track and analyze the amount of revenue generated in this paper, since it was not listed in stated reports, and we did not have the necessary data. The data on the number of employees was from the end of 2014 and we have therefore conducted a survey of the number of employees covered in the said audits and the number of employees in the companies in which the audit found significant improvements needed.

Figure 1 shows the share of the number of recommendations in the mentioned areas, in the total number of recommendations. Most Recommendations (95) refer to the area of internal control system with regard to the occurrence of fraud, and this area accounts for 25.0% of the total number of irregularities.

Figure 1. Revenues from communal contributions and benefits by levels of government (cities and municipalities)

2.1.1. Number of companies and number of employees in companies

Out of a total of 106 audited auditing companies, the State Audit Office estimates that 84 companies have undertaken fraud prevention and detection activities, requiring certain improvements, 15 companies have not undertaken the necessary fraud prevention and detection activities, and significant improvements are required, and seven companies took the necessary actions to prevent and detect fraud.

According to data from Table 2, 106 of the companies involved in auditing have employed 18,209 workers. In 15 companies that did not undertake the necessary activities to prevent and detect fraud, where significant improvements are needed, employed 905 workers. Companies that did not take the necessary actions to prevent and detect fraud, i.e. 15 companies, make up 14.2% of the total number of companies (106) and have 905 employees, accounting for 5.0% of the total number of employees covered by auditing (18,209). The aforementioned indicates that the share of employees in audited companies requiring significant improvements is considerably lower than the share of these companies (5.0% and 14.2% respectively).

Regarding the number of employees, we have determined that 106 audited companies have 18,209 employees, which is 171.8 employees per company.

Table 2. County, the number of utility companies owned by local and regional self- government units covered by efficiency audits of the prevention and detection of fraud, the number of employees in the audited companies, and the number of employees in companies that have not been covered by efficiency audits of the prevention and detection of fraud, per county

TOTAL	106	18 209	905

Source: Table drafted by the authors on the basis of data from individual reports on performed efficiency audits of the prevention and detection of fraud in companies owned by local and regional self-government units (21 Report)

The 15 companies requiring significant improvements have 905 employees, which is 60.3 employees per company. It means that the average number of employees in companies that require significant improvements is considerably lower than the average number of employees in audited companies. It should be examined whether the number of employees has an impact on the audit recommendations for the necessary significant improvements, i.e. the relationship between the number of employees and the number of recommendations, and the areas in which the recommendations are given.

2.1.2. Companies that have not undertaken the necessary activities to prevent and detect fraud, and significant improvements are needed

We have conducted a survey of companies that have not undertaken the necessary activities to prevent and detect fraud, and in which significant improvements are needed, as shown in the Table 3. As a source of data, a bulk report on the effectiveness of fraud prevention and fraud detection by companies owned by local and regional self-government units (State Audit Office, 2015, p.19). In the same table, we listed the areas in which the recommendations were given (State Audit Office, 2015, p. 13). In 15 companies, there are 68 recommendations, out of which 15 are recommendations in the area of responsibility of managers and other employees to prevent fraud, and 15 recommendations in the area of internal control system regarding the occurrence of fraud. In the audit process, a total of 380 recommendations were submitted. Out of a total of 106 companies, 15 companies or 14.2% of companies received 68 recommendations, i.e. 17.9% of all recommendations. This suggests that the share of recommendations in audited companies requiring significant improvements is higher than the share of total number of recommendations for all companies (17.9% and 14.2% respectively). If we count the average number of recommendations per company, then the average number of recommendations for all companies is 3.6 (380/106). The average number of recommendations for companies requiring significant improvements is 4.5 (68/15). The average number of recommendations for companies requiring significant improvements is 25% higher than the average number of recommendations for all companies ($4.5 / 3.6 \times 100$).

Table 3. Companies that have not undertaken the necessary activities to prevent and detect fraud, requiring significant improvements and areas where recommendations are given

Source: Table drafted by the authors on the basis of data from Izvješće o obavljenoj reviziji učinkovitosti sprječavanje i otkrivanje prijevара kod trgovačkih društava u vlasništvu jedinica lokalne i područne (regionalne) samouprave, skupno izvješće, Državni ured za reviziju, Zagreb, November 2015, p. 13. and p. 19.

Recommendations are given in five areas, as shown in Table 3. Below, we are going to detail the areas in which recommendations are given to companies.

Representation of a occurrence is shown by relative numbers (State Audit Office, bulk report, pp. 7-11), and are shown graphically below.

In the area of fraud prevention policy and procedures it has been established that:

- 84, i.e. 79.2%, companies have a document listing ethical values, business principles and liabilities by interest groups
- In 77, i.e. 72.6%, companies, weaknesses and omissions related to fraud-proofing policies and procedures have been identified and largely relate to omissions in rules of conduct, property protection and transparency requirements
- In 39, i.e. 36.8%, companies, there is no provision in the general acts for giving and receiving gifts and hosting
- In 33, i.e. 31.1%, companies, the use of the company's funds for business purposes is not regulated in the general act
- In 15, i.e. 14.1%, companies, weaknesses were identified with respect to the requirements of transparency and documentation of business decisions.
- 52, i.e. 49.0%, companies did not publish on their web site all the information they are required to publish.
- In the area of responsibility of managers and other employees to prevent fraud it has been established that:
 - In 65, i.e. 61.3%, companies, weaknesses and omissions related to the responsibility of managers and other employees to prevent fraud have been identified, relating to insufficient regulation of reporting and reporting procedures for possible conflicts of interest, failure to regulate the obligations of the manager and other employees in case of suspected fraud and lack of regular training on fraud
 - In 43, i.e. 40.1%, companies, the general act contains no general procedures for reporting potential conflicts of interest
 - In 30, i.e. 28.3%, companies, a general act does not regulate the obligations of managers and other employees in case of suspected fraud.
 - In the area of internal control system regarding the occurrence of fraud it has been established that:

- In 94, i.e. 88.7%, companies, weaknesses and omissions related to the system of internal controls were identified regarding the occurrence of fraud, relating to omissions in regulating the functioning of internal controls in general acts and their regular evaluation
- In 37, i.e. 35.3%, companies, the general acts do not regulate the functioning of internal controls, i.e. there is no written regulation on control activities, the procedures and measures they encompass, the way in which they are applied and in which phases of the process, and who is authorized and responsible for their implementation
- In 25, i.e. 23.6%, companies, internal controls are not regulated in a way that prevents fraud, since general acts do not regulate division of duties, employee rotation and affairs, approval, proper documentation, physical control, monitoring and independent audits
- In 70, i.e. 66.0%, companies, the functioning of internal controls is not evaluated regularly, or at least once a year
- 66, i.e. 62.3%, companies did not evaluate areas of their operations where there is a greater risk of fraud and have not developed adequate countermeasures and action plans to manage those risks and thus prevent the occurrence of irregularities and fraud.
- In 42, i.e. 39.6%, companies, there was no approval of financial transactions exceeding certain set amounts.
- In the field of analytical and other fraud detection procedures it has been established that:
- In 68, i.e. 64.2%, companies, weaknesses and omissions related to analytical and other fraud detection procedures have been identified and relate to omissions related to disclosure and reporting of suspicious activities
- In 44, i.e. 41.5%, companies, the general acts did not regulate reporting requirements regarding suspected fraud,
- In 43, i.e. 40.6%, companies, the general act does not guarantee the anonymity and protection of individuals reporting suspected fraud
- In 32, i.e. 30.2%, companies do not investigate suspicious activities,
- In 30, i.e. 28.3%, companies, fraud detection methods and techniques do not cover individual level of responsibility

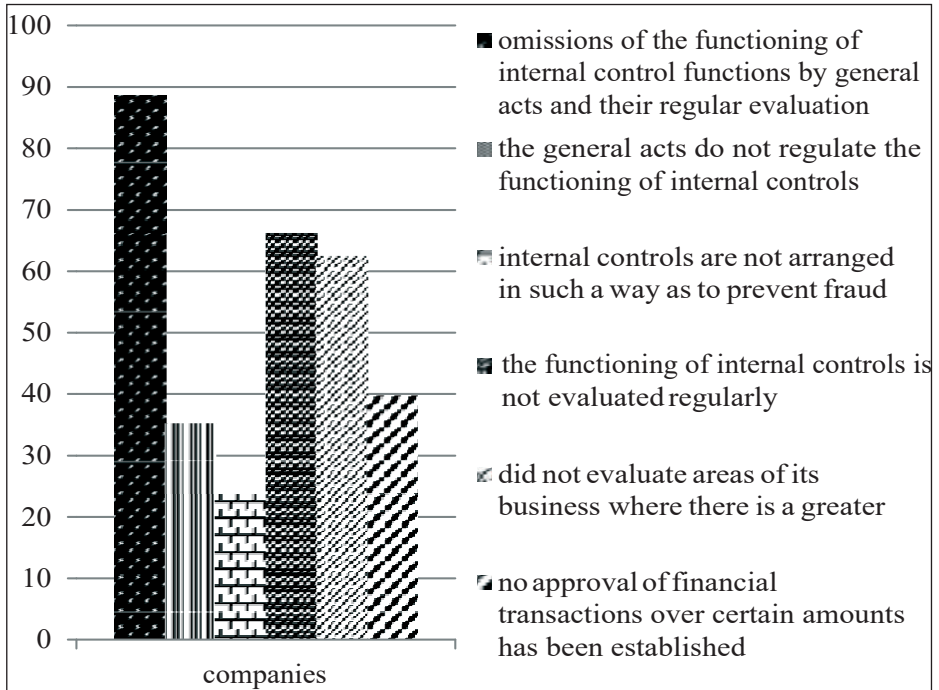

- ✦ In 27, i.e. 25.5%, companies, no anonymous and trusted reporting channels for employees, service users, suppliers, and other interest groups have been established with the purposes of reporting suspicious activities
- ✦ In 9, i.e. 8.5%, companies regularly monitor data relating to areas subject to fraud, and most companies have stated that they have not received any complaints that may indicate fraudulent activities.
- ✦ In the area of other irregularities, performed investigation in relation to areas most often considered susceptible to fraud (employment and promotion, calculation and payment of salaries and remuneration, public procurement and donations) has established that:
 - ✦ In 37, i.e. 34.9%, companies, weaknesses and omissions have been found in the field of employment
 - ✦ In 25, i.e. 23.6%, companies, weaknesses and omissions have been found in the area of salary and compensation calculation
 - ✦ In 31, i.e. 29.2%, companies, weaknesses and omissions have been found in the field of public procurement.

Revision procedures covered business operations for the year 2014. Below we list 15 companies, number of employees at the end of 2014, their share capital and ownership (Table 4). The companies listed in Table 4 have performed communal activities. Below we list the activities for those companies that have more than 100 employees, while other companies have also carried out similar activities:

- ✦ cleaning and washing of public areas and collection and disposal of waste
- ✦ supply and distribution of natural gas and production, distribution and supply of heat and hot water and public lighting maintenance
- ✦ collection and disposal of municipal waste, maintaining public space cleanliness, maintenance of green areas, cemeteries, funeral services, and the management and maintenance of premises and facilities used for market services in the area of founder cities.

In 25% of the companies covered by the audit, recommendations were given in the area of internal control systems (Table 1). Below, we show the percentages we have indicated regarding the area of the internal control system. (Figure 2)

Figure 2. The area of internal control system with regard to the occurrence of fraud

Source: Table drafted by the authors on the basis of 6 individual reports by the State Audit Office on the performed efficiency audit of preventing and detecting frauds in companies owned by local and regional self-government units

Preventing or early detection of fraud affects better public funds management. “The auditor should rely on experience, professional judgment, and understanding of the manner in which abuse is being used to identify it” (Mahaček, 2016, p. 126). On the role of state audit in detecting misuse, look in more detail in the same work. Taking action in this area is of special importance. The recommendations given in the audit process need to be constantly monitored and work on their elimination.

According to international auditing standards and available literature “prevention and detection of fraud is the responsibility of management through the constant introduction and operation of the appropriate accounting system and internal control system. The auditor is not, nor can he be responsible for the prevention of fraud or error” (Tušek, Žager, 2006, p. 418).

In the process of auditing, it is important to identify irregularities and errors. Among other “errors discovered in previous audits of financial statements, it is likely that errors will probably occur in the ongoing audit” (Messier Jr., 1998, p. 365). Therefore, it is necessary to work on their elimination.

3. CONCLUSION

This research has shown that the majority of companies owned by local and regional self-government units have undertaken activities to prevent and detect fraud, but that certain improvements are needed. In this paper, a survey was conducted covering the areas where the recommendations were given, as well as the number of employees, in companies that did not undertake the necessary activities to prevent and detect fraud, and in which significant improvements are needed. An assumption was made that companies in which significant improvements are needed have a greater number of areas in which the recommendations are given than the average number of areas established for all companies. The average number of employees in companies requiring significant improvements is considerably lower than the average number of employees in audited companies. In this paper establishes the correlation between the number of employees and the number of recommendations, but further research would be useful to determine whether there is a correlation between the number of employees and the recommendations of the audit in the part of specific recommendations within the given area. In addition, it would be useful to establish the correlation

between total revenue and number of recommendations, which was not the research subject in this paper.

Abstract

Activity-Based Costing has been developed as a possible alternative and a practical solution to overcoming deficiencies in existing traditional cost accounting systems that can significantly affect product valuation and pricing. Throughput Accounting is a simplified management accounting approach that provides managers with support in decision-making concerning the improvement of the company's profitability. It is a relatively new approach that identifies constraints and limitations that prevent the company from achieving its goals and focuses on simple measures that direct the functioning of key areas towards achieving organizational goals. While Throughput Accounting is a profit-focused cost accounting method designed for short-term decision making, the ABC method focuses on cost management and is used in making long-term decisions, which is why it is widely used in the business world. A comparative analysis provides a detailed overview of these two contemporary cost accounting methods, both

developed in the 1980s. This is achieved by looking into their characteristics, concepts, differences, specificities, and adequacy. Another aim of the work is to highlight and examine the possibilities and benefits of their mutual application.

Keywords: *decision-making, Throughput Accounting, Activity-Based Costing (ABC), comparative analysis*

JEL Classification: M41, M49

1. INTRODUCTION

Due to significant changes in the business environment during the 1970s and 1980s such as globalization, the rapid development of new technologies, growing competition, changes in the cost structure, an increased focus on customer wants and needs, etc., cost management has become imperative for the survival and growth of any company, which is why cost management methods have become increasingly important. The implementation of the Theory of Constraints (hereinafter referred to as TOC) developed by Eliyahu Moshe Goldratt in the early 1980s, which focuses on eliminating all constraints that restrict a company's value-adding process, has been labeled Throughput Accounting (hereinafter referred to as TA). TA is a simplified management accounting approach that provides managers with support in decision-making aimed at increasing a company's profitability. Numerous management techniques, methods, and tools are based on the Theory of Constraints, of which the TA method focuses entirely on direct costs and supports production decisions in the short and medium term. It is mainly used, both in theory and practice, in making product mix decisions (Souren et. al., 2005, p. 362).

In the late 1980s, two new cost accounting methods were developed: Activity-based Costing (hereinafter referred to as the ABC method) and *Prozesskostenrechnung* (PKR); an American and a German cost accounting concept variant, both of which are process-oriented (Gulin et al., 2011, p. 483). Around that same time, Robin Cooper and Robert S. Kaplan developed the ABC method as a potential alternative to existing traditional cost accounting systems whose deficiencies started to have a significant impact on product valuation and costing. It was first introduced into practice in the 1990s when Information Technology began to grow exponentially. In this approach, processes or activities provide the basis for cost accounting and management in line with the fol-

lowing statement: Costs do not cause activities; activities cause costs (Gulin et al., 2011, p. 483).

2. THEORETICAL CONSIDERATIONS OF THROUGHPUT ACCOUNTING AND THE ABC METHOD

TA is a relatively new method of management accounting aimed at identifying factors that limit the company in achieving its goals and then focuses on simple measures that drive behavior in key areas towards reaching organizational goals. According to Northrup (2004, p. 75), this method is characterized by a simplified approach, which any profit-focused accounting department will welcome. TA operationalizes the key facets of TOC management and focuses management's attention on three basic objectives: increasing throughput, reducing inventory, and reducing operating expenses (IMA, 1999, p. 25). As maintained by Northrup, it differs considerably from traditional approaches and thus requires significant political and procedural changes as well as changes in the measurement systems. The three key elements of throughput accounting include throughput - the rate at which a system generates money, that is, the amount of products or services that an enterprise can produce and sell in a given period; operating expenses - all costs incurred in achieving the throughput, other than direct material costs, and assets - the focus is on inventory which is defined as the money that the system spends on things it intends to convert into throughput. One of the main driving forces of TA lies in predicting maximum throughput and in the way in which a company's goals are met. Primary obstacles to maximizing throughput are scheduling and identifying constraints (Northrup, 2004, p. 82). This method creates a focus on bottom-line results, i.e. profit or loss, using global operational measurements which identify net profit as the absolute measure and look at its relationship with the amount of investment made by the owners or shareholders of the enterprise. In practice, the specific applications of Throughput Accounting differ. The two strengths of this method are its relative simplicity and ability to generate weekly and even daily reports. Given that Throughput Accounting is not accepted under Generally Accepted Accounting Principles (GAAP), it must be kept separate from the official financial statements, and therefore many companies do not consider using it (Stenzel & Stenzel, 2003, p. 159). TA also provides a more realistic reporting

of the effectiveness of the system in relation to its goal - making money now and in the future. The main advantage of this method is that it yields the best short-term incremental profits if it is religiously followed when making production decisions. However, this can result in production mixes that seriously delay the completion of jobs for some customers, which is not good for customer relations (Dharma Putra, 2014). Its disadvantages also include the fact that it focuses mainly on short term performance and ignores strategic performance. Furthermore, it does not focus on specific costs but the whole cost of the operations (Sebastiao, 2013). According to Freeman (2007, p. 6), TOC and TA have several specific drawbacks that limit their application; they are short-term decision tools; they may only be valid concepts if applied to the totality of the supply chain including management, production, resources, and support; and dependent on circumstances, operating expenses under TOC/TA are regarded as fixed, which is simplistic in the view of detractors.

The ABC method was developed to address the deficiencies of traditional cost allocation systems. Growing competition and market globalization have forced the management of many companies to focus not only on reducing the amount of time required to complete a process (Time Based Management - TBM) and increasing the quality (Total Quality Management - TQM) but on the costs as well. The share of indirect costs in total costs has grown dramatically due to the increasing number of turnkey jobs, a growing variety of products and activities, and increasing product complexity. The ABC method represents a departure from traditional costing concepts. Traditional methods allocate costs to cost centers using an allocation key, which can lead to inadequate cost transparency, inaccurate accounting, and finally, poor business decisions. In order to maintain and improve its competitive advantage, a company needs to have the ability to make quality business decisions, which is provided by the ABC method (Pajić, 2000, p. 14). The basic assumption of activity-based costing is that processes consume resources, and products consume processes. In other words, this accounting method is based on the principle that costs are not incurred by products and services, but by processes, i.e. logistics, production, marketing, sales, and other support functions. Process costs are then allocated to cost objects (products, services, buyers, etc.) based on how much each of them was actually supported by the defined processes. The assumption here is that each expense has a driver and that these drivers need to be managed. In a way, process costing eliminates the concept of overhead costs, given that each

type of cost has a driver, thus establishing a strong link between the cost driver and the cost itself. A resource is an economic element used for process implementation, while the process is defined as a chain of activities needed to produce the output. It is characterized by measurable output, qualitative nature, cost-per-resource requirements, and a factor that causes the creation of a process that can be a process performance measure. The cause of a cost, i.e. a cost driver is a factor that causes the cost of a certain process. A cost object can be a product, service, customer, contract, project or another unit for which cost measurement has been specially designed (Gulin et al., 2011, p. 483). The ABC method helps reduce distortions caused by cost allocation using traditional methods. It provides a clear picture of the impact of the company's production mix on long-term profits, i.e. its products, services, and activities. According to Blocher et. al. (2002, p. 113), the main benefits of activity-based costing methods are as follows:

1. They provide more precise and detailed information on production costs that allow for more precise calculations of product profitability and strategic decision-making regarding prices, production lines, target markets, and capital expenditures;
2. They provide more accurate measures for spending factors, thus assisting management in making better product design decisions, managing costs, promoting more value-added projects, thus adding value to products and processes;
3. They provide managers with easy access to costs relevant to decision-making, thus improving the company's competitive position.

Despite the fact that the ABC method allows for easier tracking of costs at the individual product level compared to traditional methods, management should be aware of the limitations of this method when using it. Authors Blocher et al. (2002, p. 113) state that although activity data are available in some situations, some costs may require allocation to departments and products due to specific activities that cause these costs to be incurred, which is not practical (facility maintenance costs, plant cleaning costs, and production process management costs). Furthermore, the ABC method does not consider some of the costs identified in specific products. Activities that cause such costs include marketing, advertising, research and development, and product engineering. Additional costs would be allocated to individual products and added to production costs to determine the total cost of production. Finally, the de-

velopment and implementation of activity-based costing are quite costly and time-consuming. Similar to most innovative management or accounting systems, it takes longer than a year for this method to be successfully developed and implemented.

3. COMPARATIVE ANALYSIS OF THROUGHPUT ACCOUNTING AND THE ABC METHOD

The proponents of both of these methods find that their application provides increased profits and facilitates cost control (Lockhart & Taylor, 2007, p. 14). There are a number of differences between the TA and the ABC method, the most important of which are listed in the text below.

FOCUS AND WAYS OF ACHIEVING GOALS

One of the major differences between TA and ABC is the focus. While the ABC method primarily focuses on costs, i.e. its goal is to increase profits by reducing costs through reducing complexity. By contrast, TA focuses on profit and seeks to maximize it while maintaining a defined level of throughput. According to Lockhart & Taylor (2007, p. 15), in order to maximize profit, this method only considers product complexity, while the process of cost allocation is ignored. To achieve the goal, i.e. successful cost control, the ABC method has several basic guidelines. Successful cost management requires a reduction in the number of activities. Enterprises often have a large number of activities that cause unnecessary costs, which could be greatly reduced by eliminating or simplifying them. Furthermore, reducing the production mix would, in turn, reduce the number of activities and simplify the production process. By contrast, TA seeks to maximize the use of constraint resources thereby maximizing the profit. This method is intended for eliminating activities that do not create value-added, thus enabling control of the production process (Lockhart & Taylor, 2007, p. 14). Integration of cost and production information provides managers with the basis for decision making, given that the functioning of the production system directly affects the costs, while the costs directly affect production decisions. The ABC method provides the basis for planning procurement decisions that take into account physical constraints in operational activities and costs associated with resources consumed by these activities. This method is

more efficient in the processing of information for procurement management, for planning decisions, and for making freeing up unused resources in some activities and redirecting them to other activities. Moreover, this method is very effective in identifying activities where savings can be made or costs eliminated. By contrast, it is recommended to use TA in systems with lower inventory levels and operating expenses, and a stable procurement level in accordance with the production plan (Kirche & Srivastava, 2005, p. 1707-1708).

ASSUMPTIONS ABOUT COSTS

Due to some partially unfounded assumptions, there has been much discussion and disagreement among scholars and professionals in the field of accounting. The ABC method assumes that costs are largely variable in the long run and that recognizing their variability is of crucial importance for decision making. For decades, Cooper and Kaplan have evidenced the accelerated growth of fixed costs in specific companies, which is contradictory to the very nature of fixed costs. They argued that a dramatic increase in so-called fixed costs was not recognized because managers assumed that fixed costs were not subject to significant changes and that they need not be closely monitored and recorded. Lockhart & Taylor (2007, p. 15) point out that recognizing the true variability of these costs would encourage managers to monitor and limit their growth. By contrast, the assumptions of TA are completely different. Most production costs are largely fixed, while material costs are the only consistent variable costs. Numerous research studies on companies using TA prove that managers control the fixed costs even when faced with growing complexity. They have found a way to improve processes and reduce the number of activities that do not add value, thus maintaining the same level of fixed costs. The ABC method classifies variable costs into unit-level, batch-level, product-sustaining, and facility-level costs, while TA considers all variable costs as unit-level costs. The ABC method implies that all costs are variable, while TA identifies the part of the costs as fixed costs. Lockhart & Taylor (2007, p. 14) posit that fixed costs can only change at the end of production cycles. According to the ABC method, cost allocation represents the best cost management method for reducing unit-level costs. TA is not aimed at reducing unit-level costs, but at maximizing throughput. This is why it does not have a developed cost management method, but by considering the total amount of fixed costs and overall operating expenses, provides a less reliable basis for cost management. Furthermore, the ABC method

recognizes the majority of production costs when the unit is sold, while TA recognizes the majority of costs at the moment when they incur (Lockhart & Taylor, 2007, p. 14).

CAPACITY

The ABC method enables identification of unused capacity if the number of activities carried out is practical, or if the capacity utilization is at about 85%. At this capacity utilization level, the ABC method allows for several possibilities. It is possible to determine the available capacity of each resource and unavailable capacity of bottleneck resources. According to Lockhart & Taylor (2007, p. 18), if the capacity is not fully utilized or cannot be determined, ABC is unable to identify unused capacity. By contrast, TA identifies the level of utilization of each resource and is able to determine whether the capacity of some resources is constrained. It focuses on internal constraints and is aimed at maximizing profit per constraint resource by ranking output per throughput per constraint resource.

DECISION TIME HORIZON

TA and the ABC method differ in another important feature - the time horizon for making management decisions. TA is best suited for making short-term decisions because it classifies costs into a variable (material) and fixed. By contrast, the ABC method provides more reliable information for making long-term decisions because it monitors and reflects the causal relationships between activities, products, and costs (Perkins et. al., 2002, p. 2).

Figure 1. Utilization of costing methods depending on decision time horizon

Source: Fritzsche, R.B. (1998), Activity-Based Costing And The Theory of Constraints: Using Time Horizons To Resolve Two Alternative Concepts of Product Cost, *Journal of Applied Business Research*, 14(1), p. 88.

Since TA classifies the majority of costs as fixed, this method is most effective for making operational short-term decisions. These include, for example, decisions on scheduling, process, and reorganization of production, i.e. decisions that can be taken for shorter time horizons of less than six months. The ABC method considers all product costs as a variable. This suggests that it is appropriate for making long-term decisions, especially when introducing new products and production designs, and for developing long-term marketing strategies. Some researchers find that using these methods for making medium-term decisions is not appropriate, while a large number of them argue that a combination of the two methods can provide a reliable basis for decision-making (Fritzsich, 1998, p. 88).

ASSET SPECIFICITY OF THE PRODUCT MIX

The applications of TA and ABC depend on the specificity of the activities and resources used in the production of the product mix. The table below shows the combinations of specificity of resources/activities and the locations of constraints.

Table 1. Utilization of methods depending on the location of the constraint and the asset specificity of the product mix

	Constraint Location - Internal	Constraint Location - External
If the asset specificity of all the products in the mix is low	TA	TA
If the asset specificity of at least some products in a mix is high	TA-ABC integrated model	ABC

Source: Sridharan, V.; Krishnan, R.; Vergauwen, P. & Arthanari, T. (2009) The TOC-ABC Choice Debate for Product Mix Decisions: Introducing Asset Specificity as an Alternate Explanation, *The Journal of Global Business Issue*, Vol. 3, No. 1, p. 108.

There are situations when a company uses resources that are non-specific in nature, which makes it less likely that the activities relating to product mix will change. A low specificity implies that all the products in a product mix can be manufactured by different types of resources without significant variations. For example, assuming that product A can be made by machines X, Y or Z or by any employee group. Regardless of how it is manufactured, it is unlikely that

the activities relating to its production will change because there are several ways to produce it. In such circumstances, TA can be an appropriate decision tool since it considers only the relevant costs and ignores all other costs for activities that are less likely to change. Furthermore, TA provides useful ways to optimize the resource use to enhance the constraint's productivity, regardless of whether the constraints are located within or outside the company. TA can thus be a cost-efficient decision tool low asset specificity contexts (Sridharan et al., 2009, p. 107). By contrast, in a high asset specificity context, each product in a product mix may require a specific type of resource, e.g. a particular machine or uniquely skilled labor. This commonly occurs when products are produced for special orders. In such circumstances, scope exists for opportunistic problems if the company continues to apply TA. For example, an employee can hide behind or justify his/her inefficiency in resource usage since TA treats all operating expenses as fixed and hence ignores their changes. This issue can be resolved by using the ABC method because it systematically identifies the activity costs and prevents inefficient utilization of resources. According to Sridharan et al. (2009, p. 108), when there is an external constraint, such as a decline in market demand, the ABC method also enables the analysis and planning of unutilized capacity costs in different resources within the company.

Problems arise when the constraint exists within the company that seeks to evaluate high asset specific product mix. The ABC method does not recognize the existence of constraints within the company because the demand and supply of resources are likely to be equal. TA enables companies to manage internal constraints; however, it is not effective when the asset specificity of product mix is high. This is where an integrated TA-ABC model may be a more appropriate solution. The integrated model can identify product profitability by subtracting different activity costs from the throughput contribution per time of the constraining resource (Sridharan et al., 2009:108). The two methods are also helpful when allocating costs and making decisions on joint products, i.e. products whose share in the total market value of output with the same raw material input is greater than 5%. When used for joint products, TA focuses on maximizing the throughput subject to the company's bottleneck activities used in the production processes in order to maximize short-term profit. When determining short-term profit, it is necessary to consider all combinations of joint products and the ratio of profits they bring in. By contrast, the ABC model for joint products is used to trace resource costs to processes and then to products.

In the long run, when a company's management has complete control over its labor and overhead resources, the ABC method will obtain the highest long-term profit (Tsai et al., 2008, p. 219).

4. COMPARATIVE ANALYSIS OF THROUGHPUT ACCOUNTING AND THE ABC METHOD USING A HYPOTHETICAL PRODUCTION COMPANY AS AN EXAMPLE

In order to provide a detailed comparison of TA against the ABC method, an example is given of a hypothetical manufacturing company making production decisions. The authors analyze whether it would be more cost-effective if the company were to manufacture the product internally or if it were to outsource a portion of manufacturing. The company XYZ produces two types of products (P and Q) and considers outsourcing part of product Q production. The text below contains calculations and decisions made following the traditional costing, TA and the ABC method (Sheu et. al., 2003, p. 439).

4.1. TRADITIONAL COSTING METHOD

Table 2 shows the decision-making process following the traditional costing method.

Table 2. Decision making following the traditional costing method

Item	Product P	Product Q (Outsourcing)	Product Q (In-house manufacturing)
Material cost	40.00	60.00	45.00
Production length (in minutes)	60	50	65
Labour cost (10/h)	10.00	8.33	10.83
Operating expenses (20/h)	20.00	16.66	21.66
Unit cost	70.00	85.00	55.50
Selling price	180.00	200.00	200.00
Profit contribution	110.00	115.00	122.50

Source: Sheu, C.; Chen, M. and Kovar, S. (2003) Integrating ABC and TOC for better manufacturing decision making, *Integrated Manufacturing Systems*, 14(5), p. 440.

Under this method, profit contribution is the decision criteria. The production of product P requires 60 minutes, while the production of product Q requires 65 minutes. The company considers outsourcing part of product Q production that requires 15 minutes. The labor costs amount to 10 HRK/h while operating expenses amount to 20 HRK/h. For example, the entire production of product Q by the company XYZ requires 65 minutes, which means that labor costs will amount to HRK 10.83 while operating expenses will amount to HRK 21.66 as can be seen from the calculation below:

- ✦ Labour costs = 65 minutes x HRK 10/60 minutes = HRK 10.83;
- ✦ Operating expenses = 65 minutes x HRK 20/60 minutes = HRK 21.66.

Profit contribution is calculated by subtracting cost per unit, which is calculated as the sum of material costs, labor costs, and operating expenses, from the selling price, as shown in the calculation below:

- ✦ Cost per unit of product P = 40 + 10 + 20 = HRK 70;
- ✦ Profit contribution of product P = 180 – 70 = HRK 110.

Profit contribution to product P is HRK 110. Profit contribution for product Q is calculated by comparing amounts for in-house manufacturing vs. outsourcing a portion. If a company decided on outsourcing, the material costs would be higher than they would be if it decided to produce the entire product in-house, while labor costs and operating costs would be lower. If it decided to produce the entire product in-house, it would save HRK 15 on material cost when compared to outsourcing, while labor costs and variable costs would be higher due to the 15 minutes of additional work. The profit contribution per unit is higher when product Q is produced in-house, so the XYZ company will choose this option, taking into account the estimation made under the traditional costing method (Sheu et. al., 2003, p. 439).

4.2. THROUGHPUT ACCOUNTING

What is lacking in this traditional costing analysis is the consideration of the constraint resource from a system perspective. If the production of product P requires the constraint resource machine B, TA would make the decision based on the usage of the constraint resource.

Table 3. Decision making following TA

	Product P	Product Q (Outsourcing)	Product Q (in-house manufacturing)
Selling price (HRK)	180.00	200.00	200.00
Material cost (HRK)	40.00	60.00	45.00
Contribution/unit (HRK)	140.00	140.00	155.00
Constraint time – machine B time (min)	10.00	15.00	30.00
Contribution /constraint minute (HRK/min)	14.00	9.33	5.17

Source: Sheu, C.; Chen, M. and Kovar, S. (2003) Integrating ABC and TOC for better manufacturing decision making, *Integrated Manufacturing Systems*, 14(5), p. 440.

Assuming that product Q consumes 30 minutes of machine B, while outsourcing would free up 15 minutes of machine time for other more profitable operations (in this case, product P manufacturing). The explanation for these statements can be found in the amount of contribution per constraint resource. The contribution is calculated by subtracting material costs from the selling price as illustrated by the calculation below:

- Product P contribution = HRK 180 – HRK 40 = HRK 140.

The result is divided by the minutes of machine B utilization to obtain contribution per constraint resource. The calculation below confirms the above statements:

- Throughput/constraint minutes of machine operation = HRK 140:10 minutes = 14 HRK/min.

Since the above indicator is higher in the case of outsourcing a portion of the manufacturing, the XYZ company will opt for outsourcing, thereby freeing up more minutes of machine B time for the production of product P (Sheu et. al., 2003, p. 439).

4.3. ABC METHOD

The ABC method provides a much clearer picture of the costs, as it is able to allocate costs more accurately. The table below shows the weekly labor costs and overhead associated with machine operation.

Table 4. Information on the cost of machine operation

Machine	Labor cost	Overhead	Total
A	400	800	1,200
B	400	800	1,200
C	400	800	1,200
D	400	800	1,200
Total	1,600	3,200	4,800

Source: Sheu, C.; Chen, M. and Kovar, S. (2003) Integrating ABC and TOC for better manufacturing decision making, *Integrated Manufacturing Systems*, 14(5), p. 440.

Assuming that each machine operates 40 hours per week and labor cost is HRK 10 per hour, while overhead amounts to HRK 20 per hour. An example of the calculation of labor costs and overhead costs incurred by machine A operation is shown below:

- Labour costs = 40 hours of machine operation x HRK 10/h = HRK400 per week;
- Overhead = 40 hours of machine operation x HRK 20/h = HRK 800 per week.

The main difference between deciding on in-house manufacturing vs. outsourcing a portion of it lies in the use of machine B as shown in the table below:

Table 5. Allocation of costs incurred by machine operation

Machine	Product Q (outsourcing)				Product Q (in-house production)			
	Product P		Product Q		Product P		Product Q	
	Cost (HRK)	Machine time (min)	Cost (HRK)	Machine time (min)	Cost (HRK)	Machine time (min)	Cost (HRK)	Machine time (min)
A	480	10	720	15	480	10	720	15
B	480	10	720	15	300	10	900	30
C	900	20	300	10	900	20	300	10
D	900	20	300	10	900	20	300	10
Total	2,760	60	2,040	50	2,580	60	2,220	65

Source: Sheu, C.; Chen, M. and Kovar, S. (2003) Integrating ABC and TOC for better manufacturing decision making, *Integrated Manufacturing Systems*, 14(5), p. 440.

An example of the calculation of the cost of using machine A in the manufacturing of product P if XYZ were to opt for outsourcing a portion of product Q manufacturing is shown below:

- ♦ Production cost = 10 minutes of use (for product P): 25 minutes of use (for both products) x HRK 1,200 = HRK 480.

The cost of using other machines in the production of products P and Q is calculated in the same way. If a company were to decide to produce product Q in-house, machine B would be used 15 minutes longer, which would increase the cost of its use to more than HRK 900 and lead to the HRK 15 saving of material cost. On the other hand, outsourcing a portion of product Q manufacturing would free up machine capacity which could be used for manufacturing product P. Figure 6 shows the criteria for deciding between in-house manufacturing and outsourcing under the ABC method.

Table 6. Profitability analysis

	Product Q (Outsourcing)		Product Q (In-house manufacturing)	
	P	Q	P	Q
Product	P	Q	P	Q
Selling price	180.00	200.00	180.00	200.00
Material cost	40.00	60.00	40.00	45.00
Other costs	27.60	68.00	25.80	74.67
Profit margin per unit	112.40	72.00	114.20	80.33
Total product P and product Q profits	184.40		194.53	

Source: Sheu, C.; Chen, M. and Kovar, S. (2003) Integrating ABC and TOC for better manufacturing decision making, *Integrated Manufacturing Systems*, 14(5), p. 440.

Assuming that the XYZ company will produce 100 units of product P and 30 units of product Q, and the company decides to outsource part of the production, other product P costs are calculated as follows:

- ♦ Other costs = HRK 2,760 (total production costs for all P products)/100 units = HRK 27.60.

Other product Q costs are calculated in the same way, the only difference being that 30 units are produced, so it is necessary to divide total production costs for all Q products by 30:

- ♦ Other costs = HRK 2,040 (total production costs for all Q products)/30 units = HRK 68.00.

Profit per unit is calculated by subtracting the cost of materials and other costs from the selling price. For example, the profit per unit of product P in

the case of outsourcing a portion of product Q manufacturing is calculated as follows:

$$+ \text{ Profit per unit} = 180 - 40 - 27.60 = \text{HRK } 112.40.$$

After calculating individual profits, it is necessary to add product P and Q profits to make a decision between in-house manufacturing and outsourcing. In the above example, by applying the ABC method, the XYZ company would opt for in-house manufacturing of product Q, as the profit earned would be higher in this case (Sheu et. al., 2003, p. 440).

4.4. COMPARISON OF TRADITIONAL AND CONTEMPORARY COSTING METHODS

The choice between in-house manufacturing and outsourcing is similar to the product mix decision. Table 7 shows a comparative overview of traditional and contemporary costing methods used in this example as well as the accompanying measures based on which the decisions have been made. The amounts of measures represent the sums of P and Q product profits.

Table 7. Decision-making criteria by methods

Method	Measure – decision criterion	Product Q (Outsourcing)	Product Q (In-house manufacturing)
Traditional method	Profit contribution	225.00	232.50
TA	Throughput/limited minutes	23.33	19.17
ABC method	Sum of profits	184.40	194.53

Source: Authors' work

In this example, the traditional costing method could fail to provide management with accurate information because it does not consider constraints in the production system. If machine B were the bottleneck resource, then the decision on outsourcing would result in more system throughput by freeing up some machine B capacity to produce more of product P, which is a more profitable operation. The focus of TA on revenue maximization for the entire system through monitoring of throughput per constraint resource makes it very useful in making short-term decisions. First, operating expenses, which are generally irrelevant when making these decisions, are not associated with the individual product, leaving only relevant information for the decision. Second, if a product's selling

price goes up or the price of raw materials goes down, throughput per constraint resource will reflect the changes that are relevant to decisions being made. The impact of deciding between in-house manufacturing and outsourcing should also be considered from a long-term perspective. If it is more cost-effective to manufacture products in-house, it is necessary to provide additional capacity of the constraint resource. Furthermore, there are other accompanying long-term costs associated with both decisions that are impossible to estimate with any precision in the short term. The ABC method can account for the extensive batch-related costs and thus prevent any cost-related uncertainty (Sheu et. al., 2003, p. 441). Consequently, managers should formulate these decisions first by utilizing TA in the short run and then review them regularly using the ABC method in the long run. The described example shows that these two methods lead to two completely different production decisions, which was expected given the differences between them. The management's ability to utilize both costing methods to manage the interplay between long-term and short-term decision making is vital. The goal is to maximize throughput per constraint resource in the short run, and then, by utilizing the ABC method, optimize the mix of activities performed in the long run (Sheu et. al., 2003, p. 441).

5. CONCLUSION

By observing, analyzing and comparing the features and characteristics of Throughput Accounting and the activity-based costing method, the authors have arrived at the conclusion that there are a number of major differences between them, the most important of which arise from their focus and decisions made by management. However, despite the fact that they have quite contradictory assumptions, the combined use of these two methods in certain segments can be extremely useful. By reconciling certain assumptions of the two methods, a more advanced decision-making tool could be created. TA is most effective when applied in making short-term decisions aimed at maximizing profit, while the ABC method focuses on long-term cost management. A combined approach would improve the cost management system, which can facilitate cost identification, allocation, and reporting as well as production mix decision making, and impact the length of the production cycles/activities. Finally, it may be concluded that in the future companies should definitely consider various methods for sustainable cost management that will increase their market com-

petitiveness. To achieve this, the described costing methods can be applied individually; however, in the segments where they would complement each other well, they can be applied together. Short-term decisions can be made on the basis of TA assumptions, and then reviewed regularly by using the ABC method in the long term. Considering their differences, it is obvious that using them separately will lead to contradictory production decisions. However, the possibility of the combined application of these two methods makes it an extremely valuable tool for managing short- and long-term changes. Despite the fact that these two methods have different approaches to cost management, their integration can be complementary and produce an advanced and sustainable cost management system, which warrants further investigation, in particular of the possibility and benefits of their integration.

Abstract

Studies are showing that information technology (IT) became more and more important for companies, and still will become even more important in the future. This includes the accounting as well. IT is possible to support the company for example with automatical book entries. As well it is possible to use IT for the outsourcing of services, or the company can use clouds, for saving data or to provide software. There are a lot of possibilities. The implementation of IT in the accounting is not only a huge possibility for bigger companies to get more efficient. Nearly two thirds of all companies (Bitkom, 2018: 3). are already using clouds and realized the huge potential of them. The use of IT and especially clouds has not only advantages. There are still a lot of disadvantages, companies have to be careful with. One important point is, that the company need to ensure, that even with the use of IT, the German „principles of proper accounting” still have to be applied.

Keywords: IT, cloud computing, accounting

JEL Classification: M15, M41

1. VORBEMERKUNG

Mit der zunehmenden Digitalisierung hat auch der Einsatz von Informationstechnologie im Bereich der Buchführung bei Unternehmen stark zugenommen. Dies kann sowohl automatisierte Buchungen als auch der Einsatz von Cloud-Diensten zur Speicherung von Daten, oder der Bereitstellung von Software sein. Wichtig ist hierbei, dass dennoch die Ordnungsmäßigkeit der Buchführung eingehalten wird. Da dieses Thema seit Jahren an Wichtigkeit zunimmt, hat das Institut der Wirtschaftsprüfer (IDW) mit IDW RS FAIT 1 eine Stellungnahme zur Rechnungslegung veröffentlicht. Da Unternehmen zunehmend die Dienste von Cloud-Anbietern nutzen, wird durch die Thematik des Cloud-Computing, sowie dessen Vorteile und Nachteile beleuchtet. Die Aktualität des Themas zeigt eine Studie¹ von Bitkom Research im Auftrag der KPMG. Hierbei wurde festgestellt, dass zwei von drei Unternehmen bereits Cloud-Computing planen oder darüber diskutieren (Bitkom, 2018: 3).

Abbildung 1: Bitkom 2018: 3

Aus Sicht der Wirtschaftsprüfer sollte dieser Themenkomplex ebenfalls nicht vernachlässigt werden. Aufgrund dessen hat das Institut der Wirtschaftsprüfer mögliche Risiken bei der Einhaltung von Anforderungen der §§ 238, 239 und 257 HGB beim Einsatz von Informationstechnologie im Zusammenhang mit der Auslagerung von rechnungslegungsrelevanten Dienstleistungen diskutiert (IDW FAIT 5).

¹ Basis der Studie: Alle befragten Unternehmen (2017: n=557 | 2016: n=554 | 2015: n=457)

2. GRUNDSÄTZE ORDNUNGSGEMÄSSER BUCHFÜHRUNG

Dem Jahresabschluss wird gem. § 264 Abs. 2 HGB die Funktion zugeschrieben, den Adressaten ein „den tatsächlichen Verhältnissen entsprechendes Bild der Vermögens-, Finanz- und Ertragslage der Kapitalgesellschaft zu vermitteln“.² Dies hat unter Beachtung der Grundsätze ordnungsgemäßer Buchführung zu erfolgen.

Bei den Grundsätzen ordnungsgemäßer Buchführung, kurz GoB, handelt es sich um einen unbestimmten Rechtsbegriff, welcher sowohl durch Rechtsnormen als auch durch die Rechtsprechung geprägt ist. Die GoB sind von der Rechtsprechung und ebenfalls von der Verwaltung jeweils im Einzelfall auszulegen und anzuwenden: Die GoB sind einem ständigen Wandel unterworfen. Somit ist es möglich, dass die GoB sich beispielsweise durch gutachterliche Stellungnahmen, Handelsbrauch, organisatorische oder technische Änderungen weiterentwickeln. Aufgrund der zunehmenden Digitalisierung hat das Bundesministeriums der Finanzen (BMF) im Rahmen einer Meinungsäußerung, den GoBD³, deren Vorstellung einer zeitgemäßen IT-gestützten Rechnungslegung dargestellt. Seit dem 1.1.2015 gelten diese Grundsätze zur ordnungsmäßigen Führung und Aufbewahrung von Büchern, Aufzeichnungen sowie Unterlagen in elektronischer Form, ebenso wie zum Datenzugriff. Durch den schnellen Wandel im IT-Bereich enthält die GoBD keinerlei technischen Spezifikationen oder konkrete Bezügen zu markttypischen Softwareprodukten wie beispielsweise SAP oder Microsoft.⁴

An die Buchführung eines Unternehmens stellen die Grundsätze ordnungsgemäßer Buchführung sowohl materielle als auch formelle Anforderungen. Letztere ergeben sich aus den §§ 238ff HGB. Die materiellen Anforderungen stellen Bücher und Aufzeichnungen dar, welche es dem Unternehmen möglich machen, Geschäftsvorfälle hinsichtlich ihrer Vollständigkeit, Richtigkeit, Zeitgerechtigkeit sowie in ihrer Auswirkung zu ordnen. Somit sollen sowohl Geschäftsvorfälle nachvollziehbar dargestellt, als auch nachfolgend gebucht werden.⁵

² Paragraph 264 (2) HGB.

³ Vgl. BMF IV A 4 – S 0316/13/10003, Rz. 17f.

⁴ Vgl. Giebichenstein/Schirp (2016), S. 69

⁵ Vgl. BMF IV A 4 – S 0316/13/10003, Rz. 19.

Die GoB sehen kein bestimmtes Buchführungsverfahren vor, weshalb auch der Einsatz von Informationstechnologie hierbei grundsätzlich möglich ist, sofern die Voraussetzungen des § 239 Abs. 4 HGB erfüllt werden.⁶ Auch das Institut der Wirtschaftsprüfer hat hierzu mit IDW RS FAIT 1 Stellung genommen. Hierbei werden die Anforderungen an eine Buchführung unter Einsatz von Informationstechnologie durch die §§ 238, 239 und 257 HGB spezifiziert.⁷

Bei dem Einsatz von Informationstechnologie im Bereich der Rechnungslegung ist zu beachten, dass die GoB zur Führung von Handelsbüchern nur erfüllt sind, wenn gewährleistet ist, dass die Ordnungsmäßigkeitskriterien in den Bereichen der Erfassung, Verarbeitung sowie Ausgabe und Aufbewahrung der rechnungslegungsrelevanten Daten der Geschäftsvorfälle eingehalten werden. Diese sechs Kriterien umfassen:

- Vollständigkeit (§ 239 Abs. 2 HGB)
- Richtigkeit (§ 239 Abs. 2 HGB)
- Zeitgerechtigkeit (§ 239 Abs. 2 HGB)
- Ordnung (§ 239 Abs. 2 HGB)
- Nachvollziehbarkeit (§ 238 Abs. 1 Satz 2 HGB)
- Unveränderlichkeit (§ 239 Abs. 3 HGB)

Die Verantwortung der Einhaltung der Kriterien obliegt dem gesetzlichen Vertreter des bilanzierenden Unternehmens und kann auch nicht bei einer Auslagerung an ein Dienstleistungsunternehmen übertragen werden. Das Kriterium der Vollständigkeit hat für das Unternehmen zur Folge, dass alle buchführungspflichtigen Transaktionen und Geschäfte vollständig aufgezeichnet werden müssen und eine doppelte Erfassung eines Sachverhalts verhindert werden muss. Richtigkeit bedeutet, dass diese Transaktionen inhaltlich korrekt dargestellt werden müssen und auch im Einklang mit den gesetzlichen Vorschriften sind. Diese Kriterien werden um das Kriterium der Zeitgerechtigkeit ergänzt. Dies bedeutet, dass die Zuordnung des Geschäftsvorfalles in der richtigen Periode erfolgen muss. Ebenfalls wird hierunter auch die zeitnahe Buchung verstanden. Der Begriff der Ordnung umfasst die Darstellung eines Geschäftsvorfalles in zeitlicher Reihenfolge (Journalfunktion) und hinsichtlich der sachlichen Zuordnung (Kontenfunktion). Ebenso wird vorausgesetzt, dass gebuchte Transaktionen von deren Entstehung bis zur Abwicklung nachvollzogen und

⁶ Vgl. IDW FAIT 1, Tz. 1.

⁷ Vgl. IDW FAIT 1, Tz. 3.

die Buchungen reproduziert werden können. Nachträgliche Veränderungen von aufgezeichneten Geschäftsvorfällen sind zu verhindern. Dies wird durch das Kriterium der Unveränderlichkeit sichergestellt.⁸

Diese allgemeinen Anforderungen zur Ordnungsmäßigkeit werden in Unternehmen auf die entsprechende buchführende IT-Systeme übertragen. Zur Erfüllung der allgemeinen Anforderungen dienen die nachfolgenden Funktionen:

Belegfunktion

§ 238 Abs.1 HGB setzt für die ordnungsgemäße Buchführung den Grundsatz der Nachvollziehbarkeit voraus.⁹ Hierfür dient die Belegfunktion im Rechnungswesen. Die Existenz und die Berechtigung einer jeden Buchung müssen durch einen Beleg nachgewiesen werden, um im Zweifel dessen Richtigkeit beweisen zu können.¹⁰ Die Funktion setzt somit voraus, dass vom Urbeleg bis zum Abschluss und vice versa die Buchung durch einen Beleg nachgewiesen werden kann. Es gilt der Grundsatz „Keine Buchung ohne Beleg“.¹¹ Beim Einsatz von Informationstechnologie im Unternehmen, kann diese Voraussetzung auch bei automatisierten Rechnungslegungsverfahren, wie beispielsweise bei der Buchung von Abschreibungen, eingehalten werden, auch wenn der Nachweis somit nicht durch konventionelle Belege erbracht wird.

Der Nachweis wird hierbei nach Meinung des IDW durch nachfolgende Funktionen erfüllt:

- ausreichende Dokumentation bezüglich programminterner Vorschriften zur Generierung der Buchung,
- Nachweis eines autorisierten Änderungsverfahrens, welchem die Vorschriften der Dokumentationen unterlegen haben (bspw. Zugriffsschutz),
- Nachweis der Anwendung des genehmigten Verfahrens, sowie
- Nachweis der tatsächlichen Durchführung einzelner Buchungen.

⁸ Vgl. Tritschler/Lamm (2018), S.27.

⁹ Vgl. IDW FAIT 1, Tz. 33.

¹⁰ Vgl. Tritschler (2018), S. 14 i.V.m IDW FAIT 1, Tz. 33.

¹¹ Vgl. Tritschler/Lamm (2018), S.27f.

Wie die Einhaltung der Belegfunktion im Einzelfall realisiert wird, hängt jedoch vom Geschäftsprozess des zu bilanzierenden Unternehmens ab. Die Buchung eines Geschäftsvorfalles hat jedoch, um die Vorschriften zu erfüllen, mindestens eine ausreichende Erläuterung des Vorgangs zu enthalten. Des Weiteren muss sich aus der Buchung ein Buchungsbetrag, sowie Wert- und Mengenangaben, welche den zu buchenden Betrag ergeben, den Zeitpunkt des Geschäftsvorfalles, sowie die Bestätigung durch den Buchführungspflichtigen ergeben.¹²

Journalfunktion

Im Vergleich zur Belegfunktion hat die Journalfunktion nicht die Aufgabe, die Existenz der Berechtigung einer Erfassung zu erfüllen, sondern dient dazu, den Nachweis der tatsächlichen und zeitgerechten Verarbeitung der Geschäftsvorfälle sicherzustellen.¹³ Die buchführungspflichtigen Geschäftsvorfälle sind demzufolge vom bilanzierenden Unternehmen möglichst zeitnah nach deren Entstehung sowohl vollständig als auch verständlich und in zeitlicher Reihenfolge aufzuzeichnen (Journal).¹⁴ Die Funktion ist jedoch nur erfüllt, sofern die Aufzeichnungen gegen Veränderung und Löschung geschützt sind.¹⁵ Im Journal sind alle Angaben für einen Geschäftsvorfall, welcher für die Erfüllung der Belegfunktion vorausgesetzt ist, nachzuweisen. Weiterhin ist zu beachten, dass Belege in Zwischendateien, welche zur reinen Kontrolle für eine eventuelle Erfassungskorrektur dienen, nicht als Journal einzustufen sind, sondern lediglich als Erfassungsprotokolle dienen. Grund hierfür stellt die ausstehende abschließende Autorisierung des Geschäftsvorfalles dar.¹⁶

Kontenfunktion

Die in zeitlicher Reihenfolge aufgezeichneten Geschäftsvorfälle müssen durch die Kontenfunktion auch in sachlicher Ordnung auf Konten abgebildet

¹² Vgl. IDW FAIT 1, Tz. 35f.

¹³ Vgl. FAIT 1, Tz. 41 i.V.m. Tritschler/Lamm (2018), S. 28.

¹⁴ Vgl. Tritschler (2018), S. 14.

¹⁵ Vgl. IDW FAIT 1, Tz. 43.

¹⁶ Vgl. Tritschler/Lamm (2018), S. 28.

werden.¹⁷ Beim Einsatz von Informationstechnologie im Rahmen computergestützter Buchführungsverfahren werden Journal- und Kontenfunktion meist gemeinsam ausgeführt. Dies geschieht, indem bei der erstmaligen Erfassung eines Geschäftsvorfalles die Angaben für eine sachliche Zuordnung ebenfalls erfasst und beispielsweise durch maschinelle Kontenfindungsverfahren unterstützt werden.¹⁸ Zu beachten ist, dass die Geschäftsvorfälle in Sach- und Personenkonten zu gliedern sind und zusätzlich mit den nachfolgenden Angaben abgebildet werden müssen:

- Kontenbezeichnung,
- Buchungsdatum,
- Belegdatum,
- Buchungstext bzw. dessen Verschlüsselung,
- Kennzeichnung der Buchung,
- Summen und Salden nach Soll und Haben,
- Gegenkonto,
- Belegverweis.¹⁹

Dokumentation

Grundsätzlich gilt, dass gem. § 238 Abs. 1 S.2 HGB die Buchführung so auszugestalten ist, dass ein sachverständiger Dritter sich innerhalb angemessener Zeit ein Überblick über die Geschäftsvorfälle und die Lage des Unternehmens erhalten kann. Dieser Grundsatz bleibt auch bei einer IT-gestützten Rechnungslegung unverändert.²⁰ Für ein nachvollziehbares Buchführungsverfahren gilt eine ordnungsgemäße Verfahrensdokumentation i.S.d. § 238 Abs.1 S.3 HGB als Voraussetzung, welche die Beschreibung aller zum Verständnis der Rechnungslegung erforderlichen Verfahrensbestandteile zu enthalten hat.²¹ Bei einer IT-gestützten Rechnungslegung besteht dies aus einer Anwenderdokumentation, der technischen Systemdokumentation sowie der Betriebsdokumentation.²²

¹⁷ Vgl. Tritschler (2018), S.14.

¹⁸ Vgl. IDW FAIT 1, Tz. 52.

¹⁹ Vgl. Tritschler/Lamm (2018), S. 29.

²⁰ Vgl. IDW FAIT 1, Tz. 52.

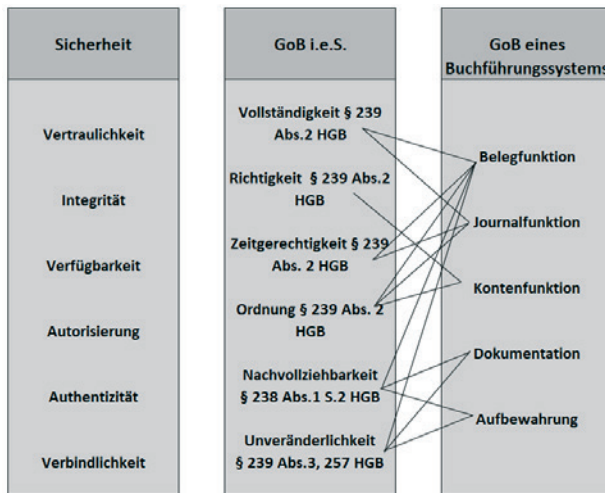

²¹ Vgl. Tritschler (2018), S. 14.

²² Vgl. Tritschler/Lamm (2018), S. 29.

Aufbewahrung

Gemäß § 257 Abs. 4 HGB sind alle zum Verständnis der Buchführung erforderlichen Unterlagen über einen Zeitraum von 10 Jahren aufzubewahren.²³ Um dies zu gewährleisten, muss sowohl sichergestellt werden, dass die Art der Aufbewahrungsmedien dies erfüllen kann, als auch die technische Voraussetzung für die Gewährleistung der jederzeitigen Wiederherstellung und Lesbarkeit gem. §§ 257, 261 i.V.m. § 239 Abs. 4 S. 2 HGB erfüllt wird.²⁴

Abbildung 2: Eigendarstellung in Anlehnung an Tritschler/Lamm (2018: 30)

Zu beachten ist zudem, dass neben den genannten Voraussetzungen ebenso die Sicherheit der rechnungslegungsrelevanten Daten durchgehend gewährleistet sein muss, für dessen Einhaltung die gesetzlichen Vertreter des Unternehmens verantwortlich sind. Somit ist vom Unternehmen ein Sicherheitskonzept zu entwickeln, das die Einhaltung der Informationssicherheit garantiert.²⁵ Die Sicherheitsanforderungen an ein IT-System stellen die nachfolgenden Kriterien dar:

²³ Paragraph 257 HGB

²⁴ Vgl. Tritschler/Lamm (2018), Seite 30.

²⁵ Vgl. IDW FAIT 1, Tz. 19ff.

Tabelle 1: Vgl. IDW FAIT 1 Tz. 23.

Sicherheitsanforderung	
Vertraulichkeit	Erlangte Daten von Dritten dürfen nicht unberechtigt weitergegeben, oder gar veröffentlicht werden.
IT-Integrität	Diese ist gegeben, wenn Daten und IT-Infrastruktur sowie IT-Anwendung vollständig und frei von Fehlern zur Verfügung stehen und zusätzlich vor Manipulation geschützt sind.
Verfügbarkeit	Setzt voraus, dass IT-Infrastruktur, IT-Anwendung und Daten ständig verfügbar sind. Ebenso müssen diese in angemessener Zeit funktionsfähig bereitstehen.
Autorisierung	Festgelegte Personen haben Zugriff auf Daten. Diese müssen im Voraus bestimmt worden sein. Autorisierte Personen dürfen nur die im System festgelegten Rechte wahrnehmen.
Authentizität	Ein Geschäftsvorfall muss dem Verursacher eindeutig zuordenbar sein.
Verbindlichkeit	IT-gestützte Verfahren können gewollte Rechtsfolgen bindend herbeiführen.

Hinsichtlich der Datensicherheit ist ein aktuelles und viel diskutiertes Thema die Datenschutz-Grundverordnung. Gemäß Artikel 17 Datenschutz-Grundverordnung (DSGVO) besteht grundsätzlich das Recht auf Löschung personenbezogener Daten. „Die betroffene Person hat das Recht, von dem Verantwortlichen zu verlangen, dass sie betreffende personenbezogene Daten unverzüglich gelöscht werden, und der Verantwortliche ist verpflichtet, personenbezogene Daten unverzüglich zu löschen [...]“²⁶, sofern die Voraussetzungen zutreffen. Somit ist nachfolgend zu klären, ob Artikel 17 DSGVO im Widerspruch zu § 257 Abs. 4 HGB, der Aufbewahrung der Unterlagen über einen Zeitraum von 10 Jahren, stehen könnte.²⁷ § 35 des Datenschutzgesetzes (BDSG) konkretisiert diese Frage weiter. Gemäß § 35 Abs.2 S.1 BDSG dürfen Betroffene, deren personenbezogene Daten gespeichert wurden, ihren Anspruch auf Löschung der Daten jederzeit geltend machen. Falls dies nicht mit unverhältnismäßigem Aufwand in Verbindung steht, oder gar unmöglich ist, müssen die personenbezogenen Daten in der Regel gelöscht werden und es entsteht hieraus eine Löschungspflicht. § 35 Abs. 3 S.2 Nr.1 BDSG nennt jedoch Ausnahmen, für welche eine Löschungspflicht nicht zutrifft. Dies ist der Fall, wenn einer Löschung gesetzliche, satzungsmäßige oder vertragliche Aufbewahrungsfristen entgegenstehen, wie es bei § 257 Abs. 4 HGB zutreffen würde. Somit tritt anstelle einer Löschung eine Sperrung und die Regelungen der DSGVO stehen nicht im Widerspruch zu den GoB.²⁸

²⁶ Art. 17 Abs.1 DSGVO

²⁷ Vgl. Artikel 17 DSGVO

²⁸ Vgl. Paragraph 35 BDSG

3. INFORMATIONSTECHNOLOGIE IM UNTERNEHMEN - DER EINSATZ VON IT SPEZIELL IN DER RECHNUNGSLEGUNG

Beim Einsatz von Informationstechnologie in der Rechnungslegung sind die gesetzlichen Vertreter dafür verantwortlich, dass geeignete Regelungen eingeführt werden, um das damit einhergehende Risiko zur Einhaltung der GoB bei dessen Einsatz auszuschließen.²⁹ Das IDW bezeichnet als Informationstechnologie im Rahmen der Rechnungslegung, die „Gesamtheit der im Unternehmen zur elektronischen Datenverarbeitung eingesetzten Hard- und Software“.³⁰ Der Einsatz von IT im Unternehmen erfolgt durch ein sogenanntes IT-System, welches die IT-gestützten Geschäftsprozesse, die IT-Anwendungen und die IT-Infrastruktur beinhalten. Diese werden vom IT-Kontrollsystem geprägt, welches wiederum vom IT-Umfeld und der IT-Organisation abhängig ist.³¹ Die gesetzlichen Vertreter haben die Aufgabe, die IT-Strategie, welche von dem Schwierigkeitsgrad und Vielfalt des Unternehmens geprägt ist, mit der Unternehmensstrategie abzustimmen, um ein wirksames IT-Kontrollsystem einzurichten. Die IT-Strategie beinhaltet ebenfalls die Risikobewertung der IT-Risiken aus der Geschäftstätigkeit des Unternehmens, welche wesentliche Auswirkungen auf die Rechnungslegung haben könnten. Sie können für Unternehmen, welche eine IT-abhängige Unternehmenstätigkeit ausführen, zum bestandsgefährdendem Risiko werden, weshalb ein Risikofrüherkennungssystem für ein Unternehmen unabdingbar ist.³² Errichtet ein Unternehmen ein IT-System, ist hierbei zu beachten, dass die Anforderungen der GoB an eine ordnungsgemäße IT-gestützte Rechnungslegung für alle Bereiche des IT-Systems sicherzustellen sind.³³

4. DIE AUSLAGERUNG VON PROZESSEN UND FUNKTIONEN

Wenn rechnungslegungsbezogene Prozesse und Funktionen ausgelagert werden, die zur Speicherung oder Verarbeitung rechnungslegungsrelevanter

²⁹ Vgl. IDW FAIT 1, Tz. 6.

³⁰ Vgl. IDW FAIT 1, Tz 2.

³¹ Vgl. IDW FAIT 1, Tz. 6-7.

³² Vgl. IDW FAIT 1, Tz 76.

³³ Vgl. IDW FAIT 1 Tz. 76.

Daten dienen, haben sie auch für die Jahresabschlussprüfung Relevanz. Ausgelagerte Prozesse und Funktionen können beispielsweise Daten über Geschäftsvorfälle, Ereignisse oder betriebliche Aktivitäten speichern oder verarbeiten. Sie können hierbei sowohl direkt in die Rechnungslegung einfließen oder auch dem Rechnungslegungssystem als Grundlage für Buchungen dienen. Sofern dies zutrifft, werden die Prozesse und Funktionen ein Teil des IT-Systems und des IT-gestützten Rechnungslegungssystems des Unternehmens.³⁴

Beispiele hierfür können sein:

- + Auslagerung von IT-Ressourcen;
- + IT-gestützte oder manuelle rechnungslegungsrelevante Geschäftsprozesse;
- + die Verarbeitung von rechnungslegungsrelevanten Geschäftsvorfällen;
- + die Bereitstellung von rechnungslegungsrelevanten Unterlagen in elektronischer oder anderer Form, welche für den Abschluss des Unternehmens dienen sowie zusätzlichen Informationen (z.B. Buchungsdaten, Buchungsbelege und Informationen zur Lageberichterstattung).³⁵

Wenn betriebliche Prozesse und Funktionen teilweise auf ein Dienstleistungsunternehmen verlagert werden, wird von Outsourcing gesprochen. Gründe hierfür können Einsparungen der Kosten, sowie Risiko- und Compliance-Gründe sein. Ein Unternehmen kann neben den Kernprozessen ebenfalls den IT-Betrieb, die Applikationsbetreuung oder die Bereitstellung der erforderlichen Soft- und Hardware auslagern. In diesem Fall wird von IT-Outsourcing gesprochen. Ein Beispiel hierfür stellt der Rechenzentrumsbetrieb, auch Hosting, dar. Hierbei werden Server des Unternehmens beim Dienstleister untergebracht, welcher die dafür notwendige IT-Infrastruktur bietet. Werden genau definierte Lösungen von einem IT-Dienstleister an den Auftraggeber erbracht, wird von Managed Services gesprochen. Die Service-Leistung wird bei dieser Form bei Vertragschluss gemeinsam definiert. Hierbei können beispielsweise die Überwachung der Verfügbarkeit der eingesetzten Systeme, das Update- und Patchmanagement³⁶ sowie die System- und Softwareadministration ausgelagert werden. Managed Services lassen sich in drei Kategorien unterteilen:³⁷

³⁴ Vgl. IDW Tritschler/Lamm (2018), S. 12.

³⁵ Vgl. IDW FAIT 5 Tz, 5 i.V.m. Tritschler/Lamm (2018), S. 12.

³⁶ Beispielsweise eine Systemverwaltung, bei der mehrere Codeänderungen auf einem verwalteten Computersystem installiert werden.

³⁷ Vgl. Tritschler/Lamm (2018), S. 13f.

- ♦ IT-Security Services - Betrieb von IT-Security-Lösungen
- ♦ Storage Services: - Services bezüglich des Storage-Systems³⁸
- ♦ Application Services³⁹- Bereitstellung, Konfiguration sowie Wartung von zentralen Server Applikationen

5. PRAXISBEISPIEL: CLOUD- COMPUTING (FAIT 5)

Werden beim IT-Outsourcing die IT-Infrastruktur und die IT-Dienstleistungen, Cloud-Services, bereitgestellt, handelt es sich um eine Sonderform des IT-Outsourcings, dem Cloud-Computing.⁴⁰ Nach Definition von Bitkom wird unter dem Begriff [...] eine Form der Bereitstellung von gemeinsam nutzbaren und flexibel skalierbaren IT-Leistungen durch nicht fest zugeordnete IT-Ressourcen über Netze [...]“ verstanden.⁴¹ Hierbei werden beispielsweise Speicherplatz, Rechenleistung oder auch Anwendersoftware für einen kurzen Zeitraum über das Internet bereitgestellt. In der Zwischenzeit bestehen keinerlei signifikante leistungstechnische Unterschiede mehr zwischen Cloud-Services und IT-Inhouse-Lösungen, weshalb deren Nutzung immer beliebter wird.⁴²

Im Jahr 2017 nutzten 66 %⁴³ aller Unternehmen Rechenleistungen aus einer Cloud. Dies ist ein Anstieg um ein Prozent im Vergleich zum Vorjahr. 83 % der Unternehmen erwägen den Einsatz einer Cloud. Lediglich für 13 Prozent der Unternehmen stellen Cloud-Dienste keine Alternative dar.⁴⁴

Der Unterschied von Cloud-Computing und Outsourcing besteht darin, dass Hardware, Software oder andere Sicherheitseinstellungen mit anderen Nutzern in der Cloud geteilt werden. Daten und individuellere Konfigurationen der Software sind vom resource-pooling ausgenommen und sind nur für die eigene Verwendung bereitgestellt.⁴⁵ Cloud-Services haben typischerweise nachfolgende Merkmale:

³⁸ Definition: Ein Cloud-Speicherdienst, welcher die Daten seiner Kunden verwaltet und diese Daten über ein Netzwerk, in der Regel das Internet, zugänglich macht.

³⁹ Definition: Cloud-Anwendungen, welche nicht lokal gespeichert sind.

⁴⁰ Vgl. Tritschler/Lamm (2018), S. 15

⁴¹ Vgl. Giebichenstein, (2011), S. 2218.

⁴² Vgl. Tritschler/Lamm (2018), S. 16.

⁴³ Ergebnis einer repräsentativen Umfrage von Bitkom Research im Auftrag der KPMG AG unter 557 Unternehmen ab 20 Mitarbeitern in Deutschland.

⁴⁴ o.V. (2018), S. 1450.

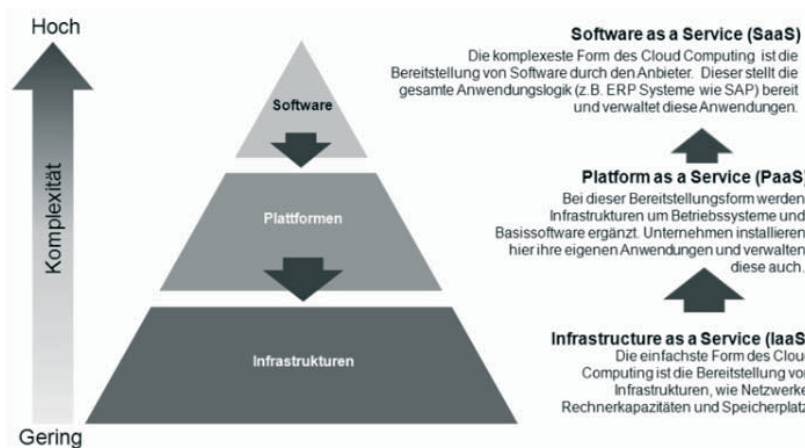

⁴⁵ Vgl. Tritschler/Lamm (2018), S. 16.

Tabelle 2: Vgl. Tritschler, Lamm (2018: 17)

Merkmal	
On-demand self-service	Selbstzuweisung von Leistungen aus der Cloud durch Nutzer, welche bei Bedarf des Unternehmens bereitstehen sollen.
Broad network access	Über Standardmechanismen in einem Netzwerk sind Leistungen aus der Cloud erreichbar.
Resource pooling	Ressourcen einer Cloud, wie beispielsweise Rechenleistungen oder Storage, werden unter unterschiedlichen Kunden der Cloud-Dienste geteilt.
Rapid elasticity	Virtuelle Ressourcen können schnell nahezu unbegrenzt aus der Sicht des Nutzers skaliert werden, ebenso wie automatisiert auf Laständerungen angepasst.
Measured service	Die Nutzung der Ressourcen kann gemessen und zusätzlich überwacht werden.

Das Cloud-Computing lässt sich in verschiedene Service-Modelle weiter untergliedern. Die Aufteilung erfolgt hierbei in die drei Schichten: Infrastruktur, Plattform und Anwendung, wie Abbildung 3 zu entnehmen ist.⁴⁶

Abbildung 3: Giebichenstein, 2011: 2218

Neben den Servicemodellen lässt sich das Cloud-Computing ebenfalls in vier weitere Anwendungsmodelle untergliedern:

- „Public Cloud“
Diese wird dem Unternehmen über das Internet von einem Anbieter bereitgestellt. Die Allgemeinheit oder eine große Gruppe, beispielsweise

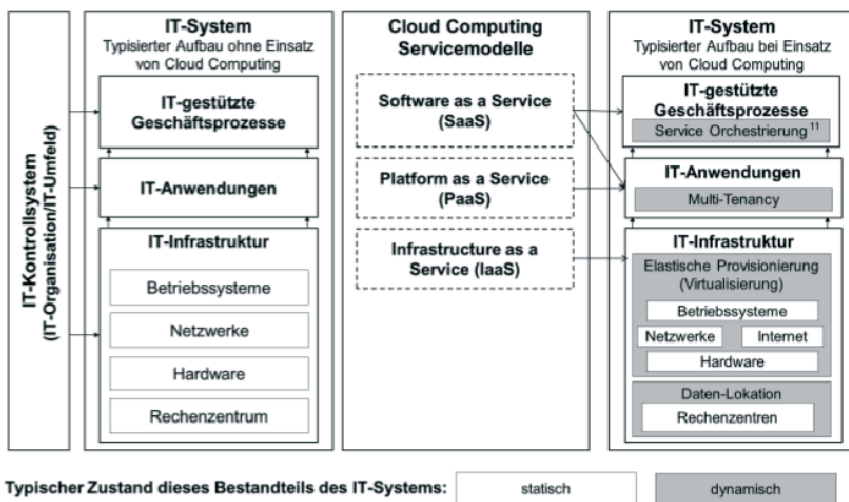

⁴⁶ Vgl. Giebichenstein (2011), S. 2218.

eine Industriebranche, kann die Services der Public External Cloud gegen ein Entgelt nutzen.⁴⁷

- ✦ „Private Cloud“
Hierbei wird ein geschlossenes Netzwerk von IT-Ressourcen einer Organisation bereitgestellt, wobei keine andere Organisation Zugriff hierauf hat.⁴⁸
- ✦ „Community Cloud“
Bei der Community Cloud wird die Infrastruktur von mehreren Institutionen mit ähnlichen Interessen geteilt und kann von einer der Institutionen oder auch einem Drittanbieter betrieben werden⁴⁹
- ✦ „Hybrid Cloud“
Hierbei werden mehrere für sich gesehen eigenständige Cloud-Infrastrukturen über standardisierte Schnittstellen verbunden und gemeinsam genutzt um somit Daten und IT-Anwendungen auszutauschen.⁵⁰

Abbildung 4 veranschaulicht abschließend die Gemeinsamkeiten und Unterschiede zwischen klassischem Outsourcing einerseits und Cloud-Computing gem.

Abbildung 4: IDW RS FAIT 5, Tz.13.

⁴⁷ Vgl. Tritschler/Lamm (2018), S.19 i.V.m. Giebichenstein (2011), S. 2218.

⁴⁸ Vgl. Giebichenstein (2011), S. 2218.

⁴⁹ Vgl. Tritschler/Lamm (2018), S.19.

⁵⁰ Vgl. Tritschler/Lamm (2018), S.19.

Nichtsdestotrotz bringt die Auslagerung von Prozessen und Funktionen auch Risiken mit sich. Ein Grund hierfür ist, dass Unternehmen durch die Auslagerung in eine Cloud den direkten Einfluss auf den Schutz der Daten und die betrieblichen Systeme verlieren. Gleiches gilt für einen ordnungsmäßigen Betrieb der IT-Infrastruktur und die Verarbeitung rechnungslegungsrelevanter Sachverhalte. Zu beachten ist, dass die Verantwortung für die Einhaltung der Ordnungsmäßigkeits- und Sicherheitsanforderungen bei einer Auslagerung nicht an das Dienstleistungsunternehmen übertragen werden kann.

Exemplarische Risikokategorien können darstellen:

- + Sicherheits- und Ordnungsmäßigkeitsrisiken,
- + Fehlerrisiken in der Rechnungslegung bei einer Auslagerung von Prozessen sowie
- + Datenschutzrechtliche Risiken.⁵¹

Bezüglich datenschutzrechtlicher Risiken spielt auch die DSGVO für Unternehmen eine Rolle. Diese verlangt von Unternehmen, dass diese nachweisen können, welche Dienstleister sie für welche Daten im Auftrag auf personenbezogene Daten zugreifen lassen. Somit muss der gesetzliche Vertreter sicherstellen, dass beim Anbieter ausreichende Garantien für eine datenschutzkonforme Datenverarbeitung vorliegen. Zusätzlich ist ein Datenschutzvertrag mit dem entsprechenden Dienstleister zu schließen. Dieser muss die Mindestinhalte des Artikel 28 DSGVO aufweisen, deren Anforderungen nur durch eine systematisch geführte Liste kontrolliert werden können. Nach der DSGVO wird Cloud-Computing weiterhin als Auftragsverarbeitung eingestuft und ist deshalb nur zulässig, wenn die entsprechenden Voraussetzungen vorliegen.⁵²

Dass die DSGVO bei vielen Unternehmen auch bei der Auswahl des Cloud-Anbieters keine nachrangige Bedeutung hat, zeigt die Studie von Bitkom Research im Auftrag von KPMG. Hierbei ist die Konformität des Cloud-Providers mit 97 %⁵³ das Top-Kriterium bei der Anbieterauswahl. Auf den nachfolgenden Plätzen stehen bei Unternehmen Themen wie transparente Sicherheitsarchitektur und –kontrollen sowie die im Vertrag regelbare Ausstiegsstrategie.⁵⁴

⁵¹ Vgl. Tritschler/Lamm (2018), S. 20f.

⁵² Vgl. Kramer (2018), S. 54-56.

⁵³ Basis für die Umfrage waren 521 Unternehmen, welche Cloud-Lösungen nutzen, planen oder darüber diskutieren. Mehrfachnennungen waren möglich.

⁵⁴ Bitkom (2018), S. 7.

6. KRITISCHE WÜRDIGUNG

Sowohl die Auslagerung von Prozessen und Funktionen als auch der Einsatz von Informationstechnologie im Rahmen der Buchhaltung bringen Unternehmen viele Vorteile. Dies können sowohl Kosteneinsparungen sein, als auch der vielseitige Einsatz von Cloud-Computing. Nichtsdestotrotz sind Unternehmen durch die Nutzung Risiken und auch Herausforderungen ausgesetzt, welche frühzeitig erkannt werden müssen.⁵⁵ Der Einsatz von Informationstechnologie kann sowohl Sicherheits- als auch Ordnungsmäßigkeitsrisiken mit sich bringen, welche sich indirekt auf die Rechnungslegung auswirken können. Bei ausgelagerten Prozessen, welche für die Rechnungslegung relevant sind, können sich auch direkte Fehlerrisiken für die Rechnungslegung ergeben. Dies ist meist auf unzureichende Kontrollen seitens des Dienstleisters zurückzuführen. Die Fehlerrisiken setzen sich aus inhärentem Risiko und Kontrollrisiken zusammen. Diese Risiken resultieren aus nicht angemessenen und/oder nicht wirksam ausgestalteten Kontrollen.⁵⁶ Um aus Sicht des Wirtschaftsprüfers wesentlich falsche Angaben in der Rechnungslegung ausreichend beurteilen zu können, müssen gem. IDW nachfolgende Aussagen abgedeckt sein. Bei Berücksichtigung aller nachfolgenden Aspekte ist es dem Abschlussprüfer möglich, Aussagen zu kombinieren, wie beispielsweise dass ein Geschäftsvorfall vollständig erfasst, verarbeitet und somit im Abschluss enthalten ist.⁵⁷

- ✦ Aussagen über die Art der Geschäftsvorfälle und Ereignisse innerhalb des Prüfungszeitraums bezüglich:
 - ✦ Eintritt des Geschäftsvorfalles sowie Zurechnung zum Unternehmen
 - ✦ Vollständigkeit
 - ✦ Genauigkeit
 - ✦ Periodenabgrenzung
 - ✦ Kontenzuordnung
- ✦ Aussagen über die Kontensalden am Periodenende können sich beziehen auf folgende Aspekte:
 - ✦ Vorhandensein
 - ✦ Zurechnung

⁵⁵ Vgl. Giebichenstein (2011), S. 2219 i.V.m. Tritschler/ Lamm (2018), S. 20.

⁵⁶ Vgl. Tritschler/ Lamm (2018), S. 31.

⁵⁷ Vgl. Tritschler/ Lamm (2018), S. 35-36.

- ✦ Vollständigkeit
 - ✦ Bewertung und Zuordnung
- ✦ Aussagen über Abschlussinformationen können sich auf nachfolgende Kriterien beziehen
 - ✦ Eintritt des Geschäftsvorfalles und Zurechnung zum Unternehmen
 - ✦ Vollständigkeit
 - ✦ Ausweis und Verständlichkeit
 - ✦ Genauigkeit und Bewertung⁵⁸

Wenn das Unternehmen den Einsatz von Cloud-Computing in Erwägung zieht, ist es vor dessen Einführung zu empfehlen, dass das entsprechende Unternehmen eine sorgfältige Analysen der Chancen und Risiken durchführt, um Fehlentscheidungen und Risiken für das Fortbestehen des Unternehmens zu vermeiden.⁵⁹

Abstract

Possibilities of meeting public needs at national and local level depend on budget outturn. The role of the state audit is to supervise budget outturns and expenditures. The aim of the paper is to examine the number of budget funds at the county level in the Republic of Croatia as well as to investigate and analyze the amount and trends in tax revenues in relation to all assets realized. A characteristic of tax revenues is that they have no statutory purpose, as opposed to most other local unit revenues. This paper gives an overview of the legislative framework governing the organization of local units, their financing, and supervision. The main sources of data are the data of the Ministry of Finance and the State Audit Office, legal regulations and scientific literature. The results show that tax revenues in 2017 decreased in all counties compared

to the previous year. A different share of tax revenues in total revenues in each county is also evident.

Keywords: budget revenue, tax revenue, state audit, local and regional self-government units

JEL Classification: H20, H71

1. INTRODUCTION

The Act on the Financing of Local and Regional Self-Government Units determines the sources of funding and the way of financing the activities of self-governing entities like counties, municipalities and cities, i.e. local and regional self-government units. Revenues are received from their own sources and shared taxes as well as state and county budgets. The main sources of revenue for counties include revenue from their property, county taxes, fines, and other revenues determined by special acts. County taxes refer to the inheritance and gift taxes, the motor vehicle and boat taxes, and the coin-operated amusement machine tax. County taxes can be ceded in whole or in part to a city or municipality on whose territory a taxpayer is a resident. Municipalities or cities may introduce the following taxes: a local income tax, a consumption tax, a holiday home tax, a trading name tax, and a public land use tax. In January 2018, the new Act on the Financing of Local and Regional Self-Government Units came into force, which regulates differently the system of income tax revenue allocation, the fiscal equalization system of local and regional self-government units and the decentralized financial system. However, there is still the equalization fund because there is a difference in the economic, and consequently, the budgetary power of individual cities, counties, and municipalities. The role of the fund is to reduce the gap in the levels of economic development in order to enable all citizens to enjoy equal living conditions. All local and regional, i.e. regional self-government, units should be given an opportunity to deliver comparable public services.

The scope of operation of any county, city, and municipality is provided for by the provisions of the Act on Local and Regional Self-Government Units. The scope of operation of a county encompasses activities of regional importance, harmonization of interests aimed at a balanced development of municipalities and cities as its constituent units as well as of the county as a whole, and in particular the activities related to education, health, spatial and urban planning,

economic development, traffic and transport infrastructure, maintenance of public roads, planning and development of networks of educational, health, social and cultural institutions, the issuance of construction and location permits and other building and construction related acts, the implementation of urban planning and construction documents and other activities pursuant to special acts. The task of local units is to improve the quality of life of residents living in their respective areas. It is necessary to achieve this by collecting revenues through the existing system of financing. Revenues should enable uninterrupted operation within the jurisdiction of a local unit. Activities falling within the scope of operation of a city and a municipality refer to urban development and housing, spatial and urban planning, communal economy, child care, social welfare, primary health care, upbringing and primary education, culture, physical culture and sports, consumer protection, protection and improvement of the natural environment, fire protection and civil protection, and traffic in their respective areas, and large cities deal with public road maintenance, the issuance of construction and location permits and other building and construction related acts, as well as the implementation of urban planning and construction documents. Large cities are local self-government units, which are at the same time economic, financial, cultural, health, transport and scientific development centers of the wider environment with more than 35,000 inhabitants. According to the 2011 census, there are 17 cities in the Republic of Croatia with more than 35,000 inhabitants (together with the City of Zagreb with its 790,017 inhabitants).

This paper examines tax revenue trends at the level of local (regional) self-government units, i.e. at the county level. The structure of the Republic of Croatia is based on 20 regional self-government units, as well as cities and municipalities as local self-government units (126 cities and 428 municipalities, and the City of Zagreb with the special status of both a city and a county). This implies that there are 555 local self-government units in the Republic of Croatia and 576 local and regional self-government units. With respect to county-level revenues, this paper includes revenue outturn of all cities and municipalities that exist in the territory of a particular county.

2. BUDGET OUTTURN AT THE COUNTY LEVEL

An overview of budget outturn at the county level in the Republic of Croatia is given below. Public needs are financed by these resources, hence the ability

to meet the public needs in their jurisdiction depends on their availability. The revenue and receipt outturn data at the county level also include revenue and receipt outturn of cities and municipalities located in the territory of each county.

Revenue and receipt outturn can also be observed such that budget outturn of a city, a municipality or a county itself (excluding the revenues of the cities and municipalities in the territory of that county) is put in relation to the number of inhabitants. Year after year, budget outturn data referring to Croatian local self-government units point to the following:

- a decisive impact of a coastal location on the financial condition of cities and municipalities;
- frequent major oscillations in the local government unit revenues and expenditures observed year after year; and
- inadequate status determination criteria for municipalities and cities. (Ott et al., 2018, p. 3).

Table 1 gives an overview of revenues and receipts of each county. Indices showing total revenues at the level of each county in the period 2014-2017 are calculated (with the year 2014 as the basis for comparison). By using chain indices, budget outturn for 2017 is shown in relation to 2016. The total revenue outturn index calculated for 2017 in relation to 2016 shows an increase in total revenues of all counties by 2.4%. Compared to 2014, this indicates an increase of 1.5%. In the same way, one can analyze revenue trends of each county. In 2017, six counties recorded lower revenues than in 2016, while other counties had higher revenues in 2017 than in 2016.

Table 2 gives an overview of total revenues and receipts of all counties in the period 2014-2017, where the emphasis is placed on the type of revenues. Revenues are hence divided into business revenues, revenues from the sale of nonfinancial assets and receipts from financial assets and borrowing. If total revenue outturn is taken into account, it can be concluded that the largest share of tax revenues (52%, 48.9%, 49.5%, and 46.3%) is observed in all four years under consideration (i.e. 2014-2017) and that there is a tendency to a decrease in total revenue outturn. Revenues from the sale of nonfinancial assets in 2017 account for 3.1%, while the share of receipts from financial assets and borrowings is 4.2%, which is lower than in 2014 when receipts from financial assets and borrowings accounted for 7.1% of total revenues at the level of all local self-government units. This points to the need to review other budget revenues of local self-government units and the possibility for increasing them.

Table 1 – Revenues and receipts by county in HRK

County and the number of local units	Total revenues and receipts, in HRK					Index for 2015; 2014 = 100	Index for 2016; 2014 = 100	Index for 2017; 2014 = 100	Index 2017/ 2016
	2014	2015	2016	2017	2017				
1	2	3	4	5	6	7	8	9	
Zagreb, 35	1,357,503,140	1,436,866,134	1,459,500,932	1,558,295,890	105.8	107.5	114.8	106.8	
Krapina-Zagorje, 33	447,112,699	420,251,129	459,285,558	465,055,748	94.0	102.7	104.0	101.3

3. TAX REVENUE OUTTURN BY LOCAL GOVERNMENT UNITS

Tax revenues have a significant share in total revenues and receipts at the level of local self-government units. In 2004, 2005 and 2006, tax revenues and their share in total revenues and receipts by counties (in all counties, excluding the City of Zagreb) amounted to 52.88%, 51.97%, and 52.54%, respectively (Perić and Mahaček, 2009, pp. 104-109). Furthermore, the share of tax revenues at the level of all local self-government units (including the City of Zagreb) in 2007, 2008, 2009, 2010 and 2011 was 55.5%, 55.6%, 59.1%, 58.1% and 51.6%, respectively (Mahaček et al, 2015, pp. 376-380).

Trends in total revenues and receipts of local self-government units were monitored in the period from 2010 to 2012 in order to draw a conclusion on total revenues and receipts of municipalities, cities, and counties. In 2012, the City of Zagreb participated in total revenues and receipts with 29.1%, whereas cities, municipalities, and counties participated with 39.4%, 15.4%, and 16.1%, respectively (Mahaček and Včev 2016, p. 670). The hypothesis has been confirmed that city budgets have the most significant impact on the financing of public needs, followed by county budgets, while municipality budgets have fewer participation opportunities to engage in funding, although their number is significant.

Trends in revenues of local self-government units as well as the role of tax revenues as a source of budget funds can also be seen from the point of view of the share of individual counties in the overall outturn.

Based on the data, we can draw conclusions about the significance of tax revenues at the county level. When it comes to the overall budget outturn of all local self-government units in 2014, tax revenues accounted for 52.0%. We also conclude that in the context of income of each county, tax revenues participate with different shares, which is reflected in the possibilities of financing various needs (Mahaček, 2017, p. 612).

A budget outturn of municipalities, cities, and counties (excluding cities and municipalities in their territories) in relation to the number of inhabitants indicates that there are differences in per capita revenues. The authors give an overview of revenue and expenditure related data and state that the published data, as well as a number of other data in previous press releases published by

the Institute of Public Finance, point to the need for reform of the territorial and fiscal structure. (Ott et al., 2018, p. 4).

Table 3 gives an overview of the tax revenues of each county in the period from 2014 to 2017. Based on these data, it can be seen that each county has different amounts of tax revenues that are presented in absolute values. For each county, tax revenues are placed in relation to the total revenue outturn of that county. The results indicate that the share of tax revenues in the total revenue of a county varies. At the level of all counties, 2014, 2015 and 2016 tax revenues accounted for 52%, 48.9%, and 49.5%, respectively, while in 2017 this share was 46.3%. The largest share of tax revenues in 2014 was recorded by Zagreb County (66.4%), the City of Zagreb (64.1%) and Krapina-Zagorje County (53.3%). On the other hand, the smallest share was recorded in Virovitica-Podravina County (26.7%). The largest share of tax revenues in 2015 was recorded by the City of Zagreb (71%), Zagreb County (54.3%) and Krapina-Zagorje County (49.6%), whereas the smallest share was recorded in Virovitica-Podravina County (20.1%). The largest share of tax revenues in 2016 was recorded in the City of Zagreb (70.2%), Zagreb County (57.5%) and Krapina-Zagorje County (49.4%), whereas the smallest share was recorded in Virovitica-Podravina County (22.6%). The largest share of tax revenues in 2017 was recorded by the City of Zagreb (66.2%), Zagreb County (50.9%) and Krapina-Zagorje County (46.0%), while Virovitica-Podravina County recorded the smallest share (21.7%).

Source: Authors, according to the Ministry of Finance data available on <http://www.mfin.hr/hr/ostvarenje-proracuna-jlprs-za-period-2014-2017>

Based upon the aforementioned, it can be concluded that the list of counties with the highest share of tax revenues in the period under consideration (i.e. 2014-2017) does not change, and the same holds for counties with a low share of tax revenues. This points to the need to re-examine the reasons for this phenomenon, i.e. the need to balance these revenue sources.

Table 4 shows the share of tax revenues of individual counties in the total tax revenue outturn at the level of all counties in the period 2014-2017. A calculation basis for these shares were the data given in both Table 1, which shows total revenues and receipts by individual counties, and Table 3, which shows tax revenue outturn presented in absolute values. At the level of all counties, the City of Zagreb recorded the largest share in the total tax revenue outturn in the period 2014-2017, whereas, with the share of 0.6% in 2017, Virovitica-Podravina County and Požega-Slavonia County recorded the smallest share in the total tax revenue outturn of all counties.

Table 4 – The share of county tax revenues in the total tax revenue outturn at the level of all counties in the period 2014-2017

County	Share in % for 2014	Share in % for 2015	Share in % for 2016	Share in % for 2017

Source: Authors, according to the Ministry of Finance data available on <http://www.mfin.hr/hr/ostvarenje-proracuna-jlprs-za-period-2014-2017>

The revenue and tax revenue analysis indicate that sources of local budget revenues are statutory and stable, but they differ across counties. It can, therefore, be concluded that within each county public needs are met depending on the resources available to them. This causes counties to develop differently. The new Act on the Financing of Local and Regional Self-Government Units came into force in January 2018, which provides for a different allocation of funds at the national level that should eliminate differences in economic development and create equal conditions for citizens in all counties.

4. THE ROLE OF THE STATE AUDIT IN THE IMPLEMENTATION OF BUDGET OUTTURN AND EXPENDITURE SUPERVISION

The State Audit Office is the highest audit institution in the Republic of Croatia. According to the State Audit Office Act (2011), an audit includes the inspection or examination of documents, records, reports, internal control and internal auditing systems, accounting and financial procedures and other records to verify that the financial statements present a true financial position and the results of financial activities in line with the accepted accounting principles and standards. An audit is also a process of examining financial transactions in terms of legal utilization of funds. It also includes the assessment and evaluation of efficiency and effectiveness of activities, as well as the assessment and evaluation of how effectively the general objectives or the objectives of individual financial transactions, programs and projects are met (State Audit Office Act, Article 7). It primarily focuses on financial activities, but also includes activities aimed at verifying efficiency, cost-effectiveness, and effectiveness. The State Audit Office may carry out a financial audit, but also a performance audit, in an entity, which differs according to their objectives and methods of operation. However, conducting both financial and performance audits is equally important (Mahaček, 2016, p. 141). By supervising fund outturn of local self-government units, the state audit can detect and eliminate irregularities, The

State Audit Office issues orders and recommendations the entities are required to comply with.

Improved outturn and utilization of funds are influenced by monitoring the orders and recommendations issued to entities. According to the Report on the Activities of the State Audit Office for 2017 (2017, p. 6), in the reporting period from 1 October 2016 to 30 September 2017, the audit included financial statements and operation of 82 local self-government units, and 24 unconditional, 56 conditional and two unfavorable opinions were expressed. It is reported that the audit identified irregularities and omissions that, in addition to other irregularities, also refer to the execution of orders and recommendations from the previous audit, budget planning and execution, accounting and financial reporting, revenues and receivables, expenditures, public procurement, liabilities, and borrowing. If these irregularities are expressed numerically, a total of 575 irregularities and omissions were found in past revisions. It was established that 315 (54.8%) orders and recommendations were processed, 62 (10.8%) are being processed, and 198 (34.4%) have not been processed at all. The largest number of orders and recommendations that have not been dealt with relates to accounting, communal economy expenditures and collection of receivables. When performing the audit in the period that follows, the given orders and recommendations are checked.

5. CONCLUSION

This paper confirmed the hypothesis about a significant share of tax revenues in the total revenues at the level of total revenues and receipts of all counties (including outturn of all cities and municipalities), and within the framework of revenue outturn of each county. Taxation as an instrument of economic policy can be influenced by achieving certain goals at the national level, from revenue allocation, price stability, higher employment, etc. This paper studies tax revenue outturn by individual counties and respective trends in the period 2014-2017 and indicates the different possibilities of meeting public needs at the county level. No analysis was made in the paper on the type of taxes, but the emphasis was placed on the number of tax revenues within the budget. The hypothesis was confirmed that the share of tax revenues in total revenues at the level of all counties declined in the last year under consideration, and it can be concluded that there are still some funds in the budget for meeting needs for

which the sources of funding have not been legally defined. Local self-government unit budget funds meet public needs, most budget revenues are planned, and the share of such revenues increases, as confirmed in the paper. This indicates that it is necessary to manage available budgetary resources rationally and efficiently in order to better meet public needs.

THE AGROKOR GROUP'S ROLL-UP FINANCING: BUSINESS AS USUAL OR A DEVIATION FROM COMMON PRACTICE

Zoran BUBAŠ, Ph. D.
City of Zagreb

E-mail: zoran.bubas@zagreb.hr

Abstract

In Q1 2017 Croatian policymakers prepared a legislative act that, over and above the ordinary pre-bankruptcy and bankruptcy procedures, envisaged a special reorganization regime for a distressed company of “systemic importance”. The Republic of Croatia Systemically Important Company Emergency Management Procedures Act stipulates that, during a one-year period, the systemically important company’s business operations must be stabilized and an agreement on claims settlement between creditors be reached, or standard bankruptcy procedures will be invoked. In case of an activated emergency management procedure, super-seniority post-petition debts may be incurred with the prior consent of the creditors’ council, if used to reduce systemic risk, maintain business continuity, retain assets or cover operational business cost payments. The trigger for the preparation and passage of the lex specialis was undoubtedly the situation in Agrokor, the financially troubled largest privately-owned company in Croatia and one of the leading regional companies, and indeed, immediately after the lex entered into force, this emergency management procedure was initiated in the Agrokor Group. In critical moments for the company i.e. mid-April 2017, the emergency management arranged a syndicated revolving facility of €80m, followed in June 2017 by a new debt deal in the amount of €1.06bn. The latter one, the (in)famous so-called roll-up financing, raised such a tide of public’s questions about its (un)suitability that just a few months later, when new debt creation was enabled in pre-bankruptcy procedures through the legislative amendment of the Bankruptcy Act, the Croatian lawmakers apparently shied away from the possibility of rolling up pre-petition debts. This paper provides insight into this type of financing and how it became

part of Agrokor's new debt, whereby distinctly underscoring that the existence of a systemic crisis management framework based on entirely transparent and well-argued processes is a necessity if public credibility of the process and its participants (stakeholders) is to be preserved.

Keywords: *financial distress, emergency management, roll-up financing, transparency.*

1. INTRODUCTION

On April 6, 2017, the Croatian Parliament passed the Republic of Croatia Systemically Important Company Emergency Management Procedures Act. The Lex instituted a special reorganization regime for any distressed company of “systemic importance” and was expeditiously published on the same date and became effective the next day. Immediately after the law entered into force, this emergency management procedure was initiated in the Agrokor Group, one of the leading regional companies with total revenues of €6.4bn and almost 60,000 employees. The larger the troubled company, the stronger the negative economic impact and social burden of its fall – accordingly, the greater the government’s courage to act (Eklund et al., 2018; Lee et al. 2011).

The distress of this Croatian-based conglomerate and its debt overhang was in public’s perception the obvious motive for the preparation and singular purpose of the legislation; therefore, the law is commonly referred to as “*Lex Agrokor*.” On the other hand, in his statement of reasons for the legislative proposal, the Croatian Prime Minister said in Parliament that: ... it is not ‘*Lex Agrokor*’, it is a bill whereby Croatia and the government are protecting the interests of the Croatian financial system, the economy, the workers and employees of Agrokor, family farms, suppliers and all stakeholders that are currently involved in the processes connected to that largest Croatian company (Government of the Republic of Croatia, 2017). Be that as it may, the stipulated purpose of the EMA is “to protect the business sustainability” of the systemically important company and hereinafter the Lex is referred to as the EMA (Emergency Management Act).

With the passing of the EMA, the Croatian legal framework was supplemented with some rather unique modes for protecting the viability of trou-

bled real economy firms of “systemic importance”.¹ Compared to the Croatian pre-bankruptcy or bankruptcy procedure, an important novelty in the EMA was that it would allow new debt creation, and through the legislative amendment of the Bankruptcy Act in November 2017 this option was also introduced in pre-bankruptcy proceedings. Under the EMA insolvency regime, the emergency management of Agrokor arranged and the creditors’ council approved two interim financing deals. Agrokor’s second new-debt deal from mid-2017 was a roll-up in a total of €1.06bn, half of which being pre-petition debts that were rolled up to super priority. However, the roll-up became so tarred and feathered by the public that the Croatian lawmakers practically shied away from this interim financing model just a few months later.²

With the rationales behind interim finance and its common practice as a framework, this paper deals with Agrokor’s roll-up financing. Generally, the aim is to see how they differ if at all. The article’s part two briefly underlines some whys and wherefores of interim financing and roll-ups. While the overview of Agrokor’s post-petition debt is given in chapter three, in this central part of the paper, special emphasis is placed on the bargaining environment and the leading post-petition lenders. Case-specific issues are discussed in part four, followed by concluding remarks.

2. INTERIM AND ROLL-UP FINANCING

When a company ends up in financial distress, financing its business operations becomes extremely difficult, even impossible as the creditors and suppliers

¹ That is, besides (ordinary) Croatian pre-bankruptcy and bankruptcy procedures (see Čuveljak & Rašić, 2017; Rubinić & Bodul, 2018). From international perspective the EMA is not so unique, as two Croatian members of the EU parliament pointed out in their question for a written response to Commission Rule 130 (European Parliament, 2017). The Croatian EMA resembles in terminology and content to the Italian special procedure for large insolvent companies and Chapter 11 of the US Bankruptcy Code. For insight into the Italian procedure see e.g. Belhocine et. al. (2018), Garrido (2016), Clifford Chance (2015, pp. 58-79), or Manganelli (2010) who compares the US Chapter 11 and the Italian extraordinary administration for large insolvent companies.

² While explaining the amendments to the bankruptcy law in parliament (27. October 2017), the Croatian Minister of justice explicitly ruled out the roll-up possibility for interim financing. He persistently emphasized that, if the bankruptcy process is invoked, seniority status is given with the exception of the first higher-ranking creditors to no more than the amount of provided interim financing. This argumentation, while true for bankruptcy, is flimsy regarding the pre-bankruptcy procedure. Despite the impression the Croatian lawmakers tried to make during parliamentary bickering, such limits were not foreseen for the latter i.e. roll-ups are nevertheless possible.

retreat to reserve positions, unwilling to extend their exposure to looming business failure. Pre-bankruptcy and bankruptcy regimes serve as frameworks for denouement (business turnaround or winding down) within a reasonable time. Placed between the hammer and the anvil, the stakeholders must decide about their best interest, and if their correction of expectation will be towards going concern i.e. business continuity, they mostly must accept that new financing³ is a *sine qua non* for keeping the business alive during the corporate reorganization.

Depending on the distressed company's balance sheet as well as overall market conditions, lenders without a prior lending relationship with the debtor or those with pre-petition exposure can be approached. On the ordinary loan market, participants rarely seek for opportunities to provide financing to troubled businesses, no matter how appealing rates and/or fees they could charge. The more conservative, traditional lenders are restrained from borrowing to desperate, overindebted firms; their risk appetite is simply too small and often regulatory constrained. Therefore, interim financing is more often sought from the distressed company's existing lenders. Without outside competition, the existing lenders have the upper hand: they are in a position to insist on advancing the priority of their pre-petition claims in return for extended financing. Some categories of original debtholders will rather prefer not to extend their risk exposure and give way to "outsiders" that are willing to obtain a seat at the table.

By acquiring pre-petition claims from risk-averse creditors, investors seeking high-return enter the distressed company's capital structure.⁴ These players do not enter the game in order to be passive bystanders, instead, they are most active in pursuing superior returns through a business turnaround or lend-to-own strategy.⁵ In many situations, they are crucial for obtaining the needed financing and they determine the overall restructuring direction. Namely, interim/new financing and the restructuring process are often causally connected through loan provisions that force the distressed company to achieve certain milestones within a rather tight timeframe. The shortfall in achieving these ob-

³ New financing and new debt, as well as interim financing and post-petition debt(s) are in this paper used as synonymous terms. Under the US Bankruptcy code, the new financing is known as debtor-in-possession (DIP) financing.

⁴ As emphasized by Levitin (2009), although claims trading is an actuality, the standard arguments about claims trading still focus on whether claims trading should or should not be allowed.

⁵ See, generally, Jiang & Wang (2012), Baird & Rasmussen (2010), Harner (2008), Goldschmid (2005), Hotchkiss & Mooradian (1997).

jectives penalizes the company mainly through dramatically worsened financing conditions, thus weakening the already challenging financial situation. Since financing conditions combined with milestones are a power-shifting advantageous tool that can be prejudicial to other stakeholders, the court scrutinizes and carefully weighs them against the disruption they can cause.

Under the trustee's and court's supervision, creditors have to agree on the claims settlement and the reorganization plan whereby the new liquidity provides fuel for and serves as proof of operative (none)viability of the business engine. During this most challenging time in a company's life, it is of utmost importance that the stakeholders respect the rules of the game and do not overstep the line of fairness in a basically zero-sum game. Therefore, in most jurisdictions, the commercial or bankruptcy court has the final say about the appropriateness of new financing and/or restructuring for the troubled business. Debtors are rarely in condition to obtain post-petition unsecured financing. Their burdened balance sheet set them on the other side of the spectrum where first priority lien on the unencumbered assets, and/or second priority lien on remaining encumbered assets serve as minimum standard protection mechanisms. In many situations these options are also exhausted, so most jurisdictions foresee granting administrative priority/super-priority to post-petition debts, ranking them above or equal to all other secured debt. Basically, the "last in, first out" principle serves as lender's assurance that they are most likely to be repaid, even if the company ends up being liquidated. There is a diversity of approaches amongst insolvency regimes as the mechanisms of interim and/or restructuring financing are tailored according to the country's legal culture and norms.⁶ Simply transplanting ideas that work well elsewhere could do more harm than good in other regimes (McCormack, 2017; Payne & Sara, 2017, p. 33), e.g. introducing priming that allows existing security interests to be overridden could potentially jeopardize the funding for distressed companies that existing lenders are currently prepared to provide.⁷ Keeping that in mind, this paper looks at the roll-up financing, an option that is mostly found in the US and Canadian practice of corporate bankruptcy reorganization financing. In mid-2017 this option was applied in a large European insolvency case, under

⁶ See e.g. ELI (2017, pp. 215-221) regarding the distressed business financing diversity in Europe.

⁷ For discussion of interim financing and European union efforts to harmonise insolvency laws, see e.g. de Weijjs & Baltjes (2018) and Tollenaar (2017), McCormack (2017), Epeoglou (2017).

extraordinary circumstances of a speedily created “systemic importance regime” in Croatia.

A roll-up is a form of defensive interim financing i.e. provided by pre-petition lenders on the condition that, effectively, the pre-petition debts are bought out by the new credit facility. The debtor draws on the new loan to pay off part or all lender’s pre-petition claims.⁸ Thus, the new lending arrangement directly improves the prospects for pre-petition debt repayment and enhances the lender’s influence over the process. In that regard, the roll-up is closely related to cross-collateralization, another extraordinary financing provision where the post-petition lender obtains a security interest that serves as collateral also for his pre-petition claims. Both provisions improve the post-petition lender’s recovery prospects for their pre-petition claims to the detriment of other creditors and are therefore questionable regarding the *pari passu* principle violation.

In general, the approval of post-petition financing depends on convincing the court that another form of financing is unavailable on better terms or at all and that the lender favoring package is in the best interest of the troubled business. In practice, the “aggressiveness” of the roll-up financing is somewhat alleviated by arranging the post-petition advances over time rather than in a lump sum, and/or by applying business cash receipts received post-filing to extinguish pre-filing indebtedness, while the (new) lender’s advances are used to pay post-filing working capital needs. This “creeping roll-up” is essentially less challengeable than the direct usage of new funds for the repayment of pre-petition claims. The discussion about the permissibility of roll-ups and other forms of new lenders protective facilities is far from being over in both North American jurisdictions, and the judicial consensus is not likely in the foreseeable future. Instead, cases in which roll-ups have been approved serve as “general guidance” for avoiding potential issues of overprotection and excessive creditors’ control.

Jurisdictions, where the roll-up (interim) financing has been practiced for decades, have the most valuable knowledge repository for countries that are rethinking its implementation into their insolvency regimes. Reforms should normally be preceded by an in-depth discussion of fundamental pros and cons,

⁸ An illustration that compares DIP loans with and without roll-up can be found in Tung (2018, p. 33). He provides empirical analysis of 292 large US public company bankruptcy filings from 2004-2012 and reveals that in 182 cases DIP loans are present, of which 98 contain roll-ups. Almost $\frac{3}{4}$ of the roll-ups (43% of of the DIP loans in the sample) were 100% roll-ups i.e. all of the lender’s pre-petition claims were rolled-up.

challenges and potential implementation pitfalls. In the case of Croatia's insolvency regime intervention i.e. the EMA, any public or broader expert discussion was left out; due to the economic and political challenge looming from Agrokor's business failure, the government delivered a fast-tracked *ad hoc* response. The Lex was prepared under wraps, but whatever best intentions and measures may be adopted, secrecy can not pass publicly unchallenged. Despite great understanding for the Agrokor's case-specific urgency, the Croatian public is fully justified in expecting transparency - if not *ex-ante* then at least *ex-post*. When the dust settles, the general public's and experts' questions should be answered, leaving as little space as possible to speculative interpretations that undermine the confidence in the economic and legal ecosystem.

3. AGROKOR'S POST-PETITION DEBT

In critical moments for Agrokor i.e. mid-April 2017, the emergency management arranged a debt deal of €80m with four domestic banks, followed in June 2017 by a new deal in the amount of €1.06bn. The first financing, realized during the first days of the extraordinary administration, was emergency financing of, at the time, blocked company accounts. This super-senior revolving facility was initially planned in the amount of €150m, however, two (Russian) banks refrained from participation. The loan was arranged with a repayment period of 12-15 months and the interest rate of approx. 9.5%. However, the €80m was just an immediately necessary fire-fighting loan, not sufficient to satisfy the Group's liquidity needs. The trustee and his management identified that for long-term stability and viability of Agrokor's operations almost €0.5bn was needed, half of which were operating cash needs to normalize operations and fund seasonal cycles, €150m for payments of pre-petition trade claims of critical suppliers (ensuring supply continuation) and €80m for the refinancing of the above-mentioned revolving facility. Only two financing proposals were received, of which the "SPTFA lenders" proposal was accepted.

According to the emergency management, the following €1.06bn deal with super-seniority status (Super-Priority Term Facilities Agreement – SPTFA) served mainly to balance the liability and receivable maturity structure in anticipation of the summer season and to fully repay the previously arranged €80m loan. In practice, one half of the €1.06bn loan was foreseen to refinance the pre-petition debts of creditors who decided to participate in the new financial

agreement by rolling up their old claims to super-priority on a one-for-one basis, i.e. applying a 1:1 ratio between new money and old debt raised to super-seniority. The remaining part of the loan was to be used for liquidity, payments of pre-petition claims from suppliers with allocations to micro-suppliers, historic suppliers that will continue to supply goods on industry standard terms and a discretionary fund for other suppliers. The maturity was agreed at 15 months counting from the commencement of the EMA, with the option of earlier repayment as well as extension. During these 15 months period, the interest rate was in the area of about 4%. The facility was extendable, however with significantly rising costs of debt. The interest rate practically doubled for the remainder of 2018, and if not repaid by year-end, the effective interest rate would rise over 10%, with a monthly 0.5 percentage point increase.

According to Debtwire (2017), in the US during the 1H 2017, 76 interim financing deals were arranged, providing over USD 12bn of lending to 66 financially distressed companies. Out of that, almost USD 11bn was provided by pre-petition lenders and on aggregate, every third deal was a roll-up. Measured by the total and roll-up amounts, Agrokor's deal would be in the top three most substantial North American roll-ups of the first half of 2017. With one exception, the larger US deals i.e. with roll-up amounts above USD 100m and total amounts above USD 200m have rolled-up a larger percentage of the total amount than Agrokor's 50%. With its initial interest rate below 6%, Agrokor's financing is comparable with 10% of the best US debtor-in-possession financing arrangements. However, due to the facility extension, Agrokor's final, effective interest can be expected in the upper part of the 6%-12% range, where over 70% of US 1H2017 deals were situated. Of the 76 US market arrangements, there were only three with all-in costs below 5%, while 28 deals were between 5-10% and 20 between 10% and 15%. Under the assumption that Agrokor will refinance the SPTFA by mid-2019, its maturity would be in the rank of the longest US deals, whereby the largest among them had a maturity of at least twelve months.

The idea of the abovementioned roll-up financing structure was introduced by Agrokor's new key bondholders led by Knighthead Capital Management (KHCM), an employee owned hedge fund sponsor.⁹ They were buyers of debt

⁹ According to KHCM's co-founder Thomas Wagner, KHCM bought their first bonds in January 2017, at the price of 85 to 90, and they became Agrokor's largest bondholder during March 2017. He also stated that they would not buy Agrokor bonds if they had knowledge about inaccuracies in

notes that, due to the avalanche of negative news¹⁰, the initial holders sought to get rid off. After the EMA was activated for the Agrokor Group, KHCM became the representative of bondholders in the five-member interim creditor council.¹¹ The EMA stipulates that post-petition debts may be incurred only with the prior consent of the creditor council, and if used to reduce systemic risk, maintain business continuity, retain assets or cover operational business cost payments. Article 39 of the EMA defines new financing as debt with super-priority except for workers claims, while Article 40 opens the possibility for pre-petition financial claims to be paid during the extraordinary procedure if they are connected to debt claims which have super-priority. Principally, these are the essential legal prerequisites for the application of the roll-up financing model under the EMA regime.

At first glance, the buying of Agrokor's precipitously declining bonds in Q1 2017 seems to be an irrational move, but for investors that are specialized in making money out of distressed companies, that is exactly the right time for entering the game. This contrarian investing is known as distressed debt investing¹², a form of event-driven deep value investing. Because these investors often seek opportunities in idiosyncratic business failure events, in the popular press they are sometimes disparagingly referred to as "vulture investors". However, although these market participants are indeed found around "sick or wounded" businesses, their role in the financial ecosystem is nevertheless opposite from the natural role of these birds of prey (Goldschmid, 2005; Hotchkiss & Mooradian, 1997). That is firstly because these market players are providers of liquidity on the secondary market when debt and equity instruments of troubled businesses have extremely low ratio of buyers to sellers and secondly, they provide liquidity and/or capital directly to the distressed firm in critical moments when the usual providers are restrained due to looming business failure. Investments in distressed debt and the activities of distressed investors are

the financial statements (Wagner, 2017). However, this issue was redflagged already in mid February - see e.g. Smith (2017a, 2017b), Hafenden et. al. (2017) or Reuters (2017).

¹⁰ See e.g. Moody's Investor Service (2017a, 2017b, 2017c); Garaca, M. (2017a, 2017b).

¹¹ According to the EMA, the creditors influence the process through a creditor council of up to nine members, each representing a group of creditors. In Agrokor's case, the trustee proposed, and the court initially appointed, an interim five-member creditor council representing groups of creditors (small and large suppliers, bondholders, unsecured and secured creditors). The interim council has all the powers of a permanent creditor council until the latter's establishment.

¹² For an overview of distressed debt investing from the alternative investor's perspective see Jain (2012).

often key to successful turnarounds of financially troubled firms, and these are undeniably high-risk investments. However, as the risk-return tradeoff states, if their engagement turns out well the investors are awarded the right high return. The distress-oriented investors' archetype investment target is the overleveraged business for which tenable arguments about its fundamental viability subsist. Therefore, it is not surprising that these specialists in search of "viable weakness" set their sights on the troubled Agrokor.

The published list of some thirty Agrokor's SPTFA "new money" suppliers (SeeNews, 2017) revealed two types of lenders: (a) distress-oriented investors and (b) financial institutions that were pre-petition creditors. While the banks participated in the roll-up financing to reduce the overt final loss from their pre-petition credit exposure, the distressed investor group's key motive was to lock-up their ROI. Except for few banks, the list represents a cross-section of players in the distressed securities market e.g. hedge and specialized debt funds, private equity firms, brokerage firms, and even private investors. The list also indicates that KHMC was the largest individual roll-up participant, and by far the largest creditor from the distressed investor group. From the cumulative initial creditor participation in the SPTFA (Agrokor, 2018a, p. 8) arrises that bondholders refinanced €223.4m, thus having an implied SPTFA participation of €446.8m, in which KHMC contributed about 45%.

In the bargaining environment of Agrokor's emergency management i.e. creditors' council, KHCM stands out in several ways. As a distress-focused investor, they are a "repeat player" in the field, with sophisticated analytical and negotiating skills, expertise, networks and legal background (Lim, 2010). In other words, they have lots of experience in clearing inefficiencies in financial distress situations, compared to little or no experience of other participants in this settlement process. In a simplified view of the bargaining arena, a deal is reached when the parties agree, formally or informally, on shared norms about who gets what and how much. Reaching the agreement is more likely to be accomplished with the existence of focal points i.e. someone that will provide an understanding of what form a recovery/restructuring plan should take (Baird & Rasmussen, 2010, p. 688). The distress investor representative seems to be the natural-rational pivot choice, especially if the demand for speedily bargaining facilitation is present. Other professionals with shaping influence on the

processes in Agrokor are the key restructuring turnaround and legal advisers.¹³ From an adviser list of international and Croatian professionals, the latter were providers of local support to leading international firms that share a common global environment with distress investors.

The main operational role is assigned to the emergency management i.e. the trustee, who is the formal execution of the troubled business and runs it until the creditors come to an agreement. He is the shuttle diplomat who helps resolve eventual disputes and steers the process actively toward accord and operational sustainability. The Croatian legislators did not foresee any commercial court role regarding the suitability of post-petition financing, only the consent of the creditor council that decides by majority vote. The court's role under the EMA is indeed more passive, compared with the pre-bankruptcy and bankruptcy procedures, although being still a formal material factor, since important milestones in the process require a court decision.¹⁴ After the High Commercial Court confirmed the settlement plan adopted by the creditors, the next step would be its implementation i.e. transfer of operations to the "New Group" and wind-down of Agrokor Group. The SPTFA will be refinanced into the Exit facility. However, the leverage implied by the total of the expected debt amounts outstanding indicates that Agrokor has no further debt capacity. The debt-market testing for a facility to refinance the SPTFA resulted with only 11 indicative bids out of 76 contacted financial institutions. Potential Exit facility creditors raised concerns about the Group's high leverage, EBITDA and cash flow forecasts, lack of a permanent management team; political and legal risks, uncertainties regarding the transfer of assets to the New Group and the perfection of

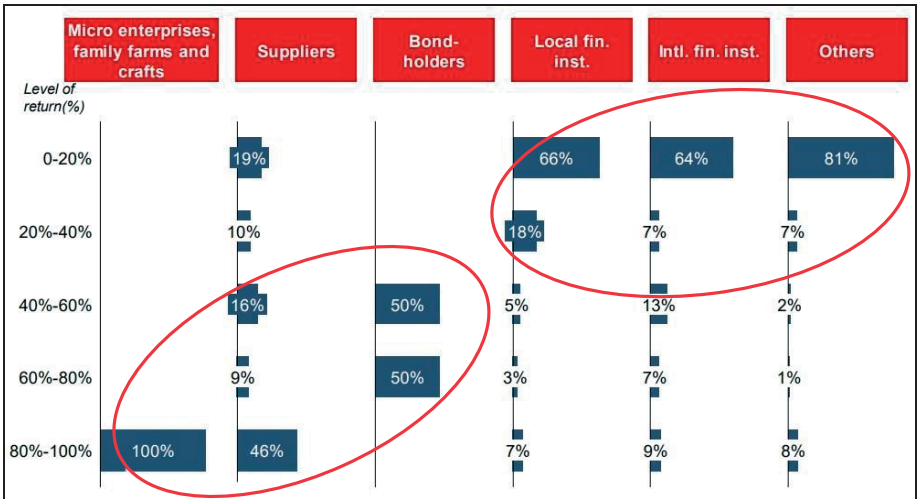

¹³ Edward I. Altman remarks that the (viable) financial market demand and supply dynamics provided the incentive for „a special breed of investors“, that are experienced in distressed investing and able to attract capital. They provide to original investors the potential to monetize their troubled assets and are lasting throughout the duration of the bankruptcy process (Altman, 2013, p. 10). In Altman's opinion, the reasonably effective restructuring of defaulted debt comes from combined efforts of the bankruptcy law professionals and restructuring specialists, including investors, broker-dealers and turnaround management consultants (Altman, 2013, p. 5)

¹⁴ The United Nations Commission on International Trade Law (UNCITRAL, 2004) as well as the World bank (2016) advise that the process is overseen by a court and emphasize the importance of active creditors participation in the insolvency procedure. The choice of a creditors committee as the principal vehicle for mediating the interests of the general creditors as a group may be due to the fact that settlement procedures guided by Croatian courts are in practice far from being efficient and effective. For insolvency proceedings time is very often of critical importance, and with limited capacity of the judiciary it seems reasonable to diminish some of the court's role and allocate the decision making to the creditors committee, while still respecting that the insolvency proceeding is a judicial proceeding (IMF, 1999).

security granted to secure the New Group’s obligations under the Exit facility, etc. These concerns made refinancing prior to the launch of the settlement plan unviable, and the emergency management decided to extend the SPTFA in anticipation that investors’ uneasiness would be soothed at a later date.

Moody’s assessed mid-2017 that corporate family recovery prospects may fall toward the lower end of the 35%-65% range and that the recovery prospects for the senior unsecured notes are likely to be less than 35% (Moody’s Investors Service, 2017d). A year later, the extraordinary administration presented that all small suppliers i.e. some 2,400 micro firms, family farms and crafts received repayment of all their claims and that approx. 4,850 suppliers recovered 60% on average (excl. of the SPTFA). Bondholders and suppliers suffered lower claim write-offs than financial institutions (Agrokor, 2018b, p. 9). The bondholders will also hold 25% ownership share in the New Group. Figure 1 indicates that no bondholder will recover less than 40% and half of them should recover between 60%-80%. Moreover, the group of three creditors in the left half of figure 1 seem to have fared better than the opposite side. In the five-membered creditor’s committee, they represent three votes.

Figure 1: Claims recovery by the level of return and number of companies (in %)

The fact that the same key stakeholders were involved in the preparation of the EMA and in the implementation of the law was a fertile ground for criticism

that came primarily from stakeholders who were left out of the settlement process. The non-participation of equity holders at the bargaining table stemmed from the simple fact that Agrokor Group's equity was €1.9bn out-of-the-money at FYE 2016 (figure 2) and €2.7bn at FYE 2017 (Agrokor, 2018c, p. 11).

Figure 2: Agrokor Group's consolidated equity change from 2014 to 2016 (in €, year-end)

Source: Adapted from Agrokor (2017, p. 10).

Guided by the going concern principle, the EMA is a dynamic upgrade of the Croatian bankruptcy framework in which two important features for curing debt overhang are integrated, namely bankruptcy's automatic stay and post-petition financing (Ayotte & Skeel, 2010, pp. 476-477). Due to the automatic stay that puts a stop to creditor collections, the interim financing proceeds can be directed to business operations and not to the repayment of pre-bankruptcy creditors, thus crucially increasing the likelihood that private post-petition financing will be available. Roll-up financing, especially cross-collateralization, is in that sense controversial, although generally acceptable if proved that existing lenders are willing to provide better financing terms than other lenders, and that harmful or detrimental results for other creditors are likely small. Contrary to the practice applied in Agrokor's case, the evaluating role usually belongs to the court and not to the (interim) creditor counsel. Altogether, it seems that professional distress investors led the creditor coalition building process by successfully transforming their crucial advantage, namely professional experience, and knowledge, into a settlement plan that secured the buy-in of other key voting stakeholders. With the settlement reached, the EMA fulfilled its main purpose in Agrokor: the in-law rooted preference of business continuation. The

settlement implementation process will formally end with the transfer of Agrokor's business activities to the new Group, marking also the final milestone of completing the extraordinary administration procedure. At the same time, this is the beginning of the next crucial phase of unknown duration, from which a successful business restructuring, that will ensure the long-term stability and viability, is expected.

4. CASE SPECIFIC CONSIDERATION(S)

Given the great public interest in this unprecedented case, the process itself was heavily scrutinized and criticized. In that regard, one stumbling brick proved to be impassable for two key people, namely Croatia's deputy prime minister (and minister of economy) and the extraordinary trustee. They resigned from their posts in first half of 2018 amid allegations of conflict of interest arising from the fact that the deputy PM prepared the EMA with a group of consultants in secrecy, that one of the workgroup members became the extraordinary trustee in Agrokor and that some of the informal group members indirectly received lucrative engagements as consultants in Agrokor during the extraordinary administration. The state attorney's office investigated and dismissed the allegations, while the Croatian Conflict of Interest Commission (CCIC) decided that the former deputy PM and the actual Minister of Finance¹⁵ violated the principle of holding public office by failing to act transparently, credibly and responsibly (HINA, 2018). The CCIC's admonition to the two public officials reflects the standpoint that, unlike the usual understanding of the concept, conflict of interest, in general, does not refer to actual wrongdoing, but rather to the potential to become involved in improper acts (Speck, 2006). Lo & Field (2009, pp. 45-48) emphasize that the relevant primary interest in the making of professional decisions should not, in and of itself, be seen as outweighed by a secondary interest i.e. biased personal preference stemming from a previous collaboration. However, the fact that Agrokor's first extraordinary trustee indeed came from the group of experts that were involved in drafting the EMA and being that these connections were involuntarily revealed through the leaking of private e-mail correspondence created an appearance of impropriety that

¹⁵ Prior to his nomination as Croatia's Minister of Finance in February 2016, he was an employee of the Agrokor Group for four years as the executive director for strategy and capital markets, responsible for international financing, investor relations and M&A.

undermined confidence in the public officers and their professional activities (Callaghan, 2016). In other words, conflict of interest was present, but it was not a legal matter (Peters & Handschin, 2012, p. 20). In terms of political ethics, this case irresistibly recalls the basically utilitarian theory where actions and means of political agents that would otherwise be seen as wrong are “permitted for the sake of the public interest”. But unlike for instance national security issues, in economic matters concealment can hardly be justified by extraordinary conditions. Transparency, accountability and the rule of law are interconnected universal values that rest on a partnership between officials of the state and its citizens, and secrecy undoubtedly undermines that relationship (Johnston 2006, p. 3).

In bargaining situations, from a cooperative game theory perspective, focal points play an important role (Schelling, 1980). These “Schelling points” are stable norms or conventions in a form of common knowledge or understanding among a population of agents that, if followed, maximize their interest i.e. their joint welfare. For at least the past two decades, in insolvency cases where stockholders’ equity is negative, such “order without law” (Ellickson, 1991) is that the shareholders do not participate in the bargaining i.e. settlement process (Baird & Rasmussen, 2010, pp. 688). Consequently, the extraordinary trustee is relieved from the fiduciary duty to the equity holders and owes it to the troubled business creditors. Under the EMA, their interests are protected by the creditors’ committee, whose five members have a fiduciary responsibility to the class of creditors which they represent. Owing loyalty to their constituency, committee members may not use their status to further their own interests at the expense of other creditors (Krudys, 1994, p. 117). Although members of official creditors’ committees, as well as creditor steering committees, generally have no fiduciary duty to the debtor, due to the knowledge of material non-public information they have a duty of confidentiality and may be viewed as “temporary insiders” of the debtor. From that perspective, for distressed debt investors that are involved in debt trading, membership in creditors’ committees can be problematic (Neier & Schoch, 2013; Pearson, 2009; Groskaufmanis & Ochs, 2007; Sprayregen et al., 2004). On the other hand, distress investors like KHCM often assume the leading role in post-petition financing that is in most cases not only necessary in order to give the troubled business a chance of survival but is also beneficial in the process of negotiating a rehabilitation plan. From a trustee’s duty and main goal perspective, it is obviously rational to propose a seat

at the creditors' committee table to such a "buy side" investor that has expertise and experience in clearing inefficiencies in insolvency situations.¹⁶

Due to the size and complexity of Agrokor's case, the circumstances in which the previous and current trustee were fulfilling their duties were indeed difficult. The trustee's legal liability risk from potential duty violation was wisely mitigated by obtaining advance approval of the creditor's committee before making decisions with conflicting potential. However, the previous trustee did not escape the hail of robust public concerns and criticism, with conflict of interest objections being the common denominator. After assessing that his exposure to pressures could endanger the entire process and without a legally proven wrongdoing, the trustee decided to resign from his post. The failure to disclose pre-petition "connections" was a major tailwind boost for public objections about favoritism (cronyism). It is easily imaginable that these were asserted for other aspirations i.e. obtaining a perceived contest advantage by discrediting the key player(s) in the process but even so does not matter from the standpoint of compliance. Conflict of interests is damaging when revealed involuntarily or belatedly - actual, potential or perceived, direct or indirect, benign or material, with legal consequences or not.

Being that seemingly no constituency or party-of-interest in this process was spared of criticism raises inevitably the question of its foundations and about prevention of distortions with potential to mess-up or disrupt the reorganization processes. The (non)validity of concerns about Agrokor's post-petition financing as well as actual and potential conflicts of interests could have easily been determined under accurate and complete disclosure rules. The Croatian pre-bankruptcy and bankruptcy legal framework including the EMA does not contain any provisions that address conflict of interest. While being regulated in the public sector since 2011, the Croatian corporate sphere is still in need of at least soft-law guidelines and/or safe harbor procedures regarding conflict of interest issues. Although it will probably never be possible to list all the rules, fears of overregulation are just poor excuses for nonregulation. Even in circumstances with no specified local guidelines, international standards of business ethics and professional common sense do provide an aplenty guiding light for

¹⁶ What thereby must be considered is the necessity of effective "Chinese walls" that keep the confidentially obtained information by individuals on creditors committee separated from the distress investor firm's trading part.

individual conscience, be it managers, officials, trustees, council members, advisors or owners.

5. CONCLUSION

Agrokor's insolvency resolution process was conducted under the EMA, a special reorganization regime for a distressed "company of systemic importance". Such terminology implies the inherent presence of public interest in the form of preserving the national economy from problems at the unhealthy company that spread, like a contagion, to the entire system. Therefore, all constituencies, decision makers and/or stakeholders should in principle align their interests with the primary i.e. public interest objective. In general, the reaching of a settlement agreement in this exceptionally complicated case indicates that this main purpose of the law is fulfilled. Due to the unprecedented nature of the case in the Croatian context and even at a European scale, virtually all aspects of the procedure were heavily criticized by various concerned parties in the process. While some concerns lose meaning when compared with international practice e.g. Agrokor's post-petition financing compared with interim financing in North American jurisdictions, the objections generally regarding conflict of interest seem to be on firmer ground. *Ex post*, such criticism can hardly be dismissed, but it could still be mitigated by disclosing information that the public considers relevant. Due to the obvious lack of domestic experience and knowledge in addressing and clearing business inefficiencies of similar magnitude, the need for clarifications was even more pronounced. For example, regarding the roll-up financing, more complete and accurate information of the explored financing alternatives would have been soothing. In the absence of publicly available and more detailed evidence that the company was unable to obtain alternative financing on better terms than were offered by the SPTFA facility, its fairness, rationality, and adequacy under the circumstances will most probably remain questioned until proven otherwise. Overall in that regard, the Agrokor case does not show deviations from the usual practice, except that a neutral assessment on the above matters, usually provided by the courts, is not provided in the EMA. Therefore, even more, important seems the need for disclosure of analytically strong evidence that substantiates the decisionmakers actions and dispels the shadows of doubt about "tailor-made" law, processes and individual interest favoritism. Timely transparency has an appealing effect on the volatile nature of

public perception, in contrary to the lack of transparency which, when discovered, harms the stakeholders' and due process reputation. The absence of a legal basis, regulation or other heteronomous legal or 'soft' sources of duly practice does not mean that utmost transparency is redundant. In fact, it goes without saying that business ethics principles, as well as common moral rules that apply to everyday life, are quite suitable for self-assessment before undertaking action. The thoughts of Peter Drucker (1981, p. 36) about society's rightful expectations that managers, executives, and professionals shun behavior they would not respect in others can serve as a reminder to ask ourselves the right questions at the right time. Indeed, the Agrokor case demonstrates that questioning just the legality of possible, alternative actions are not sufficient.

Abstract

The primary goal of this paper is to define measures for attracting the investments and to develop a communication strategy for entrepreneurial zones of small towns and municipalities with a population of up to 15.000 inhabitants. The cities which develop an investment attraction plan have a key role in creating enticing entrepreneurial zones. This paper describes the most successful entrepreneurial zones in Croatia that are located in different regions. The comparison of Croatian cities with the best measures and communication strategies is presented. There are several significant factors for investors to make a decision about the entrepreneurial zone selection. Research on investors from different sectors has been conducted with the aim of improving the quality of incentive measures. Based on the results of the research, a case study of entrepreneurial zones in the town of Slatina was created. Slatina is located in Virovitica-Podravina County and it does not have well-developed incentive measures nor communication strategy. The case study includes current state analysis of entrepreneurial zones, a problem analysis, and SWOT analysis. A comparative view of entrepreneurial zones in Slatina and entrepreneurial zones in other, more developed cities, as examples of best practices, is made. An

investment attraction plan and communication strategy for entrepreneurial zones in cities and municipalities of up to 15.000 inhabitants have been developed, with measures, cost-effectiveness, their impact on employment growth and the impact on the annual budget of the city. Research results show the importance of planning and establishing quality measures, as well as a communication strategy that leads to potential investors. Successful investment attraction plan has a strong impact on the economic growth of the cities as well as the social impact driven by employment growth.

Keywords: *entrepreneurial zones, investment attraction plan, communication strategy, small towns*

JEL Classification: M30, O16

1. INTRODUCTION

The impact of entrepreneurial zones and incentive measures is of great importance for local, regional and national development. With the aim of creating the value of infrastructure-equipped entrepreneurial areas and high level of location competitiveness, giving investors a number of incentive measures and benefits for the business of a particular environment recognize the importance and invest in them. The status of entrepreneurial zones in the Republic of Croatia will be best seen through an overview of incentive measures and facilitators for investors and the level of equipment for entrepreneurial zones.

The paper deals with the description and comparison of prominent entrepreneurial zones (Bakar Industrial Zone, PODI, Ivanec Industrial Zone, EIZ Nematina, Economic Zone Antunovac), which are the most successful in the Republic of Croatia. By investigating the main holders of attractiveness in the entrepreneurial zone, an analysis of the comparison of the most successful categories was conducted. The detailed presentation of the entrepreneurial zone in the town of Slatina rounds off the concept where an appropriate communication strategy can be applied which will provide current and future investors with the necessary information and guide them to the many advantages it provides.

The paper gives an insight into the description and comparison of entrepreneurial zones in the Republic of Croatia, which defines and clarifies the basic elements for an easier understanding of the investment process, entrepreneurial activities and incentive programs. The second part of the paper deals with a com-

parison of the main factors of the attractiveness of investment in entrepreneurial zones, which is defined as the most important for successful growth and entrepreneurship. Along with defining and comparing the main factors, the proposed Case Study presents the advantages and disadvantages of this entrepreneurial zone and gives suggestions for a communication strategy and improving the conditions for attracting new investors. Finally, conclusions are drawn on the basis of collected data that categorize and define the success of a particular entrepreneurial zone.

2. COMPARISON OF THE MOST SUCCESSFUL ENTERPRISE ZONES IN THE REPUBLIC OF CROATIA

In previous research authors Kadlec, Hetrih, and Bedeković (2018) defined that the task of small cities is to develop their strategies for attracting investment, also they have indicated the most attractive measures and incentives for inciting the investment environment in the entrepreneurial zones of small cities. Based on previous research, this paper conducted a case study on investment attraction plan and communication strategy. The Law on the Promotion of Entrepreneurial Infrastructure contains priorities and objectives that provide the need to encourage innovations and knowledge as well as to improve entrepreneurial infrastructure in entrepreneurial zones and encourage entrepreneurship and new employment (Narodne novine 2018). According to the Revised Audit Report on the efficiency of establishing and investing in equipping and developing entrepreneurial zones, investments in the development of entrepreneurial zones reached to approximately 3.5 billion Croatian kunas, mainly invested in documentation, land, as well as in infrastructure and the promotion of zones. Despite all of this, investments have not achieved the desired level of development and efficacy of most of the entrepreneurial zones in Croatia. The audit has provided recommendations for improving the development of entrepreneurial zones. The feasibility study for building a zone and researching investors' interest are some of the audit recommendations. The audit also provided recommendations for exemptions for entrepreneurs (communal fees and contributions etc.) and promotion of entrepreneurial zones (websites, brochures, attending fairs, etc.) (Državni ured za reviziju, 2014).

By comparing programs and measures to encourage entrepreneurship in the zones of a large number of Croatian cities, great similarities can be observed.

They are precisely reflected in the quality implementation and monitoring of the success of the measures and their adaptation depending on the specifics of each entrepreneurial zone. Some measures are aimed at empowering already existing entrepreneurs in the areas while others are more focused on attracting new investors. The paper presents measures to encourage entrepreneurship in five entrepreneurial zones that are located in different cities and different Croatian regions. Their programs include measures adopted by other Croatian cities, but the proactivity of local administration in implementing these measures and a quality communication strategy has brought these entrepreneurial zones to be one of the most successful in Croatia. The aim and purpose of entrepreneurial infrastructure and business environment and their improvement are "the creation of fully infrastructured entrepreneurial areas, high level of location competitiveness that includes the high quality traffic connections of these areas with major traffic routes, and the incentive measures and benefits system for these areas in the local, (regional) and national level within the Republic of Croatia (Narodne novine, 2018). "The selected entrepreneurial zones analyzed in this paper will be described precisely through the above-mentioned aspects as well as the incentive measures and benefits system proposed in the example of entrepreneurial zones in the town of Slatina. Defining Entrepreneurial Infrastructure as an Infrastructure, Incorporating Energy, Utility, Traffic and Communication Infrastructure, it is important to mention the available area of a zone that is defined by law as "a surface obtained by removing the area of land from the total area of a plot that is not intended for entrepreneurs but apply for example to roads, green areas, all types of pipelines, and the like." (Narodne novine, 2018).

Unlike available zones of an active entrepreneurial zone or its area, refers to the area where entrepreneurship has been initiated by an entrepreneur or to start construction work on it. Accordingly, in terms of the Law on Promotion of Entrepreneurial Infrastructure, Entrepreneurial Zones, according to the intensity of activation of available areas, is defined as follows:

1. Inactive entrepreneurial zones - where the degree of activation (occupancy for active entrepreneurs) of the available area of the zone is 0% (0 ha of the activated area of the entrepreneurial zone), after the first year of establishment of the entrepreneurial zone

2. Initial activation zones - where the degree of activation of the zone is <33% of the available area of the zone, expressed in hectares of the area of the entrepreneurial zone
3. Medium active zones - where the degree of activation of the zone is 33% <66% of the available area of the zone, expressed in hectares of the area of the entrepreneurial zone
4. Fully active zones - where the degree of activation of the zone is $\geq 66\%$ of the available area of the zone, expressed in hectares of the area of the entrepreneurial zone (Narodne novine, 2018).

The Bakar Industrial Zone is located in the hinterland of Bakar, 10 km away from the town of Rijeka. The first activities on the construction of the zone started in 1975. One of the main advantages of this zone is its location and an exceptionally favorable geostrategic position, making it one of the best entrepreneurial zones in Croatia. The area has a high-quality road connection and is located on an extremely favorable geostrategic route that connects Central Europe with the Mediterranean (located on the Rijeka-Zagreb motorway and the planned Rijeka-Split motorway, as well as the motorway connecting Rijeka and Trieste). The Bakar zone is only 3 km away from the harbor-traffic knot in Bakar. The railway station Škrljevo is in the immediate vicinity of the zone and connects the zone with the main cities of Slovenia and Croatia, ie Ljubljana and Zagreb. The airport of Krk is 10 kilometers away from the zone.

In the immediate vicinity of the zone is also a land transport network for connection to the LNG terminal in Krk, which will provide additional gas supply (Industrijska zona Bakar, 2019). The industrial zone Bakar on Kukuljanova became the central zone of Primorsko-goranska county and is considered as the most advanced Croatian zone. More than HRK 120 million has been invested in the development of the area, and new investments are also underway in the area's roads and other supporting infrastructure with the aim of faster development of entrepreneurship (Glojnarić, 2016).

The area was built on a total area of 500 ha, of which 225 ha of the free area is currently available. The number of employees in the zone is 3,500 to a total of 150 entrepreneurs, or user zones. The zone is infrastructurally equipped with a water supply system for sanitary water, high voltage network, modern TT network, gas and a split sewage system of rainwater and fecal water. In the brochure of the entrepreneurial zone as one of the most important advantages

for investors, the possibility of repurchase or establishment of building rights, land repayment up to 24 equal monthly installments, the possibility to operate in the free zone regime, the release of utility contributions, compensations and benefits for entrepreneurs engaged in manufacturing activities. There are three types of activity in the zone: production (28%), trade (22%) and service (50%) (Katalog industries zone Bakar, 2019).

The price of the land for sale is determined by the price list of services and is determined by the multiplication of the cost with the coefficient of the type of activity, which for production activities is 1,00 and for the services 1,20. The basic price of land ranges from 66 € / m² and is determined depending on the level of equipment of the land, which is divided into two groups. According to the price list, it is possible to determine additional price differences based on demand and market opportunities, and estimates for the management of the industrial zone. The lowest starting price of the fee for establishing the right of the building and land tenure is 0.35 € / m² and is determined based on the price of the cost and the coefficient based on the degree of equipment (Cijenik za 2019. godinu, 2018).

Entrepreneurial zone Podi is the largest in Croatia by its surface and is considered the most promising zone due to its location close to the motorway, the seaport and the railway, but also because of the strong support of the local community. Entrepreneurial promotion measures in this zone include the release of municipal contributions, a reduced land price of EUR 5 per sqm, as well as obtaining permission from investors for local self-government. The area includes investors from Croatia, Slovenia, Germany, Austria, Italy and the Netherlands (Glojnarić, 2016). The planned area of the zone is 550 hectares, 130 hectares have been built and 100 hectares are available in the zone. All the parcels in the zone are fully equipped with infrastructures, and the most important advantages of the zone are the traffic connections, ie the connection of the motorway zone over the 4 km long local road and the connection to the state road D-58. Near the same area, there are two airports, Trogir, 50 km away and Zemunik 45 km away. Water supply and drainage system have been set up, and the availability of electricity is extremely important for investors investing in production plants. Currently, 5 MW is available in Podi Zone, and an extension of 30 MW is planned. There is also an optical telecommunication cable available in the zone, which is a very important factor in the attractiveness of the zone. The port

and railway terminal are 5 km away from the industrial zone (PODI - Industrijska zona Šibenik, 2019).

The Ivanec Industrial Zone is located along the main roads of the state road D35 and between the Macelj-Zagreb and Varaždin-Zagreb motorways. In the immediate vicinity of the railway line, one of the advantages of the zone is the proximity of the border with Slovenia. The location advantage of this zone is its geographic position in one of the most economically developed counties of Croatia, 22 km away from Varaždin and about 80 km from Zagreb. The surface area of the industrial zone is 30 ha and the maximum surface area is 18.5 ha. So far, 3 ha has been bought by private investors. The main advantages of this zone are its geostrategic position, exemptions, and privileges for investors, competitive land prices and the possibility of expansion. The area is equipped with drainage and sewerage system, gas connection, electricity connection, DTK and telephone installations, and within the zone are asphalted roads.

The Town of Ivanec and the Ivanec Industrial Zone defined the greenfield and brownfield investment facilities. Land price ranges from 10 to 17 € / m² and additional reductions for new jobs are possible. This industrial zone for greenfield investment offers the service of buying land for a well-known investor and fixing of property rights, which significantly accelerates the investment realization process. When obtaining building permits, entrepreneurs are relieved of the costs of land conversion in their entirety. The area is also offered permanent disbursement of municipal contribution payments for greenfield investments, which is a significant exemption for investors investing in larger production facilities. In the case of investments, entrepreneurs are exempt from payment of communal fees in their entirety for the first 5 years of business, which makes this zone more attractive than most other because the other zones have been released in a way that they are released in 100% only in the first year, while in other for years of lower rates of liberation. For brownfield investments, entrepreneurs can also obtain exemptions from paying utility fees in full for a period of 5 years, and a 15% communal contribution, with the option of an hourly repayment. The exemptions for brownfield investments relate exclusively to investments in the manufacturing industry (Poslovna zona Ivanec, 2019). Although entrepreneurial zones in the town of Ivanec are not large, their advantage over other zones in Croatia, but also widespread is a good entrepreneurial climate, local government efficiency, and an excellent communication strategy. In addition to this, the acknowledgment that this city gained in contributing to

entrepreneurship and communication with investors, among which one should be ranked first in the list of top 10 small European cities with the best foreign investment attracting strategies awarded to one of the most authoritative world magazines of specialized for business, Financial Times. Several times, the town of Ivanec was awarded the BFC SEE (Business Friendly Certificate in South East Europe) certificate (Grad Ivanec, 2019). Ivanec is a good example of how cities with fewer than 15,000 people can establish quality measures to encourage entrepreneurship despite small budgets.

The administrative services offered by this entrepreneurial zone and the town of Ivanec further multiply the impact of measures to encourage entrepreneurship. Investors in the area offer expert assistance in realizing investments, privileged pricing and EU project implementation, and free education, counseling and promotion organizations. Entrepreneurs in the zone also offer membership in the “Ivanec Business Club”, which offers them the possibility of joint participation with EU institutions, banks, ministries, and interest groups.

Eco-Industrial Zone Nemetin is the first green economic zone in Croatia and is located close to the town of Osijek. The total area of the zone is 101 ha and the parcels are from 2,500 to 50,000 m². Entrepreneurs have in EIZ Nemetin electric and thermal energy from renewable energy sources, ie biogas plants available. EIZ Nemetin has a great traffic connection, and the advantage of the zone is also the proximity of the border with Hungary and Serbia (Industrijska zona Nemetin, 2019). The corridor VC is 26 km from the zone, the airport is 8,4 km away, the river port Osijek is 2.4 km away and the railway passes through the area (Industrijska zona Nemetin – pogodnosti, 2019). The area is fully equipped, the land is offered at reduced retail prices, and it is possible to realize the right of construction with an annual fee of 1.00 kn / m² up to 36 months after the construction contract has been concluded. It is also possible to realize the benefit of a flat-rate repayment of municipal contributions (Glojnarčić, 2017). The reduction of land prices is realized by priority activities or by NKD groups that are preferable to enter the industrial zone. The allowances range from 30% for the first group, 10% for the second and 5% for the third group. Additional price reductions can be made by export-oriented entrepreneurs, investors who open up new jobs, and between 70% and 90%, the price of land for entrepreneurs investing over € 1m can be lowered. The price of the land will be reduced only by employees residing in Osijek on the basis of job openings (Industrijska zona Nemetin – program olakšica i poticaja (2019).

The economic zone of Antunovac is decorated and equipped with private capital resources, and in it, there are 7 business facilities built on 14 hectares of land, and another ten new ones are planned (Glojnarić, 2017). The economic zone has a favorable geotraffical location and is located along the southern border of Osijek, near the A5 motorway and the future corridor of the expressway Varaždin-Ilok, which will be connected to the corridor VC (Budapest - Sarajevo - Ploče). The Osijek-Vinkovci railway line and state road D 518 are located along the same area. The size of the plot ranges from 1,500 to 10,000 m², and all the parcels are completely equipped with energy, traffic, communal and internet, and telecommunication infrastructure. Gas is available from other infrastructure in the zone, access roads and traffic infrastructure are built within the zone, water supply installations, rainfall drainage, and industrial sewage are installed. Entrepreneurs in this Economic Zone offer a reduction of the communal contribution ranging from 0 to 15 kn / m³. The water contribution for the production activity is 1.90 kn / m³, and 15.75 / m³ for the business activity. In the Economic Zone, entrepreneurs are provided with credit lines for financing land, buildings, documentation, and utilities, and offers the possibility of co-operation on a “turnkey” basis (Gospodarska zona Antunovac, 2019).

3. ZONE ATTRACTIVENESS FACTOR WITH SUCCESSFUL EXAMPLES

For the purpose of defining key factors and incentives for entrepreneurship, surveys were conducted through questionnaires on the representatives of cities that manage entrepreneurial zones and entrepreneurs operating in these zones in order to obtain an overall analysis of the zones’ status and the attractiveness of each zone.

3.1. ANALYSIS OF LOCAL SELF-GOVERNMENT UNITS

The first part of the survey refers to managers in entrepreneurial zones from the cities of Ivanec, Bakar, Osijek, Šibenik and Slatina and from the municipality of Antunovac. Based on the key advantages that stand out in their entrepreneurial zones, all respondents except the town of Slatina have highlighted the most important traffic infrastructure. All cities highlighted the availability of energy and professional staff and communal equipment as the main advantages

of communicating to potential investors. As the two most important factors for which investors select their entrepreneurial zone, all cities have chosen the equipment of the entrepreneurial zone and the assistance (proactivity) of local self-government and support institutions. The second most important factor that all respondents have chosen is the availability of energy in the zone. It is interesting to note that the traffic infrastructure factor at Slatina and Ivanec is at the last place, while in contrast to other respondents (Osijek, Bakar, Antunovac and Šibenik have put the traffic infrastructure in the high place by importance). In the second part of the survey, it was examined which incentive measures were introduced in their entrepreneurial zones, in Table 1, a comparison of the use of individual measures in 6 local self-government units.

Table 1. Incentive measures and exemptions in entrepreneurial zones

	Antunovac	Ivanec	Bakar	Osijek	Šibenik	Slatina
Reduction in land sale prices	YES	YES	YES	YES	YES	NO
Communal rates exemption	YES	YES	YES	NO	YES	YES
Communal rates exemption	NO	YES	YES	NO	YES	YES
Reduction of Fees for Construction rights	NO	NO	YES	YES	YES	NO
Incentives for recruiting new workers	YES	NO	YES	YES	YES	NO
Grants for the purchase of new equipment	NO	NO	YES	NO	YES	NO

Source: Author's work

Table 1 shows that measures to encourage incentives are generally reduced to purchase price and exemption from communal fees and contributions. These measures are most commonly used by other cities in Croatia, and one of the reasons is that these exemptions do not require additional budget expenditures, but cities in this way give up part of their income by selling land or collecting fees.

The last part of the survey deals with exploring ways in which local self-government units come to potential investors. The first in the marketing toolkit is the Internet, or websites, social networks, and other channels. The second most important tool is the brochure of entrepreneurial zones. All JLS, except Slatina, use advertising campaigns and videos as a promotion, while other tools such as fairs, conferences, and performances on TV and radio stations are used occasionally.

3.2. ANALYSIS OF ENTREPRENEURS OPERATING IN ENTREPRENEURIAL ZONES

The second part of the survey was conducted on a sample of 37 entrepreneurs operating in entrepreneurial zones in six local self-government units (cities Ivanec, Bakar, Osijek, Šibenik and Slatina, and Antunovac municipalities). The research was conducted on entrepreneurs from the manufacturing and processing industry, IT sectors, transport and logistics, and other service activities. According to the number of employees 72.9% of entrepreneurs belong to micro enterprises (0-9 employees), while 13.5% of entrepreneurs belong to small enterprises (10-49 employees), and the same percentage 13.5% belong to medium-sized enterprises (50-249 employees). The first part of the analysis concerned the entrepreneur's satisfaction with the location of the entrepreneurial zone in which they are located. The current location encompassing all the important factors, entrepreneurs from all zones rated the average rating of 4.05 out of 5. The lowest rating of their location was estimated by entrepreneurs in entrepreneurial zones in Slatina and 3.82 out of 5. The respondents are most satisfied with the level of availability of energy in their zone, while the second factor with which the most comfortable communal equipment of entrepreneurial zones is, which means that the zones have quality infrastructure. When comparing the results of an entrepreneurial survey with the results obtained on the basis of research on JLS representatives, it is clear that the results are similar, which means that zone managers are well aware of the needs of entrepreneurs located in those zones. As the most important factors in making a decision, the respondents point out the three most important ones: zone availability (4.3), availability of energy (4.49) and availability of professional staff (4.3), ie workforce. The last part of the survey referred to the analysis of the most important incentive measures for entrepreneurs. As the two most important stimulus measures, respondents pointed out incentives for recruiting new workers and grants for the purchase of new equipment (4.95), and secondly, they were exempted from utility contributions (4.24) and communal fees (4.30).

What can be deduced from the conducted research is that the results that speak of the key factor of the location and the most important incentive measures for entrepreneurs largely coincide with both groups of respondents. Such results are evidence that these entrepreneurial zones are among the most successful in Croatia because they have recognized the needs of potential investors and based on these needs developed a high-quality set of measures that affect a

favorable entrepreneurial climate. The only disadvantage in most of the entrepreneurial zones is that there is no support for investment in equipment and facilities, which the contractors point out as one of the most important measures, but one of the reasons is significant budget outlays required by this measure. When looking at the satisfaction rating of the location of entrepreneurs located in entrepreneurial zones in Slatina, it is evident that it is lower than the other respondents, positively correlating with the fact that the entrepreneurial zones in Slatina do not have a clear program of incentives for entrepreneurship and communication strategy.

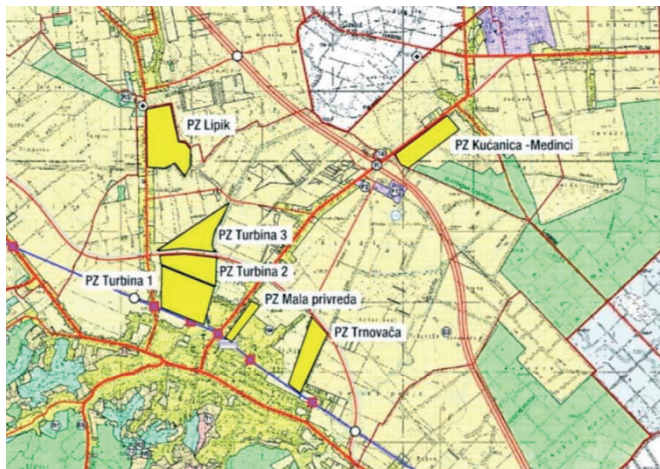

4. CASE STUDY - ENTREPRENEUR ZONE IN THE TOWN OF SLATINA

For the purpose of producing a good case study, an interview with representatives of the town of Slatina was conducted on the basis of which the authors received all the key information about entrepreneurial zones and entrepreneurship promotion measures. The town of Slatina does not have a well-developed communication strategy that would attract potential investors, which is one of the reasons for the weakness of the zone. At the moment of writing this paper, measures to promote entrepreneurship in Slatina were not developed, but there is a proposal for measures that are in the public consultation process. The Case Study is based on the activities that need to be undertaken with the aim of developing quality measures and communication strategies for small local self-government bodies that do not have high budgets. According to the Town Development Strategy of Slatina, Slatina has 7 entrepreneurial zones, of which the Small Economy Zone is completely filled, while all other areas are partially completed or are only in the construction phase. Of the activities in the zones, the largest share includes the manufacturing industry which accounts for 18.37% of the total number of entrepreneurs and 50.55% of the total employment. Agriculture is also significant activity in the town of Slatina, and according to data obtained on the basis of interviews with representatives of the Town of Slatina, 467 OPGs are currently in the area of the town. In 2018, the number of companies is 210, out of which 16 are new. The number of crafts in 2010 was 327, of which 45 were newly founded (Strategija razvoja grada Slatine, 2016).

4.1. ANALYSIS OF THE STATUS OF ENTREPRENEURIAL ZONES IN SLATINA (EQUIPMENT, OCCUPANCY, OWNERSHIP RELATIONS, INVESTMENT INCENTIVES MEASURES)

According to the data of the representative of the city of 7 entrepreneurial zones 5 are in operation, and 2 zones are inactive, ie in preparation for construction (Turbina 3 and Lipik). The problem that occurs in the zones is the weak entrepreneurial activity and the small area of the fully-equipped zones. The two entrepreneurial zones in Slatina, according to the Law on Promotion of Entrepreneurial Infrastructure, can be considered fully active, namely PZ Small Economy and PZ Turbina 1. Zone Turbina 2, and Kućanica-Medinci are in the middle active, while Trnovača zone in initial activation. Figure 1 shows the plan and arrangement of entrepreneurial zones in the town of Slatina.

Figure 1. The plan of the business zones in the town of Slatina

Source: www.slatina.hr (28.12.2018.)

From the table below in the business zones that are in operation, it is apparent that most of the particle has already been sold, but the problem is that on a small number of particles entrepreneurship has been launched.

Table 2. Infrastructure Equipment of Entrepreneurial Zones in Slatina

	PZ Trnovača	PZ Turbina 1	PZ Turbina 2	PZ Turbina 3	PZ Mala Privreda	PZ Kućanica-Medinci	PZ Lipik
Total area (ha)	24,60	25,00	23,90	23,00	10,00	25,00	45,00
For sale (ha)	3,10	0,00	1,40	19,00	0,00	3,50	25,00

Source: Author's work

According to data from Table 2, the total area of all 7 zones, including the areas under preparation, is 176.50 ha, and available for sale is 52.00 ha. In areas currently in operation, only 7 hectares are available for sale, while the remaining area available for sale is available in zones that are in the construction phase.

Table 3. Infrastructure Equipment of Entrepreneurial Zones in Slatina

	PZ Trnovača	PZ Turbina 1	PZ Turbina 2	PZ Turbina 3	PZ Mala Privreda	PZ Kućanica-Medinci	PZ Lipik
Drainage system	○	●	◉	○	◉	○	○
Gas	○	●	●	○	○	◉	○
Telecomm. infrastructure	○	●	◉	○	◉	○	○
Internet	○	●	◉	○	◉	○	○
El. energy	●	●	●	●	●	●	●

Legend:

- Fully equipped
- ◉ Partially equipped
- Not equipped

Source: Author's work

Along with all the other areas that are not fully equipped, the gas pipeline and telecommunication infrastructure pass through. According to the Town Development Strategy of Slatina, the weak construction of the sewerage network is a limiting factor for economic development in entrepreneurial zones due to the lack of connecting collectors over which the sewage network could expand into economic zones (Strategija razvoja grada Slatine, 2016). According to the data obtained from the representative of the city of Slatina, this problem will be resolved within the framework of the agglomeration project being implemented. The energy system in the town of Slatina is well developed and the main substations are in a good position with respect to the entrepreneurial

zones, and also the investors who have opened the plants to renewable energy sources in the zones. The greatest advantage of entrepreneurial zones in Slatina is the availability of energy, especially those obtained from renewable sources. Electricity capacity in Slatina is 80 MW, and all energy facilities have been renewed and provide secure supply and delivery of energy (Strategija razvoja grada Slatine, 2016).

In the entrepreneurial zone of Kućanica-Medinci, there are two energy obtaining plants from renewable sources and one in Trnovača's entrepreneurial zone. The Biogas plant of Biointegra Slatina is located in the Kućanica-Medinci area with a power plant capacity of 2.4 MWh, or about 20 GWh per year (Biointegra, 2019). In the same zone, there is also a solar power plant with an annual capacity of 565,000 kWh (Sunčana elektrana Sinerot, 2015). The Cogeneration timber felling plant Energy 9 is located in Trnovača's entrepreneurial zone, and the capacity of the plant is 5 MWh or 40 GWh per year (Resalta, 2019). Biomass plants have a production capacity of about 25 MW of heat, of which part is consumed in their own production, and some may be used for the operation of other plants. In addition, in Slatina, there are potential sources of geothermal water with recorded water temperature up to 190 ° C. The energy capacities available to entrepreneurs in Slatina with a quality communication strategy can be extremely attractive to new investors.

The traffic connections between Slatina and Virovitica-Podravina County with motorways and expressways are one of the biggest drawbacks to the attraction of their zones. According to the Development Strategy of the Town of Slatina (2016), three state roads pass through Slatina: Varaždin-Osijek (D-2), Daruvar-Donji Miholjac-Josipovac (D-34) and state road Slatina-Požega-Pleternica (D-69). The problem of traffic connections in the local sense has been successfully resolved by building a 10.2 km long bypass and one 1.1 km long mini bypass. Along the edge of the entrepreneurial zones, Trnovača and Turbina 1 passes the Varaždin-Koprivnica-Virovitica-Osijek-Dalj railway line, which provides a direct link to the most important economic centers in Croatia. Airports are considerably distant from the entrepreneurial zones in Slatina, and the closest airport within the borders of Croatia is that of Osijek, 96 km away. The nearest international airport is located 75 km from the entrepreneurial zone in Slatina and is located in Pécs (strategija razvoja grada Slatine, 2016).

4.2. A SWOT ANALYSIS OF ENTREPRENEURIAL ZONES IN THE TOWN OF SLATINA

In the SWOT analysis (Table 4) of the entrepreneurial zones as a substrate, the data from the Town Development Strategy of Slatina and the data from the conducted interviews with the representatives of the city were used. The main weaknesses of entrepreneurial zones are reflected in poorer communal facilities and the lack of communication strategies, while the most important strengths and opportunities relate to the natural potentials of entrepreneurial zones in Slatina and the availability of energy.

Table 4. A SWOT analysis of entrepreneurial zones in Slatina

STRENGTH	WEAKNESS
<ul style="list-style-type: none"> • The tradition of Manufacturing, Textile and Wood Industry • Availability of free surfaces gospodarskih zona • The ability to use existing business facilities (brownfield investments) • High-quality energy grid for acceptance and extra energy production • Availability of renewable energy sources • Preserved environment (soil, water, air) • Pre-qualification in the function of the economy – harmonization of the program of the Public University with the labor market 	<ul style="list-style-type: none"> • Insufficient number of startups • Low entrepreneurial activity and insufficient equipment of entrepreneurial zones for attracting entrepreneurs • A small number of innovative entrepreneurs and initiatives • Low competitiveness of entrepreneurs • Insufficient construction of sewage and sewage treatment systems in entrepreneurial zones • Lack of communication strategy
OPPORTUNITIES	THREATS
<ul style="list-style-type: none"> • Possibilities for investing EU funds in the infrastructure of entrepreneurial zones • Providing incentives for youth employment • Connecting with cities in the environment to enhance competitiveness Construction of an entrepreneurial incubator • Establishment of a program of measures to encourage entrepreneurship • Investing in energy self-sustainability and renewable energy sources 	<ul style="list-style-type: none"> • Emigration of young people • Traffic isolation due to insufficient involvement in fast roads and motorways • Close to cities with a competitive industry and better transport links • Frequent changes to legal regulations

Source: Authors work

4.3. DEVELOPMENT OF INCENTIVE MEASURES AND COMMUNICATION STRATEGY

At the time of writing this paper, the web site www.slatina.hr announced a public consultation on the development of entrepreneurship promotion measures in the town of Slatina. Measures to promote entrepreneurship in entrepreneurial zones in the town of Slatina will include, in one part, the measures that are on public consultation, but the focus of these measures is only on the activities that are to be stimulated in entrepreneurial zones. In order to achieve a better impact of the measures, it is necessary to establish a list of priority activities to be promoted in entrepreneurial zones, which will be divided into 3 groups (no specific activity list will be included in this paper). A list of priority activities should be applied to all exemptions defined by the program, and where applicable. The reduction in land prices and the exemption of utility contributions and remuneration can only be achieved by entrepreneurs who open new facilities in entrepreneurial zones or existing entrepreneurs only in the case of release for new employment.

Measure 1. Reduction of the price of communally-equipped land - The lowest land price can be at least 1 kn / m², and the exemption from payment of part of the land price will be defined in three groups of exemption: by priority activity groups, for the employment of new employees residing in the area of Slatina and towards export orientation.

Measure 2. Exemption from payment of communal fees - Exemptions from payment of communal fees can be made by entrepreneurs based on the list of priority activities, for new employment and for launching brownfield investments, namely:

1. For the 1st priority activity group 100% for the first 5 years, for the 2nd and 3rd priority activities 100% in the first year and 50% for the second and third year of business
2. For entrepreneurs employing 10 or more employees residing in the area of the town of Slatina 100% in the first year, 50% in the second and third
3. 100% in the first 5 years for brownfield investments in the first 3 groups of priority activities

Measure 3. The release of payment of municipal contribution - Exemption of payment of utility contributions can be achieved according to the list of priority activities and for new employment.

Measure 4. Procurement subsidy and installation of new machinery and equipment - The measure of subsidies for machinery and equipment has been shown to be the most attractive measure among the entrepreneurs, due to the small number of sources available for funding such projects. The grant intensity may be up to 50% of the eligible activities, up to 50.000,00 kn per year for manufacturing activities, while the highest amount for the service and other activities is up to 10.000,00 kn per year.

Measure 5. Subsidizing the start-up of entrepreneurial activity of beginner entrepreneurs - This measure may be used by entrepreneurs in the first three years from the beginning of the business, provided that at least one employee is employed for an indefinite period by the applicant. The grant intensity may be up to 50% of the eligible activities, up to 30.000,00 kn per year for manufacturing activities, while the service and other activities are awarded the highest amount up to 10.000,00 kn per year (one entrepreneur can only use this measure once).

Measure 6. Subsidizing The Croatian Institute for Health Insurance and Croatian Pension Insurance Institute obligations to employees in the first year of activity or after a larger investment employing at least 10 workers residing in the area of the town of Slatina - The costs of pension and health insurance can be subsidized in the amount of 50% of the cost with the obligation to retain the minimum number of employees at the time of granting the aid throughout the subsidized year.

Measure 7. Administrative Aid to Investors in Realization of Investments - This measure encompasses assistance to investors in resolving property rights, obtaining building permits, releasing land conversion costs in full if it is converted for the purpose of carrying out the activity on the established priority list. Entrepreneurs in the area will also offer more favorable preparation and implementation of EU projects. These measures are key to accelerating investment and boosting activity in entrepreneurial zones.

In the town budget of Slatina in 2019, HRK 1.495.000,00 was provided for measures to encourage entrepreneurship. This amount is intended to implement measures 4, 5 and 6 from the incentive program, and the creation of a score list should give priority to projects that will generate new employment.

The plan of revenues from utility contributions and compensation in 2019 amounts to 6,906,588.00 kn. In 2018 there were no exemptions from the payment of utility contributions, and from the payment of the communal fee was exempted from 5 business entities, with a total of 98,453.06 kn. The implementation of these measures is expected to have a significant effect on the increase in employment, with the emphasis on employment of employees residing in the area of the town of Slatina. By implementing measures 5 and 6 of the incentive program it is expected that 20 new jobs will be generated annually. The estimate was based on the number of newly established companies (trades and companies) in 2018, of which were 61, and estimates were taken into account that only one-third of newly established companies generate one new job. Due to weaker entrepreneurial activities in entrepreneurial zones and on the basis of data on the exemptions from the payment of communal fees in 2018 it is expected that as part of Measures 1, 2 and 3 to generate 30 new jobs per year, which would be based on the existing number of open enterprises in the town of Slatina, 0.5 new jobs per entrepreneur per year. The estimated employment impact assessment was determined by the conservative method given the incentive measures only at the start-up stage (Grad Slatina, 2019).

4.4. COMMUNICATION STRATEGY

Based on the results of the research carried out within this paper, the most important factors for making a decision on investing in the zone are equipment of the zone and availability of electricity and professional staff. In the SWOT analysis of entrepreneurial zones in Slatina, as well as the availability of renewable energy sources and the alignment of educational programs with the labor market, in Virovitica-Podravina county there is a high school with programs that monitor the labor market and develop high-quality human resources. According to the Town of Slatina Development Strategy, the vision for the urban area of Slatina is "Slatina is an energy-efficient city with a developed business climate, preserved natural heritage and cultural content to the satisfaction of its citizens". It is precisely on energy sustainability and the development of the entrepreneurial climate that it is necessary to build a communication strategy. The main tools to be used to implement the communication strategy are the website of the entrepreneurial zones and brochures that proved to be the best communication tools for targeted investors in Croatia's most successful cities. Since Slatina does not have an entrepreneurial zone website where it will provide all

important information to entrepreneurs, it needs to be created. Publicly available entrepreneurial brochures have not been updated for years and the data is out of date. The activities planned to be implemented as part of the improvement of the communication strategy will be listed below, while the development of the activities takes into account the city budget which is limited in capacity as the units of local self-government are up to 15,000. Based on the results of the research and vision of the city itself, all communication activities will be aimed at promoting communally-equipped zones, the availability of renewable energy sources and the availability of professional staff.

Activities:

1. Creating an entrepreneurial zone website in Slatina with all important information for investors
2. Creating a map of entrepreneurial zones in the GIS system that will be on the website and will contain all the information on the urban plan, zone regulation planned projects and the state of the communal infrastructure (drainage, telecommunication infrastructure, transport infrastructure ...)
3. Creating brochures for entrepreneurial zones for investors that include all exemptions for entrepreneurs, investment guides and the main advantages of entrepreneurial zones
4. Entry of all zones into the database of the Single Business Register of Entrepreneurial Infrastructure (JRPI)
5. Performances at trade fairs and crafts The aim of these activities is to promote entrepreneurial zones in the town of Slatina as high quality communally equipped and energy-self-sustainable zones with a focus on the availability of renewable resources and professional staff.

5. CONCLUSION

Investing in a communal building of entrepreneurial zones starts the cycle of attracting investments and creating a favorable entrepreneurial environment in cities and municipalities. There is a large number of entrepreneurial zones in Croatia, which is a real challenge and seeks competition between local self-government for the best investors. Entrepreneurial zones imply a certain level of communal and infrastructure equipment to start the entrepreneurial activity,

and precisely the programs of measures and exemptions play a major role at the level of entrepreneurial activity within the zone.

The paper included a comparison of 5 cities and one municipality whose incentive measures and liberation among the best in Croatia. When selecting the most successful zones, their regional distribution was also taken into account in order to cover all the Croatian regions. Measures and programs to promote entrepreneurship with a large number of local self-government are similar, but the proactivity of local self-government is what separates them from those who are less successful. Among the most successful cities and municipalities, a sample of respondents was selected, covering two surveys on one sample of 6 representatives of local self-government and entrepreneurial zones and 37 entrepreneurs operating in these areas. Research has revealed key factors for investor decision making, which largely relate to communal equipment, availability of energy, and availability of skilled labor. Research has shown that the most successful entrepreneurial zones are well aware of the needs of entrepreneurs in their business and, on that basis, elaborate quality measures and exemptions.

After defining the status of entrepreneurial zones in Slatina and developing a SWOT analysis defining the starting points for the elaboration of measures and exemptions in entrepreneurial zones, they started to elaborate on them. Through 7 measures, the exemptions are defined based on the list of priority activities that are to be encouraged in the zones and the granting of grants for subsidies for workers' obligations. A quality set of measures has been rounded up by the communication strategy and by defining key activities to achieve a more favorable investment environment by promoting the main advantages of entrepreneurial zones in Slatina. This paper provides an example of approaches to the development of incentive measures and communication strategies that are made from fundamental analysis through the definition of key forces and opportunities to implement concrete activities. Emphasis is placed on cities and municipalities of up to 15,000 inhabitants due to limited budget resources that could be put into the function of developing entrepreneurial measures. Each strategic process and document begin with an analysis at the planning stage and ends with setting the mechanisms for monitoring the implementation. In this paper an extensive fundamental analysis was conducted, the investor's interest was examined and based on the results, incentive measures and communication strategy were adopted. The results of the Revised Audit Report on the efficiency of entrepreneurial zones have shown that significant resources have

been invested in the established entrepreneurial zones, but many of them didn't achieve the desired effects, and therefore high-quality mechanisms should be established to improve the efficiency of their implementation. Further research should focus on the development of mechanisms to monitor the implementation of established incentive measures and communication strategy, with the aim to achieve the desired level of efficacy and development of entrepreneurial zones.

Abstract

The cultural and creative sectors have always played an important role in the creative economy generating economic growth, employment opportunities, and innovation capacities. In order to strengthen European identity, culture, and values, the creative industry has a significant role in enhancing entrepreneurial and innovative potential. Although the cultural and creative sector is characterized by a predominance of small enterprises, the majority of enterprises are one-person-enterprises. In comparison to other sectors, due to their generally smaller size, they are knowledge-intensive, generators of innovation and in a position to foster spill-over effects to other sectors. With regard to their specific characteristics, a high share of intangible assets, specificity of their business models or uncertain demand for their products and services, they also face

various challenges, limiting them from improving their full potential. The European Commission has recognized and undertaken a variety of initiatives and actions in order to provide support to the creative industry. Specifically, one of four priority area in Work Plan for Culture (2015-2018) concerns the cultural and creative sectors, the creative economy and innovation. This paper highlights the prominent role of creative industry and its still scarcely explored entrepreneurial and innovative potential contributions to the on-going debate on the creative industry as indispensable part for almost every new product and service.

Keywords: *creative industry, entrepreneurship, innovation, business models*

JEL Classification: L26, O30

1. INTRODUCTION

Culture and creativity are important factors for economic development. Due to the broad range of impacts that they can generate, they promote creative entrepreneurship, show above-average growth and create new employment opportunities, while stimulating economic growth and strengthening social cohesion (EC, 2018). As such, the creative industry has been one of the successes of the UK economy in recent times. Over the past 20 years, the contribution made by companies within these industry has increased from 3.96% to 5.20% of the total UK economy, while the number of employees working in this industry has also increased by 94%, from 1997 to 2014 (Oliver, 2017). Further, 13% of all start-ups in Germany occurred in creative industries in 2010, whilst, the self-employment rate in creative industries was 24%, compared to 11% in the total economy in Germany in 2013 (Kohn and Wewel, 2018). Furthermore, between 2011 and 2017, European Union cultural employment increased up to 8.7 million employees, accounting for 3.8% of total employment. In 2017, the percentage of self-employed in cultural employment in the EU was at least a double of that observed in total employment (Eurostat, 2018). According to Eurostat, there was 8.7 billion Euros trade surplus in cultural goods, and cultural and creative sectors are estimated to contribute with 4.2% to EU gross domestic product in 2016 (EC, 2018a). In Croatia, culture and creative industries represent 2.3% of Croatian GDP, 3.0% of the total number of employees, and makeup to 5.7% of the total number of business entities in Croatia (EIZ, 2015).

“Cultural and creative industries are at the heart of the creative economy: knowledge-intensive, based on individual creativity and talent, they generate huge economic wealth and preserve European identity, culture, and values. Moreover, they include a number of subsectors, such as architecture, archives, and libraries, artistic crafts, cultural heritage, design, fashion, film, high, end, music, performing and virtual arts, publishing, radio, television, and video-games” (EC, 2018b).

There is no unifying European or global classification of the creative industry sector. In UNESCO’s analysis (UNESCO, 2013), different models of division of the sector and their relevance to the creative industry were set out, from which the researchers highlight four basic models of the creative industry: DCMS Model, Symbolic Texts Model, Concentric Circles Model, and WIPO Copyright Model. Analyzing European approaches in defining the creative industry, KEA (KEA, 2006) outlines three European approaches: UK approach - “creative industries”, The French approach - “cultural industries” and The Nordic approach - “the experience economy”. UNCTAD defines the “creative economy” as a “growing convergence on a core group of creative industries and their overall interactions both in individual countries and at the international level” (UNCTAD 2010, 9). In defining creative industry Horvat et. al. (2018) emphasize that the creative industry implies copyrighted production covered by the projects generating non-material products and services intended for market exchange.

According to the European Commission, cultural and creative sectors include all sectors whose activities are based on cultural values or artistic and other individual or collective creative expressions. On the other hand, the cultural and creative industries, focus more on the further stages of the value chain, including the production and dissemination stages of industrial and manufacturing operations (EC, 2018c).

Whatever we addressed them, they are at the forefront of innovation and create spillover effects to other sectors and industries, as well as contributing to the entire society. Hence, with the emergence of more complex and networked business models, the cultural and creative sectors are becoming a decisive component in the value chain of almost every product and service (EC, 2018c). There is a binding role of the European Commission in strengthening the sense of European Identity and awareness of cultural heritage. In the Communica-

tion of the European Commission “Promoting cultural and creative sectors for growth and jobs in the EU” (EC, 2012), the European Commission stated that cultural and creative sectors are a largely untapped resource for the EU 2020 strategy because they are high growth sectors, catalysts for innovation as well as a key element in global competition (EC, 2016). In 2014, EC adopted the Work Plan for Culture (2015-2018) in which set out four main priorities for European cooperation in cultural policy-making. One of them concerned the Cultural and creative sectors, the creative economy and innovation (Priority area C: Cultural and creative sectors: Creative Economy and Innovation). These are complemented through a variety of actions and initiatives, the Creative Europe Programme and funding from other Commission sources. In 2018, EC adopted the New Agenda for Culture in order to achieve the full potential of culture, supporting innovation, creativity and sustainable jobs and growth. Although, the New Agenda has three strategic objectives, comprises social, economic and external dimensions, many actions will serve as cross-cutting actions.

Despite all efforts, still, 36% of Europeans do not participate in any of cultural activities (Eurostat, 2017). Market fragmentation, insufficient access to finance and uncertainty in contractual conditions and incomes are still the most common challenges faced in the creative industry (EC, 2018a).

This paper is aiming at providing recent data on creative industry among EU Member States enterprises, focusses on its entrepreneurial and innovative potential. Further, this paper is closely linked to the survey of the European Commission and Austrian Institute for the SME research and their initiatives to a better understanding of the cultural and creative industries. The purpose of this paper is to provide a better grasp of the creative industry by identifying differences between individual sub-industries and determining its standing on the EU level measured by employment and presence of companies. By analysis of existing information, this paper will give insight into the level of regional development of cultural and creative industries on the EU level.

The paper is organized as follows. After the introduction, the next section provides key findings from the literature on objectives and challenges faced by the creative industry. The third section analyses recent trends in the creative industry followed by concluding remarks.

2. STRATEGIC OBJECTIVES AND CHALLENGES FACED BY CREATIVE INDUSTRY – KEY FINDING FROM LITERATURE REVIEW

Cultural and creative enterprises do not fit well in traditional business models due to an asymmetry of information between banks and creative enterprises and whereas a lack of specialists in evaluating cultural and creative business models. Although creative enterprises are of high economic importance and show inviable financial results, their **access to finance** is difficult. Moreover, small and micro size of such enterprises, high share of intangible assets, complexity of their business models, uncertainty regarding the demand for their products and services and uncertainty in income are just some of challenges creative enterprises are facing in accessing finance and preventing them from exploiting their full potential (EC, 2016).

Most of the **employee in the creative industry** is characterized by a high share of educated people and by a high share of flexibility and mobility within working time (Benhamou, 2003). Further, the cultural and creative sectors are an important contributor to youth employment. According to Lhermitte et al. (2014), in 2013, almost one-fifth of employed was between 15 and 29 years old. Furthermore, another important characteristic of the creative industry is the high percentage of self-employment, so called, “One-Person-Enterprises” (OPEs) and freelancers (Rammer et al., 2008). Because of the specificity of business models characterized in the creative industry (development of creative goods and services that are complex and hard to standardize), these models do not fit well in traditional working time (Falk et al., 2011). As of uncertainty in demand for products and services and incomes, most of the employee have irregular forms of employment such as part-time jobs or temporary form of employment. Many of creative workers combine freelance or part-time jobs with a permanent job in order to provide financial stability to maintain their creative activities (Kooyman, 2010). Those specific forms of creative employment directly influence the innovativeness of the creative industry. Creative workers are often engaged in frequently changing project team, allow a free flow of information and fresh ideas, facilitating interactive learning and innovation processes (Falk et al., 2011).

Business-to-business (B2B) is the main form of relationship between **clients and customers** in the creative industry. Austrian’s Report on Creative Industries Recent shows that sales to other creative enterprises (either in the same

creative sector or in culture creative industries cross-sector alliances) account for almost one-third of total sales in the sector (EC, 2016). Another study from the UK showed high importance of purchases of creative products by creative industries themselves (Bakhshi et al., 2008). Creative alliances across different creative sectors and integration in creative networks results with better business performance and higher success rates in attracting customers and interesting projects (Voithofer et al., 2010). The client's benefits from the creative industry include high professional competence, flexibility in delivering a product or services to clients' specific needs and bringing in innovative ideas. This innovative process also includes client's own innovative efforts in order to improve business processes, develop new products and to gain competitive advantages (Gassler et al., 2015; Voithofer et al., 2010).

The market of the creative industry is characterized by specific market conditions in which creative enterprises or persons across different creative sectors operate. Many of creative enterprises operate successfully on domestic markets and abroad. For others, because of language barriers and specific market demand, but and due to their small size, the market is limited only within the national market. In addition, the market demand for creative products and services is often highly uncertain. There is always uncertainty about how the market will react to new innovative products or services (Dörflinger et al., 2014). Another reason is the high share of intangible assets (Intellectual Property Rights) as part of product or services are made of, the value which is often inappreciable or uncertain. Hence, the fragmentation of the markets not only hampers opportunities to access foreign markets and to grow but also increases distribution and marketing costs (EC, 2013).

Another feature characterized by creative industry is **collaboration and business networks** among enterprises. Due to their generally small or micro-sized enterprises (including a large share of one-person-companies and freelancers) and because of their high level of specialization, business relationships with other creative companies become necessary to combine competencies for the purpose providing more complex and more integrated creative products. Especially for large orders and large deals. Hence, the creative sector depends on mutual cooperation and networking, gathering in places a high concentration of creative enterprises, talented individuals and institutions, pooling knowledge and resources such as creative eco-systems, creative hubs, and clusters which are of particular importance to the creative industry (EC, 2016). Therefore, this industry can be called

project industry, as companies, one-person-companies and freelancers occasionally or permanently associate within projects that result with creative products.

Moreover, the creative industry is among the most **innovative industries** in the economy. Their business models are developed through new innovative ideas and the transformation of these ideas into commercial products for their customers. Innovation and new creative products in the creative industry are usually a result of collaboration, flexible business networks, and project co-operation between enterprises (EC, 2016). The specific structure of the "creative" market, is characterized by co-operation between business competitors, business networks and clusters, directly affects the sector's innovation and innovation processes. The so-called Functional Networks allow creative enterprises to continuously produce and absorb fresh ideas (Falk et al., 2011). Furthermore, the innovation of the creative sector is also influenced by the fluid labor market and the high level of worker mobility (networking of creative professionals around the world). Business-to-business (B2B) is another important wheel in knowledge transfer and spill-over to other sectors (Bakhshi et al., 2008). As well, it was found that cultural and creative industries were shown as industries resistant to the changes caused by economic crisis and, in even in recession showed growth trends (Bestvina Bukvić et. al., 2017). One of the reasons for this advantage of these industries could be new forms of innovation processes, such as design thinking, open design, and open innovation are characterized by creative industry. The design is not used in the innovation process just to create new products and services, but design-thinking methods can also be applied in the process of creating new business models and organizational innovations (EC, 2013a). They also encourage innovations and cause spill-over effects across the entire value chain: encourage innovation in client companies ("forward linkage effects"), but they also require more innovative products and services from their suppliers ("backward linkage effects"). Creative enterprises also help their clients to introduce innovations by finding new ideas, supporting entry into new markets and the implementation of new products, or designing new products (Rammer et al., 2008). According to European Commission (EC, 2018d), the innovative potential of "the cultural and creative sectors is essential for the European economies and societies, because it generates well-being and cohesion, shapes the public space used by millions of Europeans, modernises industries and business sectors with new creative input and methods, provides meaning and a feeling of belonging, upgrades urban and rural areas, designs our products and services, produces and digitises content,

enriches our visual experiences and provides content for debates”. In the addition to spill-over effects of creative innovation, the main focus of **cross-sectoral innovation** is how to better use the innovation potential of the cultural and creative sectors for other parts of the economy and society as a whole. These sectors are able to generate a positive influence on other economic sectors by connecting industries. Further, **user-driven innovation** bases its innovation on existing technologies or develop new business models or services driven by users or suppliers. So-called, co-creation is the process by which groups of people with different backgrounds getting together with the same goal to create value through improving or developing services, processes, and products. The aim of the user-driven innovation process is to create value for users and to increase the chances of product and market success. Furthermore, the effects of innovation in the cultural and creative sectors that take place in defined geographical areas like cities or regions are known as **place-bound innovation**. Innovation provided by art galleries, museums or cultural festivals boosts the attractiveness of societies and places. At the same time providing economic growth in and around such cultural and creative locations.

The creative industry is perceived as the “forerunner of the new digital society” as they are the ones often the first users of new services and technology. Cultural and creative sectors were among the industries where transformation processes were caused by digitalization - influencing the business, consumption patterns and production processes (Lhermitte et al. 2014). Through the digitalization creative sector benefit from lower production costs, new distribution channels, new business models and the development of new markets, products or services (Tera Consultants, 2010). Further, adaption to rapid changes in consumer expectations driven by new technological opportunities and loss of revenue due to piracy in digital form is another challenge creative sector is faced with (Tera Consultants, 2010).

Internationalization and exports are key elements of the successful creative industry. According to Horvat et. al. (2018), **the creative industry** contributes to economic development in general, has an export potential and is based on knowledge, science, technological and artistic innovation, development of talents and preservation of national cultural heritage through its implementation into contemporary products and services. Small and medium enterprises are essential in requiring support in order to expand on international markets. Therefore, smart internationalization and export promotion policies are needed. As far as

exports to third countries are concerned, numerous tariffs and non-tariff barriers prevent the presence of European creative enterprises on the markets of third countries. The export intensity differs among the creative sectors: cultural goods account for 1.6% of total EU exports, fashion-related products account for 12.3%, and high-end industries account for 18% of total EU exports (EC, 2016).

Due to their form of intangible assets, **Intellectual Property Rights (IPR)** represent a major challenge in the creative industry, particularly in the modern era of digitalization and internet. (EC, 2016). Intellectual property rights promote innovation and creativity, which in turn generates jobs and improves competitiveness. Intellectual property rights enable authors, artists, designers, inventors, and other IPR users to benefit when others use their creations and inventions (EC, The Protection of Intellectual Property). According to The Innovation Policy Platform, “innovations in creative industries are often a collective process involving many heterogeneous individuals and informal knowledge communities that have very specific IP needs. These actors often combine different types of intellectual property rights, including copyrights, patents, and trademarks”. Overall, “IPR-intensive sectors account for around 42% of EU GDP (worth some EUR 5.7 trillion annually), generate 38% of all jobs, and contribute to as much as 90% of EU exports. As companies increasingly compete on innovation, creativity, and quality in the global economy, the protection of IPR is essential for them, particularly for SMEs who do not have the same level of resource” for protection of Intellectual rights as large enterprises (EC, 2017).

3. ANALYSIS OF ENTREPRENEURIAL AND INNOVATIVE POTENTIAL OF CREATIVE INDUSTRY

According to the European Commission, cultural and creative business is characterized by the predominance of small and micro enterprise size (EC, 2012). In general, the vast majority of enterprises in the creative sector (96%) are micro-enterprises with less than 10 employees. Though, the structure of the enterprise size differs between the sectors: the proportion of One-Person –Enterprises (OPEs) is highest in design and visual arts as well as performing arts and artistic creation (83% each), followed by architecture (75%), advertising (72%) as well as software and games (71%). In the sectors radio and TV (15%), books and press and software and games (6% each), the proportion of

larger enterprises employing 10 persons or more is particularly high. Further, high-end industries are characterized by large companies and multi-national brand groups on the one hand, as well as small scale manufacturers as part of the supply chain (Figure 1).

Figure 1. Enterprises by size class for selected sectors in %, 2013.

Source: EC, 2016.

According to Eurostat (2018a), in 2015, there were 1.2 million cultural enterprises in the EU, representing 5% of all enterprises in the non-financial business economy. Cultural businesses accounted for 2.8% of total value added in the EU, generating 200 billion Euros of value added and 80% of people employed in the cultural sector in the EU worked in small or medium-sized enterprises. The cultural sector's turnover (the total value of market sales of goods and services) was around EUR 475 billion, which represented 1.7% of the total turnover of the non-financial business economy. Further, the only Member States with over 150 000 cultural enterprises in 2015 were France and Italy, accounting for around 15% of all cultural enterprises in the EU, each. Along with Germany (with around 130 000 enterprises) and the United Kingdom (100 000), represented nearly half of the total number of cultural enterprises in the EU. All those countries, with the exception of Italy, were above the 5% EU average of cultural enterprises in the total economy. But the Member States with the most share of cultural enterprises Sweden with 7.6%, followed by the Netherlands with 7.3%, Belgium with 6.5%, and Slovenia with 6.4% (Figure 2).

Figure 2. Number of cultural enterprises as % of the total business economy, EU-28, 2015

Source: Eurostat, 2018.

Note: Confidential data for Ireland; Unreliable data for Spain and Malta.

In 2017 around 8.7 million people in the EU were working in a cultural sector or occupation, accounting for 3.8 % of the total number of employment (Table 1).

Source: Eurostat, 2018.

According to Eurostat (2018), analyzing each Member State, the percentage of people employed in culture in 2017 varied from 1.6% in Romania to more than 5% in Estonia (Figure 3). The share of cultural employment in the total employment between 2012 and 2017 varied among the EU Member States. In the majority of countries, there was a slight increase or stagnation of cultural employment, while in some other countries (Luxembourg, Denmark, Germany, Estonia, Greece, Hungary and Finland) a slight decrease was observed. Further, with around 155 000 more cultural jobs in 2017 than in 2012, the United Kingdom accounted for almost 30% of the total increase in cultural employment in the EU, followed by Spain with 22%. Spain was observed as a country with the largest relative increase in the share of cultural employment, from 3.1% in 2011 to 3.6% of total employment in 2017. Regarding Croatia, the percentage of employed people in culture varied from 3.6% in 2011 to 3.8% in 2014 and then decreased to 3.1% in 2016. Compared to surrounding countries, such as Slovakia, the percentage is much higher, but compared to Slovenia, Croatia is just around the EU average with no significant increase, like Slovenia. This could indicate a lack of developing economic measures on the state level encouraging small and medium-sized businesses, especially in cultural and creative industries. As well, it could also be an indicator of unfavorable economic environment for entrepreneurship development in the countries shown at the bottom of the list (Figure 3).

Figure 3. Self-employment in cultural employment and in total employment (%), 2017

Source, Eurostat, 2018

Note:(¹) Low reliability for cultural employment

Moreover, among the labor characteristics available for analysis, self-employment take a significant part of cultural employment (Figure 3). At EU level in 2017, one-third of cultural workers were self-employed (33%), against 15% observed for total employment. In other words: the percentage of self-employed in cultural employment is over twice as much then in the total employment.

4. CONCLUDING REMARKS

Cultural and creative sector trough sub-industries of creative industry contributes directly to employment, economic growth and social cohesion. This paper is aimed to provide recent data on creative industry among EU Member States enterprises, focusses on its entrepreneurial and innovative potential. Despite the lack of data, the analyzed research, however, proves that this industry is fast growing along with its entrepreneurial and innovative potential. On the other hand, the lack of secondary data resulted in reduced scientific interests and open space that allowed uneven interpretation of available data as well as multidisciplinary analyses and interpretations. This can be justified by the fact that this industry is in the process of institutionalization, but also and due to the absence of a unified model by which the creative industry and its sub-industries would be defined. Although the interest in the creative industry is growing as well as a number of scientists and scientific research in this field, it is necessary to highlight its multidisciplinary

narity and existence of collaboration between different scientific fields. The study found that there is a strong imbalance in the development of cultural and creative industries in different EU countries. In order to reduce the negative effects of these differences, it is necessary to create development measures at the level of the Member States but also on the regional level that would reduce the inequalities in development of cultural and creative industries and as well, the economies of the Member States as a whole. The Recommendations for future research are arising from the data limitations of the research, hence it is necessary to conduct more comprehensive primary research by analyzing creative employment, both for the creative industry and its sub-industries in order to identify key similarities and differences in this heterogeneous industry.

Abstract

Romania has recently made significant changes to its energy policy through new legislative tools aimed to promote the use of renewable energy and energy efficiency. Programs and support schemes, especially those that target domestic use, were revised, restarted, but also some completely new ones were open: the most important, the so-called „prosumer” law that enables consumers to also produce energy and balance their electricity expenses. This new approach of the 2030 strategic horizon for renewable energy concentrates on including individuals in the efforts to comply with targets set for Romania by the National Renewable Energy Action Plan. This paper will also try to capture a glimpse of the overall assessment of Romania`s progress on pursuing the current targets, with 2020 around the corner. For now, we are on the final laps for the 2020

targets; Romania is well on track on its share of renewable energy in total energy consumption thanks to hydro, solar and wind, but could do better in energy efficiency and climate change mitigation.

Keywords: *renewable energy policy strategy*

JEL Classification: O13, Q48

1. INTRODUCTION

When Directive 2009/28/CE was enforced, all EU member states were required by June 2010 to adopt a National Renewable Energy Action Plan as a strategic tool for implementing EU's Energy Policy for 2020.

Romania was fairly well placed statistically from this point of view, with a quota of renewable energy in gross final energy consumption of 23,4%, very near of its final target of 24% for 2020 (Pirvu, 2015), but strongly dependent on hydro and the old infrastructure used for harvesting water's energy. Regarding other renewable energy technologies, deployment and investment were low or inexistent.

This paper intends to follow Romania's status in reaching the objectives set for 2020, but also the very important extension of perspective to 2030, starting from the moment before the adoption of the NREAP, analysis on legal framework and other tools aimed at accelerating the transition to a green energy-intensive economy, and the local specifics.

2. NATURAL POTENTIAL REGARDING RENEWABLE ENERGY

Geographical factors are crucial in assessing the natural potential for renewable energy, and it is quite easy to identify the fact that in Romania's case, solar energy has more potential than wind energy. Annual solar radiation of 1.700 or even over 1.700 kWh/m² are being measured along the Danube river, in the region of Dobrogea and the Grand Isle of Brăila, but also levels near or over 1.500 kWh/m² in the rest of the country. Regarding wind energy, the situation is a bit different: bigger potential (450 W/m² and over) in the mountain areas which are inaccessible and thus hard to harness, but on the other hand, vast accessible areas in the counties of Brăila, Buzău, Tulcea or Constanța, all of them

with circa 350 W/m² potential wind energy. The rest of the country's areas have low potential. It is worth mentioning the offshore areas that have great potential but are currently impossible to access due to lack of legislation and also high costs of deployment and exploitation of offshore wind farms in the Black Sea. (Figure 1 and Figure 2).

Another specific element is the hydro energy potential, from its rich hydrographic basin, especially from the Danube river, but also other rivers and fast creeks. There are important hydro facilities deployed all over Romania's territory; this makes hydro the main electricity producer in the country and also offers an explanation on how Romania managed to achieve its 2020 targets as early as 2014 (Pîrvu, 2015).

3. THE IMPORTANCE OF RENEWABLE ENERGY IN THE ENERGY MIX

Energy is the central element of the economic and political life of the third millennium, both an indispensable resource of the modern-day economy, but also a powerful instrument of geopolitical negotiation often used to set relations between states and even generate military conflicts.

Even though abundant energy can be found in the universe, in different forms (kinetic energy, chemical, electric, nuclear, etc.), the way we harness it, under the law of conservation of energy, is made by processes of transformation of different kinds of energy, processes that are not efficient; some of the energy is lost during transformation. On top of that, we must take into consideration the fact that natural energy resources are scarce, and continuously diminishing because of ever-increasing thirst of energy that the human society developed in the last two centuries. Actually, the level of influence that mankind has gotten to apply on the whole planet since the industrial revolution, but especially after World War II, has also led anthropologists to start adopting the term *Anthropocene* to define the age of man (Zalasiewicz et. al, 2010). We are also observing that remarkable ability of fundamentally transforming their environmental conditions that humankind as a species has developed, and we find the term appropriate.

Given the fact that, traditionally, for obtaining useful energy, primary sources like coal, gas and liquid fossil fuels are burned, thus emitting greenhouse gas, man-driven climate change is an important characteristic of this Anthropocene era. The ever-growing need for energy that human society has been experiencing in the search for economic growth has determined an exponential rise in energy demand and with that in carbon emissions (over 40% more than in the pre-industrial age), methane (150% increase), nitrous oxide (20% increase), increases with no precedent in the last 800.000 years (IPCC, 2014).

Most forecasts regarding greenhouse gas emissions show that they will probably keep their growth trend, determining increases in average temperature of at least 0,4-1,6 °C by mid-century (IPCC, 2014). All predictive scenarios show a higher degree of warming onshore than offshore, except for the Arctic area, but also Collins estimates that increases of average temperature will be double over there compared to global levels (Collins et al., 2013).

Negative human 'footprint' on the quality of air is not the only form of pollution. Water, soil, ecosystems, in general, are also disturbed, especially in the extreme cases of ecological disasters; from nuclear power plants failures (with well-known cases of Chernoble and Fukushima), oil spills (Gulf war oil spills or BP's spill in the Gulf of Mexico), chemical industry spills, all of these produce drastic changes of the environment, sometimes irreversible.

Damaging the environment through irresponsible human action puts human society's own future in jeopardy. Security of humankind is highly depen-

dent on its energy supply security. The problem of energy security is intensely studied and debated at world level, with a broad series of authors specialized in the field, but the essence of this notion has yet to be fully defined because of it being “polysemantic” and “slippery”, as Chester describes (Chester, 2010).

The shift from the use of conventional sources of energy to renewable ones could not only improve global climate problems, but it also has the potential to generate economic benefits on the long term, emphasizing the sustainable nature of renewable energy sources. But renewable energy technologies and markets are at an incipient maturity level, so external incentives are to be used to diminish investment risk. These forms of support are financed through public budgets and are being elaborated according to numerous international agreements. The most complex legal framework for supporting the development of the renewable energy sector is active in the European Union, and Romania as a member state contributes to the achievement of EU’s renewable energy strategy targets.

3.1 EVOLUTIONS IN ENERGY CONSUMPTION

Romania’s gross inland consumption follows a general decreasing trend in the interval considered (2007-2016), with an obvious negative evolution of circa -12% from 2008 to 2009, and a slightly milder descent for 2012/2013. Actually, the negative trend is quite clear only for the first part of the interval, but then after 2013, the values gravitate around 32.400 ktoe.

Figure 3 Evolution of gross inland consumption of energy in Romania between 2007-2016 (ktoe)

Source: own calculations after Eurostat database

We think that these descending values in consumption come from the efforts of increasing energy efficiency, as an element of a qualitative side of development instead of a quantitative one. European societies are characterized by a relative maturity and thus tend to favor the quality of life (awareness of climate change and with it climate change mitigation, limitation of waste through rationality of consumption, etc), and not only the quantitative increases in consumption, wealth and immediate satisfaction.

The period between 2013 and 2016 has positive evolutions in Romania's macroeconomic indicators, especially GDP and GDP per capita, and that has also triggered an increase in consumption. Given the market needs, this consumption was made up of electronics and house appliances that either replaced old ones or were completely new. Of course, some of them contributed to the decrease in energy consumption, thanks to the energy efficiency standards of new products, but we are also talking about a change in the kind of energy they use: electrical heaters replaced gas ones, electrical ovens as well, sometimes even electric vehicles replaced those with internal combustion engines. This way, electricity became a more important energy source in the consumption pattern, and therefore the only common element between the trends of gross inland energy consumption and electricity generation is that abrupt descent from 2008 to 2009. Consumption follows a general downward trend after that, but electricity generation is slightly going up. The fact that the residential sector is Romania's largest consumer of energy, with a share of 33,28% of consumption (Eurostat, accessed in February 2019), makes this shift of consumer behavior towards electricity to have the effect shown in Figure 4.

Figure 4 Evolution of electricity generation in Romania between 2007-2016 (TWh)

Source: own calculations after Eurostat database

3.2 THE IMPORTANCE OF RENEWABLES IN THE ENERGY MIX

Renewable energy has been in the last decades in the center of a lot of discussions and public debates regarding energy policy, and real integration of green energy sources in world energy infrastructure is one of the great challenges of the 21st century.

The technology needed to harness renewable energy is, like many other newly arrived products, obliged to compete with well established conventional technologies, thus being in an unfavorable position. When they appear on the market, new technologies have not yet achieved their full performance potential, lacking reliability and efficiency. Those can be obtained only after prolonged processes of research and development, that need important investments of time and money. In other words, as Arthur claims, new technologies are not used because they are efficient, but they become efficient once they are being used (Arthur, 1989).

The importance of renewables in Romania's energy mix is quite high, statistically; it has reached its objective for 2020 (24% of the total consumption) long before the deadline, in 2014, and since now even surpassed it. Realistically speaking, this important share of renewable energy in energy comes from hydro; Romania's electrical system is highly dependent on electricity produced alongside the Danube river, especially at the Porțile de Fier hydro plant. Efforts in innovation and new investments are necessary for also developing other renewable energy sources and technologies: we are talking about solar, wind and even geothermal, bearing in mind the great geographical potential.

Table 1 Electricity production from renewable sources in Romania (ktoe)

	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
Total (all sources)	5.123,2	5.219,9	4.767,5	5.016,8	5.167,1	5.075,4	4.859,8	4.993,6	5.089,8	5.122,8
Total from renewables	1.440,0	1.465,5	1.472,9	1.524,0	1.608,6	1.703,7	1.823,2	2.081,3	2.196,8	2.188,0
Hydro	1.436,8	1.463,1	1.471,1	1.488,9	1.479,8	1.457,3	1.385,1	1.386,6	1.416,8	1.435,0
Wind	0,1	0,4	0,8	25,6	111,7	227,4	380,4	512,3	564,6	550,9
Solar	0,0	0,0	0,0	0,0	0,1	0,7	36,1	139,0	170,4	156,5
Biofuels	2,9	2,0	0,9	9,4	16,2	16,5	17,3	39,0	39,7	40,1
Others	0,2	0,1	0,0	0,1	0,7	1,7	4,3	4,4	5,2	5,6

Source: Eurostat

Regarding renewable energy used in transportation, results are not as good. The mandatory target for 2020 will be difficult to reach, as an increase of 80% is needed in order to make it. A more realistic assumption will be that maybe 8% of the energy used in transportation will come from renewable sources. Transportation is one of the most energy-consuming sectors, therefore there are dedicated efforts and targets for 2020 and the trend is also kept onwards to 2030, with stimulative programs across EU member states regarding the acquisition of electric vehicles: cars, vans, trucks, but also alternative transport like bikes and scooters.

Figure 5 Share of renewables in Romania between 2006-2016 (% in total)

Source: Eurostat

From this point of view, Romania is witnessing a phenomenon that will further burden the efforts of reaching the desired targets for transportation: the import of second-hand automobiles from western-European countries, vehicles that are –obviously– less efficient and more pollutant than new ones, due to the elimination of some fiscal barriers (especially the automobile environmental tax – registration tax).

4. LEGAL FRAMEWORK AND SUPPORT PROGRAMS

Support, promotion and stimulation policies for research and development of technology, and also an investment in production facilities and infrastructure are also necessary for renewable energy to reach its potential, other than being a niche market, but a broadly used resource, integrated into the world economic circuit.

Successful integration of renewables in world energy systems can be done only by surpassing certain difficulties and barriers. In order for them to be overcome, the existence of a set of measures in instruments is needed, to determine an efficient exploitation of the renewable sources of energy: financial, fiscal or of any kind, put in a coherent legal framework, and also support policies for investments in technology, research and development (Lee & Zhong, 2014). This section of the paper intends to emphasize policies and instruments, with their according to legal framework currently (or past) in force in Romania, and how they can affect the reaching of 2020 targets and the further ones going to 2030 and beyond.

Romania's National Renewable Energy Action Plan was preceded by *law no. 220/2008* regarding the promotion and production of energy from renewable sources that, along with others normative acts that modified and consolidated it, establish methods by which ANRE (National Agency for Management of the Energy sector) can support producers of green energy. Complementary, in the same year, *Government Ordinance no. 22/2008* regarding energy efficiency and the promotion of the use of renewable energy by final consumers was also adopted. Actually, according to ANRE's transparency reports, as many as 12 normative acts modified, consolidated or introduced exceptions from law 220/2008 and this has generated a lack of predictability that, among with bureaucratic difficulties faced by investors, but also the diminishing of the support for the green certificates are the main reasons why Romania is no longer present in the Renewable Energy Country Attractiveness Index's top 40. Last time Romania was included was in 2015, on 34th place (EY, 2015), with similar previous performances, in the last quarter of the ranking.

Romania's support programs and schemes for renewables are:

Astfel, programe de sprijin și sistemele de stimulente active în România sunt:

- *Quota obligations*, under the form of *green certificates*, which are being offered to producers of energy from renewable sources, and they can sell them on the free market; conventional energy producers have the obligation to purchase a certain number of certificates, based on their production; according to ANRE's transparency reports, in 2018, a number of 189 producers had the obligation to buy a total number of 3,85 million green certificates (ANRE website reports). We have to mention the fact that only renewable energy production facilities built before January 1st, 2017 are eligible to receive green certificates, and in 2017 the total installed power that benefited from green certificate government support was of 4.787 MW, and the annual quota of electricity from renewables was 8,3%, following *Government Ordinance 1014/2016* directives;
- *Subsidies* offered especially through *Rural Development National Programme, Measure 4: Investment in physical assets*, where production of energy from renewable sources is not financed as a business activity, but the applicant can buy energy production equipment to assist the main business activity; also, through *Government Decision no. 216/2017*, new subsidies were put in place for investing in energy production capacities from lesser known and used renewable energy sources like biogas, geothermal or biomass;
- The possibility of authenticating in the energy system as a *prosumer*, which constitutes a specific type of a *feed-in tariff* scheme mixed with a *net metering* scheme. It consists of the right of household producers of energy, with an installed capacity of under 27 kW, to get a guaranteed tariff for their excess quantities of electricity. Electricity operators have the obligation to connect them to the grid (for a fee, of course), and with no bureaucratic barriers. To avoid further unnecessary bureaucracy, there is no cash involved, as for the financial obligations owed by the electricity company to the household is being subtracted from the next electricity invoice and that's where the net metering instrument comes into place;
- *Fiscal incentives* – small household producers, with a producing capacity of maximum 27 kW, are exempt from fiscal obligations for products destined for autoconsumption but also for the one sold to the network;

- *Quota obligations* – of biofuels in total fuels sold on the market;
- *Rabla (old car) Plus programme* individuals based in Romania can receive a voucher for buying a hybrid-electric car (20.000 lei ~ 4000 €), or a fully electric car (45.000 lei ~ 10.000 €).

One of the widely known programs for stimulating investment in renewables, *Casa Verde (The Green House)*, is not active at the moment of elaboration of this paper; in late 2018 some changes and plans for the future of the program were in public debate, but the failure of the Government to produce a state budget for 2019 did not help in re-starting *Casa Verde*. The most discussed proposal was that the subsidy should stimulate the acquisition of solar photovoltaics used for producing electricity instead of solar panels used for heating water as the initial versions of the programme did. This way, it would stimulate more high-tech and more performant investments in household renewables.

There is an intense debate at the moment of this paper's writing on *Government Ordinance no. 114/2019*, from different stakeholders, especially the banking system, telecommunications, and energy. In its initial form, the document enforced price caps on energy sold on the market, that threatened to bankrupt a lot of energy actors, and generating an increase in energy imports, especially from Russia.

5. SPECIFIC LOCAL ISSUES

During the implementation of the Renewable Energy Strategy assumed through the National Renewable Energy Action Plan, the Romanian market was characterized by numerous legislative inconsistencies. One of the eloquent examples is that whilst law 220/2008 stated the possibility of small-size producers of electricity to sell their excess production to the grid, the fiscal legislation forced them to issue invoices for this activity. Bearing in mind that the vast majority of small-sized producers are households (families or individuals), they were not able to issue any invoices, so selling electricity into the grid was virtually impossible. More than that, even if some small-sized producers were to have the possibility to issue invoices, they were supposed to pay VAT, taxes, and excises for this activity, which made the net incomes from domestic electricity production go down to almost zero. Further, than that, administrative and bureaucratic barriers like difficult authorization, expensive connection to the grid as a producer and other obstacles blocked the implementation to a

standstill. Law no. 220/2008 defined the prosumer, but it did not support the development of that network of prosumers that would feed the grid; to better stimulate prosumers, it was modified and amended by law no. 184/2018, that gave a clearer path for their aim of making the most of the excess electricity they produce.

Analyzing the support schemes for renewables active now, we can observe that the intensity of support for large-scale producers has dropped with the new law no. 184/2018 as opposed to law no. 220/2008. Support from green certificates was already decreasing in the last period (2015-2017), and it finally ceased for production facilities built after January 1st 2017. This period coincided with that decrease in attractiveness for investors mentioned earlier.

Market actors had a say about this situation, especially those that were involved in wind energy; Romania's Wind Energy Association expressed their concerns regarding the future of their investments in Romania, proposing the establishment of higher objectives together with stronger support schemes for wind energy, according to Romania's important natural potential (RWEA, 2018). Public debate, discussions with these market actors can only be beneficial for the whole society, so we think that they should take place more often, especially in the early stages of legislation drafts writing; this will normally bring coherence and extra relevance to the legal framework to be adopted nation-wide.

Speaking of natural potential, another element of specificity for Romania is its geographical positioning. As mentioned earlier in this paper, both solar and wind energy have relevant potential, and hydro is not only hypothetical potential, it's now producing an important share of Romania's electricity. Also, neighboring countries like Hungary, Bulgaria, and Serbia don't have a comparable potential of producing energy and a good interconnection with national power grids can make Romania an important regional energy supplier.

In achieving this goal, investments in energy and renewable energy in Romania are supported through different instruments, European funds is one of the most important. For 2014-2020, Cohesion policy had reserved 1.5bn € for investments in increasing energy efficiency of buildings, construction of renewable energy production capacities, but also implementing intelligent energy infrastructures. For the innovation component and increasing SMEs competitiveness, there are still over 15 million € available until 2020, according to Energy Union Factsheet – Romania 2017, Romania's third report on the State of the

Energy Union¹. The same document mentions a total sum of 3,745 bn € destined for transport.

Through ERDF numerous energy efficiency projects for thermal isolation of old buildings were financed, in the total value of over 75 million €. Also, centralized heating infrastructure in cities like Timișoara and Oradea were rehabilitated, reducing fuel consumption by 30.000 toe in 2017 (Romanian Government, 2018). Also, through Connecting Europe Facility, 20 financing deals were signed, totaling over 1.2 bn €, especially in developing intelligent transport systems and alternative fuels.

Investors in renewables in Romania accessed, according to IRENA Renewable Energy Public Investment Database, investment credits of a total value of 1.25 bn €, mainly from EBRD (550 million € for 7 wind parks, 63 million € for the EDPR Solar Project and 77 million € for the rehabilitation of Stejarul Hydro-plant), but also EIB (around 200 million € for Fântânele wind park, 350 MW capacity, and another 200 million for a wind park of 260 MW capacity, also in the Dobrogea region, called ENEL Green Power Romania). International Finance Corporation, the member of the World Bank Group, credited Cernavodă wind park with cca. 100 million €. In 2013, a total of 53 investment projects in renewables were finished, with a total installed running power of 225 MW (Romanian Government, 2018), so investments made in the present period have drastically grown Romania's energy-producing capacity from renewable sources.

Developed projects in the renewable energy field have supported more than 53.000 jobs directly, along with other indirect jobs. Their distribution is shown in Figure 5 and is liquid biofuels (over 23.800 jobs), solid biomass (approximately 11.400 jobs), big hydro (cca. 8.800 jobs). We observe once again that these are not the technology-intensive renewables, but mostly the "traditional" component of renewables, with a stronger environment footprint. We believe that labor productivity in renewables in Romania is suffering because of that. Total market turnover was of only 1.6 bn € in 2016.

Figure 5 Number of employees in renewables in Romania, by technology, in the year 2016

Sursa: own calculations after Eurostat database

Greenhouse gas emissions in Romania have a general decreasing trend in the last 10 years, in 2016 it totaled approximately 113 million tonnes of CO₂ equivalent, compared to over 153 million tonnes in 2007, a 27% decrease. Emissions per capita are also relatively good for Romania compared to Europe, at fewer than 6 t of emissions per capita, thanks to confinement of industrial activity.

From the GPD point of view, evolutions are characterized by a general increase in the last 10 years, but if we are considering GDP/capita, Romania still needs serious improvements to be done to reach at least half of the EU average GDP/capita. In order for that objective to be met, energy policy instruments directed to energy efficiency and stimulating individuals to produce their own energy needs from renewables can be a successful approach. Individual users, but also SMEs, can increase their energy efficiency by thermal isolation of their homes and offices, intelligent design, and can limit energy waste with the use of electric and electronic tools and appliances that run on electricity locally produced. This generates a surplus, and that could generate more investment in the long-run. But, it can be at the cost of a not-so-free market, ruled by subsidies and support schemes.

Figure 6 Romania's final energy consumption in 2016, by sector

Sursa: own calculations after Eurostat database

As Figure 6 shows us, residential use of energy is the main energy consumer of the country, with 33,28%, followed by industry and transport that are approximately equal in share (27-28%). Services and other activities of the economy account for a little more than 10%.

6. CONCLUSIONS

Romania's path to achieving 2020 targets is almost a done deal, with a few exceptions regarding transport. From the share of renewables in total energy consumption, the 24% target was already surpassed and is expected to increase as more and more projects are being finished and ready for operation.

With industrial activity decreasing, support schemes enforced through recent legislative changes (law 184/2018) target especially residential and small enterprise energy users, as we were showing in the paper, so it is expected to generate positive effects in terms of energy savings and the volume of renewable energy consumed in total consumed energy.

Through European funding, continued after 2020 with 2020-2026 multi-annual budgeting, Romania has the chance to also secure 2030 targets ahead of time. Unfortunately, legislative turbulences like the Government Ordinance

114/2019 introduces unpredictability, sometimes chaos in the internal market, and of course that is not very appealing for investors.

Abstract

Corporate Social Responsibility (CSR) is a concept that represents the commitment of business and civil society to the promotion of lifelong learning on sustainable development that will contribute to the safe and healthy lifestyle of individuals and employees, their families, the local community and society as a whole. The implementation of the concept of CSR into the business of a company implies assuming responsibility for the employees within a company, as well as for the environment which the company is affecting. By applying the concept of CSR, the company raises its activities to a higher level of business through which people inside and outside of the company become aware of the importance of influencing the social community and of the way they contribute to long-term sustainability. Also, CSR affects the company's competitiveness and creates a positive corporate image.

In this paper, a survey was conducted, in which consumer attitudes about socially responsible business and the purchase of products of socially responsible companies were examined. The survey found that consumers are familiar with CSR and recognize its importance and prefer to buy products from socially responsible companies.

As an example of good practice, the authors reviewed the company Coca-Cola HBC Croatia and applied the concept of socially responsible business operations of the enterprise mentioned above and the activities that the mentioned concept implements. Coca-Cola HBC Croatia is a pioneer of CSR in the Republic of Croatia, which published its first Business Sustainability report as early as 2003. Coca-Cola HBC Croatia carries out the following activities of CSR: health care and safety at work, health care and safety of consumers, care for employees, environmental protection and sustainable use of natural resources, wastewater management, energy savings and climate protection, production management and packaging waste management, as well as its support for young people.

Keywords: CSR, society, environment, consumer experience

JEL Classification: D23, M14

1. INTRODUCTION

Corporate Social Responsibility (CSR) is one of the most important and most urgent issues that business people are facing today. As Pavić-Rogošić (2010: 2) states, “Investing in our not environmentally hazardous technologies can contribute to corporate competitiveness. In the social sphere, investing in education, working conditions and adopting good relationships with employees can also contribute to productivity.” For that reason, the authors decided to observe the situation in the Republic of Croatia in more detail, precisely because “Corporate Social Responsibility is the concept in which companies integrate taking care of society and the environment into their business and their associations, on a voluntary basis. Being socially responsible does not mean only fulfilling legal obligations, but also investing in human capital, environment, and stakeholder relations” (Pavić-Rogošić, 2010: 2).

This paper studies Corporate Social Responsibility and what is necessary to make the company socially responsible. Today, Corporate Social Responsibility has become one of the standards in business, and all companies are trying, apart

from making a profit, to do something positive for the social community and to behave ecologically responsible. This means incorporating social, ecological and ethical principles into the strategy of doing business. According to Pavić-Rogošić (2010: 2), there are internal and external dimensions of socially Corporate Social Responsibility. The internal dimension refers to investment in human capital, health, and safety as well as change management, while the external dimension refers to those activities outside of the enterprise itself and includes cooperation between the local community and various stakeholders. The importance of Corporate Social Responsibility lies in the fact that companies must be the ones who will materialize a better and more sustainable future. Enterprises can serve as drivers of sustainable development in order to improve the living conditions of people, the local community and society in general. According to Šušnjar (2018: 4), the concept of Corporate Social Responsibility is most often applied to large companies simply because their influence on society and the environment is the largest and most visible, their power is the greatest. Regardless of this fact, small and medium-sized enterprises also have significance in the concept.

This paper consists of six parts. Except for the introduction and the conclusion, in the second chapter, the authors provide a theoretical review which includes the historical development of the term and concept of CSR, types of corporate responsibility, the description of the CSR index and specific activities involving CSR. The third chapter refers to a methodology of work that includes one hypothesis, and apart from that, a description of how the consumer experience survey was conducted by the method of univariate statistical analysis (descriptive statistics). The fourth chapter consists of research carried out in 2019, in which consumer attitudes towards CSR, as well as consumer preferences towards products of socially responsible enterprises were explored. The chapter contains the results of the conducted research, as well as the analysis of the hypothesis. In the fifth chapter, the authors highlighted Coca-Cola HBC Croatia as an example of good practice that works in accordance with the principles of CSR and described the core tasks the company conducts to achieve a high level of sustainability. In the last chapter, the authors made general conclusions, but also specific conclusions, based on the above-mentioned survey.

2. THEORETICAL REVIEW

The business of each company can be divided into many parts and perspectives, which can be separated into those relating to the whole business and those

relating to certain parts of the business, and Glavaš et. Al. (2018) state that all the functions of an enterprise must be interconnected, i.e. integrated so that the companies can achieve a competitive advantage. Jalšenjak and Krkač (2016: 169) state that the “Green Paper: Promoting Corporate Social Responsibility” is about three aspects that can be measured by CSR: financial success, the friendly mood for the environment and social responsibility. In every part of the company or business entity, as well as in its entirety, it is required to fulfill all three criteria, i.e. to be financially successful but at the same time ecologically and socially responsible. According to Jalšenjak and Krkač (2016: 184), there are also three core interests of each company, for which all stakeholder groups can also be divided into three groups that ensure the long-term success of the company. The stated interests are social responsibility, business success, and environmental responsibility. Social responsibility refers to a real, positive and measurable attitude towards society (within itself, such as employees; at the company’s frontiers and society like consumers; and outside companies such as local communities, laws by the state and respect the rules of the free market). The business success includes financial success and many other parts, such as successful production, management, marketing, etc. and finally, environmental responsibility refers to an environmental relation that can be social and environmental. This relationship is often represented by three diagrams that overlap each other, and are found in the following figure.

Figure 1. Types of business interests and responsibilities in order to achieve full business success

Source: Jalšenjak, B., Krkač, K., (2016.) Poslovna etika, korporacijska društvena odgovornost i održivost, p. 184 - 185

Figure 1. shows that complete success (the goal of every successful business) is achieved only in the area of overlapping of all three previously stated responsibilities (in area 1). Jalšenjak and Krkač (2016: 184-5) state that the goal is less achievable in case of overlapping two of the three areas (areas 2, 3 and 4) and that it is least achievable if it is beyond the overlap of the area. Of course, there are business entities that are oriented solely to one of the stated aspects of responsibility. The above authors further mention a concrete example: “Unions take care of workers and their attitude towards work, towards employers and the state, or there are associations and agencies that want only to protect the environment, and so on. In the case of companies, if the company were in area 2, it would mean that it lacks profitability and has two possible directions: either to seek profitability or to become a non-profit organization. Areas 3 and 4 are connected. They mean that the company is successful in business, even if it is not socially or environmentally responsible (Jalšenjak and Krkač, 2016: 185).

The concept of CSR arises from the long-standing work of experts and the study of the business cycle itself and the business processes. Also, it stems from the needs of both consumers and producers, as well as the environment itself - in the context of sustainable development. Therefore, it can be said that there are many definitions for the Corporate Social Responsibility of the company. Regardless of how many different definitions exist, each of these definitions revolves around several critical factors that include community contribution, ethical behavior and sustainability, and not just making profits, as long considered. According to Carroll (2008, Agudelo, 2019), Corporate Social Responsibility was rarely mentioned until the period of World War II, when several authors began to mention the activities of CSR, the awareness of CSR started to develop, corporate behavior began changing, and the term of CSR was formed. Since the authors have been discussing the topic of CSR for 80 years and are continually developing the term of CSR, the literature is rather ‘broad’, which can be seen in the following chapters of this paper.

Agudelo et al. (2019), along with other authors in the previous years, made a detailed overview of academic literature on the development of the concept of CSR. According to these authors, the Corporate Social Responsibility concept has been developing since 1953, when Bowen points to the responsibility of employers in business that contributes to the values of society. Ten years later, McGuire points out that every corporation, apart from financial and legal obligations, is obliged to fulfill those social responsibilities. Shortly after,

in 1962, Friedman defines CSR as the concept in which companies use their resources and participate in profit maximization activities as long as the listed activities respect the rules of open and free competition (Fox, 2012), and in 1963 McGuire considers the welfare of employees and community, as well as educational and political needs of the society. In 1973, Davis mentioned the realization of the company's social benefits, in 1975, Sethi introduced corporate behavior in line with social norms, values, and expectations (Zheng, 2006), and Davis and Blomstrom speak about the managerial obligation to take actions that, together with their interests, protect and enhance the well-being of society. In 1979, Carroll said that companies that act responsibly must meet the economic, legal, ethical and discretionary expectations of society, Donaldson in 1983 says that companies are moral agents that must fulfill social expectations (Kashyap, 2004: 52). In 1994, Reder said that social responsibility relates to the way the company implements its internal business, including the way it treats its workforce and the company's impact on the world around it. Moreover, in 1999 Woodward-Clyde defines CSR as a "contract" between the society and the company in which the community gives the company a license to operate and in return fulfills certain obligations and behaves in an acceptable manner (Dahlsrud, 2008: 10).

According to the official CSR Europe website, in 1995, two years after European Commission President Jacques Delors called on companies to fight against social exclusion and unemployment, 20 business leaders adopted the European Business Declaration against Social Exclusion, while the European Business Network for Social Cohesion (later renamed CSR Europe) was formed in 1996 to create a space for men and women in the business world in which they can share experiences, develop solutions and engage in smart political dialogue with the EU; with the goal of improving socially responsible business within their organizations and wider..

The European Commission (2019) adopted a revised CSR strategy in 2011, combining horizontal approaches to CSR promotion with more specific approaches to individual sectors and policy areas. Adding on their strategy, in March 2019, the Commission published a working document giving an overview of the progress made by the Commission and the European External Action Service (EEAS) in the implementation of CSR and on labor and human rights.

As can be seen from the previous, many authors and institutions (through the years) in a variety of ways define and uphold the concept of CSR. Thus, Kotler and Lee (2011: 14-15) define social responsibility as a “commitment of the company to improve community well-being through discretionary-voluntary business practices and contribute to the account of their resources.” The most essential element of this definition, by Kotler and Lee, is the expression ‘volunteering’, which includes legally required business activities, as well as activities that are expected due to their ethical nature, but also the voluntary commitment of the company to exceed its usual level of application of business practice or giving various contributions.

For Vrdoljak Raguž and Hazdovac (2014: 40) “Corporate Social Responsibility (CSR) represents a unique concept of business whereby companies voluntarily and without any legal coercion endeavor to align their business with the needs of society in the widest possible sense. Therefore, the concept and practice of Corporate Social Responsibility are related to the entire range of activities. What does a company produce, how it produces, which resources it uses, how it buys, sells, how it affects the environment, how it employs, how it relates to employees, how it enables them to work, what are working their conditions, how to invest in the social community and if it respects human and labor rights are just some of the issues that determine the overall impact of that kind of enterprise on society.”

Poljak et al. (2013: 181) state the same definition of CSR as Kotler and Lee in 2009, while Hopkins defines socially responsible business as “the attention to which we relate to ethically and socially responsible behavior to interest-influential groups that are beyond, but and within the organization. The goal of social responsibility is to ensure the creation of a high standard of living for interest-influential groups outside and within the enterprise while preserving profitability (2006: 299).”

According to the official website of Corporate Social Responsibility in the Republic of Croatia (2019), it represents “a growing conviction that modern companies have more and more responsibility for their role in society. (...) According to this concept, companies in their activities and relationships with various stakeholders such as owners, shareholders, employees, consumers, suppliers, governments, media, local communities, and the general public, on a voluntary basis, integrate social affairs and protection environment with economic

indicators of the business. This is a practice that goes beyond legal requirements, and each company decides on which areas to pay more attention, following their own strategic goals, sources of risk and business opportunities. It contributes to the enhancement of its competitiveness by increasing its reputation, reducing its operating costs, tracking industrial trends, meeting customer needs, motivating and attracting the best employees, reducing risk of prosecution, access to cheaper capital, and risk management. "Also, according to CSR in Croatia, corporate social responsibility applies to companies of all sizes, though the most significant impact of large companies is being investigated because their impact is most noticeable and their power is the greatest. However, that does not mean that small and medium enterprises cannot be socially responsible.

The Croatian Chamber of Economy (in future text: CCE) held the first Conference on Corporate Social Responsibility in Croatia in 2004 and then launched the CSR Index Project. According to the Croatian Chamber of Economy, the CSR Index is a methodology for evaluating responsible practices in the business of Croatian companies. CSR Index was formed on similar world-known methodologies, such as the Business in the Community CR Index. The methodology defines several criteria for an evaluation in the primary seven areas:

- ♦ Economic sustainability,
- ♦ The involvement of socially responsible business in a business strategy,
- ♦ Working environment,
- ♦ Environmental Protection,
- ♦ Market relations,
- ♦ Relations with the community,
- ♦ Responsible Policies on Diversity and Human Rights Protection (CCE, 2010a).

All the companies that are considered to be the most successful in the Republic of Croatia according to the Gold Kuna criteria can participate in the assessment of socially responsible practices. The project aims to popularise corporate social responsibility in the Republic of Croatia in the sense of strengthening the market position of the company and building a good reputation through all segments of the business. This means the responsibility of board and management through all business processes while ensuring profitability, environmental and community management, including fundamental stakeholder interests (CCE, 2010a).

Graph 1. An overview of the number of CSR survey respondents for the period 2008 - 2017

Source: made by authors from CCE, 2019a.

Each year (beginning in 2008), the Croatian Chamber of Economy sends a call for participation in the participation of the CSR Index Questionnaire to 2,000 small and medium-sized and large enterprises (as well as public) whose business have been financially positive in the previous financial period. Filling out the questionnaire is not mandatory, but is conducted voluntarily, and only interested economic entities fill out the questionnaire. According to Graph 1, it is evident that the smallest number of respondents for the CSR index was at the very beginning, i.e. in 2008, when the survey was conducted for the first time in the Republic of Croatia. The first significant increase in the number of companies that completed the questionnaire replication of the CSR Indexes occurred in 2010 (98 companies) with a growth of over 130% over the previous year (42 companies). After several years, after including public companies in the possibility of completing the questionnaire, in 2012 the number of participants has surpassed the number of participants in 2010 from 103 companies. According to the latest available report on the number of participants in 2017, the result was increased to the 112 surveyed companies. However, despite the increase in the number of participants, there are still a small number of companies participating in this survey (only 5.6% of the total number of invited companies), but an increase is expected over the years, precisely because of increasing awareness of people and businesses about the importance of socially responsible business and behavior.

As commonly known, the most crucial goal of every business is to make a profit. Bearing that in mind, in the whole concept of social business one can ask several key questions: Where is profit? What benefit enterprises have from the business that, at first glance, brings only cost? It is hard to believe that today's businesses are socially responsible only from their own volition. The explanation of corporate socially responsible benefits has been stated by "Business for Social Responsibility", one of the leading non-profit organizations in the world that provides company information, tools, services, and consulting services related to social connectivity responsibility, important business, and strategy. Based on research and experience, it can be concluded that the companies achieve several benefits such as:

- ♦ Increase in sales and market share,
- ♦ Strengthening the position of the inside,
- ♦ Strengthening corporate image and influence,
- ♦ Strengthening the ability to attract, motivate and retain employees,
- ♦ Reduction of operating costs,
- ♦ Increasing attractiveness for investors and financial analysts "(Kotler & Lee, 2009).

Apart from those mentioned earlier, the authors consider it necessary to point out that Corporate Social Responsibility has its hierarchy where it is at the lowest level responsible for profit, followed by compliance with laws, followed by ethics in business and ultimately a contribution to the enterprise. These responsibilities are arranged from bottom to top, depending on their size and frequency with which the manager approaches. "It consists of economic responsibility (at the bottom), which includes profitability, then legal responsibility (compliance with the law), ethical responsibility involving ethical behaviour, and discretionary responsibility at the top, which implies a contribution to community and quality of life (Jakovčević, 2016: 14, from Buble, 2006).

3. METHODOLOGY

In April 2019, authors conducted online research through the Google Forms Toolkit to examine Consumer Experience and opinions of socially responsible companies in the Republic of Croatia. The research consisted of a questionnaire divided into three units. The first part contained a question about the familiarisation of respondents with the concept of CSR; the second set consisted of 14

questions that questioned the opinion of the respondents towards CSR business operations, while the last one was composed of 5 questions that examined the demographic characteristics of respondents. The question from the first unit related to familiarity with the concept of CSR was a closed type question. Other questions about the respondents' opinion about CSR were closed type (14 questions) and open (1 question) type questions. Questions related to the demographic characteristics of the respondents were closed type questions. The data collected were analyzed using the MS Office Excel program package, and the method of univariate statistical analysis (descriptive statistics) was used. In the frequency distribution tables, the modality of the observed characteristic is recorded, as well as the percentage and total value data. The questionnaire via Google Forms Toolkit was available for seven days in April.

Before conducting the research, the authors put forward a hypothesis that will be explored through consumer experience survey on socially responsible companies in the Republic of Croatia. The hypothesis is set as follows:

H1: Consumers are willing to pay a higher price for a particular product in case the manufacturer behaves responsibly.

4. RESEARCH OF CONSUMERS' PERCEPTIONS ON CSR IN THE REPUBLIC OF CROATIA

In the online survey conducted through the Google Forms Tool for the purpose of writing this paper, 111 respondents participated, 74.7% of them are women, while only 25.3% are male. According to the age structure, the most significant number of respondents belong to the category of 21 to 30 years of age, while the lowest number of respondents are represented in the category of 41 to 60 years of age. According to the working status, 72.1% of respondents are students, 23.4% of respondents are employed and 0.9% of respondents are unemployed. Respondents also differed according to monthly household incomes, 24.3% of them belong to households with monthly income between HRK 6,000.00 and HRK 9,001.00, similarly, (25.2%) of respondents said that their monthly household income is higher than HRK 9,001.00 but lower than 12,001.00 HRK. The smallest number of respondents, 11.7% of them, answered that their monthly household income was less than HRK 3,000.00 per month.

Out of the total number of respondents, 83.8% are familiar with the concept of corporate social responsibility, while the remaining 16.2% of respondents are not familiar with the term. To the question “What does the concept of socially responsible business mean to you?”, respondents could choose more than one response: Respect the law, Care for society, community and people, Care for the Environment/Natural resources, Honor, morality and prudence, Ethical behavior, Compliance with legal procedures, Good/Successful Business, Profit making. The most common response was “Care for society, community and people”, selected by 104 respondents (93.7%), or “Care for the Environment/Natural Resources” selected by 87 respondents (78.4 %). The least commonly selected answer was “Profit Making” with 10.8% (12 respondents) and “Compliance with legal procedures” with 28 responses (25.2%).

When asked “Do you feel that you are socially responsible?”, respondents could respond with grades 1 through to 5, where grade 1 meant “I completely disagree” and grade 5 meant “I completely agree” with that statement. The highest number of respondents answered grade 4 (“I agree”), 63 of the respondents, or 56.8%, while none of the 111 respondents said that they completely disagree with the statement. Only 14 respondents considered themselves to be fully socially responsible and rated 5 (12.6%). In the context of participating in the improvement of the environment, the authors asked the question “Do you believe that you can contribute to the improvement of society or the environment in which you live?” To which one of the three offered responses was possible: “Yes”, “No” or “Maybe.” The largest number of respondents, 70 (63.1%) answered “Yes”, 38 respondents answered “Maybe” (34.2%), while only three (2.7%) answered “No”, indicating the participants’ awareness of the importance of participating in improving his/her environment through socially responsible behavior and business.

In relation to the question “How important is it for companies that produce certain products, that you personally consume, to carry out certain activities?” respondents had to respond to each response offered (Respect the law, Care for society, community and people, Care for the Environment/Natural resources, Honor, morality and prudence, Ethical behaviour, Compliance with legal procedures, Good/Successful Business, Profit making) and choose the degree to which each response is important (1 to 5, from “Not important at all” to “Completely Important”).

The answer to “Respect the law” is identified as “Important” by 42 (37.84%) respondents, 3 (2.7%) responded with “Not important at all”, and 39 (35.14%) responded with “Completely important”. “Compliance with legal procedures” was not important at all for 14 respondents (12.61%). The response for “Care for society, community and people” is identified by 44 respondents (39.64%) as “Important”, with a very low number, only 3 (2.7%), selecting “Not important at all”, and 42 (37.84 %) respondents selecting “Completely important”. “Care for the environment/natural resources” is important and is of utmost importance for the same number of respondents, 42 (37.84%), while it is not important at all for 14 (12.61%) respondents. The response “Honor, morality and prudence” is considered to be of utmost importance by 43 respondents (38.74%), 37 (33.33%) respondents consider it important, and 13 (11.71%) respondents consider it completely unimportant. “Ethical Behaviour” in the business operations of the company is considered to be of utmost importance by 43 (38.74%) respondents, 39 of whom consider it important, 2 consider it irrelevant and 12 (10.81%) consider it not important at all, which can be said to be rather worrying. “Compliance with legal procedures” is completely important for 28 (25.23%) respondents, important for 45 (40.54%) respondents, and not important at all for 13 (11.71%) respondents. “Good/successful business” is considered by 17 (15.32%) respondents to be completely important, for 40 (38.74%) respondents it is considered important, 17 (15.32%) consider it irrelevant and 14 (12.61%) not important at all, while “Profit-making” is completely important for 12 (10.81%) respondents, 24 (21.62%) think that it is important, 23 (20.72%) that it is irrelevant and 18 (16.22%) that it is not important at all.

Respondents were asked the following question: “Can you remember how you chose a product of a manufacturer that was either a socially responsible/irresponsible company?” to which they were able to choose one answer (the company’s social responsibility was important to your choice, the company’s social irresponsibility was important to your choice, both elements were important, none of the elements were important, I do not remember). Almost half of the respondents (55, or 49.5%) answered that they did not remember and 19 (17.1%) of them, answered that both elements were important.

Most respondents, 72 (64.9%), are willing to pay a higher product price if the manufacturer takes care of environmental protection, 11(9.9%) of respondents are not interested in paying more in this case, while 28 (25.2%) respondents do not know.

The most significant number of respondents learned about socially responsible activities of a company through TV channels (37), rather than on the official web-pages of a particular company (28, or 24.3%) and Facebook (27, or 24.3%). Information on socially responsible activities in newspapers was encountered by only eight respondents (7.2%), while 11 of them (9.9%) did not encounter the socially responsible activities of an enterprise in any of the ways mentioned above.

When asked, "Did any media have an influence on your opinion on the company after you read, heard or saw the company's socially responsible activities?": Eighty-three respondents answered, "Yes" (74.8%), 16 answered, "No" (14.41%) and 12 answered that "I have not read, heard or seen anything about the company's socially responsible activities" (10.21%).

Regarding corporate social responsibility in the Republic of Croatia, 64 respondents answered "No" (57.66%), 35 respondents answered, "I do not know" and only 12 respondents answered "Yes".

Many respondents (77, or 69.37%) answered negatively when they were asked: "Do you know about a company that operates in the Republic of Croatia (domestic or foreign) and is considered socially responsible?". Only 34 respondents answered positively. Those respondents who answered positively on the previous question could state any company operating in the Republic of Croatia and acting socially responsible. This question was answered by 31 respondents (not 34). Most respondents, 12 (38.71%), know that DM-drogerie market is socially responsible in Croatia. Two respondents (6.45%) knew that Zara Croatia, Saponia d.d., Rimac Automobili and Avon Croatia were socially responsible. The following companies had one answer: Atlantic Grupa d.d., bio & bio (Biovega d.o.o, Zagreb), Ikea Croatia, Coca-Cola HBC, Cekin (Vindija d.d.), Domaći med O.P.G. Grgic, Good brand, Lidl Croatia, Podravka d.d., Maybel-line, Žito d.o.o. Osijek, Heineken, Konzum, Zagrebačka Banka d.d. Also, one respondent stated the answer "I cannot remember now, but I am sure they deal with the meat industry".

The most significant number of respondents stated "The improvement of the company's image" as the main reason why companies apply socially responsible business (65 of them), and 36 consider that this is due to "Attracting customers" and "Increase of income" (7), 2 respondents chose the "Attracting Employees", while one respondent chose "All Allocated".

63 (56.76%) respondents think that corporate social responsibility positively influences a company's image, 13 of them think that corporate social responsibility is not influencing a company's image positively or negatively, and only one respondent thinks it influences a company negatively.

5. EXAMPLE OF GOOD PRACTICE

As an example of good practice, the authors point to Coca Cola HBC. This is because the company carries out activities of socially responsible behavior at a global level and because it is a good example of doing business in this way, in the Republic of Croatia. Coca-Cola has been publishing its own Corporate Social Responsibility Report since 2003 and has actively participated in the DOP Index Assessment. Since 2008, the company has actively participated in the Dow-Jones Sustainability Index (Coca-Cola, 2018a: 2), where they are the leading beverage producer based on results in the area of sustainable development. In 2014, 2015 and 2016, the company occupied the highest position among representatives of the beverage industry in Europe and globally (Coca-Cola, 2019b).

Coca-Cola HBC is a socially responsible business that is aligned in all the countries in which it operates (28 countries) and is one of the largest Coca Cola Company wholesalers (Coca-Cola 2019). In addition to profit realization, Coca-Cola HBC seeks to fulfill its values by doing business differently and inspirationally. Key values of Coca-Cola HBC are authenticity, excellence, learning, concern for people, acting as a team and success with consumers (Coca-Cola, 2016: 11).

According to Coca-Cola's Sustainable Business Report 2018 (Coca-Cola, 2018), people have a fundamental role in sustainable business growth, and for that reason, Coca-Cola has a great deal of commitment to new employment, development and attracting young talents, and encouraging an effective way of thinking across the company.

The main strategic priorities in the report are:

- acquiring community trust,
- increase in market offer,
- responding to customer needs,
- cost leadership (Coca-Cola, 2018a: 5).

According to the Report on Sustainable Business in Croatia in 2018 (2018a: 5), Coca-Cola HBC is actively working on incorporating sustainability and CSR in every aspect of their business. The sustainability mission is the development of business in a responsible, sustainable and cost-effective manner with risk and opportunity assessment, decision-making and investment in which it generates social value. In order to analyze the level of company sustainability, key economic, social and environmental issues have been identified, including quality and credibility of products; health and nutrition; the well-being and employee involvement; corporate governance, business ethics and anti-corruption measures; human rights and diversity; packaging, recovery and disposal of waste; promotion of water protection; community investment and inclusion; sustainable procurement; carbon dioxide and energy.

Coca-Cola HBC Croatia has been one of the most desirable employers in Croatia in recent years, attracting employees, motivating and retaining gifted people by giving them recognition for their work by offering rewards in terms of variable salaries in terms of their performance. A part of the salaries is determined for achieving strategic business goals, as well as for increasing the company's value and improving sustainability performance (Coca-Cola, 2018a).

In addition to this, Coca-Cola HBC Croatia emphasizes the role and importance of sustainability, respect for human rights, community investment and the principles of CSR. According to the Report (2018a), from 2012 to 2016, Coca-Cola HBC Croatia has invested more than HRK 9 million in projects supporting the local community. Between 2015 and 2017, investments in extensive projects amounted to approximately 4 million and 781 thousand kunas. In the three years, two great projects have been supported: "Our Beautiful Sava" and "The Movement for Joy", while in 2017 two new projects were supported: the Coca-Cola Youth Support and the project of lighting the pedestrian bridge in Osijek.

For nearly a decade, the company's policy has shifted away from a large number of small donations with a noble purpose and has focused on long-term partnership investments for social value. Support is focused on four broad areas:

- ♦ encouraging youth development,
- ♦ environmental protection and promotion of water protection,
- ♦ community development and support in crises,
- ♦ community welfare (Coca-Cola, 2018a: 46).

In Coca-Cola's 2018 Sustainable Business Report (2018a: 50), Coca-Cola has set the 12 new goals it aims to achieve by 2020, which would mean that they still intend to continue with significant investments in CSR. The goals include the increase of spent energy from renewable and pure energy sources by 40%, recovery for use of about 40% of total packaging placed on Croatian market, collection of 20% of total used packaging from used plastic packaging and / or plastic packaging of renewable materials, certificate more than 95% of the key ingredients of agricultural origin in relation to the Coca-Cola system of sustainable farming principles, 2% annual profit before taxation in the community, doubling the number of employees participating in volunteering initiatives, reducing direct emissions of carbon dioxide by 50% in 2010, the reduction of 25% of carbon dioxide emissions in the value chain by 2010, a decrease in the use of water in plants by 30% compared to 2010, the goal is to obtain a certificate according to the EWS standard that was awarded to Coca-Cola in 2016 and in 2017 to support the European Union's goals in the area of the conservation of water resources and 10% reduction in added sugar per 100 ml of carbonated beverages in the European Union and Switzerland.

According to the CSR Index, the company Coca-Cola HBC Croatia participated in the research in 2008, 2010, 2011, 2012, 2013 and 2014 and won 2008, 2010, 2011 and 2012 prizes (CCE, 2019b).

6. CONCLUSION

Corporate Social Responsibility has become an unavoidable mode of operation for every modern enterprise, and the benefits of it are multiple. The Coca-Cola HBC, which is observed in this paper, can serve as an example and motivation for all other companies operating in the Republic of Croatia to use CSR activities, as it performs activities for sustainable economic growth and development. In the Republic of Croatia, still only a small number of companies participate in the Survey for the Social Responsibility Index, but the awareness of the importance of CSR is increasing.

The hypothesis set by the authors has been confirmed by 72 (64.9%) respondents; that respondents are willing to pay a higher price for the product if the manufacturer takes care of, for example, environmental protection and is socially responsible. Authors recommend continuing this research in the years to come and expanding (time and number of respondents) and detailing the research.

Abstract

One of the main concerns for policymakers is the ability of their nations to grow and to provide their citizens with a better standard of living. In a globalized world, this ability is increasingly being linked with the ability to export and structure of exported products. It is widely held that sophisticated knowledge and technology-intensive products offer higher prospects for growth than standardized price competitive goods. Ever since the work of Schumpeter migrations have been considered as an important driver of entrepreneurship, innovation, and technological progress. The social and professional networks of foreign-born individuals mobilize information, know-how, skills and capital to start new firms. They also provide valuable contacts and resources for both resident and newly arrived immigrants. Yet, the existing literature notes that the impact of immigration on innovations in the EU is smaller than that in the

USA due to the greater cultural and institutional barriers in the former entity. The understanding of the immigrant role in the economic performance of the EU is particularly important since the growth of the foreign-born population in the EU has been faster than anywhere else in the world. Recent waves of EU enlargement and immigration pressures from other parts of the world have further facilitated this trend. Bearing above said in mind this paper explores the relationship between export sophistication and immigration in EU28 countries over the 2006-2015 period. A dynamic panel estimator is used to discern between short and long-run effects of immigration on the international competitiveness of EU economies. Our results suggest that greater socio-economic diversity increases the sophistication of exports in both the short and long run. The long-run effects are about twice as large than short-run ones.

Keywords: migration, export sophistication, European Union, panel analysis

JEL Classification: F22, O15

1. INTRODUCTION

Two features have marked the modern globalization process, a cross-country migration of population and the rise in international movement of capital, goods, and services. The effects of the former process on host country have received much attention from both academics and policymakers. Those against immigration often base their arguments on a thesis about the inability of integration into society and economic flows due to the lack of social capital. Arguments in favor of migrations emphasize the beneficial effect of migrants and socio-cultural diversity on creativity and innovations. Immigrants are in this framework portrayed as carriers of ideas and knowledge pivotal to the development of entrepreneurship and innovations (Bodvarsson and van der Berg, 2009). It was noted already by Schumpeter (1934) that lower attachment to the traditions of the society makes the population of recent immigrants less reluctant to innovate. Empirical evidence from some countries (Saxenian, 1999; 2002) points to the important role of social and professional networks of foreign-born individuals on the mobilization of information, know-how, skills and capital for new business ventures.

The growth of modern economies is closely linked to the second feature of globalization, a rise in the international movement of capital, goods, and services. The ability to export provides countries with the ability to pay for imports

of goods and services they would otherwise be in shortage of but also brings an inflow of capital that can be used to provide their citizens with a better standard of living. More recently and building on the premises of endogenous growth models the economists have started to argue that the prosperity of nations is determined with the structure or sophistication of their exports. The essence of such reasoning is that the productivity and potential for knowledge spillovers to upstream, downstream, and rival firms are not equally embodied in all goods and that specialization in highly productive, sophisticated goods bears much higher growth potential than price-competitive standardized products. The above reasoning has spawned interest of policymakers across the globe into the structural transformation of their countries' exports and factors and forces that can facilitate movement of national export structure towards more sophisticated products. Understanding of export patterns and their drivers is among key contemporary economic questions for unleashing of growth potential in the globalized world.

The relationship between migrations and export sophistication has so far been investigated mostly indirectly through the impact of former on innovations. Yet, it is well established that human capital presents important determinant of structural transformation of exports. The recent upsurge of interest among European policymakers into the building of most competitive global exporter of knowledge-driven goods as well as raising concerns within EU member states over immigration policy make it worth examining the relationship between these two processes. In addition, the intra-EU movement of workers over the past two decades makes it further interesting to examine whether greater socio-cultural diversity caused by migration leads to higher export sophistication. To address this issue, an index of export sophistication is constructed, and the dynamic panel analysis is employed to determine short and long-run effects of migration on export sophistication. The rest of the paper is structured as follows. Next section addresses the importance of migrations for the upgrading of national production and exports structure from the theoretical and empirical point of view. Descriptive analysis of export sophistication and migration patterns in EU28 member states over the 2006-2013 period is provided in section three. Section four discusses the methodological approach while findings are presented in section five. Section six concludes.

2. MIGRATIONS, INNOVATIONS AND EXPORT UPGRADING

Immigration is one of the most controversial and politically charged processes. Allen et al. (2018) note that the migrations are central to the development of modern nation states. Yet, international public opinion polls repeatedly show that while the public is more open to international trade and financial integration, skepticism exists towards expanding the inflow of immigration. In European countries such as France, Austria, and Switzerland, far-right parties have successfully rallied voters by explicitly embracing anti-immigrant messages. Moreover, due to the political instability and war in Syria, immigration has recently become a key political and security issue in the EU, which raises key economic questions as well. It is obvious when national economies combat with declining economic trends, immigration into one's country is faced with reduced support for open immigration policies. Sectoral inflows are not characterized by these unsatisfactory effects when national economies are doing comparatively better and confidence is on a higher level. Similarly, employment growth in one's sector tends to be associated with more liberal immigration preferences.

In a globalized economy, the cross-border movement of goods, capital, and labor can come with substantial distributive consequences. For example, David Card (2009) explains US immigration's impact on wages, rents, taxes, internal migration, skill composition, population growth and the ethnic and income composition of neighborhoods and schools. Level of countries' development may affect the relationship between immigrant flows and the level of wages of natives. Immigrants often move to boom economies, in which case natives are confronted with a decline in their wages (Dancygier and Donnelly, 2012). Studies examining gateway cities indeed often fail to find wage effects following increases in the supply of local labor. In the face of locally segmented labor markets and limited worker mobility in the short term, the increased demand that accompanies the arrival of large numbers of migrants can mitigate downward wage pressures (Card 1990, 2001). Moreover, if immigrant-working force seeks employment in economies that are growing, they may provide the necessary reinforcement to meet rising demand (Massey 2008). Thus, native workers may not be fired, and any negative effect on their wages may be disguised by the offsetting increase in wages since the higher wages that would have arrived in the absence of migration are never observed.

National economic conditions could have a significant impact on the relationship (or/and perception) between immigrant-workforce and a native workforce of the observed economy. According to Dancygier and Donnelly (2012), during times of economy's expansion, native-workforce may feel less locked into their current sector of employment as job opportunities abound and help offset mobility costs. During a recession, the native workforce may consider the inflow of immigrants into their sectors as an economic threat. In other word, in the economic downturn of the country, immigrant workers are often the first ones to be laid off, ahead of their native co-workers. During recessions, joblessness among immigrants typically rises faster than among native labor, and net migration rates decline. The statistical proof can be found in the 2007–2008 downturn when the increase in the immigrant unemployment rate in the EU-15 was twice that of natives (OECD 2011a, 74). The justification of the previous thesis can be identified within the research of Peri (2010) who confirms that the labor market impacts of immigration are worse for natives during downturns than during expansions.

Literature investigates the relationship between natives and immigrants in detail. The empirical evidence of Borjas (1994, 1995) concludes that more recent immigrant waves will remain economically disadvantaged throughout their working lives; that this disadvantage may be partially transmitted to their future generations; that recent immigrants are more likely to participate in welfare programs than native workforce; and that immigration may have contributed to the increase in wage inequality observed during the 1980s. Within the research of Borjas (1995), it has been discussed that natives do benefit from immigration mainly because of production complementarities between immigrant workers and other factors of production and that these benefits are larger when immigrants are sufficiently “different” from the stock of native productive inputs.

Historical evidence, however, suggests that immigrants may have adverse effects on economic outcomes of host areas over long periods of time. Von Berlepsch, Rodriguez-Pose and Lee (2019) observe a positive effect of migration on income per capita levels of US counties in the short run and with the time span of even 100 or 130 years after the arrival of immigrants. Immigrants have a long-lasting impact on local economic development through cross-generational transmission of the ethnic capital and mentality. Yet, the positive effects of migration, according to these authors depend on the ability of immigrants to better integrate into host country society. The greatest effects come from children born to foreign-origin mothers and domestically-born fathers who were able to integrate them into society.

Besides above-mentioned effects existing literature analyses the impact of skilled immigration on innovation as a driver of technological progress, productivity growth, and consequently economic growth. According to Hunt and Gauthier-Loiselle (2010), if immigrants in the USA increase patents per capita, they may increase output per capita and make natives better off. Authors discuss that one-way skilled immigrants could boost patenting per capita is through a higher level of concentration than natives in science and engineering occupations. Immigrants are likely to be over-represented in such occupations. Scientific and engineering knowledge transfers easily across countries since it does not rely on institutional or cultural knowledge, is not associated with occupations with strict licensing requirements like medicine and does not require the sophisticated language skills of a field like law (Hunt and Gauthier-Loiselle (2010); Chiswick and Sarinda, 2007).

Skilled immigrants could also boost the patenting process per capita if a mixture of immigration policies and immigrant self-selection leads them to be more educated or of higher unobserved inventive ability. Immigrant inventors may, in turn, transform natives in the more inventive workforce. Even immigrant-workforce who do not patent themselves may increase patenting by providing complementary skills to inventors, such as entrepreneurship. Conversely, negative spillovers could offset immigrant inventors' contributions, for example, if their presence discourages natives from working in science and engineering law (Hunt and Gauthier-Loiselle (2010); Brojas, 2007). On the other side, Hunt and Gauthier-Loiselle (2010) discuss the faster increase in unskilled immigration than skilled immigration in the European low- and middle-income source countries since the Immigration Act of 1965. Studies in developed countries that have a high level of immigration and a highly skilled foreign-born population, such as some EU countries and the USA, have identified a positive relationship between the presence of immigrants and the level of innovation in firms.

Using a 1940-2000 state panel, Hunt and Gauthier Loiselle (2010) measured the impact of immigration on innovation and the individual innovation factors and regional determinants of innovation in the USA. Their empirical analysis indicates that immigrants account for 24 percent of patents, twice their share in the population. They concluded that the 1.3 percentage point increase in the share of the population composed of immigrant college graduates, and the 0.7 percentage point increase in the share of post-college immigrants, each increased patenting per capita by about 12 percent based on least squares 19

and 21 percent based on instrumental variables. The 0.45 percentage point increase in immigrant scientists and engineers increased patenting per capita by about 13 percent based on least squares 20 and 32 percent based on instrumental variables. Matloff (2013) concluded that the US technology industry, which not only employs foreign workforce to reduce labor costs but uses native employees to promote research and development as well.

The evidence of the importance of the education of migrants has been confirmed elsewhere as well. Fassio, Montobbio, and Venturini (2019) show on samples from the United Kingdom, Germany and France that highly educated migrants facilitate innovation with the effect being particularly high in industries with greater openness to trade, high inflows of foreign investment and greater ethnic diversity. At the same time this paper signals that the selection of migrants in a way that suits the needs of individual industries creates greater effects on the innovativeness of analyzed economies.

Using regional data for Germany, Niebuhl (2012) proved that differences in knowledge and capabilities of the workforce from diverse cultural backgrounds boost R&D activities. Moreover, Simonen and McCann (2008) examined the link between innovations of Finnish firms and the proportion of their foreign workforces. They have found a positive impact on innovation from hiring foreign workers who have worked in the same industry elsewhere. Downie (2010) examines different aspects of innovation across areas such as business, research, the culture sector, and global commerce in Canada. They didn't exclude effects on the individual immigrant, the firm, and the national and international economy. At every level of analysis, the author confirmed that immigrants have a beneficial impact on innovation. According to the literature, it could be concluded that a number of empirical studies explained the advantages and disadvantages of immigration. Theoretical background of this paper confirmed the economic and social roles of immigrant workers within immigrant-receiving economies.

The above findings have important implication for the understanding of export structural transformation towards more sophisticated products as such goods are characterized by a high degree of innovativeness. Rauch and Triade (2002) point to the positive effect of migrants in establishing connections among producers in the host country and home country market. Similarly, Peri and Requena-Silvente (2010) observe the export-creating effect in Spain caused by immigrants. This effect manifests itself through the establishment of

business and social networks and reduced costs of doing business with foreign markets. Most importantly, the study obtains evidence of beneficial effect of immigrants on exports of sophisticated manufacturing goods. Similar findings have been observed in other EU member states as well. Hatzigeorgiou and Lodefalk (2016) observe a positive impact on the export performance of Swedish firms from skilled migrants.

3. EXPORT SOPHISTICATION AND MIGRATION IN EU MEMBER STATES

The sophistication of exports from a given country is commonly determined on the basis of technological or knowledge intensity bounded in its goods and services. One of the most widely used such classifications is the one provided by OECD (2011b) where goods are classified into four categories based on R&D intensity and R&D embodied in intermediate and investment goods. However, such classification is relative as industries produce a wide range of products with different technological intensity. Furthermore, such classification is not directly applicable to services. Another approach to the determination of export sophistication has been recently proposed by Hausmann, Hwang, and Rodrik (2007). The starting premise here is that goods differ by their levels of productivity. Once the productivity level of a particular good is determined the sophistication of export baskets of individual countries can be revealed on the basis of the proportion of particular goods in the overall structure of their exports. Supposing that the overall exports of country j consist of n goods the total export X of country j can be written as:

$$X_j = \sum_{i=1}^n x_{ij} \tag{1}$$

The productivity level associated with given good i produced by n countries can be constructed as:

$$PRODY_i = \sum_{j=1}^n \frac{x_{ij}}{X_j} * GDPpc_j \tag{2}$$

In (2) the numerator reflects the share of each individual good in total exports of each country. The denominator is aggregate of these shares across all countries exporting particular good. Hence, this part of expression presents a revealed comparative advantage of each country in good i . The revealed com-

parative advantage is multiplied with GDP per capita of each country exporting given well. The overall index of productivity embodied in good i is then constructed as an aggregate of weighted GDP per capita across countries where revealed comparative advantages are used as weights. Hausmann, Hwang, and Rodrik (2007) note that such construction of index eliminates the effect of country size as it weights the country's income more heavily for those countries exporting larger proportions of each given well.

The above-defined method has been applied to the data taken from United Nations Comtrade database of traded goods classified according to Harmonized System (HS) 6-digit classification for the 2006-2015 period. The information on trade value is available for about 6000 goods at this level and for 170 countries. As can be seen from Table 1 the smallest levels of productivity are found among primary commodities whose share of exports is highest among the least developed countries. On the other hand, highest productivity levels are observed among groups of goods whose share of exports is relatively high among developed countries such as the United States, Germany or Luxembourg.

Table 1: Productivity of traded goods 2006-2015

	Product code	Product name	Mean value
Smallest	130214	Saps and extracts of pyrethrum	453
	230220	Bran, sharps and other residuals	571
	530410	Sisal and agave, raw	588
	261590	Ores, slag and ash	666
	90700	Cloves	742
Largest	590290	Tire cord fabric of viscose rayon	98241
	730110	Sheet piling of iron/steel	96039
	721069	Flat-rolled products of iron	91612
	721633	Angles, shapes, and sections of iron/non-alloy steel	91131
	441139	Fiberboard of wood and other non-ligneous materials	83089

Source: Authors' calculations

As noted previously, the productivity embodied in particular goods can be used to construct a country-wide index of export sophistication. Let export basket of country j consist of n goods. From there the export sophistication index can be calculated as:

$$EXPY_j = \sum_{i=1}^n \frac{x_{ij}}{x_j} PRODY_i \quad (3)$$

In equation (3) export sophistication index is a weighted sum of productivity embodied in each exported product where shares of individual products in

the total export basket of country j are used as weights. The plot of EXPY index against GDP per capita on the world sample (Figure 1) reveals that highest values of EXPY are found in the most developed countries, a finding consistent with earlier discussion.

Figure 1: Export sophistication and GDP per capita 2006-2015

Source: Authors' calculations

The same finding holds when one reduces sample to the European Union member states. As can be seen from Figure 2 highest export sophistication values are found among member states with the highest level of GDP. It is also worth noting that practically all new EU member states from Central and Eastern Europe fall on the lower end of export sophistication.

Figure 2: Export sophistication and GDP per capita in EU member states

Source: Authors' calculations

A comparison of EU member states with their main global rivals in terms of export sophistication, United States, Japan, India, China, and Russia in Figure 3 reveals that the EU28 as a whole was outperformed by both Japan and United States over this period. The EXPY value was close to that of China and above both India and the Russian Federation.

Figure 3: Export sophistication (EXPY): EU vs main global rivals 2006-2015

Source: Authors' calculations

One of the motives for transition and entrance into the European Union among Central and East European countries was the possibility of penetration to new markets. Through much of the past two decades, CEECs were known as producers of standardized price competitive products which can be labeled as less sophisticated goods. To explore whether such a trend has been reversed and these countries moved towards more sophisticated goods a comparison is made between EU15 countries and new member states (NMS) from Central and Eastern Europe in Figure 4. As it can be seen there, the difference in export sophistication between two groups of countries has largely remained stable and the two have followed a similar trend.

Figure 4: Export sophistication (EXPY): EU15 vs NMS

Source: Authors' calculations

A prominent feature of European economies over the past two decades has been a movement of population between EU member states and immigration from countries outside of EU. United Nations Migration data for the 2006-2013 period, the most recent period for which data are available in Figure 5 to reveal that the bulk of immigrants was concentrated in only a few European countries which happen to be among those with highest GDP per capita, namely France, Germany, Italy, Spain, and the United Kingdom.

Figure 5: Migration patterns in EU member states 2006-2013

Source: Authors' calculations

As noted previously, there are several channels through which immigrants can contribute to the prosperity of host economy and the competitiveness of its firms and industries ranging from the networks of foreign entrepreneurs, facilitating of creativity and increased innovation activities. Data from Figure 6 provide some support to such argumentation. From Figure 6a the highest proportion of migrants is in countries with the highest values of EXPY. The connection between two holds even after one control for potential outliers in terms of both EXPY (Luxembourg and Ireland) and a number of migrants (Germany, United Kingdom, Spain, Italy, and France) (Figure 6b). Overall, these findings suggest that immigrants could be a potential channel for the improvement of export sophistication. The continuation of the paper explores such possibility in more detail.

4. MODEL AND METHODOLOGY OF INVESTIGATION

The roots of export sophistication can be looked for in several areas. On the one hand, the building of export competitiveness is a lengthy process that requires the continuous building of own competitive advantages. In such a process, current results will be closely related to their past realizations. Previous studies have associated this index with several variables recognized in the literature as general determinants of export upgrading. Ever since the endogenous growth models, it has been argued that innovations offer higher potential for differentiation and achievement of above-average returns. Analogously, higher

productivity of exports or its sophistication can be expected in the presence of higher innovation activity. For this reason, the proportion of GDP invested in research and development is included among regressors. The quality of human capital is another important prerequisite for export sophistication upgrading as it presents the potential for a greater range of discoverable goods. To this end, a percentage of the population with tertiary education also enters the model. Size of the population is included as a control for the potential of the labor force. Hausmann, Hwang, and Rodrik (2007) associate greater labor force with potential for lower costs. We also control for the difference between EU15 countries and new EU member states with a categorical variable. Finally, the migrations enter model with variable measuring the number of foreign immigrants in each of the analyzed countries in a given year.

The analysis is undertaken with the means of two-step dynamic system panel estimator (Arellano and Bover, 1995; Blundell and Bond, 1998). The used methodology enables us to control for dynamics of export sophistication index as well as its correlation with unobserved time-invariant components of disturbance. It is also capable of distinguishing between short and long-run effects of individual variables on the export sophistication. In order to control for universal cross-sectional shocks, the estimation also includes annual time dummy variables. As system estimator tends to produce downward biased standard errors Windmeijer correction was applied. Bearing in mind that migration data are available only for a period up to 2013 this part of the analysis was limited to the 2006-2013 period. Finally, all variables for which such transformation is possible to enter a model in logarithmic form.

5. DISCUSSION OF FINDINGS

The estimation is undertaken on a model that takes the following form:

$$\begin{aligned}
 \ln EXPY_{it} = & \\
 c_0 + \beta_1 \ln EXPY_{it-1} + \beta_2 \ln Migration_{it} + \beta_3 \ln R\&D_{it} + \beta_4 \ln HCapital_{it} + \\
 \beta_5 \ln Population_{it} + \beta_6 NMS_i + \sum_{t=2007}^{2013} year_t + u_i + v_{it} & \quad (4)
 \end{aligned}$$

The validity of the model specification was examined through the number of diagnostic tests. As can be seen from Table A1 in Appendix all relevant diagnostics provide support to our model. Hence, there is an insufficient amount of

evidence to reject the null hypothesis of no autocorrelation of the second order, the Hansen test suggests that overidentifying restrictions are valid thus giving support to the chosen instruments. Similarly, difference-in-difference Sargan tests for levels equation and lagged dependent variable signal that system estimator should be preferred over differenced one and that lagged dependent variable does not follow a random walk. Finally, the number of instruments is lower than the number of cross-sectional units (groups). Overall, these diagnostics provide support to the chosen model and enable us to proceed with the interpretation of results.

Table 2. Results of estimation

Variable	Short run	Long run
Lagged dependent variable	0.47***	-
Migrations	0.03**	0.06**
R&D investment	0.02**	0.14**
Human capital	0.001	0.001
Population size	-0.05**	-0.10**
Control variable – NMS	-0.03	-0.06
Constant	5.87***	-

Source: Authors calculations

Note: ***, **, * denote statistical significance at 1%, 5%, and 10% level respectively; p-values estimated with two-step dynamic panel estimator with Windmeijer robust standard errors corrections. Annual time dummies included.

The coefficient on the lagged dependent variable is statistically significant and positive suggesting that the current sophistication of exports is the outcome of processes that take place over time. The effect of migrations on export sophistication is positive and about two times higher in the long run than in the short run. It is therefore likely that previously mentioned effects such as business networks of immigrants, their impact on creativity and on innovations all together lead to the upgrading of country's exports. Among other variables, the positive impact is observed on R&D investment and a negative one on the size of the population. While the former is expected the latter finding is somewhat surprising. A likely explanation is that this finding is driven with few outliers in our samples such as Luxembourg or Ireland.

6. CONCLUSION

Two pressing issues have marked recent EU policy, the pressure to meet ambitious objectives set in Europe 2020 strategy and the rising negative attitudes towards immigration. Despite significant efforts invested in the building of the knowledge-driven economy the lagging of EU behind its main rivals continues. This is also evident, as noted by our paper among others, in the competitiveness of EU exports whose sophistication is lower than that of main rivals such as the USA and Japan. Differences are even more pronounced if one looks new EU member states whose export structure is dominated with standardized price-competitive products. Diminishing of such differences is a challenge for future EU policy.

The improvements in export sophistication require the building of innovation-driven society. The drivers of this process were looked for in numerous areas. One area relatively omitted from such considerations is the role of migrants. Evidence from many countries points to the important role of this group in their economic life from networks of migrant entrepreneurs to establishing of links with their home countries and most importantly their role as drivers of creativity and innovation. Our findings support such reasoning as they indicate that migrants contribute to the sophistication of EU exports.

The impact of migration on export sophistication is confirmed in the short and long run. In the long run, the contribution of migration will be more vital for the sophistication of EU exports. Workforce, the especially high-skilled workforce in developed economies increases productivity which leads to more competitive companies on the international (export) market. However, export sophistication from the previous year has the most significant impact on the export sophistication from the current year. R&D expenditure plays a minor role in export sophistication in the short run but more relevant significance in the long run (because of the transformation of R&D to innovations). We concluded that human capital has the smallest impact on the sophistication of EU exports.

Due to the political tensions and negative conflict repercussions, the European Union has received migrants from Middle-East countries. EU developed countries were prone to receive migrants with various level of skills. Therefore, after the incubation stage, which can last for years, the productivity will record increase, as well as the sophistication of EU exports.

Overall, our findings offer several interesting policy implications. They reveal the existence of gaps between the EU and its main rivals as well as between EU member states. The latter is particularly evident when it comes to EU15 and new EU member states. Addressing these challenges should be a matter of interest for both cohesion and trade policymakers. Another finding is the positive impact of immigrants on improvements in export sophistication. It remains a challenge then for EU policymakers to define mechanisms for deeper integration and exploiting of innovation potential of immigrants.

Abstract

Information and Communication Technologies (ICT) have the leading role in the transformation of business, government services, lifestyles of citizens, and thus society. They are the foundation of the digital society as well as the knowledge society, which are systematically promoted and gradually built by the EU with the aim of encouraging innovation, creativity, and competitiveness of the European industry and the rest of the world.

Digitalization implies wider use of the Internet and greater involvement of people, government and companies that are engaged in it and regularly use it. Higher quality broadens the availability and intensive use of ICT infrastructure are the main priorities for the investment of ESI funds, particularly from ERDF. Allocation for that priority within Croatian Operational Programmed Competitiveness and Cohesion is EUR 307.95 million out of 6,881 billion.

This allocation must be directed towards the development of the innovative e-services of modern public administration by the “smart government” principles, including providing full services, digitizing business and administrative processes, and opening public administration information through various channels available at any time, anywhere and through different devices. The main purpose is to improve the lives of Croatian citizens and to boost the competitiveness of the economy by supporting the development of the digital economy to include the unique EU digital market.

The paper gives results of comparative analysis of key indicators of the digital economy and society level (DESI) of Croatia and EU 28 countries and measures to be taken to reach the level of EU development.

Keywords: ICT, competitiveness, digitalization, e-services, broadband

JEL Classification: M15, L96

1. INTRODUCTION

EU has recognized the importance of the development of ICT which is vital for EU competitiveness in today's increasingly digital global economy. Furthermore, the EU has decided, and it is very eager to create a Digital Single Market¹ that is recognized as a generator of economic growth and was set up as one of EC priorities². Also, enhancing access to, and use and quality of ICT is one of the objectives/priorities within Cohesion Policy³. It is the EU's main investment policy, which targets all regions and cities in the EU in order to support job creation, business competitiveness, economic growth, sustainable development, and improve citizens' quality of life.

In European statistics, there are several criteria used to assess the level reached as well as the potential for ICT growth and development. This data is used for comparison between the Member States and provides the basis for creating a development policy aimed at equalizing development on the one hand and defining the development priorities for the competitiveness of the EU and individual member states of the world ICT market on the other.

¹ Digital Single Market, <https://ec.europa.eu/digital-single-market/>

² The European Commission's priorities, https://ec.europa.eu/commission/index_en

³ Economic, social and territorial cohesion, http://ec.europa.eu/budget/financialreport/2014/expenditure/cohesion/index_en.html

By accession to the EU, for the Republic of Croatia was enabled to use funds within Cohesion Policy. Also, Croatia has recognized the importance of the development of ICT and in line with that Croatia has prepared Operational Program Competitiveness and Cohesion 2014-2020 (OPCC)⁴. OPCC is focused to achieve the overall aim of the Digital Agenda for Europe (DAE)⁵ which is to deliver sustainable economic and social benefits from a digital single market based on fast and ultra-fast internet and interoperable applications.

The aim of this paper is to evaluate the achieved level of development and the directions of the future development of the digital economy and society in the Republic of Croatia in the context of this development in the EU28, based on the comparative analysis of the DESI index. The paper will present Croatia's activities and progress through the years for reaching the OPCC objectives regarding the ICT development, especially in terms of adopting the and implementing national strategies, as well as the future steps for achieving OPCC's objectives.

2. AN OVERVIEW OF PREVIOUS RESEARCH

The subject of this paper is the development of information society in Croatia in the context of EU and Croatian strategic documents and sources of funding. Numerous researches preceded the formulation of strategic documents, development policies and the implementation of measures and programs for their realization. They are focused on different aspects of socio-economic development (economy, social relations and individuals, government institutions and population, environmental impacts, etc.) and are implemented in order to achieve different goals related to different spatial-temporal domains. Below we will give a brief overview of those researches that preceded the design of key strategic documents for the development of European society as an information society and consequently the development of society in the Republic of Croatia as an information society. We will also give a brief overview of methodological solutions for measuring the level of development of some social aspects of ICT.

2.1. RESEARCH AND DOCUMENTS RELEVANT TO THE DEVELOPMENT OF AN INFORMATION SOCIETY IN THE EU

2.1.1. The Digital Agenda for Europe

The Digital Agenda for Europe (DAE) is one of the seven flagship initiatives of the Europe 2020 Strategy⁶, set out to define the key enabling role that the use of ICT will have to play if EU wants to succeed in its ambitions for 2020. The overall aim of the DAE is to deliver sustainable economic and social benefits from a digital single market based on fast and ultra-fast internet and interoperable applications (EC, A Digital Agenda for Europe, 2010, p. 3.).

The objective of the DAE is to chart a course to maximize the social and economic potential of ICT, most notably the internet, a vital medium of economic and societal activity: for doing business, working, playing, communicating and expressing ourselves freely. Successful delivery of the DAE will spur innovation, economic growth and improvements in daily life for both citizens and businesses. Wider deployment and more effective use of digital technologies will thus enable EU to address its key challenges and will provide Europeans with a better quality of life through, for example, better health care, safer and more efficient transport solutions, cleaner environment, new media opportunities and easier access to public services and cultural content (EC, A Digital Agenda for Europe, 2010, p. 3.).

EC has identified the seven most significant obstacles that seriously undermine efforts to exploit ICT (EC, A Digital Agenda for Europe, 2010, p. 5-6.):

- a) Fragmented digital markets;
- b) Lack of interoperability;
- c) Rising cybercrime and risk of low trust in networks;
- d) Lack of investment in networks;
- e) Insufficient research and innovation efforts;
- f) Lack of digital literacy and skills;
- g) Missed opportunities in addressing societal challenges.

The DAE's action areas to tackle these seven obstacles (EC, A Digital Agenda for Europe, 2010, p. 7-27.):

⁶ Seven pillars of the Europe 2020 Strategy: Innovation Union, Youth on the move, A digital agenda for Europe, Resource efficient Europe, An industrial policy for the globalization era, An agenda for new skills and jobs, European platform against poverty.

- a) A vibrant digital single market (It is time for a new single market to deliver the benefits of the digital era);
- b) Interoperability and standards (We need effective interoperability between IT products and services to build a truly digital society);
- c) Trust and security (Europeans will not embrace technology they do not trust - the digital age is neither “big brother” nor “cyber wild west”);
- d) Fast and ultra-fast internet access (We need the very fast Internet for the economy to grow strongly and to create jobs and prosperity, and to ensure citizens can access the content and services they want);
- e) Research and innovation (Europe must invest more in R&D and ensure our best ideas reach the market);
- f) Enhancing digital literacy, skills, and inclusion (The digital era should be about empowerment and emancipation; background or skills should not be a barrier to accessing this potential);
- g) ICT-enabled benefits for EU society (Smart use of technology and exploitation of information will help us to address the challenges facing society like climate change and the aging population).

2.1.2. Information and communication technologies (ICT) as one of the cohesion policy priority for 2014-2020

Cohesion Policy is the EU's main investment policy, which targets all regions and cities in the EU in order to support job creation, business competitiveness, economic growth, sustainable development, and improve citizens' quality of life. By 2020 the EU aims to meet five concrete objectives – high employment rate, innovation, education, social inclusion, and climate/energy adaptation/improvement. Each Member State adopts its own national targets in these areas. In order to reach these goals and address the diverse development needs in all EU regions, EUR 351.8 billion has been set aside for Cohesion Policy for 2014-2020 which is almost a third of the total EU budget (European Commission (EC), An introduction to EU Cohesion Policy 2014-2020, 2014).

Funding of the Cohesion Policy goes through three main funds: European Regional Development Fund (ERDF), European Social Fund (ESF) and Cohesion Fund (CF). Together with the European Agricultural Fund for Rural Development (EAFRD) and the European Maritime and Fisheries Fund (EMFF), they make up the European Structural and Investment (ESI) Funds (EC, An introduction to EU Cohesion Policy 2014-2020, 2014).

There are 11 thematic objectives/priorities⁷ for the investment within Cohesion Policy and Enhancing access to and use and quality of ICT is one of them. Aforementioned priority is supported via ERDF (EC, An introduction to EU Cohesion Policy 2014-2020, 2014).

The ERDF aims to strengthen economic and social cohesion in the EU by correcting imbalances between its regions. Particular attention is paid to regions, which suffer from severe and permanent natural or demographic handicaps, such as the regions with very low population density as well as islands, cross-border, and mountain regions. As the ERDF contributes to the Europe 2020 Strategy⁸ for smart, sustainable and inclusive growth, it has to focus on the priorities specified in this strategy. The main priorities known as “thematic concentration” are (European Parliament and Council, Regulation (EU) No 1301/2013, 2013):

- a) Research and innovation;
- b) Information and Communication Technologies (ICT);
- c) Small and medium-sized enterprises (SMEs);
- d) Promotion of a low-carbon economy.

Within enhancing access to, and use and quality of ICT the ERDF supports investments for the (European Parliament and Council, Regulation (EU) No 1301/2013, 2013):

- a) extending broadband deployment and the roll-out of high-speed networks and supporting the adoption of emerging technologies and networks for the digital economy;
- b) developing ICT products and services, e-commerce, and enhancing demand for ICT;

⁷ 11 Thematic objectives/priorities for the investment within Cohesion Policy: strengthening research, technological development and innovation; enhancing access to, and use and quality of information and communication technologies (ICT); enhancing the competitiveness of small and medium-sized enterprises (SMEs); supporting the shift towards a low-carbon economy; promoting climate change adaptation, risk prevention and management; preserving and protecting the environment and promoting resource efficiency; promoting sustainable transport and improving network infrastructures; promoting sustainable and quality employment and supporting labour mobility; promoting social inclusion, combating poverty and any discrimination; investing in education, training and lifelong learning; improving the efficiency of public administration.

⁸ The Europe 2020 strategy is the EU’s 10-year agenda for growth and jobs. It emphasises smart, sustainable and inclusive growth as a way to overcome the structural weaknesses in Europe’s economy, improve its competitiveness and productivity and underpin a sustainable social market economy.

- c) strengthening ICT applications for e-government, e-learning, e-inclusion, e-culture, and e-health.

The level of concentration required varies according to the category of regions being supported. More developed regions have to allocate at least 80% of their ERDF resources to at least two of these priorities and at least 20% to the low-carbon economy. Transition regions have to allocate at least 60% of their ERDF resources to at least two of these priorities and at least 15% to the low-carbon economy. Less developed regions have to allocate at least 50% of their ERDF resources to at least two of these priorities and at least 12% to the low-carbon economy (European Parliament and Council, Regulation (EU) No 1301/2013, 2013).

The development of ICT is vital for EU competitiveness in today's increasingly digital global economy. Over EUR 20 billion from the ERDF and CF is available for ICT investments during the 2014-2020 funding period. These investments support EC's action to create a Digital Single Market, which has the potential to generate up to EUR 250 billion of additional growth⁹.

2.2. RESEARCH AND DOCUMENTS RELEVANT TO THE DEVELOPMENT OF AN INFORMATION SOCIETY IN CROATIA

The design of strategic documents related to the development of different aspects of ICT is preceded by numerous research and analysis. The key documents, i.e. a set of documents relevant to the European context of ICT development in the Republic of Croatia are the e-Croatia 2020 Strategy, and the Operational Program Competitiveness and Cohesion 2014-2020 (Programming Axis 2), where key resources for the implementation of the strategic goals are foreseen.

2.2.1. e-Croatia 2020 Strategy

e-Croatia 2020 Strategy was published in May 2017¹⁰. Although the strategy has been implemented almost three years after the Operational Program Competitiveness and Cohesion has started, it should be noted that other stra-

⁹ Source: EC, available at: https://ec.europa.eu/regional_policy/en/policy/themes/ict/, accessed January 22, 2019.

¹⁰ <https://uprava.gov.hr/dokumenti/10?page=1&tag=-1&tip2=1&Datumod=&Datumdo=&pojam=Strategija> e-Hrvatska 2020, pristupljeno 03.02.2019

tegic documents have been realized before or during the implementation of the operational plans, including the implementation of ICT support in many areas of social and economic development. Some of them are:¹¹

- ✦ National Strategy for Health Care Development 2012 - 2020.
- ✦ Strategy for the Protection, Conservation and Sustainable Economic Use of Cultural Heritage of the Republic of Croatia for the period 2011-2015
- ✦ Education, Science and Technology Strategy 2014
- ✦ Strategy for broadband access development in the Republic of Croatia in the period from 2016 to 2020 and the Implementation Program of the Strategy 2012-2013.
- ✦ The Strategy of Spatial Planning of the Republic of Croatia from 1997 and the Decision on Amendments to the Spatial Planning Strategy of the Republic of Croatia.
- ✦ Judicial Development Strategy, for the period from 2013 to 2018.
- ✦ Strategy for the Development of Electronic Business in the Republic of Croatia for the period 2007 – 2010.
- ✦ Other documents are relevant to the development of particular socio-economic sectors.

e-Strategy is a strategic document written with the intention of improving the quality of life of citizens in the Republic of Croatia by raising the competitiveness of the economy through ICT and providing high quality electronic public services to society. The purpose of the e-Strategy is to create a strategic framework for a coherent, logical and efficient information system of the state by providing high quality and economical electronic services at both national and European level. Ensuring interoperability between existing and new ICT systems in public administration, while eliminating duplication of their functionality, is also in the focus of the e-Strategy. The achievement of its objectives will be measured based on the percentage of citizens and companies using public e-services, as well as the level of customer satisfaction (Ministry of Public Administration, e-Strategy, 2017, p. 2.).

2.2.2. Operational programme competitiveness and cohesion 2014-2020

The basis of the OPCC is the analysis of socio-economic circumstances, identified obstacles to growth and development needs in Croatia, in the context

¹¹ Detalji se mogu naći u dokumentu Strategija e-Hrvatska 2020, str.16-19

of the Partnership Agreement (PA)¹², relevant EU and national strategies, their related targets and fundamental strategic provisions (OPCC, 2014, p. 1.).

OPCC identified that one of the main problems of Croatia in the ICT sector is broadband penetration and NGN (Next Generation Networks) coverage levels, both lagging the EU average levels. Fixed broadband penetration was 21.7% in January 2014 (the EU average was 29.8% in 2013). In 2013, 63.6% of households in Croatia had Internet access (the EU average was 76% in 2013). Although Croatia has already achieved good basic broadband coverage (97% of the population in 2013), total NGA (Next Generation Access) network coverage in Croatia amounted to only 33% in 2013, which positioned Croatia far behind EU's average NGA coverage of 62% in the same year. The current level of NGA coverage is concentrated on few densely populated areas of Croatia. Considering this, significant number of households, public administration sites, educational and health care institutions, as well as small and medium enterprises is unable to access the high-speed broadband and use advanced IT services, thus hindering uniform regional development in Croatia and exploiting of socioeconomic benefits related to the availability of NGA broadband networks (OPCC, 2014, p. 4.).

Furthermore, OPCC's detailed analysis of the Croatian public ICT sector has detected deficiencies which mostly concern inadequate and inefficient cost and investment management in the ICT public sector. Public ICT projects are mainly implemented by individual state administrative bodies, without systematic coordination or possibility to use common resources while concurrently many systems have small utilization percentages of the available ICT infrastructure. Majority of central state bodies use their own software and application solutions and data that are not accessible to other state bodies (unavailability of data). There are no common solutions for the same business processes or a system for the integration of existing applications and databases. Also, OPCC's analysis states that public e-services in Croatia are to a greater extent provided to companies than to citizens. Citizens have fully available 50% of basic public services via the Internet (in 2010), but compared to EU-27, Croatia is below average (EU27 81%). Only 30.8% of citizens communicated with public au-

¹² Each EU member state is obliged to submit a Partnership Agreement which defines a national strategy for ESI Funds. The Partnership Agreement is a comprehensive and coherent strategy of the Republic of Croatia, which fulfils common EU goals for the growth and jobs, transposed into a specific national context.

thorities through online applications in 2013 (EU-27: 50%). The level of provision and use of e-government and e-public services presently in Croatia is insufficient ("online accessibility" indicator for Croatia in 2013 amounted 57% while the average for EU27 was 74%). Institutions within public administration (particularly educational sector, land management, health care, justice, culture, and tourism sector) and other public services are lacking digital data and possibility to exchange the information. ICT equipment and infrastructure necessary for networking and provision of e-services to the public is outdated and inadequate and needs to be further supported. Additional efforts for adaptation of e-services to special needs of different population groups and adjustment of e-content to ensure accessibility of services to everyone (including distant and remote locations, especially on the islands) are necessary (OPCC, 2014, p. 4-5).

Within the scope of the OPCC's Priority axis 2 (PA2): Use of Information and Communication Technologies, ERDF funding will be used to (OPCC, 2014, p. 5.):

- a) address insufficient NGN broadband coverage of Croatian territory;
- b) improve insufficiently managed public ICT infrastructure;
- c) to tackle the lack of data and policy delivery together with the low availability of e-services.

One of the OPCC's PA2 objectives is to develop NGN broadband infrastructure in areas without enough commercial interest for investments in NGN broadband infrastructure, for a maximum increase of social and economic benefits. The objective will be achieved through actions implemented aiming at developing of aggregation (backhaul) NGN network in white and grey NGN areas¹³, and at developing of access networks (NGA with at least 30 Mbps–100 Mbps throughput) in white NGA areas (full market failure) for households, enterprises and public institutions. Investments under this objective will be focused on ensuring access to most public institutions. Considering their social and economic role, priority will be given to ensure connections for administration offices, educational, health, judicial and cultural institutions. Naturally, this means the geographical concentration of investment in regional and municipal administrative centers where the concentration of targeted public institutions

¹³ In white areas no provider of broadband access services currently is operating and there is no such provider to be expected in the coming three years either. In grey areas there is one (infrastructure-based) provider already active, however, another network is unlikely to be developed in the next three years.

tends to be highest. Second priority will be given to ensure connections for business zones, business support institutions and enterprises (OPCC, 2014, p. 72.).

The main expected result to be achieved with the use of ERDF funding and national funding (public and private) under this objective is to increase NGN national broadband coverage through three key components until 2023 (OPCC, 2014, p. 72-73.):

- a) Covering of at least 350 central administrative settlements in municipalities located in white and grey NGN areas with aggregation (backhaul) NGN networks, is the prerequisite for further development of NGN (NGA) access networks;
- b) Ensuring connections to all targeted public institutions in white and grey NGN areas;
- c) The increase of national NGA network coverage by 20%, by supporting the deployment of NGA connections for households, business zones, business support institutions and enterprises (at least 30 Mbps-100 Mbps) in settlements located in white NGA areas, with highest leverage effect on business activity in these settlements.

Other expected benefits include stimulation of the demand for broadband connectivity, supporting the development of digital economy (as a consequence of an increase in number of households and public institutions, being covered by NGN network) and in more broad economic perspective also an increase in investment opportunities for local SMEs and external companies (OPCC, 2014, p. 73.).

Second OPCC's PA2 objective is to increase the use of ICT in communication between the citizens and public administration through the establishment of ICT coordination structure and software solutions. That objective will be achieved through two complementary actions. One is to create the Shared Service Center (SSC) which will coordinate and manage the use of ICT applications and e-services provided to the citizens by various governmental institutions. SSC will enable a rational and cost-efficient development of an interconnected and interoperable ICT system within the government administration. The management from one center will impose standards in developing e-services and thereby make them easy to use. The second action for achieving the aforementioned objective and to enhance the transparency, accountability, and efficiency of public administration, is developing of the applications that

will be used for the functioning of public institutions and communication with citizens. It would be developed e-applications in areas crucial for the economic growth prospects and social cohesion like e- Construction, e-Land Management, e-Justice, e-Health, e-Tourism, e-Culture and e-Inclusion (OPCC, 2014, p. 83-84.).

Within OPCC's PA2 for the achieving of the aforementioned objectives, development of the NGN broadband infrastructure and increasing of the use of ICT in communication between the citizens and public administration, it is allocated EUR 307 million (Summary of the priorities and specific objectives of the OPCC, p. 5.).

2.2.3. Key documents for the implementation of activities within Priority axis 2

Activities for achieving the PA2 objectives will be implemented through relevant Croatian national strategies. These national strategies where ex-ante conditionalities for using the ESI Funds, and they represent the existence of the necessary conditions for effective and efficient use of ESI Funds. These conditions are linked to (EC, Internal Guidance on Ex Ante Conditionalities – part 1, 2014, p. 4.):

- a) policy and strategic frameworks, to ensure that the strategic documents at the national and regional level which underpin ESI Fund's investments are of high quality and in line with standards commonly agreed by the Member States at EU level;
- b) regulatory frameworks, to ensure that implementation of operations co-financed by ESI Funds complies with the EU acquis;
- c) sufficient administrative and institutional capacity of public administration and stakeholders implementing the ESI Funds.

Regarding the development of the NGN broadband infrastructure Croatian Government has adopted the following strategies:

- a) Broadband Development Strategy in the Republic of Croatia 2016-2020 (Croatian Broadband Development Strategy);
- b) National Programme for Backhaul Broadband Infrastructure for aggregation (backhaul) networks (NP-BBI);

- c) National Framework Programme for the Development of Broadband Infrastructure in Areas Lacking Sufficient Commercial Interest for Investments (NFP).

Croatian Broadband Development Strategy and NFP were adopted by the Croatian Government on July 13, 2016. Adoption of the Croatian Broadband Development Strategy with 13 focused measures which defines the areas of activity and clear definition and obligation of the public authorities in achieving the strategic goals, it was enabled the necessary continuation and acceleration of activities in the field of development of broadband electronic communications infrastructure in order to create preconditions for accelerated economic growth and new employment in order to develop a digital economy that can achieve competitive advantages in the single digital market of the EU.¹⁴

NFP is one of the Croatian Broadband Development Strategy measure and it is focused on the development of NGA networks. Also, it is expected that NFP will cover up to 70% of the population of the Republic of Croatia living in the NGA white areas, mostly in rural and suburban areas (Ministry of the Sea, Transport and Infrastructure, 2016, p. 4.).

NP-BBI was adopted by the Croatian Government on April 19, 2018. NP-BBI is focused on the development of broadband backhaul infrastructure in areas lacking sufficient commercial interest for investment, as a precondition for the development of NGA networks, which will cover 540 suburban and rural communities.¹⁵

Although OPCC states that actions for developing NGN broadband infrastructure within OPCC's PA2 must be carried out in the correct order where first must be implemented backhaul network and then NGA networks (OPCC, 2014, p. 76-77.), Croatian government first adopted NFP and then NP-BBI with a two-year delay.

3. METHODS FOR MEASURING DIGITAL DEVELOPMENT OF SOCIETY AND ECONOMY

Information and communication technology is used in all areas of human activity at the personal, social and economic level. It enables the collection, processing, storage and dissemination of a huge amount of data as well as communication among data users. The creation and use of ICT provide significantly faster socio-economic growth and development than the one based on the availability of natural resources and classical manufacturing and service activities. It is the foundation of the so-called. Fourth Industrial Revolution (Barr, 2018) which exploits the full potential of IT and cybernetics while simultaneously developing and applying them in all areas of human practice. The development and application of ICT within a society are today synonymous with the achieved level and the potential of socio-economic development and growth of countries and regions. For this reason, they gather numerous data and create individual and composite indices that show the state and dynamics of society's development as an information society. Below is a shorter representation of two composite indices. The first is the IDI (ICT development index) created by International Telephone Union (ITU)¹⁶ and the second is Digital Economy and Society Index (DESI) used to assess the state of the information society development in the EU.

IDI is published since 2009 and is composed of 11 indicators of ICT level of development of countries and is grouped in 3 sets:

- ♦ ICT readiness – reflecting the level of networked infrastructure and access to ICTs;
- ♦ ICT intensity – reflecting the level of use of ICTs in the society; and
- ♦ ICT impact – reflecting the results/outcomes of more efficient and effective ICT use

The first group (ICT access) contains 5 indicators, the second (ICT use) 3 and the third group (ICT skills) also contains 3 indicators. The first group in the composite index is weighted with a factor of 0.4, the second being also 0.4 and the third with 0.2.

¹⁶ ICT Development Index, <http://www.itu.int/net4/itu-d/idi/2017/index.html#idi2017economy-card-tab&HRV>

In the European Statistics, a number of indicators of the information society development are also collected and compiled into the composite DESI (Digital Economy and Society Index)¹⁷ Since 2014 over 30 indicators in 5 dimensions are collected:

1. Connectivity (DESI_1_CONN Definition: DESI Connectivity Dimension calculated as the weighted average of the five sub-dimensions: 1a Fixed Broadband (20%), 1b Mobile Broadband (30%), 1c Fast broadband (20%), 1d Ultrafast broadband (20%) and 1e Broadband price index (10%))
2. Human Capital (DESI_3_UI, Definition: DESI Use of Internet Dimension calculated as the weighted average of the three sub-dimensions: 3a Content (33%), 3b Communication (33%), 3c Transactions (33%))
3. Use of Internet Services (Notation: DESI_3_UI Definition: DESI Use of Internet Dimension calculated as the weighted average of the three sub-dimensions: 3a Content (33%), 3b Communication (33%), 3c Transactions (33%))
4. Integration of Digital Technology, (Notation: DESI_4_IDT, Definition: DESI Integration of Digital Technology Dimension calculated as the weighted average of the two sub-dimensions: 4a Business digitization (60%), 4b eCommerce (40%))
5. Digital Public Services (Notation: DESI_5_DPS, Definition: DESI Digital Public Services Dimension comprising of e-Government (100%))

DESI overall index, calculated as the weighted average of the five main DESI dimensions: 1 Connectivity (25%), 2 Human Capital (25%), 3 Use of Internet (15%), 4 Integration of Digital Technology (20%) and 5 Digital Public Services (15%).

4. RESULTS AND DISCUSSION

4.1. THE DIGITAL ECONOMY AND SOCIETY INDEX (DESI) FOR CROATIA

Since the EC has approved the OPCC at the end of 2014 and since the DESI report mostly covers the period of the calendar year that is preceding the report, the DESI reports for 2016, 2017 and 2018 could be used for the pur-

¹⁷ EC, Digital single market, Digital Economy and Society Index, <https://digital-agenda-data.eu/datasets/desi/indicators#desi-overall-index>

pose of this paper.¹⁸ However, due to an overview of the dynamics of the entire period, data for the years 2014 to 2018 will be presented. Special attention should be paid to the DESI dimensions *Connectivity* and *Digital Public Service*, according to which Croatia is the worst ranked.

Table 1 shows data for 5 dimensions and DESI Indicators for Croatia and the mean value of the same indicator for EU28, and the rank of Croatia according to the particular indicator.

Table 1. DESI dimensions and rank of Croatia in EU28 countries

Indicator	2014			2015			2016			2017			2018		
	HR	EU	Rank	HR	EU	Rank	HR	EU	Rank	HR	EU	Rank	HR	EU	Rank
Connectivity	6,35	11	28	8,11	12,4	28	9,71	13,5	27	11,1	14,6	27	12,4	15,6	27
Human Capital	10,1	12,3	20	10,4	12,9	20	10,7	13,2	22	11,5	13,7	19	12,5	14,1	18

Source: authors, according to data collected from <https://digital-agenda-data.eu>

Graphs in Figures 1-5 show the progress of certain dimensions of the DESI for the Republic of Croatia, the average EU value as well as the value of the country which had for the given dimension the best indices in the analyzed period.

Although RH shows the growth of all DESI dimensions in the analyzed period, it is not enough to get closer to the EU average and especially to the level of leading EU countries.

Regarding the *Connectivity* (Figure 1) DESI report, 2016 states that Croatia performs worse than all the other EU countries. Even though fixed broadband is available to most households, 30% of them do not yet subscribe to it. Moreover, NGA is available to 52% of homes, which is below the EU average (71%) and only 2.8% of households subscribe to it, compared to 30% EU average (EC, DESI report 2016 – Croatia, 2016).

Furthermore, Croatia faces several challenges concerning Connectivity. Although fixed broadband is available to 97% of homes (in line with the EU), NGA capable of providing high-speed internet (at least 30 Mbps) is available

¹⁸ DESI report for 2019 is not published so far.

to only 52% of homes. 70% of the households have a broadband subscription, a significant improvement compared to 61% in 2015. However, only 2.8% of the fixed Internet subscriptions are to high-speed connections (30% in the EU), the lowest in Europe. One of the possible reasons for the low take-up (subscriptions) might be affordability since the standalone fixed broadband subscription in Croatia costs as much as 2.5% of the average gross income, more than the overall EU average of 1.3% (EC, DESI report 2016 – Croatia, 2016).

Regarding the Connectivity DESI report, 2017 states that Croatia is progressing slowly. Fast broadband coverage and subscriptions have increased but they were still below the EU average. Prices for fixed broadband remained very high. There was progress in the take-up of mobile broadband, and 4G coverage could be improved (EC, DESI report 2017 – Croatia, 2017).

Regarding the Connectivity DESI report, 2018 states that Croatia did not make significant progress in this area compared to 2017, although it improved its overall score (Croatia scored 49,4 compared to EU score 62,6). On fixed broadband coverage of households (99%), Croatia performs above the EU average (97%) which is the category where the highest improvement over the last year was achieved. However, fast and ultrafast broadband coverage remained very weak. Broadband services were available throughout the country but the take-up of fast broadband was low (14 %) despite fairly wide availability (67 %). Factors contributing to the low take-up include low internet use and relatively high prices for (fast) broadband (63 on the Broadband Price Index, EU average 87). In 2018 Croatia has maintained its rank or dropped back in most of the connectivity subcategories, with exception of the fixed broadband and fast broadband coverage. The coverage of ultrafast broadband of 100 Mbps and above was also low (34.1%), and the take-up extremely low (1.4%). Croatia must put the focus on its connectivity to achieve DAE goals and to mitigate risks of losing EU Funds and to prevent even further behind in the creation of a digital economy and society (EC, DESI report 2018 – Croatia, 2018, p. 3-4.).

Figure 1. DESI by dimension Connectivity

Source: <https://digital-agenda-data.eu/charts/desi-see-the-evolution-of-two-indicators-and-compare-countries#chart>

Concerning the *Human Capital* dimension, the last two years show an intense increase in the ability to use ICT (Figure 2).

Figure 2. DESI by dimension Human Capital

Source: <https://digital-agenda-data.eu/charts/desi-see-the-evolution-of-two-indicators-and-compare-countries#chart>

In the *Use of Internet Services*, Croatia has reached, and over the last two years has overtaken the European average (Figure 3).

Figure 3. DESI by dimension Use of Internet Services

Source: <https://digital-agenda-data.eu/charts/desi-see-the-evolution-of-two-indicators-and-compare-countries#chart>

Integration of Digital Technology through digitalization of business and electronic commerce in the initial period was above the European average, but growth over the European average has slowed in the last two years. (Figure 4)

Figure 4. DESI by dimension *Integration of Digital Technology*

Source: <https://digital-agenda-data.eu/charts/desi-see-the-evolution-of-two-indicators-and-compare-countries#chart>

Croatia’s overall score for the *Digital Public Services* Croatia has made significant progress since 2015 (Figure 5). This might be partly due to the e-citizens web portal, introduced back in 2014 to tackle the very low online interaction between the public administration and citizens. An e-business module has only recently been introduced and is still being supplemented by additional features. Provision of pre-filled forms and Online Service Completion are still below the EU average but increased over the last year. On the other hand, Open Data

nearly doubled and Croatia improved its position from rank 27 last year to rank 14, now exceeding the EU average. Better online public services will likely further improve Croatia's percentage of eGovernment users: only 21% of Internet users (against 32% in the EU average) interact online and send filled-in forms to public authorities (EC, DESI report 2016 – Croatia, 2016).

Croatia ranks 24th in DESI report 2017 with an overall score of 0.43 (EU score 0,52)¹⁹. The report states that Croatian citizens are above average users of the Internet and their digital skills are steadily progressing. The use of digital technologies by enterprises is close to average. Digital Public Services are slowly improving.

Regarding the Digital Public Services dimension with a score of 44,4 (EU score 57,5), Croatia ranks 25th among EU countries. In terms of eGovernment, Croatia is progressing and remains at rank 25 in the DESI 2018. At 66%, the number of eGovernment users is above the EU average. However, there has been no progress with the delivery of services and services for businesses. On Open Data, Croatia continued to make considerable progress over the last year and still scores slightly above the European average. As to eHealth Services, Croatia is performing well and ranks 10th among the EU Member States when it comes to people who used health and care services provided online without having to go to the hospital or doctor's surgery (for example, by getting a prescription or a consultation online) (EC, DESI report 2018 – Croatia, 2018, p. 9).

Figure 5. DESI by dimension Digital Public Services

Source: <https://digital-agenda-data.eu/charts/desi-see-the-evolution-of-two-indicators-and-compare-countries#chart>

¹⁹ DESI 2016 was re-calculated for all countries to reflect slight changes in the choice of indicators and corrections to the underlying indicator data. As a result, country scores and rankings may have changed from the previous publication.

4.2. CURRENT STATUS AND FUTURE STEPS FOR ACHIEVING OBJECTIVES WITHIN PRIORITY AXIS2

Ministry of Regional Development and EU Funds (MRDEUF) is Managing authority which is in charge of the general implementation of the OPCC, and also the body responsible for the implementation of the activities within OPCC PA2.

Activities regarding the development of the NGN broadband infrastructure are not implemented as it was planned. During 2019 MRDEUF is planning to implement two complementary activities of total value EUR 246.1 million²⁰. One activity will be implemented like a Major project²¹ "Development of national aggregation (backhaul) NGN network and linkage of public institutions to NGN network in NGN white and grey areas" of total value EUR 101.4 million. It is estimated that EC will approve Major project by the end of 2019, and a significant risk that implementation of the project won't be finished by the end of the current multiannual financial framework (end of 2023) exists. Second activity for the development of the NGA networks will be implemented within Call for project proposals for grants (CfP) of total value EUR 144,7 million. It is estimated that first grant contracts will not be signed before the 2Q 2020.

Only one activity regarding the increase of the use of ICT in communication between the citizens and public administration was implemented so far. For the development of the e-services, MRDEUF has implemented the CfP of total value EUR 82.3 million. Within aforementioned CfP has been signed 9 grant contracts of total value EUR 30.9 million, and 11 projects of total value EUR 50.8 is in the evaluation phase (it is estimated that contracts would be signed by the end of 2Q 2019). Establishment of Shared Service Centre (central management and consolidation of the state's information infrastructure – state cloud) is the second and the last activity within that PA2 objective which is in the final stage of the preparation. That activity would be implemented as a strategic project of a total value of EUR 47.6 million. It is estimated that the grant contract would be signed by the end of 2Q 2019.

²⁰ 85% is financed from the ERDF and 15% is national contribution.

²¹ Major Projects are usually large-scale infrastructure projects in transport, environment and other sectors such as culture, education, energy or ICT. As they receive more than EUR 50 million in support through the ERDF and/or Cohesion Fund, they are subject to an assessment and a specific decision by the EC.

5. CONCLUSION AND SUGGESTION FOR FURTHER RESEARCH

EU secured over EUR 20 billion from the ERDF and CF for ICT investments during the 2014-2020 funding period which is confirmation that EU strives to create the digital society as well as the knowledge society, which are systematically promoted and gradually built by the EU with the ultimate aim of encouraging innovation, creativity, and competitiveness of the European industry and the rest of the world. Guided with these principles Croatia has prepared OPCC and decided to invest EUR 307 million in the development of the NGN broadband infrastructure and to increase of the use of ICT in communication between the citizens and public administration.

Based on the OPCC objectives Croatia has adopted all relevant national strategies which represent the existence of the necessary conditions for effective and efficient use of ESI Funds. Although Croatia has adopted all relevant national strategies, it can be said that they were not implemented. Within e-Strategy, only a small number of the projects were implemented for developing e-applications in areas crucial for the economic growth prospects and social cohesion, and for the communication of public institutions with citizens. Furthermore, based on the overall score in the DESI reports for 2016, 2017 and 2018 Croatia is on the EU's bottom, especially regarding the deployment of broadband infrastructure and its quality, and the digitization of public services. Croatia had a slight improvement over the years but still not enough to reach the EU's average.

Croatia must start to implement activities within national strategies to achieve DAE goals and to mitigate risks of losing EU Funds and to prevent even further behind in the creation of a digital economy and society. Priorities regarding the deployment of broadband infrastructure are i) implementation of a Major project for the development of the national aggregation (backhaul) NGN network of total value EUR 101.4 million; ii) implementation of the CfP for the development of the NGA networks of total value EUR 144.7 million. Also, regarding the digitization of public services, it is important to implement strategic project "Establishment of Shared Service Centre" of total value EUR 47.6 million.

Future research needs to be focused on a more detailed study of reasons why ICT growth in different aspects is not going at a steep pace. Research should

also address the barriers to the availability of broadband services to which telecommunications companies are predominantly responsible and detailed barriers to the slow introduction of public digital services.

E-mail: zeljko.pozega@efos.hr

Abstract

Croatian economy has been trying to recover from the crisis in 2008 when GDP per capita in Croatia was at the top. This crisis caused severe damage to Croatia, to its economy, employment rate, investments, GDP per capita et. Afterwards, there was a constant drop in GDP per capita until 2015 after which a GDP per capita was two years in a row in the constant rise. From 2015 to 2017 there was a value-added growth and this research will carry out results to see which economic development indicators, by economy sectors, have the positive correlation with value added i.e. indirectly with GDP per capita growth in Croatia and which indicators, by economy sectors, don't have that impact. Furthermore, as economy is divided into economy sectors, so it is easier to invest and measure which activities give the best results and which activities support value added the most, it can be seen in which sectors to invest that the impact on value added is the biggest and what economic development indicators can possibly be the best predictors of the economic growth, i.e. value added growth.

Keywords: Croatian economy, crisis, value added, economic indicators

JEL Classification: H12, O10

1. INTRODUCTION

Nowadays, most of the big investors that have more than the three third of the world's wealth, predict that there will be a big global crisis in the following

two-three years. Most of them claim that the cause for this possible big global crisis will be bad managing of the top management, that the problem is thinking short term instead of the long term. To achieve set goals and targets they make short term decisions and present/cover up results for the short-term success forgetting the long-term path and vision. When there is a drop in the GDP per capita i.e. value added, a government has to implement an investment plan or action plan. This plan aims certain economy sectors and takes certain actions in order to make value added grow.

This paper will present a correlation between economy sectors which shows which of the economy sectors in Croatia have the biggest impact on value added growth and which indicators can be the best predictors of the economy growth, i.e. economy drop or crisis. There are many economic development indicators but for the convenience of the research, only five economic development indicators have been taken into consideration while calculating correlation and regression analysis.

2. METHODOLOGY AND PURPOSE

This paper will take into consideration the following indicator: revenue by economy sector and total revenue per year, export by economy sector and total export per year, net export by economy sector and total net export per year, net salary by economy sector and average net salary per year and gross salary by economy sector and average gross salary per year in Croatia.

Economy sectors in Croatia taken into consideration in this paper are: agriculture, forestry and fisheries, mining and quarrying, manufacturing, electricity, gas, steam and air conditioning supply, water supply, sewage disposal, waste management, construction, wholesale and retail trade, repair of motor vehicles and motorcycles, transportation and storage, providing accommodation and preparation and serving of food, information and communication, financial activities and insurance activities, real estate business, professional, scientific and technical activities, administrative and auxiliary service activities, public administration and defense, compulsory social security, education, health care and social care, art, entertainment and recreation, other service activities and activities of households as employers.

Research is made by 20 economy sectors in Croatia and 5 economic development indicators in correlation with GDP per capita for Croatia in the period 2015 – 2017. The hypothesis is that revenue and export have a positive correlation with value added in Croatia and that revenue and export can predict value added growth in Croatia. Revenue is calculated as a total sum of the revenues from all the companies in all 20 economy sectors that have been taken into consideration in this research. Revenue presents the product of the quantity of product multiplied by the price of the products or services that the company is selling or providing.

Export presents the value of the goods and services that are sold to the entity from another country. Export in this research is the value of goods and services that companies in every of the 20 economy sectors have sold provided to the companies or entities outside the borders of the Republic of Croatia.

Value added is a result of the work that all the companies in a country put into a material production over a certain period, usually, that period is one year. Value added in this research presents effort and work from companies in all 20 economy sectors in Croatia as a difference between input and output value of the products or services. That is the value of the work and it is also called “clean/net domestic product”.

3. RESEARCH

In tables 1-3. it can be which economy sectors and economic indicators in Croatia are taken into consideration in this research.

Table 1. Economy sectors and economic indicators in Croatia for 2015

In Table 4 it can be seen that correlation between revenue and value added is significant correlation and the coefficient is 0.881, also a correlation between revenue and value added is significant correlation and the coefficient is 0,920. It means that revenue and export are closely connected to value added which represents the difference between the amount of sold goods and services and the cost of production of those goods and services.

As value added is greater it means that the economy is making more profit, creating higher value for organizations and that GDP per capita could be higher as greater value is created, and it means that organizations can have a better competitive advantage on the market as they succeed in producing goods and services at lower costs or achieving a higher price of sold goods and services.

Table 4. Correlations between five economic indicators and value added.

Correlations							
		Value added	Revenue	Export	Net export	Net salary	Gross salary
Value added	Pearson Correlation	1	,920**	,881**	.055	.055	.057
	Sig. (2-tailed)		.000	.000	.817	.816	.813
	N	20	20	20	20	20	20
Revenue	Pearson Correlation	,920**	1	,741**	-.297	.003	.001
	Sig. (2-tailed)	.000		.000	.203	.989	.995
	N	20	20	20	20	20	20
Export	Pearson Correlation	,881**	,741**	1	.391	.016	.009
	Sig. (2-tailed)	.000	.000		.088	.946	.971
	N	20	20	20	20	20	20
Net export	Pearson Correlation	.055	-.297	.391	1	.038	.027
	Sig. (2-tailed)	.817	.203	.088		.874	.910
	N	20	20	20	20	20	20
Net salary	Pearson Correlation	.055	.003	.016	.038	1	,997**
	Sig. (2-tailed)	.816	.989	.946	.874		.000
	N	20	20	20	20	20	20
Gross salary	Pearson Correlation	.057	.001	.009	.027	,997**	1
	Sig. (2-tailed)	.813	.995	.971	.910	.000	
	N	20	20	20	20	20	20

** . Correlation is significant at the 0.01 level (2-tailed).

Source: made by the author

A hierarchical regression analysis was performed to determine the possibility of prediction. The Durbin-Watson test showed that it is justified to use this statistical procedure. In the first block, revenue is included and in the second block export is included

Table 5. Regression analysis.

Value added			
1 st step	B	R	R ²
Revenue	.92**	.92	.85**
2 nd step			
Revenue	.59**	.97	.93**
Export	.44**		

Source: made by the author

From table 5 both predictors are significant, meaning that the higher the revenue, the higher the possibility that added value will be increased, and the higher the export, the greater the possibility of added value growth.

Revenue explains 85% of variance while export explains an additional 8%, and this model explains 93% of added value variation.

The growth of revenue and exports, i.e. higher revenue and exports, will predict higher added value, i.e. it means that possibility for added value growth is higher, which means that the companies will have more competitive advantages, have higher revenue and realize greater exports of their products or services. The more goods or services are exported, and more revenue is realized, the higher GDP per capita can also be achieved.

4. CONCLUSION

As this research carries out results, it can be seen that the correlation between revenue and value added and export and value added is positive and significant. Therefore, as revenue grows there will be an increase in value added, also as export grows there will be an increase in value added.

The global economy is nowadays becoming “global and local” and economies have to support their companies to catch up with the global trending becoming more flexible and have faster reactions when it comes to export and revenue in the case to preserve employment and avoid a crisis.

As in the past, work couldn't be evaluated and presented with numbers and amounts, today with value added it clearly calculated how much work is worth in companies, countries, economy sectors etc. It can be an implication for further research to seek for correlation between investment in human capital and value added in companies or organizations to see if the value added correctly presents the value of work. Also, it can be an implication for the research based on the national value added and HDI in a country, which present level of the development of the human capital.

Abstract

This research aims to analyze the impact of military expenditure on economic growth, based on a set of secondary objectives that highlight the characteristics of the defense budget, the Euro-Atlantic integration framework of Romania, and the interdependence between military expenditure and economic growth, but also other economic indicators and public debt. The dataset is consisting of annual values for the following indicators, over the period 2000-2016: mili-

tary expenditure, GDP, public debt, budget deficit, unemployment rate, and inflation rate. The correlation and causality analysis prove that military expenditure has a relationship to all the indicators previously mentioned, especially over the long term. An increase in these expenditures would lead to an increase in GDP and a reduction in the unemployment and inflation rate. This research is relevant, mainly due to the fact that the Romanian case has not been previously studied individually on this matter. Moreover, its conclusions may be useful in establishing budgets for national ministries, as long as an increase in military expenditure may act as a financial instrument for both, economic growth and reduction of economic imbalances.

Keywords: military expenditure, economic growth, public debt, unemployment, inflation, Romania

JEL Classification: O40, O47

1. INTRODUCTION

Recently, there have been more tensions between the big actors in politics, economics and military system. Moreover, the impact of military expenditure on economic growth is one of the most controversial issues in economics. Due to these contexts, the topic is considered to be of major importance and will commence by analyzing the relationships presented by other researchers. Starting from the latest 20th century and continuing with the 21st century, an important number of scientific papers related to this subject. Nevertheless, as long as there is no exact description of the military expenditure and economic growth causal relationship, we consider that the research on this subject should continue. In order to identify the reasons behind, increasing or decreasing the level of military expenditure in Romania, the effects of these changes will be related to the growth of the national economy.

Nowadays, the impact of military expenditure on economic growth is one of the most discussed topics. According to most theories underpinning the economy, since Adam Smith, many economists supported the free market. This resides in an idea that the free market is the best mechanism to provide economic growth. Although the government should not intervene in the economy in a free market, it is required to meet some basic obligations, one of them being related to national security. Therefore, as long as the defense spending rate changes from one time to another, depending on the conflicts with neighbor-

ing countries, national security may become one of the most important duties of the government. An increase in military expenditure may delay economic growth. This argument is based on the hypothesis that higher military expenditure involves a lower level of private investment and domestic savings, along with a lower consumption due to low aggregate demand. It can be presumed that higher military spending, leading to an increase in interest rates, hindering private investments (Korkmaz, 2015). However, Keynesian Economics argues in the *Military Keynesianism* that an increase in the military spending stimulates demand, increasing purchasing power parity and national production, and thus, generating positive outsourcing.

The evolution of the military concept reveals that nowadays, a country's defense capability is based not only on its military strength, but also on a multitude of other factors, the most important ones being the economic factors and the economic resources of a country, but also the human potential. In order to evaluate these resources, several variables can be considered, such as the economic degree of modernisation and complexity, the quality of human resources, labour productivity and economic efficiency, the quantity and quality of natural resources, the quality of governance, the open economy character, the production factors and their level of development, the level of education, etc.

2. LITERATURE REVIEW

2.1. EURO-ATLANTIC INTEGRATION FRAMEWORK: THE ROMANIAN CASE

The recent decades have been important for Romania, bringing a great evolution of the Romanian military system, as Romania joined the North Atlantic Treaty Organisation (NATO) and due to its integration in the European Union. With the accession process to NATO, Romania has assumed a set of obligations imposed by NATO on the financial and accounting management of resources, so that the final control of expenditures lies with the state that bears the costs of certain activities. According to the Report "Romania in NATO" (2017), this is a "statement to encourage strategic partnership by focusing on seven priority areas: combating hybrid threats including strengthening resilience of Member States; full cooperation at operational level, including the maritime and migration areas; cybersecurity and defence; defence capability

areas; defence industry and research; exercises; building capacity in third countries, especially in the Eastern and Southern neighbourhood.

The dynamics of the terrorist actions in 2016 raised concerns and became an element of instability, determining Romania to become a stable, credible player with a clearer and irreversible strategy. At the international level, the hybrid war escalated and became a priority for international security organizations. At the national level, a rise in cyber threats has been observed, developing a need for defensive measures in this area. Therefore, in 2016, Romania started to increase its combat capabilities, based on the principles of defense promoted by NATO, developing a force structure and optimizing decision-making on the basis of a program of transformation, development, and endowment of the Romanian Army. The program has specific instructions to ensure the combat capability of the Romanian Armed Forces, being applied until 2026.

Through the implementation of the acquisition of goods and services plan, the military equipment and weapons were provided, being funded by the national defense economy and of its own reserves. Although there was an overall increase of the defense stocks, the optimal stock level for some categories of military equipment has not been reached. The documents confirming the mobilization of the national defense economy are used to achieve the appropriate level of products and services needed by military units in various areas such as health, agriculture, transport, communication, and information technology. But the lack of orders for technology and equipment in times of peace lead to preservation, reduction, or disposal of production capacities for the economic operators, diminishing the optimum level of industrial products and services. In order to overcome these gaps, a series of requests were formulated in 2016, to provide the deficient sectors with military products and services. This process was included in the documents for mobilization of the national defense economy, ensuring a series of operations related to maintenance and repair of technical systems and military equipment, continuing the process acquiring reserves of products that cannot be provided by the national economy. There were 107 *procurement programs* in total, and four *essential military endowment programs*. The implementation of programs related to NATO obligations, or those required by on-going or technically prepared contracts, initiated during the allocation of financial resources, represented the top-priorities.

Strategic partnerships created facilities to build beneficial relationships with states sharing the same interests of peace. Cooperation with strategic partners aimed at providing the necessary capabilities to adapt to the new security context, under the implementation of the NATO action plan, regarding the enhancement of the operational capacity, development of partnerships between military forces and military education institutions, programs cooperation, and projects and development initiatives ensured by NATO and EU.

2.2. THE RELATIONSHIP BETWEEN MILITARY EXPENDITURES AND ECONOMIC GROWTH

Evidence of a long-term relationship between military expenditure and economic growth was presented in multiple studies in the literature. However, the question of whether military expenditure contributes to or constrains economic growth is still disputed, especially in countries where this expense is an important component of the public budget. Pieroni (2007) argued on the fact that public expenditures have a strong impact on the long-term economic growth rate. Accordingly, the size of the growth rate depends on the level of government intervention and the various components of public spending. In addition, different types of government expenditures have heterogeneous effects on economic growth. For example, public infrastructures, research, development, and public education are often considered as public goods with a positive impact on economic growth. Nevertheless, an increase in government expenditures, mainly based on non-productive expenses will be accompanied by a reduction of the revenues growth, leading to the hypothesis that the larger the size of government intervention, the higher the negative impact will be. Empirical studies presented different results, as the effect of military expenditure on economic growth has remained a controversial subject among economists. Although difficult to predict the net effect of military expenditure on economic growth, an empirical analysis on this relationship has vital implications for the national defense policies.

According to Sandino (2017), over the period 1990-2014, the United States spent yearly from \$3 billion up to \$6 billion on foreign military aid, with a slight decline between 1990 and 2002. This indicates that foreign aid is largely independent of military conflicts in beneficiary countries. The military position of the US and the increase in its presence abroad led to a change in foreign aid

decisions. While the foreign military assistance has risen far beyond its 1990 levels and peaked in 2008, external economic aid increased starting from 2003 but continued on a general trend of decrease. In fact, many countries receiving large economic aid are not classified as low-income countries. This suggests that the assistance offered is not based on conflict needs or on budget issues. There is, however, the following policy metric for the aid allocation in the US: the military aid is relatively higher for countries with political relationships with the US; low-income countries receive an aid every year, even though they generally face more conflicts and have smaller military budgets. The gap between these amounts is based on income groups and suggests that the gross amount of foreign aid granted is rather linked to the GDP and the country's military budget, than to an existing conflict or a needs for financial assistance. While countries with above-average incomes appear to align with high-income countries in terms of population and GDP growth rates, there is a significant difference between the two groups: only 3% of high-income countries have an internal conflict, whereas countries with above-average incomes have a much higher rate of about 15%.

An increase in military expenditure may have a series of benefits if the country produces military equipment and research and development within its borders, positively influencing the infrastructure and employment, by creating a demand for industrialization. In developing countries, fragile institutions and domestic violence may induce a need for military expansion, aimed not to improve economic growth by increasing industrialization, but rather to suppress riots in the detriment of civil and economic freedom (Maizels and Nissanke, 1986; Sandino, 2017). Consequently, there is an opportunity cost for the allocation of funds to military programs, instead of investing in governance programs promoting country development as the main objective. The net effect of the possible consequences of military expenditure varies greatly depending on the country, due to the large differences in government regimes, infrastructure, natural resources, or geographical location.

Endogenous development theory provides a basis for the relationship between the level of military expenditure and economic growth over long-term, predicting an inverted U-shape (Shieh et al., 2002). Theoretical arguments result from comparing the direct and indirect costs of military activities with their indirect benefits. Accordingly, if the weight of military spending is low in relation to the overall economy, it is very possible to yield higher benefits than

costs, having a positive impact on the growth rate. This assumption would not be confirmed by early studies in the literature when results emphasized the opposite: countries with a high level of defense spending tend to have the fastest growth rate, while countries with reduced military expenditure often have the slowest growth rate (Benoit, 1973; Biswas și Ram, 1986).

More recently, the Granger cause approach started to be implemented for the analysis of the relationship between economic growth and military expenditure. Chang et al. (2001) found evidence of bidirectional causality between military expenditure and real revenue in Taiwan, and one-way causality between real revenues and military expenditure in China. In developing countries, a causal relationship between military expenditure and real incomes was highlighted by studies analyzing multiple countries at once (Joerding, 1986; Dakurah, 2001). Dunne and Perlo-Freeman (2003) indicated a unidirectional relationship between economic growth and military expenditure for Southern European countries (Greece, Portugal and Spain). Researchers also targeted countries with frequent or imminent political conflicts and armed conflicts. For example, Pan et al. (2014) studied the relationship between military spending and economic growth in ten Middle Eastern countries. Their results indicate a unidirectional causal link between Turkey's military spending and economic growth, a unidirectional link between economic growth and military spending for Egypt, Kuwait, Lebanon and Syria, and a bidirectional causal relationship for Israel. Middle Eastern countries were also analyzed by Chang et al. (2011) along with countries from South Asia and Europe. Their regression analysis indicated in this case that military spending affects growth in low-income countries. Out of the four different regional groups observed, a negative and strong relationship between military spending and economic growth was found.

The relationship between military expenditure and economic growth can also be observed through other indicators, such as investments. For example, Cohen (1996) indicated that military expenditure has an indirect positive effect on economic growth through investments. Although military expenditure can lead to the development of new technologies, it can also create inflationary pressures by reducing the level of resources employed by other economic sectors (Yakovlev, 2007). A more recent analysis of three relatively homogeneous subgroups of countries reveals that military expenditure has, in general, a negative effect on investments. In this case, the mathematical model revealed as a net effect the fact that military expenditure has a negative influence on economic

growth for both, the whole sample of countries and the subgroups (Korkmaz, 2015). Gokmenoglu et al. (2015) also evidenced the indirect negative effect of military expenditure as it leads to a reduction in investment, but also in exports, constraining economic growth.

The wide range of sample sizes and countries analyzed in the literature suggests different results, implying that a certain influence of military spending on economic growth cannot be established. It needs to be further studied, taking into consideration that homogeneous datasets are necessary for relevant results.

3. METHODOLOGY AND DATA

This paper aims to analyze the impact of military expenditures on economic growth in Romania, from a macroeconomic point of view. Considering the overall period of 2000-2016, this may be divided into three sub-periods, namely: pre-crisis period (2000-2008), crisis period (2008-2012), and the post-crisis period (2012-2016). Based on these sub-periods, significant trend differences are expected in the variables observed, which will be evidenced through the statistical analysis.

The research methodology will be consisting of four stages. First, a number of economic indicators will be identified in order to carry out an economic and financial analysis at the national level. The next step is to analyze the parameters of macroeconomic indicators in order to perceive both, the type of distribution and the trend of indicators throughout the period observed. The following step is to present the relationships between economic indicators and military expenditure through graphics and correlation coefficients, and the final step is to apply Granger causality on all the variables, in order to observe whether the military expenditure are a cause of the Romanian economic growth or on the contrary, they induce economic growth.

In order to determine the impact of military expenditures on economic growth, a series of financial and monetary indicators will be employed. These are indicators of economic imbalances, as well as indicators of economic growth: GDP, unemployment rate, inflation rate, budget deficit, and public debt. The first indicator relates to economic growth, the following two indicators reflect economic imbalances, while the last two are considered financial and monetary indicators.

For the collection of reliable data, international databases were consulted. Considering the variety of the indicators, these were collected from several sources, as follows: GDP, inflation rate and unemployment rate from World Bank, budget deficit and public debt from Eurostat, and the military expenditure from Sipri database.

4. RESULTS AND DISCUSSIONS

4.1. DESCRIPTIVE ANALYSIS

Figure 1 presents the military expenditure trend, which had a relatively constant increase over the period analyzed. The absolute values increased from 2.03 bn. lei in 2000 up to 11.23 bn. lei in 2016, which in relative size represents an increase of 553%. Small deviations can be observed during the crisis period, when the indicator tends to decrease, from 7.56 bn. lei in 2008 to 6.63 bn. lei in 2010, but it continues its ascending trend over the post-crisis period.

Figure 1. Military expenditure dynamics over the period 2000-2016

Table 1 encloses the descriptive statistics for the indicators employed in this analysis. Regarding the military expenditure in Romania, the average is of 6.48 bn. lei/year, over the period 2000-2016. For this period, the indicator records a total value of 110.235 bn.lei. Its maximum value is recorded in 2016, and the minimum value in 2000. The median analysis indicates that in 50% of cases the military budget has been less than 6.63 bn.lei, while the other half exceed this limit. The amplitude of the indicator reveals that the difference between the maximum value and the minimum one is above 9 bn.lei.

Table 1. Descriptive statistics for the variables over the period 2000-2016

	Military exp. (bn.lei)	GDP (bn.lei)	Public debt (bn.lei)	Budget deficit (bn. lei)	Unempl.rate (%)	Inf. rate (%)
Mean	6.484	433.205	125.838	-15.019	6.92	10.69
Median	6.630	510.523	69.020	-9.121	7.00	6.09
Standard deviation	2.490	219.321	99.117	14.093	0.56	12.63
Kurtosis	-0.2	-1.31	-1.56	0.24	0.96	3.10
Amplitude	9.199	680.198	268.118	45.934	2.30	47.20
Minimum	2.031	81.275	18.186	-48.305	5.80	-1.54
Maximum	11.230	761.47	286.304	-2.371	8.10	45.67
Sum	110.236	7364.48	2139.250	-255.326	117.60	181.81
Relative amplitude (%)	141.863	157.015	213.066	-305.837	33.248	441.395

For a better comparison of the magnitude of macroeconomic indicators, the relative amplitude calculation formula, according to Andrei et al. (2002, p.103), the relative amplitude is calculated according to the following formula:

$$Ar = \frac{(X_{max} - X_{min})}{X_{mean}} * 100$$

The relative amplitude of military expenditure is 141.86%. It is worth mentioning that this value is significantly lower than the relative magnitude of the other macroeconomic indicators. The Kurtosis coefficient has a negative value (-0.20), and the distribution is considered to be platykurtic (less than 3, which is the case for a normal distribution), as it continues to increase over the post-crisis period.

As it can be observed in Figure 2, the evolution of the GDP is similar to the military expenditure, having a higher level of increase, from 81.27 bn. lei in 2000 to 761 bn. lei in 2016. In relative sizes, this represents 937%. Small variations are highlighted over the crisis, as the indicator has a slight tendency to decrease from 524.39 bn. lei in 2008 to 510.52 bn. lei in 2009.

Figure 2. GDP dynamics over the period 2000-2016

Based on the descriptive statistics, GDP records a total amount of 7,364 bn. lei and an average of 433.2 bn. lei, with a deviation of 219.32 bn. lei. The maximum value was registered in 2016 and the minimum in 2000. From the amplitude analysis, it can be noticed that the GDP spread is relatively small, with an absolute value of 680.2 bn. lei, and relative amplitude of 157%. From the median analysis, it can be observed that in 50% of cases the GDP was under 510,5 bn. lei, while in the other half of the cases the values were higher than this figure. With a negative Kurtosis coefficient, the distribution is a platykurtic one.

According to figure 3, public debt presents a slight increase in the pre-crisis period, from 18.185 bn. lei in 2000, up to 53.26 bn. lei in 2007. As a result of the global economic crisis, public debt increases to 221.87 bn. lei in 2012, and up to 286.3 bn. lei in 2016. This variation represents a percentage increase of 1574% in its relative size.

Figure 3. Dynamics of public debt over the period 2000-2016

The public debt statistics indicate an average of 125.84 bn. lei, and a deviation from the average of 99.116 bn. lei. The total public debt raises up 2,139 bn. lei over the 17 years period. The analysis of the average of the indicator reveals that in 50% of the cases the public debt registered values below 69 bn. lei and the other half of the cases exceed this value. With the maximum value of public debt registered in 2016 and the minimum in 2000, the amplitude of public debt reveals an important spread level (absolute value of 268.12 bn. lei; the relative amplitude of 213.06%). With a negative Kurtosis coefficient, this distribution is also considered to be platykurtic.

The trend of the budget deficit is presented in figure 4. With a slight relief in the pre-crisis period, from -3.716 bn. lei in 2000 to -2.371 bn. lei in 2005, during the economic crisis the deficit enlarged heavily. While in 2008, the deviation of the budget deficit ratio was 683%, by 2009 the same index almost doubled and reached a value of 1200%, registering a figure of - 48.305 bn. lei. Over the post-crisis period, the indicator recovered up to -5.537 bn. lei in 2015, but continued to grow in 2016, registering a 515% deviation, for a value of -22.847 bn. lei.

Figure 4. Dynamics of budget deficit over the period 2000-2016

From table 1, the statistics indicate an average budget deficit of -15,019 bn. lei, and a deviation by 14.09 bn. Overall, in the 17 years, the deficit registered the amount of -255,326 bn. lei. The maximum value was recorded in 2009, and the minimum one in 2005. From the analysis of the average, it results that in 50% of the cases the budget deficit is below -9,120 bn., while for the other half the indicator exceeds this figure. The amplitude of the indicator reveals that an

extremely high spread value, the difference between the maximum value and the minimum value being -45,934 bn. lei (or -305,8%). The Kurtosis coefficient has a positive value and therefore the distribution is considered to be high or leptokurtic.

The dynamics of the unemployment rate (illustrated in figure 5) registered small fluctuations over the period, with an average of 6.9%. It recorded a peak in 2002 (8.1%) and a minimum in 2008 (5.8%). Reporting the indicator's weights at the beginning of the period, an increase of 116% was achieved in 2002, and a decrease of 83% in 2008. The deviation of this index was 16% during the maximum period of the indicator, and -17% in the period of the minimum.

Figure 5. Dynamics of the unemployment rate over the period 2000-2016

The descriptive statistics from Table 1, indicate an average value of 6.92% over the 17 years, with a deviation of 0.56%. In 50% of the cases, the values of the indicator were below 7%, and the other half marked values higher than 7. The spread is very small compared to the indicators previously examined (absolute value of 2.30% / relative amplitude is 33.24%). The Kurtosis coefficient a positive value (0.96), and thus the distribution is considered leptokurtic.

The evolution of the inflation rate is presented in figure 6. The indicator is continuously decreasing from the pre-crisis to the post-crisis period. It presented small deviations at the beginning of the economic crisis (in 2008) but continued its downsizing trend. The maximum value of the indicator was 45.7% at the beginning of the pre-crisis period, falling to -1.54% in 2016. The calculation of the inflation rate deviation has a significant change over the three sub-periods, but overall it is reduced with 103%.

Figure 6. Dynamics of inflation rate over the period 2000-2016

The descriptive statistics express an average of 10.69% inflation rate, with a standard deviation of 12.63%. In 50% of the cases, the values are below 6.09% and the rest exceeds this limit. The maximum value of 45.67% was recorded in 2000, and the minimum value in 2016, at -1.54%. The amplitude of the indicator returns the highest spread from all the indicators analyzed, of 47,20% (a relative amplitude of 441,39%). Considering the Kurtosis coefficient, it has the highest value, namely 3.1, therefore having a high distribution.

In order to emphasize the differences, it is considered necessary to present the evolution of the six macroeconomic indicators in contrast. Figure 7 reveals the trend of military expenditure, GDP, public debt, and the budget deficit for the overall period, in comparison to 2000 (the base year). A major increase can be observed in public debt and budget deficit. The first maintains its steady level in the pre-crisis period but starts rising in 2008 with an increase of over 1000% in 2012 compared to 2000. Regardless of the end of the economic collapse, it continues the upward trend until 2016. A smaller but relatively steady increase can be observed in military expenditure and gross domestic product, even though the increase is less obvious. These two indicators do not highlight significant signs of sensitivity to the economic and financial crisis.

Figure 7. The percentage fluctuation of the indicators, with a fixed base in 2000

Figure 8 indicates major fluctuations for the unemployment and inflation rate over the 17 years analyzed. Compared to the inflation rate trend, it may be stated that the unemployment rate does not suffer major changes, regardless of the sub-period analyzed. Nevertheless, in the case of the latter indicator provided as a proxy for economic imbalances, a relatively constant decrease can be observed.

Figure 8. The percentage fluctuation of the indicators, with a fixed base in 2000

4.2. CORRELATION ANALYSIS

The correlation coefficients between every pair of variables are presented in Table 2. For the description of the relationship between military expenditures and the chosen indicators, we will proceed with the construction of diagrams. The correlations between military expenditure and every economic indicator are comprised in Figure 9. For the most relevant exposure of the relationship, a cloud of points was constructed between every pair of variables. Such a chart reveals the information on the common aspects of both variables. If there is a

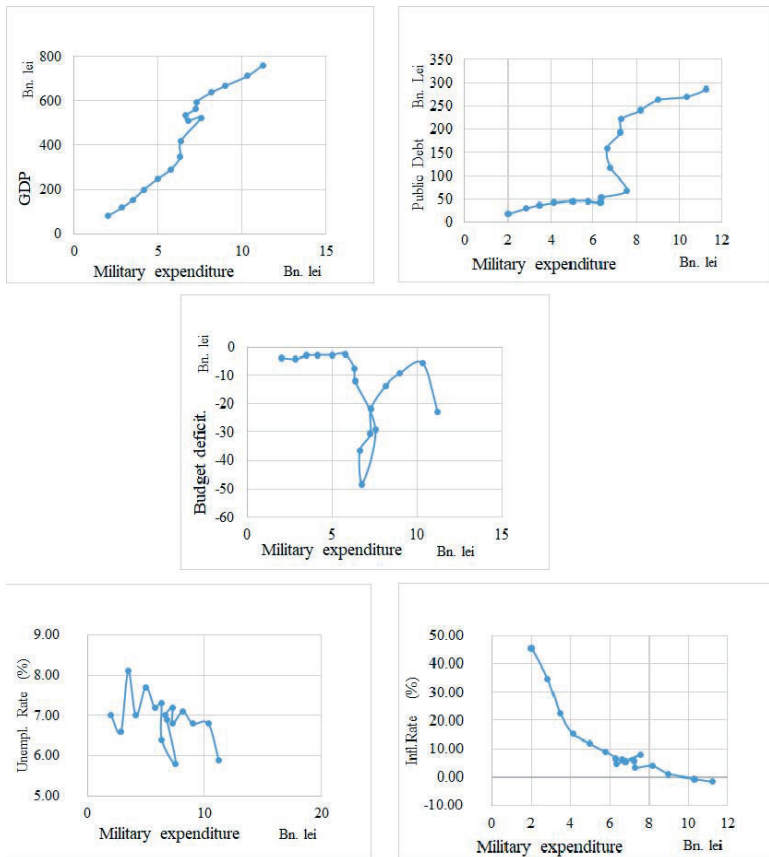

linear relation between them, then it is necessary to calculate the degree or intensity of the relationship through the correlation coefficient.

Table 2. Correlation coefficients

	Military exp.	GDP	Public debt	Budget deficit	Unempl. rate	Infl. rate
Military exp.	1					
GDP	0.9645***	1				
Public debt	0.8638***	0.9126***	1			
Budget deficit	-0.3791	-0.5237**	-0.3362	1		
Unempl. rate	-0.4755*	-0.468*	-0.3025	0.351	1	
Infl. rate	-0.8726***	-0.8455**	-0.665***	0.4059	0.2433	1

***, **, * statistically significant at 1%, 5%, and 10%, respectively

Figure 9. Correlations between military expenditure and the economic indicators

From the correlations graphics and coefficient values, it can be noticed that the strongest relationships are between military expenditure and GDP (0.96) and public debt (0.86), respectively. With a value close to 1 it means that there is a strong linear nexus between these variables, and they vary in the same direction. The inflation rate is also in a strong linear relationship with military expenditure (-0.87), but in this case, the expense would vary in the opposite direction. The correlation coefficients for the unemployment rate and budget deficit also present negative values but their influence on military expenditure is not statistically significant considering the value of the coefficients and p-values associated. However, their relationship with military expense could be a non-linear one, as the correlation graphics above indicate.

4.3. GRANGER CAUSALITY ANALYSIS

In order to include all the economic variables in regressions, data should be transformed to a similar level. This also represents a mean of correcting issues related to stationarity and normal distribution. In addition, in their current form, except for the unemployment and inflation rate, the variables observed in the analysis are not stationary. As long as the database is consisting of variables with large values (expressed in billions), while other variables are expressed in percentages (such as unemployment and inflation rate), the first difference order of the variable is employed, computing its percentage change from one year to the previous ("ch" will be added to the name of each new variable). Therefore, all the variables included in regressions will have a similar level and the unit-root tests confirm the stationarity of the variables in their new form.

Following the correlation analysis, the Granger causality may be further employed in order to observe whether the level of military expenditure causes the economic growth and the level of government debt and deficit, or on the contrary, the economic indicators cause the level of military expenditure.

The results of the Granger causality analysis are included in Table 3. They were employed based on a vector autoregressive model (VAR) with two lags. Considering the limited period analyzed, only two lags were considered in the analysis, but the results statistics prove that these were sufficient to observe the Granger-cause between every pair of variables. Based on the probability of the results, all the economic indicators, except for the inflation rate, Granger causes the military expenditure. In addition, the lagged values of public debt cause

military expenditure at a p-value of 0.058, which means that we can reject the null hypothesis that “the lagged values of public debt do not cause military expenditure” for 90% of the cases. Based on the chi-squared values, between the variables included in the analysis, the strongest cause comes from the budget deficit, followed by GDP, unemployment rate, and finally, the public debt.

Furthermore, the other Granger causality results will be presented, as they are important to reveal whether or not the military expenditure is a cause for the rest of the variables. In fact, the probability values confirm that for 99% of the cases, the lagged values of military expenditure cause GDP, public debt, budget deficit, and the inflation rate. Moreover, for 90% of the cases, the lagged values of military expenditure also cause the unemployment rate. This means that there is a bidirectional Granger causality between military expenditure and GDP, public debt, budget deficit, and the unemployment rate, respectively, and that military expenditure is a Granger cause for the inflation rate.

In addition to the cause and effects related to military expenditure, results prove that there is a bidirectional Granger causality between GDP and budget deficit, GDP and inflation rate, public debt and budget deficit, public debt and inflation rate, budget deficit, and the unemployment rate, and budget deficit and inflation rate. Moreover, the lagged values of public debt Granger cause the budget deficit and the inflation rate, while the lagged values of unemployment rate Granger cause the level of GDP, public debt, and the inflation rate.

Table 3. Granger causality results

inflrate	unemplrate	23.915	2	0.000
inflrate	ALL	1437.6	10	0.000

Applying Granger causality in this research was relevant as the lags of the variables analyzed to improve the simple linear regression model, having a predictive power on the rest of the variables to which they are linked to.

5. CONCLUSIONS

Although the literature on the topic is very broad, studies provide various results. In the case of Romania, the statistics and correlation results suggested that even though the military expenditure has a significant impact on all the economic indicators considered, the previous levels of economic growth, government debt, and unemployment also cause the military expenditure. Essentially, the economic growth will induce an increase in military expenditure, but the relationship confirms the other way around as well, especially over the long term. Therefore, while GDP has a direct impact on military expenditure, an opposite influence comes from public debt, budget deficit, and unemployment rate. Therefore, a reduced level of government debt and unemployment would induce an increase in the level of military expenditure. In addition, the autoregressive model indicates that an increase in military expenditure may also reduce the inflation rate.

In this specific case, the research faced several barriers, one of them being the lack of literature on Romanian studies. Few sources of information presented only the theoretical and management aspects of the topic. Another problem encountered in the elaboration of this specific research was the absence of statistical data on the economic indicators in Romania. Limited data are available on the National Institute of Statistics and therefore, the European and international databases were consulted.

From the economic and social point of view, the analysis of the impact of military expenditure on Romanian economic growth is considered to be important due to the fact that, at the national level, there is no recent literature on the interdependence between these two. In addition, research findings may be useful for the budgets of national ministries and public institutions, as an increase of military expenditure could become one of the financial instruments for sustaining economic growth, inflation rate stagnation and reduction of unemployment.

Abstract

The aim of this paper is to use a questionnaire to gather subjective information regarding health promotion and disease prevention in the Republic of Croatia.

The research was conducted on a sample of 980 participants from the entire Republic of Croatia. A written questionnaire was used for the purpose of gathering information. Descriptive and inferential statistical methods were used for data analysis. Descriptive statistical indicators were determined for all research variables, based on participants' responses, which were measured on a 5-point scale. Differences considered statistically significant were confirmed on the significance level of $p < 0.05$.

Participants largely agree that they need additional information regarding health promotion and disease prevention. Approximately 81% of participants expect to be informed at family physician offices about activities related to health promotion and disease prevention, while almost 84% of participants mostly or completely agree that they are willing to receive magazines issued by a health institution. Furthermore, there is also a significant number of participants who would respond to an invitation by a health institution into Health promotion counseling or disease prevention counseling and participate in public discussions on health promotion and disease prevention. Approximately 57% of participants agree with the statement that there is a form in which they can write their compliments, suggestion, complaints or remarks regarding health promotion and disease prevention, while slightly more than a fifth of participants fully or mostly disagree with that statement.

The concept of health assumes a completely new dimension with citizen active participation. It emphasizes the positive potential abilities of individual and community too, via active creation of health policy, state their needs regarding health promotion, on whose path the health is quarantined as a basic human right.

Keywords: health care, citizens, promotion, prevention

JEL Classification: I12, P46

1. INTRODUCTION

If the concept of health is to be defined, it is primarily necessary to define the concept of health. According to the World Health Organization (WHO): "Health is a state of complete physical, mental and social well-being and not merely the absence of disease and exhaustion. Health is the level at which an individual can, on the one hand, achieve the aspirations and to meet the needs, on the other hand, to change or to face the problems of the environment. Health is therefore considered as a resource of everyday life, not the object of life; it is a positive concept that includes social and personal resources as well as physical components." (WHO, 1990). Due to the breadth of the definition of health, i.e. not binding the concept of health only to curative medical procedures, Croatia and the world will remember Dr. Andrija Štampar for contributing to the health care primary trough prevention programs, availability and foresight of physicians' and nursing profession, education as a key tool for the starting point of modern health care.

Principles of Dr. Andrija Štampar, which remain the foundation of public health and social medicine (Teaching Institute for Public Health):

- Informing people is more important than the law.
- The most important thing is to prepare the field in a certain environment and to appropriately understand health issues.
- The question of public health and working on its improvement should all be addressed by all, without distinction.
- Social therapy is more significant than individual therapy.
- The physician should not be economically dependent on the patient.
- There must be no difference between the economically strong and weak (egalitarianism).

- ✦ In a healthcare organization, a doctor should seek patients, not vice versa, to cover all those who need protection.
- ✦ The physician should be a folk teacher.
- ✦ The issue of public health is of a greater economic rather than humanitarian importance.
- ✦ The main place of medical treatment is where people live, not the clinic.
- ✦ Health is the greatest asset and condition for living the individual and society as a whole.

2. PUBLIC HEALTH IN THE FUNCTION OF PRESERVATION AND IMPROVEMENT OF HEALTH OF POPULATION

The public health mission is to recognize current public health problems, to manage them with the aim of preserving and improving the health of the population. To achieve the goals, good co-operation, coordination and partnership among public health stakeholders at the national, regional and local levels is necessary. However, national healthcare is a component of the overall global public health system, so it is necessary to link and coordinate the same with other public health organizations. This implies the international cooperation of the public health system, including the WHO and European bodies, institutions, and organizations. “To achieve the basic purpose of public health, it is necessary to adopt the concept of health for all, to reduce health and health inequalities in all policies and sectors, and to consider investing in health as the most cost-effective investment in the growth and development of society” (Croatian Public Health Association, 2017).

The main functions of public health and the main instruments used by the public health to achieve public health goals are (Government of the Republic of Croatia, Ministry of Health; 2013):

- ✦ monitoring and assessing the health status and quality of life of the population, particularly vulnerable groups,
- ✦ identification of priority health problems and hazards for population health planning and preparedness for public health emergencies,
- ✦ interventions of health protection from harmful factors in the environment and at work,

- ✦ prevention of illness,
- ✦ promoting health,
- ✦ management, financing and quality assurance in public health,
- ✦ providing competent public health personnel and planning human resources in health care,
- ✦ public health communication,
- ✦ advocating health in all policies,
- ✦ research and science in public health.

The Strategic Plan for Public Health Development of the Republic of Croatia from 2013 to 2015 contains a functional network for health promotion (Government of the Republic of Croatia, Ministry of Health; 2013):

- ✦ Establishment of the Health Promotion Service at the Croatian Institute for Public Health;
- ✦ Situational analysis - using the questionnaire to collect available data on the number of persons and their health promotion activities from the public health system and other health, government and non-governmental and private sectors;
- ✦ Establishment of regional / county functional units for promoting health and strengthening of their intersectoral, multidisciplinary cooperation;
- ✦ Connecting with international institutions in the field of health promotion.

At the Croatian Institute for Public Health, the Health Promotion Service is at the same time the Reference Centre of the Ministry of Health for health promotion with an aim of enabling people to improve their own health and training to control their own health. Health Promotion Services tasks include (Croatian Public Health Association, 2017):

- ✦ Propose, encourage and participate in the organization and implementation of health promotion programs;
- ✦ Provide the necessary recommendations and promote a healthier way of life (non-smoking, proper nutrition, regular physical activity, responsible sexual behavior, strengthening the individual's ability to overcome crisis situations, etc.) through health education and enlightenment as well as public communication tools;
- ✦ Develop appropriate professional templates and/or educational and promotional materials;

- ✦ Provide professional assistance and support for changing programs for the health of life-threatening habits;
- ✦ Encourage the creation of preconditions for a healthier lifestyle to be simpler and more attractive than other options;
- ✦ Pay particular attention to encouraging the creation of such a social environment that supports the adoption of a healthier way of life, including appropriate legislative aspects;
- ✦ In the field of health promotion, improve cooperation with other sectors (education, food industry, agriculture etc.);
- ✦ Performing monitoring and evaluation of individual programs.

It should be kept in mind: “Public health is the science and the art of preventing diseases, prolonging life and improving health through the organized efforts of society. Although public health, defined this way, is a job of everyone, this strategic document defines the role and development of a professional component of public health, i.e. public health practice.” (Government of the Republic of Croatia, Ministry of Health; 2013). Public health is an essential factor in the functioning of the overall social system. Although it has tremendous social importance, public health has to act rationally and efficiently, as business entities from the profit sector have to behave. For the purpose of survival and rational and efficient public health operations, public health must also accept marketing philosophy as its primary business philosophy.

3. METHODOLOGY

The survey was conducted on a sample of respondents from all over the Republic of Croatia. For the purpose of data collection, a written questionnaire was used. The questionnaire encompassed issues that sought to identify the public’s expectations of health promotion and disease prevention.

Descriptive and inferential statistics were used for data analysis. For the purpose of describing the sample, the distribution of subjects according to gender, age, marital status, employment status, the degree of education, place of residence and assessment of IT literacy were determined. Distribution of participants was shown graphically with an aim of visualization. In addition, based on participants age, basic descriptive statistical indicators were calculated.

Descriptive statistical indicators were also determined for all variables of the study, based on participants’ responses that were measured on a 5-degree scale.

Because of the use of the ordinal scale in the study, the statistical significance of the differences in degree of agreement between the individual groups was tested by nonparametric Mann-Whitney test and the Kruskal-Wallis test. The Mann-Whitney test was used to examine the significance of differences between the two groups, and the Kruskal-Wallis test in case the differences between three or more groups were analyzed. In the case where the Kruskal-Wallis test found that there are at least two groups that statistically differ significantly, the Dunn's test was used for the purpose of their identification. Statistically, significant differences were considered to be significant at $p < 0.05$. It should be noted that participants' responses ranges and average rankings are graphically displayed using simple, double and multiple columns.

The study was conducted on a sample of 980 examinees. Table 1 shows their distribution by gender, age, marital status, employment status, and degree of education.

Table 1. Distribution of respondents by gender, age, marital status, employment status, and education level

Characteristic	Number of participants	Percentage
Gender		
Male	478	48,8
Female	502	51,2
Age group		
18 – 39	491	50,1
40 – 60	380	38,8
61 – 82	109	11,1
Marital status		
Married	515	52,6
Unmarried	353	36,0
Cohabitation	30	3,1
Divorced	36	3,7
Widowed	46	4,7
Employment status		
Student	237	24,2
Employed	466	47,6
Unemployed	102	10,4
Retired	157	16,0
Dependent	18	1,8
Education level		
Lower than high school	154	15,7
High school	617	63,0
Higher than high school	209	21,3

There are more women in the sample than men. Regarding age, respondents are classified into three groups. The first consists of people aged between 18 and 39, the other of respondents between 40 and 60 years of age, and the third group include respondents 6 years or older. More than half of the respondents belong to the younger group, while the sample is least represented by the elderly. If the ungrouped data is taken into account, the average age of respondents is 39.32 years with a standard deviation of 15.9 years. According to the median, half of the respondents were, at the time of participation, 39 years of age or younger, and the other half was 39 years or older. Half of the respondents were aged between 24 and 51 years. The coefficient of variation, which amounted to 40.45%, indicates significant data variability in the distribution of respondents by age. It should be noted that the youngest person in the sample was 18 years old, while the oldest participants were 82 years old.

The majority of the respondents stated that they were married. Followed by a group of unmarried. More than a third of the respondents fall into this group. Individuals living in cohabitation, divorced or widower was represented in the sample fairly equally. However, among such individuals, the number of widowed individuals was somewhat high, i.e. approximately 5%.

In terms of working status, employed individuals were the majority. This group is followed by respondents who have stated that they are students, and this group included slightly under a quarter of the sample. The number of unemployed in the sample is approximately 10%, while retired individuals comprise approximately 16% of the sample. Only 18 respondents, which makes less than 2% of all respondents, claimed to be dependent.

According to the level of education, respondents were grouped into three groups. The first is made up of individuals with lower than secondary education. This group included respondents who stated that they did not have completed elementary school or that their highest level of education was an elementary school. There is approximately 16% of such individuals in this sample. The majority of respondents have completed secondary education. Approximately 21% of respondents stated that they had a higher education degree (completed undergraduate studies), a postgraduate specialist degree or a master's degree. Only one respondent claimed to have obtained a master's degree in science, and no respondents in the sample indicated he/she has obtained a degree of doctor of science.

4. RESULTS AND DISCUSSION

In the questionnaire, questions relate to citizens' expectations regarding health promotion and disease prevention. Respondents stated the level of agreement with the statements on a 5-degree scale (1 – I completely disagree, 2 – I mostly disagree, 3 – I do not disagree or agree, 4 – I mostly agree and 5 – I completely agree). Distribution of respondents with respect to their responses are presented in Table 2 and Graph 1.

Table 2. Distribution of respondents by the degree of agreement with claims related to their expectations regarding health promotion and disease prevention

Claim	Level of agreement				
	1	2	3	4	5

There is a form for commendations, suggestions, objections or complaints regarding health promotion and disease prevention	86 (8,8%)	123 (12,6%)	211 (21,5%)	222 (22,7%)	338 (34,5%)

Graph 1. Distribution of respondents by the degree of agreement with claims related to their expectations regarding health promotion and disease prevention

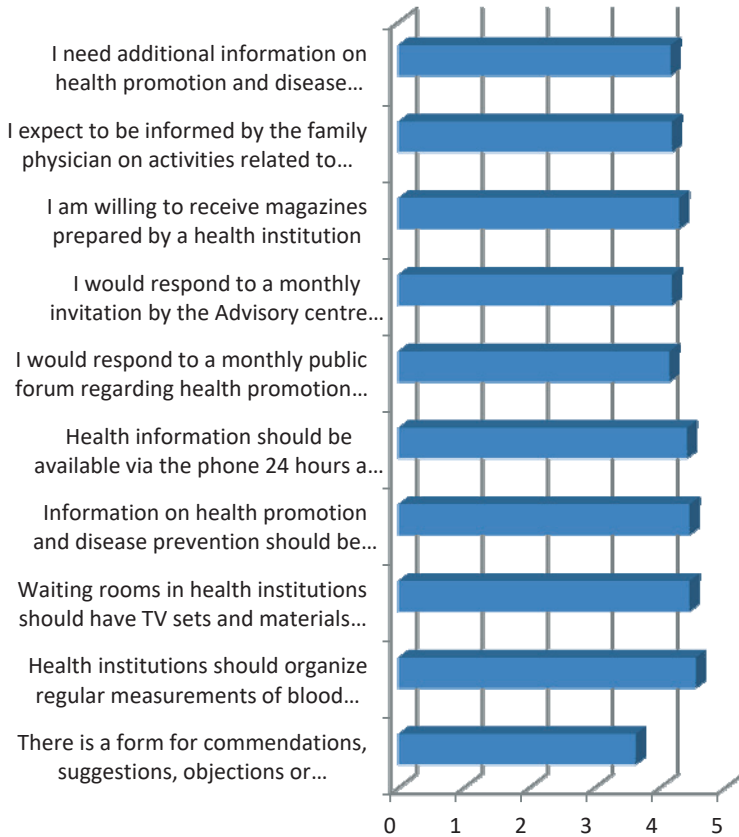

Table 3 lists descriptive statistical data, which is determined on the basis of respondents' responses regarding their expectations on health promotion and disease prevention. Arithmetic means are also shown in graph 2.

Table 3. Descriptive statistical indicators related to citizen expectations related to health promotion and disease prevention

Claim	Arithmetic mean	Median	Mode	Standard deviation
I need additional information on health promotion and disease prevention	4,16	4,00	5,00	0,81
I expect to be informed by the family physician on activities related to health promotion and disease prevention	4,18	4,00	4,00	0,77
I am willing to receive magazines prepared by a health institution	4,29	4,00	5,00	0,78
I would respond to a monthly invitation by the Advisory center for health promotion or disease prevention	4,18	4,00	5,00	0,83
I would respond to a monthly public forum regarding health promotion and disease prevention	4,14	4,00	5,00	0,89
Health information should be available via the phone 24 hours a day	4,41	5,00	5,00	0,68
Information on health promotion and disease prevention should be available via the internet	4,45	5,00	5,00	0,71
Waiting rooms in health institutions should have TV sets and materials relating to health and disease prevention	4,45	5,00	5,00	0,70
Health institutions should organize regular measurements of blood pressure, pulse, blood sugar, body weight etc.	4,54	5,00	5,00	0,68
There is a form for commendations, suggestions, objections or complaints regarding health promotion and disease prevention	3,62	4,00	5,00	1,31

The average respondents showed a very high level of agreement with all the claims. Only in the case of a variable related to the existence of a form for commendations, suggestions, objections or complaints regarding health promotion and disease prevention, the calculated arithmetic mean is less than 4. The greatest value of the arithmetic means refers to the claim that healthcare institutions should organize regular measurements of blood pressure, pulse, blood sugar, body weight etc.

Graph 2. Arithmetic means related to citizen expectations related to health promotion and disease prevention

Based on the calculated standard deviations, it can be concluded that the largest dispersion characterizes participants' responses to the statement that there is a form for commendations, suggestions, objections or complaints regarding health promotion and disease prevention. For this variable only, the average deviation of the arithmetic mean is greater than 1.

Mann-Whitney's test was used to examine the significance of differences in the responses of men and women. Its results, including the average rankings, are shown in Table 4. Average rankings are also presented in graph 3.

Table 4. Mann-Whitney test of differences in expectations regarding health promotion and disease prevention with regard to gender

Claim	Average rankings		Z	p
	Male	Female		
I need additional information on health promotion and disease prevention	475,79	504,50	-1,699	0,089
I expect to be informed by the family physician on activities related to health promotion and disease prevention	483,25	497,40	-0,843	0,399
I am willing to receive magazines prepared by a health institution	476,80	503,54	-1,610	0,107
I would respond to a monthly invitation by the Advisory center for health promotion or disease prevention	480,44	500,08	-1,166	0,244
I would respond to a monthly public forum regarding health promotion and disease prevention	486,23	494,57	-0,492	0,623

* Statistically significant at $p < 0,05$

Younger people agree statistically significantly more than middle-aged people that there is a form for commendations, suggestions, objections or complaints regarding health promotion and disease prevention. In addition, younger people agree considerably less than older people that they need additional information on health promotion and disease prevention, that they are willing to receive magazines prepared by the health institution and that they would respond to a monthly invitation by the Advisory center for health promotion or disease prevention.

The Dunn’s test also confirmed that middle-aged participants agree statistically significantly less than the elderly participants that they are willing to receive magazines prepared by the health institution and that they would respond to a monthly invitation by the Advisory center for health promotion or disease prevention.

Table 7 lists the results of the Kruskal-Wallis test, which investigated differences in terms of marital status, and the average rankings, except in the table, are also shown in graph 5.

Graph 5. Average rankings of expectations related to health promotion and disease prevention with regard to marital status

Agneza Aleksijevic: CITIZEN EXPECTATIONS REGARDING HEALTH PROMOTION AND DISEASE PREVENTION

The results of the Kruskal-Wallis's test show that in the case of the following statements there are at least two groups that are statistically significant in

terms of the levels of agreement: I need additional information on health promotion and disease prevention, I would respond to a monthly invitation by the Advisory center for health promotion or disease prevention, I would respond to a monthly public forum regarding health promotion and disease prevention and there is a form for commendations, suggestions, objections or complaints regarding health promotion and disease prevention.

For the purpose of identifying groups that statistically significantly differ with regard to the degree of agreement, Dunn’s test was used, the results of which are presented in Tables 8 and 9.

Table 8. Dunn’s multiple comparison test

Claim		Compared groups				
		Married	Married	Married	Married	Unmarried
		Unmarried	Cohabitation	Divorced	Widowed	Cohabitation

* Statistically significant at p <0,05

Dunn’s test confirmed that married participants agree statistically significantly more than unmarried participants that they need additional information on health promotion and disease prevention. The Dunn test also confirmed that unmarried individuals believe statistically significantly less than widowed individuals that they need additional information on health promotion and disease prevention. According to Dunn’s test, other differences between groups are

not statistically significant. This implies that, given the marital status, there is a fairly balanced view of the analyzed statements among the different groups.

This implies that, given the marital status, there is a fairly balanced view of the analyzed claims among different groups.

Table 9. Dunn’s multiple comparison test

Table 10 lists the results of the Kruskal-Wallis’s test, which was conducted to determine for which claims there are at least two groups, grouped according to working status, which statistically significantly differ with respect to the stated degree of agreement. Average rankings are shown in graph 6. The Kruskal-Wallis test confirmed the existence of statistically significant differences in the following cases: I need additional information on health promotion and disease prevention, I expect to be informed by the family physician on activities related to health promotion and disease prevention, I would respond to a monthly invitation by the Advisory center for health promotion or disease prevention, I would respond to a monthly public forum regarding health promotion and disease prevention, Information on health promotion and disease prevention should be available via the internet and There is a form for commendations, suggestions, objections or complaints regarding health promotion and disease prevention. In the case of the first and fourth of the aforementioned arguments, the highest average rank was determined based on the responses of retirees,

while the lowest average rank was for the dependent individual. The lowest average rank in the case of a claim relating to expectation to be informed by the family physician on activities related to health promotion and disease prevention as well as to willingness to respond to a monthly invitation by the Advisory center for health promotion or disease prevention was calculated based on the responses of students. According to the average rankings, the unemployed agree the most with the claim relating to expectation from the family physician, while retirees agree the most with the claim relating to a willingness to respond to a monthly invitation by the Advisory center for health promotion or disease prevention. Dependant individuals agree at least that information on health promotion and disease prevention should be available online, while the unemployed agree with this claim the most.

Table 10. Kruskal-Wallis test of differences in expectations regarding health promotion and disease prevention with regard to the working status

* Statistically significant at $p < 0,05$

Graph 6. Average rankings of expectations related to health promotion and disease prevention with regard to the working status

The results of the Dunn's test are presented in Tables 11 and 12. Although the Kruskal-Wallis test points to the existence of statistically significant differences in the degree of agreement between at least two groups in the case of claims that information on health promotion and disease prevention should be available online, the adjusted p-values obtained within the Dunn's test do not confirm this.

Table 11. Dunn's multiple comparison test

* Statistically significant at $p < 0,05$

According to Dunn's test, students agree significantly less with the claims than employed individuals do. According to the Dunn test, students agree significantly less than employed individuals agreeing with statements that they would respond to a monthly invitation by the Advisory center for health promotion or disease prevention was calculated based on the responses of students, as well as to a monthly public forum regarding health promotion and disease prevention. Students are also significantly less than the unemployed individuals agree that they need additional information on health promotion and disease prevention, that they expect to be informed by the family physician on activities related to health promotion and disease prevention, that they would respond to a monthly invitation by the Advisory center for health promotion or disease prevention, as well as to a monthly public forum regarding health promotion and disease prevention.

The results of the Dunn's test also confirm that students agree significantly less than retirees that they need additional information on health promotion

and disease prevention, that they would respond to a monthly invitation by the Advisory center for health promotion or disease prevention and that they would respond to a monthly public forum regarding health promotion and disease prevention. However, in relation to retirees, they agree more that there is a form for commendations, suggestions, objections or complaints regarding health promotion and disease prevention. Dunn's test also confirmed that employed need additional information on health promotion and disease prevention significantly less than retirees, while at the same time agreeing significantly more that there is a form for commendations, suggestions, objections or complaints regarding health promotion and disease prevention.

I am willing to receive magazines prepared by a health institution	471,81	482,58	527,65	5,641	0,060
I would respond to a monthly invitation by the Advisory centre for health promotion or disease prevention	501,11	467,01	552,02	16,525	0,000*
I would respond to a monthly public forum regarding health promotion and disease prevention	487,97	475,24	537,42	8,605	0,014*
Health information should be available via the phone 24 hours a day	484,98	483,80	514,36	2,345	0,310
Information on health promotion and disease prevention should be available via the internet	466,22	483,71	528,43	6,712	0,035*
Waiting rooms in health institutions should have TV sets and materials relating to health and disease prevention	465,61	484,47	526,63	6,207	0,045*
Health institutions should organize regular measurements of blood pressure, pulse, blood sugar, body weight etc.	498,33	487,65	493,16	0,275	0,872
There is a form for commendations, suggestions, objections or complaints regarding health promotion and disease prevention	468,62	497,40	486,26	1,427	0,490

* Statistically significant at $p < 0,05$

Graph 7. Average rankings of expectations related to health promotion and disease prevention with regard to the degree of education

Table 14. Dunn's multiple comparison tests

Claim		Compared groups		
		Lower than high school	Lower than high school	High school education
		High school education	Higher than high school	Higher than high school
I would respond to a monthly invitation by the Advisory center for health promotion or disease prevention	Z	1,436	-1,818	-4,029
	ρ	0,453	0,207	0,000*
I would respond to a monthly public forum regarding health promotion and disease prevention	Z	0,533	-1,756	-2,931
	ρ	1,000	0,237	0,010*
Information on health promotion and disease prevention should be available via the internet	Z	-0,776	-2,342	-2,234
	ρ	1,000	0,058	0,076
Waiting rooms in health institutions should have TV sets and materials relating to health and disease prevention	Z	-0,835	-2,290	-2,100
	ρ	1,000	0,066	0,107

* Statistically significant at $p < 0,05$

Using the Dunn's test, and based on the adjusted empirical levels of significance, the existence of statistically significant differences in the level of agreement as not been detected. Dunn's test, and based on adjusted empirical levels of significance, did not confirm the existence of statistically significant differences in degree of agreement between any two groups with regard to claims that information on health promotion and disease prevention should be available online and that waiting rooms in healthcare facilities should be equipped with TV sets and posters, brochures, leaflets and magazines related to health and disease prevention. According to the Dunn test, individuals with secondary education agree statistically significantly less than those with higher education that they would respond to a monthly invitation by the Advisory center for health promotion or disease prevention, as well to a monthly public forum regarding health promotion and disease prevention.

5. CONCLUSION

The health system of the Republic of Croatia, although faced with many problems and many tasks that need to be addressed, should be seen as a potential. However, in order to change the public image of the health system of the Republic of Croatia, and in order to maximize the function of the health system of the Republic of Croatia to promote health promotion and disease prevention in the Republic of Croatia, it is necessary for the population of the Republic of Croatia, i.e. users of the health system, to communicate effectively about the

possibilities of the health system and the importance of the preventive behaviour of the population in suppressing the disease. Quality communication with consumers is in the domain of marketing, especially the part that is called integral marketing communication. Therefore, taking into account the specificities of the economic or social system of the Republic of Croatia, and in particular the specificities of health care on the one hand, and the specificity of the needs of the population of the Republic of Croatia on the other hand, while at the same time accepting today's knowledge of marketing in the narrower sense, i.e. communication systems in the broader sense, one of the tasks of science is to research, and offer an optimal model of integral marketing communication in the function of health improvement and disease prevention in the Republic of Croatia. Accordingly, the conducted research is a starting point for a whole series of studies that should enable the implementation of integrated marketing communication in the health system of the Republic of Croatia. Today, it is more important to hear what users need than it is to send messages to users without knowing what they really want. This means that we need to make a step forward from monodirectional communication towards bidirectional communication.

E-mail: msulentic@vusb.hr

Abstract

A STEM education is more often presented in the public as a new trend in education. Most people equate STEM with robotics or computer science, although it does not correspond to the meaning of the acronym, as well as the sense of STEM education. STEM education includes studies of the four areas (science, technology, engineering, and mathematics) in an interdisciplinary way that has a measurable and clear appliance. By starting the new studies Energetics and Ecological Agriculture and Rural Development College of Slavonski Brod prove the dynamic development towards a meeting the needs of the economy. Both programs represent a competitive approach to the market, and both are required for the economy. The programs are based on the strategies of the European Union and the Republic of Croatia. During the creation of programs for the above-mentioned studies, the emphasis is placed on the development of the economy, innovation, and scientific excellence in the creation of personnel whose professions are unavailable in the labor market. This paper will present and analyze the number and structure of enrolled students in undergraduate studies Manufacturing Engineering and Plant production and in Graduate Studies in Energy and Ecological Agriculture and Rural Development in the

period from 2014/2015. to 2018./2019. academic year. According to the analyzed data, there will be given guidelines for increasing the number of students in the mentioned studies from the STEM area.

Keywords: STEM area, education, College of Slavonski Brod

JEL Classification: I21, I23

1. INTRODUCTION

Study Programs in STEM Areas of Science are programs in biotechnical, technical, biomedical, natural and interdisciplinary science and study programs that acquire the academic or professional title of Bachelor of Information Technology, business informatics, information sciences, and informatology. The Ministry of Science and Education grants scholarships to regular students enrolled in higher education institutions in the Republic of Croatia for the undergraduate university, integrated undergraduate and graduate university and undergraduate professional studies in STEM areas of science.

The subject of this paper is STEM education on College of Slavonski Brod, that has two undergraduate (Manufacturing Engineering and Plant production) and two graduate (Energy and Ecological Agriculture and Rural Development) study programs from STEM area. The first part of the paper presents the system of higher education in the Republic of Croatia and analysis the number of enrolled students in certain study areas. After that, the data on College of Slavonski Brod students, who are enrolled in study programs from the field of the STEM area, were analyzed. The data on students enrolled in pre-graduate and graduate studies are presented separately.

2. HIGHER EDUCATION SYSTEM IN THE REPUBLIC OF CROATIA

Higher education in the Republic of Croatia is performed within university and professional courses. University study programs qualify students to work in science and higher education, private and public sector and society in general, as well as to develop and apply scientific and professional knowledge. Professional study programs provide students with an appropriate level of knowledge and

skills required to work in applied professions, as well as a direct integration in the working process.

University study programs have three levels: undergraduate, graduate and postgraduate. Professional study programs are split into short professional studies, undergraduate professional studies, and specialist graduate professional studies. Undergraduate programs normally last three (180 ECTS) to four (240 ECTS) years. Upon completion, students are awarded an academic title of Bachelor with reference to a specialization. Graduate programs normally last one (60 ECTS) to two (120 ECTS) years. The total number of credits earned after completing both undergraduate and graduate studies is at least 300 ECTS.

Upon completion of both undergraduate and graduate studies, students are awarded an academic title of Master with reference to a specialization. Postgraduate university studies are divided into specialist and doctoral studies. Specialist studies last for one to two years. Upon completion, the student is awarded the title of University Specialist with reference to a specialization (univ. spec.). Doctoral studies last three years (180 ECTS). Upon completion of the doctoral study, the academic title of Doctor of Science or Doctor of Arts is awarded (dr. sc. or dr. art.). (AZVO)

Professional studies are divided into short professional studies, undergraduate professional studies, and specialist professional graduate studies. Short professional studies last two (120 ECTS) to two and a half (150 ECTS) years. Upon completion, students are awarded a professional title of Professional Bachelor of Economics with reference to a specialization. Undergraduate professional studies last three (exceptionally four) years and students earn 180-240 ECTS credits. Upon completion of professional studies, students are awarded a professional title of Professional Bachelor of Economics with a reference to a specialization. Specialist professional graduate studies last one to two years and students can earn 60-120 ECTS credits. Upon completion, students are awarded a title of Professional Specialist in Economics. The total number of credits earned after completing both undergraduate and graduate professional studies is at least 300 ECTS. There are currently 1358 accredited study programmes in the Republic of Croatia. (AZVO)

Higher education in the Republic of Croatia takes place under the Bologna process. The Bologna Declaration was a common declaration of the European education ministers signed in 1999 in Bologna, which marked the process of

higher education reform known today as the Bologna Process. The Republic of Croatia signed the Bologna Declaration in 2001. The aims of the Bologna Process are:

- ✦ Adoption of a system of easily readable and comparable degrees, among other things by introducing Diploma Supplements, in order to improve the employability of the European citizens and the international competitiveness of the European Higher Education Area.
- ✦ Adoption of a system essentially based on two main cycles, undergraduate and graduate. Graduation from the first cycle, in the duration of at least three years, is a precondition for enrolment to the second cycle. The qualification awarded after the first cycle should be aligned with the levels recognized at the European labor market. The second cycle leads to the master/doctoral cycle, as is the case in many European countries.
- ✦ Establishment of a system of credits, such as the ECTS, as an adequate mechanism for promoting student mobility. The credits can be awarded outside the higher education system, and within the lifelong learning, if they are recognized by the host institution.
- ✦ Facilitation of mobility includes removing obstacles to free movement, especially for: students, in access to higher education institutions and the connected services; teachers, researchers, and administrative staff, in recognition and valorization of periods spent in a European context researching, teaching, and training, without prejudicing their statutory rights.
- ✦ Promotion of European cooperation in quality assurance, aimed at assuring comparable standards and methodologies. Promoting the important European dimensions of higher education, especially in the development of curricula, interinstitutional cooperation, mobility programmes, and joint study, education and research programme. (AZVO)

According to AZVO, the largest number of candidates in the Republic of Croatia traditionally enrolled in studies in the fields of social sciences (economics, law, sociology, pedagogy, psychology, etc.). In addition, statistics from the Agency for Science and Higher Education are also supported. According to 2013/2014 year data, the number of enrolled students at public higher education institutions was as follows:

- ✦ technical sciences - 38786

- + biotechnical sciences - 9098
- + social sciences - 74000

In 2013./2014 academic year 42750 students were enrolled in studies in the field of economics, while at the same time 43825 students were enrolled in all studies in the field of technical sciences. There were only 7049 students enrolled in natural sciences field studies. This trend continued in the following academic years. Therefore, the Ministry of Science and Education of the Republic of Croatia has started to promote the professions in the STEM field, where STEM stands for Science, Technology, Engineering, and Mathematics.

College of Slavonski Brod also works on the popularization of its undergraduate (Plant Production and production Engineering) and graduate studies (Ecological Agriculture and Rural Development and Energetics) of the STEM area. College of Slavonski Brod endeavors to increase the number of enrolled students with numerous promotional activities, getting to know candidates with learning opportunities and by granting STEM scholarships.

In 2017/2018 College of Slavonski Brod awarded a total of 10 STEM scholarships (7 of them for the Plant Production students and 3 for the Production Engineering students). In 2018/2019 the number of STEM scholarships awarded increased and it was 22 (11 for the Plant Production students and 11 for the Production Engineering students). Besides that, in October 2018, College of Slavonski Brod started with the implementation of the STEM Eco & Energetics project in a partnership with College of Požega. The project is co-financed by the European Union from the European Social Fund.

The aim of the project is to increase the number of study programs and courses in English by strengthening the competences of students and staff of the College in Slavonski Brod and College in Požega, which will further enhance the quality, relevance, and efficiency of higher education and improve the degree of internationalization. (VUSB) Below are the data on the undergraduate and graduate STEM studies enrollments in College of Slavonski Brod from 2014/2015 to 2018./2019 academic years. The paper also shows demographic data, ie the counties where students come from, and the average grades of high school graduates.

3. UNDERGRADUATE STEM STUDIES

Since its foundation in 2006, the College of Slavonski Brod has organized and conducted undergraduate studies of Plant Production, orientation in Horticulture or Farming, and Production Engineering. Professional undergraduate study in Plant Production – Horticulture lasts for 6 semesters. Prior to graduation, a student is obliged to gain 180 ECTS. Upon completion of the professional undergraduate study in Plant Production with specialization in Horticulture, a student is awarded the qualification of Professional Bachelor - Engineer of Plant Production.

Students enrolled in the study program of Plant Production, orientation in Horticulture, gain knowledge in almost all branches of agricultural production, in particular, knowledge that is required for work with horticultural plants. The study program enables horticultural experts to independently manage technological processes in all segments of horticultural production. The study program is set up in form of lectures, exercises, seminars, and professional practice, as well as other forms of teaching, with the aim to enable graduates to apply technological and economic achievements in horticultural production in a creative way. Teaching content provides students with a level of knowledge needed for successful dealing with tasks related to horticulture and agriculture on small and large family farms.

Upon graduation, Professional Bachelor – Engineer of Plant Production is able to:

- ♦ distinguish the most important characteristics of fruit, vegetable, flower and vineyard cultures
- ♦ propose visual solutions for green areas
- ♦ identify the major biological, chemical, soil, environmental, ameliorative and technological factors in the production of plants
- ♦ propose appropriate protection of specific plant sorts
- ♦ independently coordinate less demanding technological processes in the field of plant production (fruit, vegetable, flower, viticulture, and landscaping)
- ♦ manage small agricultural farms
- ♦ recognize possibilities for continuing education and lifelong learning in order to be able to use modern technology, skills, and methods in plant production

In its structure and realization, the study program is comparable with similar programs organized in the European Union member states. Professional study program in Plant Production, orientation in Horticulture, is developed according to the model of professional studies offered worldwide (e.g. Greenmount College-Northern Ireland, Modesto Junior College-California, Harper Adams College-GB, etc.), with the intention to educate experts who would significantly contribute to the increase in vegetable, flower, fruit production, as well as in viticulture, and who would be able to independently create conceptual designs for landscape architecture.

The professional study program is carried out in CSB premises that are appropriately equipped for teaching. There are well-equipped laboratories, computer rooms, and practicums, as well as experimental plots with necessary machinery required for practical teaching. Subsistence and accommodation of students are provided in the Student Dormitory in Slavonski Brod. Professional undergraduate study in Plant Production – Farming lasts for 6 semesters. Prior to graduation, a student is obliged to gain 180 ECTS. Upon completion of the professional undergraduate study in Plant Production with orientation in Farming, a student is awarded the qualification of Professional Bachelor - Engineer of Plant Production.

Students enrolled in the study program of Plant Production, with orientation in Farming shall gain knowledge in almost all branches of agricultural production, in particular, knowledge needed for the production of arable crops. The study aims to educate experts in farming that would be able to independently manage technological processes in all areas of agricultural production. The study program is set up in form of lectures, exercises, seminars, and professional practice, as well as other forms of teaching. It enables graduates to apply technological and economic achievements in agricultural production in a creative way. Teaching content provides students with a level of knowledge needed for successful dealing with tasks related to farming on small and large family farms.

Upon graduation, Professional Bachelor – Engineer of Plant Production in the orientation of Farming will be able to:

- distinguish morphological characteristics of cereals, industrial and forage crops
- identify the major biological, chemical, soil, environmental, ameliorative and technological factors of plant growing

- ♦ explain agricultural measures in farming
- ♦ define measures for growth of certain cultures
- ♦ propose appropriate protection against pests on specific cultures
- ♦ manage independently less demanding production processes in the field of plant production (farming)
- ♦ manage small family farms that are involved in plant production
- ♦ recognize possibilities for continuing education and lifelong learning in order to be able to use modern technology, skills, and methods in plant production.

Professional undergraduate study in Production Engineering lasts for 6 semesters. Prior to graduation, a student is obliged to gain 180 ECTS. Upon completion of the professional undergraduate study in Production Engineering, a student is awarded the qualification of Professional Bachelor of Mechanical Engineering.

Upon completion of the professional study, students can enroll graduate studies offered at the Mechanical Engineering Faculty in Slavonki Brod if passing exams of the additional study year. Students enrolled in the study program of Production Engineering acquire knowledge in the field of mechanical engineering that is needed for work in production and service enterprises. The learning outcomes for the professional undergraduate study program in Production Engineering are listed below. Graduates from this study program will be able to:

1. define and solve various problems related to the basics of engineering and apply a simplified engineering judgment and creativity in defining assumptions and solution of an engineering problem. [Basics]
2. read and prepare technical and technological as well as other documentation related to realization of a production order. [Documentation]
3. constructor analyze simple heat and mechanical systems by applying knowledge in mechanics, thermal dynamics, science on materials, measuring and control and technology of materials processing with modern tools, computer visualization, and software for construction and analysis, by paying attention to their impact on environment. [Construction/Analysis]

4. plan and realize in a safe manner many laboratory experiments in order to get necessary engineering data. [Laboratory work]
5. apply, organize and perform procedures for maintenance of mechanical constructions, components and plants. [Maintenance]
6. work independently and in a team in order to solve more complex problems related to mechanical engineering. [Team work]
7. announce information related to work in the form of oral presentations or written reports, by using modern information tools and to understand texts related to profession written in a foreign language [Communication]
8. recognize the need for continuing education and lifelong learning in order to be able to apply modern techniques, skills and tools necessary in engineering practice. [Lifelong learning]
9. explain basic business principles, basic terms related to entrepreneurship, costs, meaning of a company in economy environment and key ethical issues that affect the profession. [Business skills]

Upon completion of the professional study, graduates can be employed as:

- + designers of products and components by using the CAD systems,
- + technologists dealing with the development of technological processes,
- + managers in production and logistics support in production,
- + heads of services for quality control and laboratory testing,
- + managers dealing with the maintenance of equipment and procurement of materials.

The study program is in line with the Bologna Process principles and the student performance is evaluated within the European Credit Transfer System (ECTS). Professional undergraduate study program in Production Engineering is carried out in modern laboratories and workshops for materials, technology, motor vehicles and information technology at the Mechanical Engineering Faculty in Slavonski Brod. Students are provided subsistence and accommodation in the Student Dormitory in Slavonski Brod.

Table 1: Undergraduate STEM study programs – the number of enrolled students in the 1st study year from 2014/2015 to 2018/2019

		Plant production, full-time students	Plant production, part-time students	Production engineering, full-time students	Production engineering, part-time students
2014/2015	entry quota	60	40	70	30
	number of enrolled	61	1	67	25
2015/2016	entry quota	60	40	70	30
	number of enrolled	61	3	70	29
2016/2017	entry quota	60	30	70	40
	number of enrolled	61	3	68	28
2017/2018	entry quota	60	30	70	40
	number of enrolled	33	5	77	19
2018/2019	entry quota	60	30	70	40
	number of enrolled	28	3	49	17

Source: Information system of College of Slavonki Brod

Table 1 data showed that the completion of undergraduate full-time studies of Plant Production and Production Engineering is very good in the period 2014/2015 by 2016/2017 unlike 2017/2018 and 2018/2019 when the number of enrolled decreases significantly. In that time the number of Plant production students halved. The data presented showed a significant decrease in interest in the Plant Production enrolment. There is almost no interest in the Plant Production part-time study enrolment, while in Production Engineering the situation is even better, although their number is declining.

Table 2: Secondary school average grades of students enrolled in the 1st year of undergraduate STEM study programs

	Plant Production, full-time students	Plant Production, part-time students	Production engineering, full-time students	Production engineering, part-time students
2014/ 2015	3,24	2,83	3,30	3,95
2015/ 2016	3,32	3,52	3,30	3,23
2016/ 2017	3,32	4,00	3,35	3,19
2017/ 2018	3,37	3,60	3,30	3,57
2018/ 2019	3,78	3,89	3,56	3,35

Source: author's calculation

Table 2 data showed that the majority of students enrolled in undergraduate studies had an average grade of overall high school success three (3). One of the goals of College of Slavonski Brod is to attract as many candidates as possible through a variety of activities with better overall success (very good or excellent). The continuation of the work graphically shows the demographic structure of students enrolled in the 1st year undergraduate studies in the period 2014/2015. until 2018./2019. Below the paper graphically shows the demographic structure of students enrolled in the 1st year of undergraduate studies from 2014/2015 to 2018./2019.

Figure 1: Demographic data of undergraduate STEM studies students enrolled in the 1st study year in 2014/2015

Source: author's calculation

Figure 4: Demographic data of undergraduate STEM studies students enrolled in the 1st study year in 2017/2018

Source: author's calculation

Figure 5: Demographic data of undergraduate STEM studies students enrolled in the 1st study year in 2018/2019

Source: author's calculation

Figures 1 - 5 show that undergraduate STEM studies students are mostly from Brodsko-posavska County and then from the surrounding counties in the

Slavonia region. This has its justification in the fact that these are agricultural counties and the nearness of Slavonski Brod to the place of residence of students also affects the selection of studies. Besides that, the living costs in Slavonski Brod are essentially lower than for example in Zagreb, Osijek, Rijeka or Split.

4. GRADUATE STEM STUDIES

The College of Slavonski Brod has also organized and conducted graduate STEM studies: Ecological Agriculture and Rural Development (biotechnical science) and Energetics (technical science). The first generation of students was enrolled in academic 2017/2018 year.

Graduate study of Ecological Agriculture and Rural Development is a continuation of undergraduate study (180 ECTS) and lasts for two years (120 ECTS), enabling vertical and horizontal student mobility. Professional title obtained by completion of the study: expert specialist engineer/expert specialist of ecological agriculture and rural development engineer. By completing the study students will be able to:

- explain the importance of ecological plant production and rural development,
- explain the specificities of ecological livestock breeding and animal feeding methods,
- apply a specific agrotechnic in ecological plant breeding,
- plan ecological plant production on a given surface,
- describe measures for the protection of plants in ecological production,
- differentiate ways of biological control of harmful organisms,
- make their own business plan on a farm,
- grow vegetable, fruit and farming crops and wine grape by ecological principles,
- choose the best plant species for ecological farming in a particularly rural area
- There are similar study programs in the Republic of Croatia:
 - Study of Agriculture on Križevci College of Agriculture,
 - Ecological agriculture and agrotourism on Faculty of Agriculture in Zagreb,

- Ecological agriculture on Faculty of Agrobiotechnical Sciences in Osijek.

Graduate study of Ecological Agriculture and Rural Development is comparable to the biotechnical sciences in the European Union. It has been developed by model on other similar studies such as: Harper Adams College in Great Britain, Latenstein University of Professional Education in Netherlands, Institute of technology for life, food and environmental sciences in France, Institut Polytechnique LaSalle Beauvais in France, HEI The Province of Liege - Higher Education Institution of the Province of Liege in Belgium, INP Toulouse - Institut National Polytechnique de Toulouse in France, Instituto Superior de Agronomia (The School of Agriculture) Lisbon in Portugal. (VUSB)

Graduate study of Energetics is a continuation of undergraduate study (180 ECTS) and lasts for two years (120 ECTS), enabling vertical and horizontal student mobility. Professional title obtained by completion of the study: expert specialist engineer/expert specialist of mechanical engineering. By completing the study students will be able to:

- describe and analyze the transformation of energy into thermal power plants for the production of electrical and thermal energy,
- calculate and explain the performance of gas turbines and combined steam-gas turbines.
- explain and discuss the impact on the environment of energy systems,
- calculate the main dimensions of the steam generator pressure parts,
- explain the structure, properties and application of some technical materials in energy,
- explain basic measurement methods for measuring current, voltage, power, working and reactive energy, quality of electricity, flow and liquid level, temperature, pressure, humidity, and heat energy,
- apply the knowledge gained to make heat exchanger calculations,
- choose a suitable electric motor for starting an industrial electric motor,
- describe technical solutions, equipment, and devices in the immediate application of drying of hygroscopic materials and products,
- describe the characteristics, to select the type and to implement the calculation of the thermal insulation of pipelines, tanks, and equipment,
- explore the possibilities and choose an adequate hydraulic machine for a given situation,

- ♦ describe the procedures and technologies for the construction of gas pipelines and gas installations,
- ♦ describe processes and devices in cooling technology,
- ♦ participate individually and/or in the team in the selection of equipment and to create individual segments of technical heating solutions,
- ♦ participate in energy inspection of buildings and energy inspection of large companies.

In the Republic of Croatia, a related study program is conducted by the Faculty of Engineering in Rijeka, the Faculty of Mechanical Engineering in SlavonSKI Brod and the Faculty of Mechanical Engineering and Naval Architecture in Zagreb. Graduate study of Energetics is comparable to the technical sciences in the European Union conducted by Faculty of power and aeronautical engineering in Warsaw, c in Brno, Faculty of Mechanical Engineering in Ostrava, Faculty of Mechanical Engineering in Bratislava, Faculty of Mechanical Engineering in Prague, Budapest University of Technology and Economics - Department of Energy Engineering, Faculty of Energy Engineering and Industrial Management in Oradea (Hungary), Faculty of Mechanical Engineering in Belgrade, Faculty of Technical Sciences in Novi Sad (Serbia), Faculty of Mechanical Engineering in Tuzla (Bosnia and Herzegovina), The University of Montenegro - Faculty of Mechanical Engineering, Guru Gobind Singh Indraprastha University Dwarka in Delhi, Visvesvaraya Technological University in Belgaum and others. (VUSB)

Table 3. shows the number of enrolled students for academic 2017/2018 and 2018/2019 year.

Table 3: Graduate STEM study programs – the number of enrolled students in the 1st study year from 2017/2018 to 2018/2019

		Ecological Agriculture and Rural Development		Energetics	
		Full-time students	Part-time students	Full-time students	Part-time students
2017/2018	entry quota	30	is not performed	30	20
	number of enrolled	30		18	11
2018/2019	entry quota	30	10	30	20
	number of enrolled	13	4	16	23

Source: Information system of College of SlavonSKI Brod

In 2017/2018 the entry quota for the full-time study of Ecological Agriculture and Rural Development was 100% full. The situation is worse when it comes to the study of Energetics where full-time study coverage was 60% and part-time 55%. In 2018/2019 the interest in Ecological Agriculture and Rural Development decreased considerably and the coverage was 43% on full-time studies and 40% on part-time studies. The full-time study of Energetics had a somewhat poorer rate than in the previous year (53%), while 3 students were enrolled in the part-time study more than the enrollment quota (115%). The interest in the part-time study of Energetics has increased with candidates who are already employed so their further education is necessary for the job needs. Besides that, to students who attend the subject of Energy audits, The College of Slavonski Brod, as the authorized training provider for the training of persons conducting energy certification and energy audits of buildings, issues a certificate of successful completion for the Training Program for Professional Training and Compulsory Improvement of Persons Performing Energy Inspections of Buildings and Energy Certification of MODULE 1 and MODULE 2 Buildings.

Graduate studies are for the most part enrolled by students who have also completed undergraduate studies at the College of Slavonski Brod. In 2017/2018 it was enrolled as followed:

- 82% of those enrolled in the part-time study of Energetics previously studied at the College of Slavonski Brod,
- 94% of those enrolled in the full-time study of Energetics previously studied at the College of Slavonski Brod and
- 90% of enrolled in the full-time study of Ecological Agriculture and Rural Development previously studied at the College of Slavonski Brod.
- In 2018/2019 it was enrolled as followed:
- 65% of those enrolled in the part-time study of Energetics previously studied at the College of Slavonski Brod,
- 88% of those enrolled in the full-time study of Energetics previously studied at the College of Slavonski Brod,
- 100% of enrolled in the full-time study of Ecological Agriculture and Rural Development previously studied at the College of Slavonski Brod and
- 25% of enrolled in the part-time study of Ecological Agriculture and Rural Development previously studied at the College of Slavonski Brod.

4. CONCLUSION

The data stated in the paper confirmed the fact that a small number of students in the Republic of Croatia enroll the STEM studies. The situation is similar to the enrollment of students at the College of Slavonski Brod. These are studies that are characterized as “heavy studies” in the younger population, so it is probably one of the reasons for less interest. We can often hear in the public that in Croatian primary and secondary education there are a lot of students who pass the class with great success but the awarded ratings are not a reflection of real knowledge. Such candidates are not sufficiently prepared to continue studying which means that changes in the education system must start from primary school. In the last months, the public has been exposed to fake diplomas, which is very devastating and creates an ugly picture of the system of higher education in the Republic of Croatia. This certainly does not contribute to the efforts to increase the number of highly educated people necessary for the good development and progress of Croatia.

According to the Shanghai Ranking for 2017 the University of Zagreb is between 500 and 600 (out of 1000). First place is Harvard University (for the 15th times), while Stanford University is second. The third place belongs to Cambridge University, the fourth to Massachusetts Institute of Technology (MIT), and the Fifth is the University of California, Berkeley. The Shanghai Ranking is the most famous ranking of world universities based on the indicators of scientific and research work.” (AZVO) It is unrealistic to expect that Croatian higher education institutions will achieve a jump on the Shanghai Ranking for example 300 places. This does not mean that education doesn't need more devotion and enormous efforts.

Getting a college diploma must mean that it preceded the work, effort, and cooperation of students, professors and all stakeholders in the education system. The higher education system in the Republic of Croatia should encourage young people to study in the STEM area. The completion of some of the STEM study makes it easier to find employment, as opposed to, for example, studies in the field of social sciences. Completed students of the College in Slavonski Brod, especially the students of Production Engineering, are easily employed in companies such as Đuro Đaković Group or other companies in the Republic of Croatia and/or abroad. Further, jobs for which completion is required to complete the STEM study are regularly better paid. To increase the high education

population, especially the number of students in the STEM area, it is necessary to create a favorable working and investment climate in Croatia, adequate jobs, to provide adequate income, which requires time, effort and high-quality cooperation between the Ministry of Science and Education, economy, local governments and other stakeholders involved in the education process.

Zusammenfassung

Die gegenwärtige Situation und immer stärkere Globalisierung verlangen von dem Fachfremdsprachenunterricht eine ernste Erhöhung von Leistungen der Studenten, für die dieses Gebiet nicht mehr nur einen Teil ihrer Allgemeinbildung, sondern die notwendige Voraussetzung für ihre Beteiligung an der zeitgenössischen Gesellschaft, Arbeitswelt und internationaler Zusammenarbeit darstellt. Deswegen sucht die Fremdsprachenmethodik nach Möglichkeiten, neue Modelle zu kreieren, die zu der angestrebten Leistungserhöhung führen würden. In dieser Arbeit wurde die Methode der theoretischen Analyse verwendet um neue Trends in der Didaktik und Fremdsprachenmethodik wahrzunehmen. Dabei wurde nach Möglichkeiten für ihre Implementierung in die Fachfremdsprachenmethodik gesucht, die eine bedeutende Erhöhung der Fachfremdsprachenkenntnisse, mit denen die Studenten ihre Ausbildung auf der

Tertiärstufe beenden, ermöglichen würde. Besonders fokussiert wurde dabei der Einfluss des Kennens von Persönlichkeitsmerkmalen und metakognitiven Lernstrategien von Studenten, weil es in der Forschung festgestellt wurde, dass die Persönlichkeitsmerkmale die Verwendung von metakognitiven Strategien und Leistungsniveau beim Fremdsprachenlernen stark beeinflussen, so dass man davon ausging, dass sie den Ansatz für das Konstruieren des Fremdsprachenunterrichtsmodells, das den gestellten Anforderungen entsprechen würde, darstellen könnten.

Schlüsselwörter: *Fachfremdsprache, Persönlichkeitsmerkmale, metakognitive Lernstrategien.*

JEL Classification: I23, I29

1. EINLEITUNG

Zeitgenössisches Leben impliziert das Funktionieren innerhalb einer großen Gemeinschaft globaler Größe, für welches es notwendig ist, die Kommunikationsmittel zu beherrschen. Von der Vielfalt der Sprachen, die auf der Welt gesprochen werden, ausgehend, ist es klar, dass, diese Situation den Prozess des Fremdsprachenlernens in den Fokus stellt. Dabei wurde das erwartete Niveau der Fremdsprachenkompetenz in den letzten Jahren drastisch erhöht. Heute sind wir weit von der Zeit entfernt, als es genügte die Fremdsprache einigermaßen zu beherrschen, und für den präziseren Gebrauch, sich an einen Übersetzer zu wenden, oder als man die Fremdsprachen bis zu dem Grad beherrscht hat, dass man mithilfe eines Wörterbuches übersetzen konnte. Heute wird von allen, und besonders von akademisch gebildeten Mitarbeitern erwartet, die Fremdsprache komplet zu beherrschen, um sie ohne Schwierigkeiten zu verwenden. Solche Ansprüche und Erwartungen geben der Fremdsprachenmethodik die große Aufgabe auf, das alles zu realisieren, besonders wenn man die begrenzte Zeit bedenkt, die ihr zur Verfügung gestellt wird, bei den Schülern und Studenten, dessen Studiefach nicht im direkten Zusammenhang mit der Fremdsprache steht.

Diese Situation wurde in einem breiteren Kontext bemerkt, und ging auch in Gedanken und Pläne von Regierungskörpern hinein, wie, zum Beispiel, in die Sprachenpolitik der EU, deren Raat das Konzept *Plurale Ansätze zu Sprachen und Kulturen* verfasst und dann den *Referenzrahmen für plurale Ansätze zu Sprachen und Kulturen* (https://archive.ecml.at/mtp2/publications/C4_RePA_090724_IDT.pdf) oder *From linguistic diversity to plurilingual edu-*

cation: Guide for the Development of Language Education Policies in Europe. Strasbourg. Council of Europe. Language policy division. 2007. (http://www.coe.int/t/dg4/linguistic/Guide_niveau2_EN.asp) veröffentlicht hat, worin die Mehrsprachigkeit des Menschen propagiert wird. Daraus kann deutlich gesehen werden, dass die Sprachenpolitik eine von zentralen Fragen des Raums, in dem wir leben, geworden ist, was zu den Versuchen geführt hat, über das Fremdsprachenlernen in unterschiedlichen Richtungen nachzudenken und die Maßnahmen vorzuschlagen, die es verbessern würden.

Dadurch fiel eine große Last und Verantwortung der Fremdsprachenmethodik zu, in der zahlreiche Versuche gemacht werden, den Prozess selbst, aber auch seine Ergebnisse zu verbessern. Da sich das, was oben erwähnt wurde, zwar nicht nur, aber doch im größten Maße, an die akademisch gebildete Population bezieht, ging man in dieser Ausführung von den fremdsprachlichen Leistungen der an nicht-philologischen Studiengängen studierender Studenten aus, die in zahlreichen Untersuchungen als unzureichend bewertet wurden, und suchte nach Möglichkeiten sie zu verbessern.

2. METAKOGNITIVE STRATEGIEN FÜR LERNLEISTUNGEN AUF DEM GEBIET VON FREMDSPRACHEN

In der modernen Psychologie wird viel Aufmerksamkeit den Persönlichkeitseigenschaften gewidmet, die in großem Maße den Lernprozess und die Lernleistungen allgemein, also folglich auch auf dem Gebiet des Fremdsprachenlernens beeinflussen können. Deswegen ist es sehr wichtig immer daran zu denken, dass beim Fremdsprachenlehren und -lernen nötig ist, möglichst viele unterschiedliche Ansätze und Methoden zu verwenden. Besonders wichtig ist das vor allem bei der Arbeit mit und in Gruppen, was auf den institutionellen Unterricht (Schul- oder Hochschulunterricht) zutrifft, zumal sich dort in derselben Gruppe Schüler oder Studenten mit sehr unterschiedlichen Eigenschaften und Lernstilen befinden können, die nur eine Methode nie zufriedenstellen kann.

Daneben wird in der modernen Psychologie und Pädagogik die Bedeutung von Metakognition hervorgehoben. Es wird auch das Bedürfnis der Entwicklung von metakognitiven Strategien betont, die beim Lernprozess verwendet werden, und seine Ergebnisse bedeutend beeinflussen. Auf dem Gebiet des

Fremdsprachenlernens wurde die Bedeutung von Metakognition in mehreren Studien festgestellt (Anderson, 2012; Flavell, 1976, 1979; Schraw, 1998; Wenden, 1998, 1999; Zhang & Goh, 2006) und wird in der modernen Fremdsprachenmethodik als wesentliches Element des erfolgreichen Lernens gesehen, weil sie den Lernenden ermöglicht, selbständig an der Verbesserung ihrer Leistungen zu arbeiten, indem sie eigene Schwächen entdecken, und sie zu überwinden, oder „zu umgehen“ versuchen, durch das Verwenden dessen, was sie als das Gegenteil, also ihre Stärken, erkennen. Es ist, also, klar, dass beim Fremdsprachenlernen und -lernen an der Entwicklung des erwähnten metakognitiven Bewusstseins gearbeitet werden muss, weil es ermöglicht, das eigene Lernen zu planen, ordnen und verfolgen, und somit die sprachliche Performanz zu verbessern (Schraw & Dennison, 1994).

Die Psychologen definieren die Persönlichkeitseigenschaften als stabile und konstante Charakteristiken der Individuen und ihres Handelns in unterschiedlichen Situationen (Dörnyei, 2005; Kayaoglu, 2013; Komarraju & Karau, 2005; Komarraju et al., 2009; Nofle & Robins, 2007; Pervin et al., 2005; Pervin & John, 2001). Sie stellen das einzigartige und wesentlich unveränderbare Schema von Eigenschaften, Temperament und Veranlagungen unterschiedlicher Individuen dar. In der modernen Psychologie wird über den Modell von fünf großen Persönlichkeitseigenschaften gesprochen, worunter man Extraversion, Offenheit für Erfahrungen (Intellekt), Neurotizismus, Gewissenhaftigkeit, die Charakteristiken, wie Organisationsfähigkeit, Kompetenz, Eifer, Unternehmungslust, Sorgfalt, Selbstdisziplin und Zuverlässigkeit einbezogen (Costa & McCrae, 1992; Goldberg, 1993), und Verträglichkeit versteht, die mit verschiedenen Formen des menschlichen Benehmens verbunden sind, und auch sprachliche Leistungen und Motivation (Komarraju et al., 2009), Ausführungen und Sprachleistungen (McCrae & Costa, 2003), akademische Leistungen (Chamorro-Premuzic & Furnham, 2003; Komarraju & Karau, 2005; Komarraju et al., 2009; Martin et al., 2006), Redepersistenz und Kommunikationswillen (MacIntyre & Charos, 1996; MacIntyre et al., 1998; Öz, 2014; Pavičić-Takač & Požega, 2011), die Angst vor dem Sprachenlernen (Dewaele & Al-Saraj, 2015; Payne et al., 2007), akademische Leistung und Lernstil (Komarraju et al., 2011), sowie Einstellungen gegenüber dem Fremdsprachenlernen (Pourfeiz, 2015) einbeziehen. In einigen Studien (Farsides & Woodfield, 2003; Chamorro-Premuzic & Furnham, 2003) wurde zwischen der Gewissenhaftigkeit und der Prüfungsperformanz eine positive, und zwischen Gewissenhaftigkeit und der akademischen Leistung eine negative Korrelation festgestellt.

Die Untersuchungen auf dem Gebiet des Fremdsprachenlernens (Dörnyei, 2005; Farsides & Woodfield, 2003; MacIntyre & Charos, 1996; Dewaele, 2007; Dewaele & Al-Saraj, 2015; Öz, 2014; Pavičić-Takač & Požega, 2011; Zhang et al., 2013) haben festgestellt, dass die Persönlichkeitseigenschaften auch auf diesem Gebiet sehr wichtig sind, wobei Ekstraversion und Introversion besonders hervorstechen. Eine Umfassende Untersuchung (Öz 2014), die sich mit der Verbindung von dem Kommunikationswillen und den fünf großen Persönlichkeitseigenschaften beschäftigte, hat gezeigt, dass die Kooperationsbereitschaft, Extraversion und Offenheit für Erfahrungen starke Prädiktoren der Bereitschaft in der Fremdsprache zu kommunizieren darstellen. Manche Untersuchungen (Kang 2012 nach Öz), die sich mit der Beziehung zwischen Sprachlernstrategien und Persönlichkeitseigenschaften beschäftigt haben, haben eine starke Verbindung zwischen Persönlichkeitseigenschaften des Lernenden und den sechs strategischen Gruppen in SILL (Strategy Inventory for Language Learning) (Oxford, 1900) gezeigt. Offenheit für Erfahrungen (Intellekt), Gewissenhaftigkeit und Extraversion haben eine starke positive Korrelation mit den meisten Lernstrategien gezeigt, sodass es festgestellt wurde, dass der Intellekt und die Gewissenhaftigkeit die wichtigsten Prädiktoren der Lernstrategienanwendung sind. Gleichzeitig zeigte sich negative Korrelation zwischen Neurotizismus und metakognitiven Strategien. Zu ähnlichen Ergebnissen sind auch andere Untersuchungen (Ayhan & Türkyilmaz, 2015; Dewaele, 2007) gekommen.

Da die Persönlichkeitseigenschaften stabil sind, sodass sich dieselbe Person wahrscheinlich immer ähnlich benehmen wird, ist es wichtig sie zu erkennen, um das Benehmen und die Einstellungen von Menschen zu verstehen. Das oben erwähnte ist sehr wichtig, zumal die Ergebnisse in der Forschung auf eine enge Beziehung zwischen dem Entwicklungsniveau der Person und der Metakognition, dem Mechanismus, der bessere Selbsterkenntnis, Selbstwahrnehmung und Selbstregulation der Person fördert, hinweisen.

Metakognition wird als „Denken über Denken“ oder „Kognition über Kognition“ (Anderson, 2012) definiert. Darunter versteht man die Fähigkeit des Verstehens, Denkens und Kontrollierens des eigenen Lernens, sodass ihr die zentrale Rolle beim Entwickeln von Lernfertigkeiten zukommt, weil sich das metakognitive Bewusstsein auf die Entwicklung von kognitiven Fertigkeiten richtet (Gojkov, 2009). Man glaubt, dass es zwei Hauptkomponenten von Metakognition gibt: das Wissen von der Kognition und die Kognitionsregulation. Metakognitives Wissen wird als das Wissen des Individuums über die eige-

ne Kognition oder über die Kognition allgemein (Pintrich, 2002; Schraw & Moshman, 1995; Schraw, 1998) definiert. Metakognitives Wissen bezieht drei Elemente ein: das Bedingungswissen, das sich mit dem Bewusstsein von adequate Bedingungen um metakognitive Fertigkeiten anzuwenden, beschäftigt, deklaratives Wissen oder angeeignetes Wissen von unseren kognitiven Prozessen und Lernstrategien in der Lehraktivität (Anderson, 2012).

Metakognitive Regulation umfasst eine Reihe von Unterprozeduren, die den Schülern helfen, ihre Lernprozesse anzupassen und zu beobachten und kontrollieren (Öz, 2014b, 2015a; Schraw et al., 2006). Die Kognition wird auch von dem Planen, der Fertigkeit der Informationshandhabung, der Beobachtung, der Fertigkeit des Fehlerbeseitigens und der Evaluation reguliert (Schraw, 1998).

Metakognitive Strategien (Oxford, 1990), wie das Identifizieren des Lieblingslernstils und der Bedürfnisse, das Planen von Aufgaben für das Fremdsprachenlernen, das Sammeln und Organisieren des Materials, das Einrichten des Lernplatzes und –plans, die Fehlerkontrolle, die Bewertung des Erfolgs beim Aufgabenlösen und in irgendeinem Typ der Lernstrategie stellen ihre direkte Anwendung bei der Realisation des ganzen Lernprozesses dar.

Nach einigen Arbeiten Oxfords (1990), beziehen metakognitive Strategien für das Fremdsprachenlernen drei Hauptdomänen: das Lernfokussieren, Lernplanen und – einrichten und die Evaluierung ein. Das Lernfokussieren bezieht sich auf das bestimmen des eigenen Lieblingslernstils und der Lernbedürfnisse, sowie auf das Bewusstsein über die Prozedur des Sprachenlernens und des Aufgabenmachens. Lernplanen und – einrichten beziehen sich auf das Sammeln und Ordnen von Material, Raum- und Planeinrichten, sowie auf die Zielstellung und das Auswählen von angemessenen Strategien für ihr Erreichen. Die Evaluierung bezieht sich auf das Beobachten und Kontrolle von Fehlern und die Bewertung des Erfolges beim Aufgabenlösen, sowie auf das Bewerten von Lernleistungen, Zielen und Strategien, die beim Lernprozess verwendet wurden (Öz, 2015). Zahlreiche Untersuchungen (Anderson, 2002, 2012; Hart & Memnun, 2015; Hashempour et al., 2015; Iwai, 2016; Memnun & Akkaya, 2009; Mokhtari & Reichard, 2004; Negretti & Kuteeva, 2011; Öz, 2015a; Schraw, 1998; Schraw & Dennison, 1994; Wenden, 1998, 1999) haben gezeigt, dass die Lernenden, die erfolgreich und metakognitiv bewusst die Sprache lernen, mehrere Lernstrategien verwenden im Vergleich zu denen, die es nicht bewusst machen. Metakognitives Bewusstsein befindet sich im Forschungsfokus

in fast allen Bildungsbereichen, so auch auf dem Gebiet des Sprachenlernens (Hart & Memnun, 2015; Iwai, 2016).

Einige Untersuchungen (Sun, 2013) waren den Studenten und der Häufigkeit ihres Verwendens von metakognitiven Strategien beim Englischlernen gewidmet. Die Ergebnisse haben eine wichtige Beziehung zwischen dem erreichten Leistungsniveau in der englischen Sprache und der Häufigkeit des Verwendens von metakognitiven Strategien gezeigt. Einige andere Studien (Öz, 2005, 2007, 2015a), die mit der Absicht, die Natur des metakognitiven Bewusstseins von Studenten und Englischlehrern zu erforschen, durchgeführt wurden, haben gezeigt, dass die meisten Teilnehmer ein sehr hohes Niveau des metakognitiven Bewusstseins aufzeigen. Das Bewusstsein und die Kognitionsregulation haben sogar eine signifikante Verbindung gezeigt, was die weit diskutierte Ansicht über die Nützlichkeit des kognitiven Wissens für die Kognitionsregulation hervorgehoben hat (Schraw, 1998). Es wurde bemerkt, dass akademische Leistungen in einer positiven Verbindung mit metakognitivem Wissen von Teilnehmern stehen. Der Schultyp und das Geschlecht haben, dagegen, keinen Einfluß auf das metakognitive Bewusstsein von Teilnehmern gezeigt.

Einige Autoren (Purpura, 1999) haben bei ihren Untersuchungen an Studenten beim Fremdsprachenlernen bemerkt, dass metakognitive Strategien direkten Einfluss auf die Anwendung von kognitiven Strategien hatten. Sie haben entdeckt, dass metakognitive Strategien die Anwendung von kognitiven Strategien beim Aufgabenlösen kontrollieren. Studien, die das Fremdsprachenlernen in Südafrika und der Türkei (Dreyer & Oxford, 1996) untersucht haben, haben entdeckt, dass metakognitive Strategien oft überzeugende Prädiktore für hohe Leistungen beim Fremdsprachenlernen darstellen.

3. ANWENDUNG VON METAKOGNITIVEN STRATEGIEN IN DER FACHFREMDSPRACHEN DIDAKTIK

Das, was moderne Psychologie festgestellt hat, diskutierend, wurde in der Didaktik die Frage gestellt, wie diese Entdeckungen im Unterricht verwendet werden könnten, um den Lernenden zu helfen, ihr Lernen zu verbessern und bessere Leistungen zu erreichen. Die Artikel von Didaktikern haben gezeigt, dass es von den Bemühungen der Lehrer, den Lernenden zu helfen, ihre neu

gelernte selbstregulierende Strategien auf das Niveau der automatischen Kontrolle zu übertragen, abhängt, ob die Intervention oder das Training erfolgreich wird (Boekaerts, Cascallar, 2006). Auf diesem Gebiet wurde in den letzten Jahren viel geforscht, wobei man auch versucht hat, didaktische Instruktionen, die Meta-Äußerungen effizient provozieren, festzustellen. In einer von diesen Untersuchungen (Gojkov, 2009) wurden in der Faktorenanalyse als effizient zehn Faktoren ausgesondert, dessen Inhalte unter folgende Namen gruppiert wurden: Klassifizieren, Informationskontrolle, Fehleranalyse, Fördern von Verwendung flexibler Ansätze, Erklärungsformulation, Zurückkommen an gegebene Informationen, Analyse von wichtigen Momenten, Schätzung von Möglichkeiten zum Ziel zu kommen, Überblick über frühere Strategien und Modelle und zusätzliches Nachdenken über Beziehungen und Situation.

All das bedenkend, stellt sich für die Fremdsprachenmethodik, als Fachdidaktik, die Frage, wie man in ihr das Wissen über Metakognition implementieren kann, und wie sie verwendet sein könnte, um den Unterricht zu verbessern, und den Schülern zu helfen, nicht nur ihre momentane Leistungen zu verbessern, sondern ihnen auch Wege für die Zukunft zu öffnen, beziehungsweise sie für effektives selbständiges weiteres Lernen auszurüsten. Das ist besonders für den hochschulischen Fremdsprachenunterricht wichtig, weil es sich hier für die meisten Studenten um die Endstufe von formaler Ausbildung handelt. Moderne Umstände und Charakteristika der Zeit, in der wir leben, die das lebenslange Lernen kennzeichnet, bedenkend, bedeutet das, dass die Studenten für das weitere selbständige Lernen auf diesem Gebiet gut ausgerüstet werden müssen.

Nach einigen Autoren (McCormick, 2006; Yang, Ling, Wang, 2007) gibt es metakognitive Fragen, die im Lernprozess verwendet werden können, um den Lernenden zu helfen. Man ist der Meinung, dass man die Realisation des Aktionsplans und Lernfortschrittüberwachung mithilfe folgender metakognitiver Fragen unterstützen kann:

- Wie geht mein Aufgabenlösen/Lernen von Inhalten voran?
- Bin ich auf dem richtigen Weg?
- Wie soll ich weitermachen?
- Habe ich den Lehrer/die Lehrerin in Beziehung auf das Ziel dieser Arbeit richtig verstanden? Soll ich den Lehrer/die Lehrerin bitten, mir das näher zu erklären, oder werde ich auf meine Weise weitermachen?

- ♦ Soll ich mich an den Lernplan halten, oder wäre es besser, ihn zu revidieren?
- ♦ Brauche ich zusätzliche Informationen?
- ♦ Was soll ich machen, wenn ich etwas nicht verstehe?
- ♦ Wie vieles ist mir noch unklar?
- ♦ Sollte ich lieber die Richtung ändern?
- ♦ Habe ich genug Zeit?

Kennen der Wichtigkeit von Metakognition, bringt dem Lehrer die Pflicht an ihrem Wecken und Entwickeln zu arbeiten als natürliche Reaktion. Obwohl man im Hochschulunterricht mit der Population arbeitet, für die man erwartet, dass die Metakognition schon entwickelt ist, weil es sich um fast Erwachsene handelt, die durch unterschiedliche Prüfungen ihre höhere Intelligenz schon gezeigt haben, für die in der Forschung eine enge Verbindung mit der Metakognition festgestellt wurde (Stojaković, 1998, 2009), haben weitere Untersuchungen gezeigt, dass das nicht unbedingt der Fall sein muss, so dass es umso wichtiger ist auf dieser Bildungsstufe ihr Aufmerksamkeit zu widmen.

4. METHODISCHER RAHMEN

In dieser Arbeit ging man von der Annahme aus, dass, das Stellen von entsprechenden Fragen im Fremdsprachenunterricht die Entwicklung von Metakognition fördern wird, die dann auch auf weitere Gebiete des Fremdsprachenlernens übertragen werden wird, und die Studenten für weitere, erfolgreiche Fortbildung auf diesem Gebiet ausrüsten wird, die auch ohne Führung und Hilfe eines Lehrers erfolgen kann. In dem Sinne wurden bei der Vorbereitung auf den Fachfremdsprachenunterricht (Deutsch und Englisch) passende Fragen und didaktische Instruktionen konzipiert, mit der Absicht die Entwicklung von Metakognition bei Studenten zu provozieren. Diese Fragen wurden bei der Realisation einer kleinen explorativen Untersuchung des qualitativen Ansatzes mit der Gelegenheitsprobe von 120 Studenten des ersten (30) und zweiten (25) Studienjahrs der Pädagogischen Fakultät der Belgrader Universität (Lehrabteilung in Vršac) und der Pädagogischen Fachhochschule „Mihailo Palov“ in Vršac (65) verwendet. Der Wahl des Studiums (zukünftige Lehrer und Erzieher) entsprechend, überwiegte in der Probe weibliche Population (100), und männliche war viel weniger (20) vertreten. Von der erwähnten Idee ausgehend, dass man

mit Verwendung von adequaten Fragen und Instruktionen die Entstehung und Entwicklung von Metakognition provozieren kann, die nicht nur den Erwerb von Wissen aus diesem Gebiet im Unterricht erleichtern wird, sondern auch die Studenten für weiteren erfolgreichen, selbständigen Fortschritt auf diesem Gebiet auch nach der formalen Bildung befähigt, wurden im Unterricht durch systematisches, nicht-experimentelles Beobachten Daten gesammelt, darüber, wie solche Fragen auf die Studenten und ihre Arbeit wirken. Als Instrumente wurden Observationslisten - Metakognition im Fremdsprachenlernen (Anlage 1) und Selbstbeobachtungsprotokoll – Metakognition im Fremdsprachenlernen (Anlage 2) verwendet, die, auf allgemein akzeptierten Elementen für das Definieren von diesem Konstrukt basierend, für diese Untersuchung konstruiert wurden. In die Observationslisten haben die Professoren die Fragen und die Reaktionen von Studenten evidenziiert, und der Selbstbeobachtungsprotokoll diente den Studenten, eigene Gedanken wahrzunehmen und zu notieren. Die erhaltenen Daten wurden danach in Diskussionen mit Studenten ausgewertet und es wurde erwogen was und in welchem Maße solche Fragen in ihnen provozieren.

5. BEFUNDE UND DISKUSSION

Obwohl viele Studenten schon alle notwendigen grammatischen Elemente beherrschen, so dass sie mit Leichtigkeit das Repertoire von ihren Sprachfertigkeiten durch Elemente, die direkt mit ihrem Studiumfach verbunden sind, weiter ergänzen, zeigt die konkrete Arbeit im Unterricht, dass das nicht bei allen Studenten der Fall ist. Das trifft besonders auf Deutsch zu, das heutzutage in Serbien, wie Französisch, Russisch und alle anderen Fremdsprachen auch, neben dem Englischen, das von der ersten Klasse der Grundschule Pflicht ist, als zweite Fremdsprache in den höheren Klassen der Grundschule und im Gymnasium gewählt und gelernt wird. Das bedeutet, dass es vor dem Studium insgesamt acht Jahre gelernt werden kann. Aber, da in Serbien nicht nur Abiturienten das Studium antreten können, ist das oft nicht der Fall. So befinden sich in den Gruppen, neben Studenten die es seit acht Jahren lernen, auch solche, die es nur vier Jahren, entweder in der Grundschule, oder in einer Fachmittelschule gelernt haben. Eines von den schwierigeren Elementen, die sowohl im Deutschen, als auch im Englischen als Fachsprache öfter vorkommen, stellt das Passiv dar, das, besonders als Vorgangspassiv im Serbischen fast gar nicht

vorkommt, und dadurch für unsere Lerner eine besondere Herausforderung darstellt. Die erwähnten Besonderheiten dieses Sprachelements bedenkend, wurde es erwählt, um dessen Lernerfolg durch Fragen zu fördern, von denen man erwartet, dass sie das Erscheinen und die Anwendung von Metakognition unterstützen und provozieren.

In dem Sinne wurden Fragen konzipiert und gestellt, für die angenommen wurde, dass sie die Studenten dazu bringen würden, über neue Strategien nachzudenken, und dadurch ihre Metakognition weiter zu entwickeln. Die schon früher erwähnte Entdeckung, dass diese Schritte auch unterbewusst geschehen können, bedenkend, scheint es nützlich zu sein, die Studenten zu „trainieren“, in der Richtung, in der sie beim Kontakt mit den Sätzen, in denen diese grammatische Konstruktion vorkommt, nachdenken sollten. Zu diesem Zweck wurden bei der klassischen Aktiv in Passiv Transformation, die meistens den ersten Schritt beim Passiv-Üben darstellt, folgende Fragen gestellt:

- ♦ Was bedeutet dieser Satz?
- ♦ In welchem Tempus steht dieser Satz?
- ♦ Wer/Was ist in diesem Satz Subjekt?
- ♦ Gibt es in diesem Satz ein Objekt?
- ♦ Wer/Was ist in diesem Satz das Objekt?
- ♦ In welchem Kasus steht das Objekt in diesem Satz?
- ♦ Wer ist die handelnde Person/Agens in diesem Satz?
- ♦ An wem/Woran wird die Handlung in diesem Satz ausgeübt?
- ♦ Was braucht man, um diesen Satz ins Passiv zu transformieren?
- ♦ Wer/Was wird im Passivsatz Subjekt sein?
- ♦ In welchem Kasus wird es stehen?
- ♦ Was wird im Passivsatz mit dem Agens (der handelnden Person) geschehen?
- ♦ In welcher Form wird es stehen?

Am Anfang wurden die Studenten gefragt, welche Fragen man sich stellen sollte, wenn man einen Satz aus dem Aktiv ins Passiv transformieren will. Danach wurde zusammen die erwählte Liste zusammengefasst. Solche Fragen sollte man den Studenten stellen, solange es nötig ist. In dieser Forschung hat es sich gezeigt, dass sie bald von selbst anfangen, alle Elemente anzugeben, die

Antworten auf erwähnte Fragen darstellen würden, falls man sie fragen würde. Das könnte als eine Art Manifestation von metakognitiven Prozessen, die bei ihnen entweder auf der bewussten, oder auf der unbewussten Ebene geschehen, betrachtet werden, was in späteren Diskussionen von den Studenten auch bestätigt wurde. Das erwähnte Bedürfnis nach lebenslangem Lernen bedenkend, sollte man den Studenten die Mechanismen erklären, und sie daran erinnern, was in ihren Köpfen vor sich geht. Sie sollten, also, hingewiesen werden, mehr Aufmerksamkeit diesen Prozessen zu widmen, um über sie einmal Kontrolle zu übernehmen, und ihr Lernen und Denken selbständig zu steuern.

Im weiteren Schritt des Passiv Lernens kommt das Bedürfnis vor, das Umgekehrte zu machen, bzw. die Passivsätze in Aktivsätze zu transformieren. Obwohl das als leichter als die erste Transformation scheint, weil es das Zurückkehren „auf dem schon gegangenem Wege“ bedeutet, zeigt die Praxis, dass das nicht der Fall ist. Solche Aufgaben verursachen bei einigen Studenten, die die Aktiv-Passiv-Transformation schon beherrschen, eine Art Ratlosigkeit und Verwirrung, die dann viel Üben benötigen um überwunden zu werden. Deswegen ist auch hier sehr wichtig die Studenten zu leiten und in der Richtung von Metakognition hinzuweisen, damit sie später selbst die Kontrolle über eigenen Lernprozess übernehmen. Hier wurde dasselbe Prinzip angewandt. Es wurden zuerst zusammen mit den Studenten Schritte festgelegt, die man bei der Transformation unternehmen muss, bzw. was man alles davor wahrnehmen muss. Danach wurde auf das konkrete Üben mit dem Stellen von Fragen übergegangen und das wurde geübt, bis diese Prozesse Routine wurden, was sich als das Übergehen zum direkten Transformieren manifestiert hat, und gezeigt hat, dass metakognitive Prozesse automatisiert wurden. Die Fragen, die am Anfang gestellt wurden, waren:

- + In welchem Tempus steht dieser Satz?
- + Wer/Was ist in diesem Satz Subjekt?
- + Wer/Was ist in diesem Satz das Präpositionalobjekt?
- + Wer/Was ist die handelnde Person/Agens in diesem Satz?
- + An wem/Woran wird die Handlung in diesem Satz ausgeübt?
- + Wer/Was wird in diesem Satz Subjekt sein?
- + In welchem Kasus wird es stehen?
- + Wer/Was wird in diesem Satz Objekt werden?

- ♦ In welchem Kasus wird es stehen?
- ♦ Welches Verb wird das Predikat in diesem Satz sein?
- ♦ In welchem Tempus und welcher Person wird es stehen?

Bei den Sätzen mit Modalverben wurden die Fragen gestellt, die die Studenten nachzudenken veranlassten, über das spezifische Problem und dessen Lösen, abhängig davon, ob der Satz im Aktiv oder Passiv konzipiert ist.

- ♦ Welches Verb ist das Predikat in diesem Satz?
- ♦ In welchem Tempus steht es?
- ♦ Steht solches Verb in einem Satz allein?
- ♦ Wer/Was ist in diesem Satz Subjekt?
- ♦ Wer/Was ist in diesem Satz Objekt?
- ♦ Wer/Was ist die handelnde Person/Agens in diesem Satz?
- ♦ An wem/Woran wird die Handlung in diesem Satz ausgeübt?
- ♦ Wer/Was wird in diesem Satz Subjekt werden, wer/was wird in diesem Satz Objekt werden, und in welchem Kasus wird es stehen?
- ♦ Welches Verb wird das Predikat im neukonstruierten Satz werden?
- ♦ In welchem Tempus und welcher Person wird es verwendet werden?

Bei den subjektlosen Passivsätzen wurde die Prozedur wiederholt und ähnliche Fragen gestellt, nur wurde hier der Fokus zuerst auf die Tatsache gelegt, dass der Aktivsatz keinen Akkusativobjekt hat, und deren Folgen im Passiv, bzw. umgekehrt, falls es sich um einen Passivsatz handelt. Hier wurde die Aufmerksamkeit der Studenten zuerst auf Folgendes gelenkt, damit sie bemerken:

- ♦ Wer/Was ist in diesem Satz Subjekt?
- ♦ Wer/was ist in diesem Satz Objekt?
- ♦ In welchem Kasus steht es?
- ♦ Was bedeutet das für unsere Transformation?
- ♦ Wie wird es im transformierten Satz aussehen?
- ♦ Wer ist die handelnde Person/Agens in diesem Satz, und an wem/woran wird die Handlung in diesem Satz ausgeübt?
- ♦ In welcher Form wird es stehen?

- Was bedeutet das für das Prädikat/Was für Folgen hat es für das Prädikat/In welcher Person wird es stehen?
- Was wird an welcher Stelle im Satz stehen?

Danach wurden schon erwähnte Fragen bis zur Automatisierung der Satztransformation weiter gestellt. Der nächste Schritt verlangt von den Studenten, dass sie erkennen, ob es sich um einen Aktiv- oder Passivsatz handelt, und dass sie es danach in das Umgekehrte transformieren. Auch hier wurden adäquate Fragen gestellt, die die Metakognition von Studenten gefördert und sogar „trainiert“ haben. Sie wurden darauf hingewiesen, sich entsprechende Fragen zu stellen, und so auch nötige Denkprozesse auszuführen. Nach den Einleitungsinstruktionen und Besprechungen wurden folgende Fragen gestellt:

- Was ist in diesem Satz das Prädikat?
- Was kann man daraus schließen?
- Wer ist die handelnde Person/Agens in diesem Satz, und an wem/woran wird die Handlung in diesem Satz ausgeübt?
- In welchem Tempus steht dieser Satz?
- In welcher Form steht der Satz, und in welcher Richtung soll er transformiert werden (Aktiv → Passiv / Passiv → Aktiv)?
- Was bedeutet das für uns; Was soll gemacht werden?

Im Deutschunterricht können auch die Sätze mit dem Verb *werden* genauso behandelt werden. Den Studenten kann es am Anfang verwirrend erscheinen, dass dieses Verb drei verschiedene Funktionen haben kann, bzw. dass es als Hilfsverb für Futur I im Aktiv, Hilfsverb für das gesamte Passiv und Vollverb mit eigener Bedeutung im Satz verwendet werden kann. Bei solchen Übungen wurden den Studenten zuerst alle Möglichkeiten vorgestellt und erläutert, und danach wurden sie mithilfe folgender Fragen zum Nachdenken aufgefordert:

- Wie viele Verben gibt es in diesem Satz?
- Welches Tempus befindet sich in diesem Satz?
- Was steht am Satzende; ein Infinitiv, Partizip Perfekt oder nichts?
- Von welchem Verb kommt das?
- Wer/Was ist der Agens, und wer/was ist der Patiens?
- Wer/Was ist das Subjekt, und wer/was ist das Objekt in dem Satz?

♦ Was bedeutet der Satz?

Dasselbe wurde gemacht, sowohl bei der Transformation, als auch bei der Erkennung von Zustandspassivsätzen, für die dieselben Fragen gestellt wurden. Derselbe Ansatzpunkt wurde die Grundlage für das Verfahren, mit dem die Texte, die immer, sowohl bekannte, als auch unbekannte und neue, Wörter, Konstruktionen, Phrasen und Wendungen enthalten, bearbeitet wurden. Wie in dem vorherigen Beispiel, wurde auch hier zuerst zusammen mit den Studenten der Arbeitsablauf geplant, der schon erwähnte, festgelegte, für die Metakognition wichtige, Elemente von didaktischen Instruktionen enthalten hat. In dem Sinne fing man das Textbearbeiten mit dem Kennenlernen, bzw. mit dem Wahrnehmen von Informationen und Aufgaben die zu lösen sind, an. Der nächste Schritt war die Instruktion, sich in den Text zu vertiefen, und das Bekannte von dem Unbekannten zu trennen, um dann das, was als unbekannt erkannt wurde, sich wieder anzusehen, es zu klassifizieren, und das Wesentliche, ohne das der Text nicht zu verstehen wäre, von dem, was dafür nicht entscheidend ist, zu trennen. Dabei wurden den Studenten die Fragen gestellt, bzw. sie wurden dadurch geführt, sich die verlangten Überblicke zu verschaffen, und ihre Möglichkeiten zum Ziel zu kommen, bzw. den Text zu verstehen oder die gestellten Aufgaben zu lösen (die Fragen zu beantworten, den Text zu ergänzen, die Titel/Untertitel zu schreiben, von den angebotenen, das passende Wort zu wählen ...) zu schätzen. In dem nächsten Schritt wurden die Studenten darauf angewiesen ihre Strategien und Verhaltensmuster zu reflektieren und noch einmal nachzudenken, sowohl über den Text und seinen Inhalt, als auch darüber, ob sie alle Möglichkeiten, um die Aufgabe zu lösen, erschöpft haben. In diesem Moment wurden sie durch Fragen dazu gebracht, eventuelle weitere Möglichkeiten; anderes Verknüpfen, oder sich etwas aus einer anderen Perspektive ansehen, zu bedenken, wodurch sie sich, vielleicht, doch bessere Resultate und weitere Klärungen verschaffen würden.

Bei der Lernstoffbearbeitung wurden die Studenten durch erwähnte Fragen geführt, bzw. ihre Metakognition wurde provoziert, und die Beobachtungen haben die Professoren in die Observationslisten eingetragen. Wie es schon erwähnt wurde, bemerkte man schnell, dass die Studenten nach einer kurzen Phase, in der sie die Fragen beantwortet haben, dasselbe weitermachen, auch wenn die Fragen ausbleiben. Dadurch wird das, was gewöhnlich, von fremden Blicken verborgen, in ihren Köpfen geschieht, sichtbar. Es wurde bemerkt, dass entsprechende Instruktionen ihren Ziel erreichen und die beabsichtigten

Denkprozesse in Gang setzen, die zum Lösen von Aufgaben und weiter zum Lernstoffbewältigen führen. Es wurde weiter bemerkt, dass in der nächsten Phase dieses „Beantworten“ von nicht existierenden Fragen ausbleibt. Die Studenten gehen einfach zum Sagen von richtigen Lösungen über. Das weist auf die Tatsache hin, dass bei ihnen die Automatisierung von diesen Denkprozessen stattgefunden hat, so dass ein Teil ihrer Aufmerksamkeit für anderes frei wird, und sie in die Domäne des Unbewussten übergehen (Segalowitz, 2003).

In der nächsten Phase wurden den Studenten die Aufgaben aus dem Bereich, der vorher bearbeitet wurde, gestellt, mit der Bitte, bei der Arbeit den Selbstbeobachtungsprotokoll zu führen, um die Einsicht in den Prozess des Lösens, bzw. Charakteristiken ihres kognitiven Funktionierens zu ermöglichen. Erhaltene Daten haben auch die Wichtigkeit der erwähnten Instruktionen und des Führens gezeigt. Bei der Frage, in der von den Studenten verlangt wurde, ihre Ideen, Pläne und Schritte beim Aufgabenlösen, wie auch die Gründe für die Auswahl, zu notieren, haben die Studenten, nämlich, am öftesten die Fragen und Instruktionen, die bei der Bearbeitung von diesem Lernstoff verwendet wurden, genannt, und als Begründung wurde oft die Auferlegung dieser Fragen erwähnt, die sie dann durch das Lösen von Aufgaben „geführt“ haben. Solche Antworten bestätigen die Anfangsidee, dass man mit entsprechenden Fragen und Instruktionen die Metakognition provozieren kann, bzw. dass man im Fremdsprachenunterricht, neben Wissen von diesem Gebiet, auch zum sogenannten „Lernen des Lernens“ und zur Befähigung von Studenten für weitere selbständige Weiterbildung kommen kann.

Nach der durchgeführten Forschung wurde ein Treffen mit den Studenten organisiert, bei dem die Ergebnisse präsentiert wurden, und die Studenten gebeten wurden ihre Meinung über dieses Verfahren zu äußern. Sie wurden auch gefragt, wie nützlich solche Arbeit für sie war, und wie sie in diesem Moment, nach dem Provozieren der Metakognition bei neuen Aufgaben nachdenken. Wie erwartet, haben alle Studenten bestätigt, dass sich bei ähnlichen Aufgaben die Fragen, die im Unterricht in der Anfangsphase der Bearbeitung von diesem Lernstoff gestellt wurden, aufdrängen, und sie dann führen. Diese Kommentare haben das bestätigt, was auch beim Beobachten von ihrer Arbeit im Unterricht bemerkt wurde. Das fällt mit dem bemerkten Übergehen zum selbständigem „Antworten“ auf nicht gestellte Fragen zusammen. Noch wichtiger sind aber die Kommentare von Studenten über ähnlich, aber doch anders gestellte Aufgaben. Für diese Situationen haben die meisten angegeben, dass sie nach dem

ersten Überblick über die Aufgabe stehen bleiben und „sich selbst fragen: Was soll ich jetzt und wie unternehmen?“ Von diesem Punkt aus haben sie dann ihr Nachdenken und Schritte des Lösens angefangen, für die sie sagen, ihrer viel bewusster zu sein als früher.

6. SCHLUSS

Aufgrund der gesammelten Daten kann es geschlossen werden, dass der Fremdsprachenunterricht mit Elementen, wie Klassifizieren, Informationskontrolle, Fehleranalyse, Fördern von flexiblen Ansätzen, Erklärungsformulation, Zurückkommen auf gegebene Informationen, Analyse von wichtigen Momenten, Schätzung von Möglichkeiten zum Ziel zu kommen, Übersicht über vorherige Strategien und Formen und nachdenken über Beziehungen und Situation, die die Metakognition provozieren, durchwoben werden sollte, und dass diese Elemente durch Instruktionen und Fragen implementiert werden sollen, die die Studenten nicht nur den betreffenden Lehrstoff lehren, sondern sie auch für weiteren Fortschritt ausbilden werden. Es wird also schlussfolgert, dass die Fachfremdsprachendidaktik die Möglichkeit bietet, neue Modelle zu entwerfen, die es ermöglichen würden, beim Kennen der Persönlichkeit von Studenten das Wissen aus der Didaktik anzuwenden, und dadurch bessere Lernergebnisse in der Fachfremdsprache zu erzielen. Das wäre ein guter Ansatzpunkt für Konstruieren von Fachfremdsprachelehrmodellen, die die Studentenleistungen auf diesem Gebiet signifikant erhöhen würden, die die Voraussetzung für ihre Beteiligung an der internationalen Mitarbeit darstellen.

ANHANG I: OBSERVATIONSLISTE – METAKOGNITION IM FREMDSPRACHENLERNEN (MIFL)

1. Wie entwickelte sich der Prozess des Aufgabenlösendens?
2. Haben die Studenten, während der Arbeit, nach zusätzlichen Informationen gefragt, und falls ja, welche haben sie verlangt?
3. Sind die Studenten, beim Aufgabenlösen, wieder an den Anfang, oder an bestimmte Etappen zurückgegangen, und falls ja, wann war das der Fall, bei wem und an welche Etappen kamen sie zurück?
4. Haben die Studenten ihre Arbeit geprüft; haben sie sich selbst kontrolliert?
5. Haben die Studenten manchmal ihre Arbeitsweise geändert; haben sie wieder von vorne angefangen und einen anderen Weg gewählt?
6. Haben die Studenten auf die Uhr geschaut oder nach der Zeit gefragt (haben sie gefragt wie viel Zeit sie noch haben)?

ANHANG 2: SELBSTBEOBACHTUNGSPROTOKOLL – METAKOGNITION IM FREMDSPRACHENLERNEN (MIFL)

Wir bitten Sie, beim Lösen von gestellten Aufgaben, Ihre Beobachtungen über den Prozess des Lösens, bzw. über einige Charakteristiken Ihres kognitiven Funktionierens, zu evidentieren.

1. Beschreiben Sie, in welchem Maß Sie mit Ihrer Effizienz beim Aufgabenlösen zufrieden sind und womit sie in Ihrem eigenen Funktionieren beim Aufgabenlösen nicht zufrieden sind.
2. Wenn Sie sich, bevor Sie mit dem Aufgabenlösen angefangen haben, Ihre schon bekannte „Schwächen“, bzw. dass, worauf sie besonders aufmerksam sein sollen, bewusst gemacht haben, notieren Sie das, worauf sie selbst aufmerksam gemacht haben, um die Fehler beim Nachdenken vorzubeugen.
3. Wenn Sie zu der Idee kommen, bzw. wenn Sie schon eine Skizze, einen Plan für das Lösen der Aufgabe haben, bringen Sie es zu Papier. Schreiben Sie danach auch jeden weiteren Schritt, sowie Ihre Gründe, warum Sie so gehandelt haben, nieder.
4. Beschreiben Sie die Momente, als Sie erkannt haben, dass etwas gut geprüft werden sollte, und als Sie verstanden haben in welcher Richtung Sie nach der Lösung suchen sollen.
5. Was haben Sie gemacht, als Sie verstanden haben, dass Sie nicht auf dem richtigen Wege sind?

Danke!

FUTURE OF SHARING ECONOMY IN MEDICINE IN CROATIA

Abstract

Sharing economy (SE) is a new fast-growing economy model and the biggest economy trend of all time. It is based on peer to peer sharing of goods and services and as opposed to previous ownership-based economy it puts focus on the accessibility of a good or service instead of ownership. One of the principles in SE is that unused value is wasted value, therefore, it makes use of unused equipment or possessions and it is estimated that there is over £3,5 trillion worth of unused goods in the world. SE differentiates itself from the classical economy in that it doesn't have a common hierarchy where one side is the provider of the service and the other is the consumer, in SE everyone can be a provider and a consumer of service at the same time. In the last couple of years, SE has grown in a number of users, companies, start-ups and different fields in which SE has taken the lead. In the past, there have been several attempts of introducing SE in the health profession and some (i.e. COHEALO) were more successful than the others. Health and health services are one of the biggest problems in the world as well as in Croatia. There is a current lack of medical staff in all medical fields and medical devices are very expensive to own. Therefore, there is a need for reduction of medical expenses. In this paper we will analyze the possibility of implementing SE in everyday work in hospitals and other health centers as well as possible places of its implementation and

how could it be used in the near future. SE in medicine will be regarded from a professional, financial, legal, and cultural perspective in Croatia.

Keywords: *sharing economy, medicine, public health, management*

JEL Classification: I18, M19

1. INTRODUCTION

Sharing economy (SE) is a trend that has taken the world economy by a storm in recent years. It came into the public eye as a result of the success of various companies such as Airbnb and Uber. Even though it is a relatively new trend the concept of sharing, collaborative or peer-to-peer economy exists, in its primitive form, since the beginning of mankind. SE in a way deletes the past strict wall between the producer and the consumer and creates a market where everyone can be a producer and a consumer of the goods and services at the same time. SE has developed in the last fifteen years because increasingly people find that there are some things that they do not need to own to enjoy them, such as vehicles, accommodation and so on. It is a reaction to the ever-growing technological industry and smart tech that allows people to have all of those things just a call or a message away in the palm of their hand. True evidence of SE popularity is the fact that in 2017. The value of SE economy has grown to \$2 trillion (BofAML, BIA/Kelsey, 2017). Sharing economy today can be divided into 4 different subgroups: access economy, gig economy, collaborative economy and commoning economy (Ferrer, 2017). There are subtle differences in each subgroup. Access economy refers to access to goods and services through renting them for a period of time and it is not based on ownership of said goods and services. The pivotal part of the access economy is that ownership doesn't matter just the access to the goods. The gig economy is based on sporadic gigs where the transaction is done through the digital market. The collaborative economy as a subgroup of SE is known as economy *inter pares* and is more widely known as a peer-to-peer economy. This economy is based on the principle that its own customers help develop the economic activity of said company by participating in the process of developing and designing the production of assets. Finally, we have a commoning economy. "Commoning" is a word developed and popularized by the writer Peter Linebaugh and he described it in his book *The Magna Carta Manifesto* as a word that means people living in close connection to the common people and life. Therefore, the commoning economy means that there

is a growing need for cooperation in place of competition and that economic growth and market should serve the community. Sharing economy today is a melting pot of all four subgroups and today it gives the opportunity to everyone to develop their business in a different and modern way. Sharing economy is a way to use unused goods and resources that go to waste each year.

The aim of this paper is to show the past and present usage of sharing economy in health-related businesses and to propose SE business models that have the potential of developing in Croatian healthcare.

2. RESEARCH METHODOLOGY

Today, the key question is how to redesign health care systems without damaging the foundations these were built on. Research has shown that the costs of financing health care will further increase in the near future. Around one-third of this increase will be the consequence of an aging population, and the remaining two thirds will refer to the excessive growth of costs, reflecting thus technological changes, income growth, and health policies. It is necessary to point out that the increase in health costs occurs at a time when countries need to undertake significant fiscal adjustments to reduce public debt and state budget deficit in the light of the global financial crisis.

The key challenges and problems of Croatian health care can be divided into three groups: functioning of health care systems, health care personnel, and external factors. Research has shown that key challenges related to the functioning of health care are inefficiency, financial unviability, inadequate infrastructure, and the lack of system transparency. Poor governance is another limiting factor. With regard to health care personnel, they face the problems of low salaries, which then lead to migration challenges and a potential shortage of health care personnel. The following external factors are deemed to be among the most significant challenges: an aging population, bad living habits, and an increase in the number of chronic diseases. However, problems caused by the global financial crisis and the consequential macroeconomic situation must not be neglected.

Following the above-explained complex situation of Croatian health care system, the authors are proposing the SE model a solution for reducing the inefficiency and financial unviability of the Croatian health care system.

In the course of the research, a considerable number of scientific methods was used, among which the following should be highlighted: the method of deduction, the method of analysis and synthesis, the method of causal inference, the method of abstraction, the method of composition, the method of analogy, the historical method as well as the method of descriptive inference.

3. SHARING ECONOMY IN DIFFERENT BUSSINES ENVIRONMENT

3.1. SHARING ECONOMY SECTORS

According to the report by the European Commission, we can divide the sharing economy into five key sectors (Vaughan & Daverio, 2016):

1. Peer-to-peer accommodation: households sharing access to unused space in their home or renting out a holiday home to travelers through digital platforms. Some of the platforms include Airbnb, LoveHome-Swap and HomeAway.
2. Peer-to-peer transportation: individuals sharing a ride, car or parking space with others through an app. This includes short-distance and long-distance rides as well as car sharing networks. Platforms in transportation are Uber, Blablacar, GetAround, Zipcar and so on.
3. On-demand household services: freelancer marketplaces enabling households to access on-demand support with household tasks such as food delivery and “Do It Yourself”, they are online “crowd-based” marketplaces which give access to household task services and deliveries. They include specialized and general delivery services and on-demand household chores platforms like UberRUSH, Instacart, TaskRabbit and Deliveroo.
4. On-demand professional services: freelancer marketplaces enabling businesses to access on-demand support with skills such as administration, consultancy, and accountancy. This differs from the previous sectors since freelancers usually work remotely. Business’ included in this sector are Upwork and HolterWatkin
5. Collaborative finance: individuals and businesses who invest, lend and borrow directly between each other, such as crowd-funding and peer-to-peer (P2P) lending, this is different from traditional intermediaries like

banks. Crowdfunding platform includes Kickstarter and LendingClub is an example of lending platform.

As reported by European Commission (Vaughan & Daverio, 2016) regarding the data from PricewaterhouseCoopers (PwC) UK (Table 1.) - The sharing economy - Sizing the revenue opportunity, these sectors generated revenues of almost €4 billion and facilitated €28 billion of transactions within Europe in 2015 and to date it includes 275 collaborative economy platforms which are an increase from the previous report (Vaughan & Daverio, 2016). The report shows that the UK and France are the countries with most collaborative economy organizations founded with over 50 organizations; they are followed by Germany, Spain, and the Netherlands with over 25 organizations. Regarding specific sectors in sharing economy most revenue was made by P2P Accommodation and P2P Transportation which cumulatively make around 79% of total revenue from sharing economy in Europe in 2015 (Figure 1.) which was to be expected since not only are they pioneers in the field of sharing economy but they require the least amount of resource. More interesting for us is seeing that just 2% of revenue and 3% of total transactions were done in the field of on-demand professional service where we could categorize medical services as well. The reasons for this could be many but most probable ones could include the stability of the employment where medical staff don't have needs to provide their service outside of their regular jobs and another reason could be the fact that there aren't many medical sharing economy platforms and those that exist are not very well known and are not used. Unfortunately, there haven't been official reports regarding medical SE platforms in Europe. Either way, the growth in transactions and revenue is fast (Figure 2.) and since there aren't many medical platforms for SE this could be an unexplored and potentially very profitable future market for SE and medical economy in general.

Table 1. Revenues and transaction values facilitated by collaborative economy platforms in Europe (€m, 2015)

Sector	Revenue 2015 (m)		Value 2015 (m)	
P2P Accommodation	€	1150	€	1510
P2P Transportation	€	1650	€	5100
On-demand household services	€	450	€	1950
On-demand professional services	€	100	€	750
Collaborative Finance	€	250	€	5200
Total	€	3600	€	28100

3.2. BUSINESS IN THE ERA OF MODERN SOCIAL NETWORKING

Social networking is a social system that exchanges resources, the interactions occur between organizations or, what is recently becoming more popular, individuals to achieve the common goal (Kang, 2018). Its main concept includes the exchange and sharing of different products, capital, information services and many more. It gives a basis for developing social capital, also known as a collective asset, which is defined as an assembly of actual or potential resources connected to the continuous network ownership level. Social capital promotes a specific behavior in regard to the structure of transactions (Coleman, 1988). This has evolved during the time and we can see the emerging and growth of collaborative ownership, where the main point of the market and business isn't just profit but

social growth and development of social capital. This is resulting in the development of shared values between the producer and the consumer since, in time, they are becoming the same. Today social networking is more approachable than ever through different social networks and development of technology.

3.3. LAWS, REGULATIONS, AND POLICIES AFFECTING THE SHARING ECONOMY IN THE EUROPEAN UNION

Since its start sharing economy has encountered problems with regulations worldwide. With its disruption of previous business concepts, there were no laws that covered the sharing economy. Many traditional businesses that provided similar services were found at a sudden disadvantage. Most of them require either special permission, additional tax fees or extra courses or tests. We present several cases of these changes (Vaughan & Daverio, 2016). Italy has recently proposed a 'sharing economy act' which includes definition of the sharing economy as well as its platforms, requires all platforms to sign up to a sharing economy registry and provide documents for the *Autorità Garante della Concorrenza e del Mercato* (AGCM) (competition authority) approval all that with addition of extra taxes according to income rate. In Germany Uber has stopped operations in three German cities citing a 'difficult regulatory environment'. Drivers were required to register as a private rental car enterprise, which made the registration process too costly and lengthy for many. Another example is France where Airbnb started collecting 'tourist tax' of €0.83 per room night. In Spain Uber has been banned nationally in December 2014 and is now trying to re-enter the Spanish market by only working with drivers who carry a valid professional VTC license which is required by all professional drivers. This is similar to the law passed in Croatia in 2018. where Uber drivers were required to pass same programs and licensing as regular taxi drivers (Zakon o prijevozu u cestovnom prometu, 2018).

3.4. SHARING ECONOMY PROTOTYPES

3.4.1. Uber

Today Uber is the most recognized and arguably the most successful SE business in the world (Gabel, 2016). Uber has been a star in SE. It was first started in 2009 by Garrett Camp and Travis Kalanick in San Francisco. The idea was to make affordable driving service where both the driver and the pas-

senger could have an easy to access driving service at a lower cost. The company operates on a mobile app principle. Users can sign in as either a driver or a passenger in two separate apps. The drivers go under background check and have a registration requirement and car standards. The passengers have to download the Uber app register and simply order their drive.

The main problem for Uber is the opposition of traditional Taxi drivers to this form of taxi service. Since Uber is more available through digital platforms, usually faster, more accessible and affordable for the driver and the consumer since the only thing it requires is for the driver to register through the Uber app as a driver and for him to own a car it is much easier for a person to become an Uber driver rather than a Taxi driver. Following this, since Uber was developed as a form of SE the laws and legislation that applied to traditional taxi drivers didn't and couldn't be applied to Uber drivers and consumers. There are many examples of this throughout the world from London, Toronto, Melbourne to New York. In recent years there have also been lawsuits against Uber regarding their working policy and driver exploitation since in the beginning there were no working hour limitations and many drivers for example in the USA drove from their home town to the big cities for the weekdays or the weekends and lived inside their cars to maximize their working hours. In Croatia, a new Law on Transportation in Road Traffic passed in 2018 (Zakon o prijevozu u cestovnom prometu, 2018) which enabled every driver who has a B category driver's license to take an additional test and, if they pass, provide driving services. This law legalized Uber driving service in Croatia but resulted in a reduction of Uber drivers across Croatia because it required a lot of additional registration and additional examination.

3.4.2. Airbnb

Airbnb is another extraordinary SE business. As opposed to Uber which is more of an example for the gig economy, Airbnb is based first and foremost in access economy. While Uber has just one digital transaction per person for a very short time, Airbnb offers a longer service and connects people who want to rent their accommodation to those who are looking for accommodation. There are several benefits of this kind of business such as free listings, hosts being able to set their own price, additional services and protection for guests and hosts (Folger, 2019). Unfortunately, much like Uber, Airbnb has faced legal problems.

Since both Uber and Airbnb can be classified as disruptive innovation, they also created disruption in legal regulations in different countries which were never introduced to this form of market making these businesses basically illegal.

3.5. SHARING ECONOMY IN THE WORLDWIDE HEALTHCARE

3.5.1. Cohealo

Cohealo was developed in 2011 in Boston, Massachusetts. It was developed as a platform to use unused surgery equipment, such as surgical tables, from one hospital in another. This would activate unused capital from one hospital that had extra equipment and use it to create profit. This was created to lower the cost of everyday hospital management.

3.5.2. “Šestar”

“Šestar” is an internet platform on which scientists can exchange diagnostic machines that are not in use at the moment in their laboratory. This type of SE offers a highly effective and complete usage of all machines and at the same time saves money to the laboratories so that they don't have to buy them and therefore they can use their money on other needed materials. The way the site works is that there are different machines listed, they have a contact person and the location of the machine available (Šestar, 2019).

3.5.3. Telehealth platforms - Teladoc

Modern telehealth platforms present a variety of unique benefits to both consumers and physicians. Patients may seek telemedicine services for episodic care, specialty management of chronic illnesses, and primary care. Consumers stand to experience increased convenience in accessing medical services and encountering a variety of connection services platforms, choosing the modality they prefer based on their own unique characteristics as consumers. In contrast to traditional, office-based services, patients may access medical services in an “on-demand” fashion, engaging in instant message exchanges, video chats, and remote exams. Lastly, clinicians will also benefit from the improved work-life balance due to flexible practice hours and location, in addition to potential increased earnings.

Both consumers and physicians will also benefit from the system's innovations that will accompany the increased use of telehealth platforms. For example, in order to mitigate malpractice risk, telehealth platforms will need to differentiate between, and then route, patients requiring higher-acuity or more specialized care to the right point and service provider. Telehealth platforms may also innovate in how they regulate quality and safety standards and screen and select providers, and in how consumers rate service providers—a common feature of many platforms in the sharing economy. By facilitating information collection and making it transparent, telehealth platforms have the potential to protect and empower consumers.

Telehealth platforms can further expand access to general medical services by reaching out to consumers in underserved areas and providing access to highly specialized consultancy services. Currently, medical care delivery is highly local, with physicians practicing in their towns or cities and patient interaction occurring primarily in person in an office or hospital setting. Highly localized delivery, coupled with state-based licensure systems, potentially restricts the supply of physicians and limits consumer access to, and price competition for, telemedicine services. Telehealth platforms offer an opportunity to expand access without major financial investment, in addition to increased price competition for some medical services.

Early market evidence supports the conclusion that telehealth platforms yield substantial consumer and clinician benefits. Teladoc, a publicly traded telehealth platform company, had 576,000 visits in 2015 with 95% consumer satisfaction, 5 while physician hourly income increased 50%. These and other benefits will power market growth, with estimates of the current telemedicine market ranging from \$1.9 billion to \$30 billion. Despite this rapid growth, some have raised concerns regarding the safety of telehealth platforms as a rationale for restricting the market entry and growth of telehealth platforms. In addressing this concern, one must note that physicians have successfully practiced telemedicine for over 100 years by using the telephone to conduct physician-to-physician consults, diagnose and treat patients, prescribe medications, and order diagnostic tests. Like the taxi industry's move from telephone dispatch to matching through GPS-enabled smartphones, modern telehealth platforms represent a natural outgrowth of the practice of medicine, using modern technology to grow a systems approach to safety and quality (Miller et al.; 2016).

3.6. POSSIBILITIES OF FUTURE USE OF SHARING ECONOMY IN HEALTHCARE IN CROATIA

3.6.1. Developing tech exchange between hospitals

Even though hospitals are usually overcrowded with patients and patient waiting lists are a couple of months-long there are occasions in which not all facilities and diagnostic machines are adequately used. The reasons for this vary from too few patients in that town or region which is usually a result of low population in that area to the lack of specialists and other experts who work in the specific medical field. Reason for the lack of experts can be found in higher immigration rates and older population of doctors in some areas who then retire. As a result, we have on one side overcrowded waiting lists in larger hospital centers, and on the other hand unused, expensive and highly sophisticated diagnostic machinery. A solution for this could be found in an app that enables all hospitals to list their devices and when they are not in usage offer them to those institutions with long waiting lists. This is similar to previously presented “Cohealo” and “Šestar”. Problem with this is that the larger machines would be very expensive to transfer from one hospital to another so profitability would be a limiting factor, another problem is potential damage to the machines that could occur to the machines.

From the medical point of view, the main problem would be “What to do when there is an emergency and those machines are needed?” this is solvable since most of the hospitals have more than one machine of one kind and it could be used in an emergency.

The overall technological exchange between hospitals is possible and achievable but with smaller devices and with the calculation of the profitability of this exchange.

3.6.2. Patient redirection

Another way of using SE in medicine is to redirect patients from overcrowded hospitals to those with fewer patients. That way we could completely bypass all the problem with the transport of medical machinery.

All patients who are using health insurance in Croatia would have opportunity to download an app that would show all waiting lists of all hospitals, of

course, all patients would have their unique ID which would be shown in the lists and the app could just show when the next available appointment is. Another possibility for this app would be that when the patient decides in which hospital, he wants to go he could register on their waiting list in the app. This form of admitting patients already exist in Croatia in primary medicine but it is only available to Family medicine specialists who can “save your date” for their patients. This is a problem because if there are sudden open places for new admissions the hospital has to contact the next patient on the waiting list or leave it unused. This is a great waste of medical personnel, money and time. Firstly, because you have an administrator who has to use his time to call other patients to see whether there are patients who are able to come at different time and secondly, because a lot of patients are unable to come on call into hospital, it usually leaves that time unused which results in lost profit for the hospital.

This solution is cheaper and easier to carry out in reality. Main problem for this model is that except for Zagreb there are no cities in Croatia with more, large hospitals and hospital centers to which the patients could be rerouted so the patients wouldn't be able to use the app in an adequate way or they would have to travel larger distances to reach the hospital which would increase patient's cost. On the other hand, the pilot of this app could be done in Zagreb with great efficiency.

3.6.3. Doctors and nurses on demand

With a increasingly aging population, longer lifespan and more people with chronic diseases there is a larger need for in-house care. With the usual population of 2000 patients per family medicine specialist, there is very little room for healthcare workers to visit each patient daily. This would enable the immobile patient's adequate healthcare. There are several problems. First of all, house call visits already exist, and they are a part of regular healthcare services for a specific kind of patients

3.6.4. Chronic patients

Two of the most common chronic diseases that require daily supervision and regulation are hypertension and diabetes. With technical development we now have smart devices that can measure blood pressure and glucose levels in

the blood, however, while the regulation of hypertension requires just daily consumption of antihypertension drugs, insulin dependent diabetes requires a sometimes-complex administration of insulin. Since diabetes is still considered a disease of older age and taking into consideration the fact that a lot of elderly are still not used to use advanced settings on their smartphones or some of the modern technologies used in diabetes therapy it would be beneficial to have a platform where previously educated personnel (nurses, doctors, and even medicine students) could be employed by family members of diabetic patients to ensure that those diabetic patients regulate their blood sugar levels daily by measuring blood sugar levels and administrating insulin or per oral therapy.

3.6.5. Pharmacology in the palm of a hand

Because of the difference in size, location and need for drugs in each location, all pharmacies don't carry the same drug, and because of the supply organization and management, it can sometimes happen that the specific pharmacy doesn't carry the required drug. This problem has two solutions either there needs to be peer – to – peer exchange of drugs between pharmacies so that one pharmacy can supply the other with the required drug in between orders. This would require a list of available drugs for each pharmacy as well as a way of informing and delivery. Other solution would be to offer a list of other pharmacies that carry the required drug to the patients. Out of these two possibilities we expect the best solution to be the one where a patient is offered a list of pharmacies with available drug because pharmacies are fairly widespread in every city and it wouldn't require a high increase in patient's personnel costs to go to another pharmacy, while the first solution would create much larger expenses for the pharmacies, and unnecessarily complicate everyday work.

3.6.6. Doctors and nurses as freelancers

With ever-growing lack of medical staff in all hospitals especially in rural areas, there is a need to provide quality health service in those areas. Since urban areas, especially large cities, give a lot of opportunity for medical practice most of the doctors gravitate towards jobs and practices in urban area, leaving the rural area jobs with either short-time practitioners who go from one practice to another, or no doctor at all. A possible way of solving this problem would be to create a platform for doctors and nurses only on which the short-term jobs

(one to two days a week) would be offered. A sort of freelancers in medicine where a doctor or a nurse could fill a spot in a practice and in that way enable quality health service in all areas. The app would have a possibility to apply for a job a month in advance after which a schedule would be formed and sent to the applicants according to the days on which they applied. There would be set payment for each qualification (i.e. those with specialization, sub specialization, and finished courses would get additional increase of payment in set percentages) and a grading system and scale for doctors and nurses in accordance to their training and education (i.e. an MD with valid practice license would get 10 points, a specialization would grant another 15 points, Ph.D. another 5 points and every further education such as ultrasound of heart, abdomen or Color Doppler would grant additional 8 points and so on). This way if there are more applicants, they would get an advantage to choose desired jobs according to their qualifications. In addition, at jobs that require certain qualification (i.e. pediatric practice) those with required qualification would get additional points and preference before other applicants. Advantage of this kind of project and platform would enable health care in underdeveloped locations, open more jobs, and create a job for health professionals after they finish their internship or if they want to do more work. Problem with this kind of work would again be focused on the distance from the larger city and the amount of work required since this frequent exchange of doctors can account for them not knowing regular patients (like their regular family medicine specialist would), and also many doctors and nurses would not be interested in traveling that far so the jobs would probably be filled with younger staff that is still not specialized with some exceptions.

4. CONCLUSION

SE will reduce costs and improve healthcare, particularly its accessibility. Our goal should be to help accelerate these changes first by identifying them and driving awareness, and also giving them a context and framework so that new models can be developed more rapidly. The important step to be taken now is to change the way of designing and thinking about our healthcare facilities in light of the emergence of these new models of economies. It is time to stop debating whether the SE will affect our healthcare ecosystem or not, as this is an undeniable solid fact. It is time instead to discuss what happens after the change occurs

like community-driven health, and how we can regulate it to ensure quality and privacy. We also need to think about the new data ownership rights and how we can provide our patients with full access to their medical records without hampering their privacy. SE is here to stay, it has taken a large and important piece of cake in the economic market and as far as we see it will only keep on growing exponentially. The main problem of SE is that even though it is very adaptable there are usually just recycled versions of the same idea that are not applicable to all fields of the market. SE is an interdisciplinary phenomenon and it requires interdisciplinary solutions. Since healthcare is a highly specialized field of work and science with a lot of highly specialized experts it calls for a more specific and focused problem-solving applications of SE.

THE AGING SOCIETY: A CHALLENGE FOR POLICY MAKERS

Ivana BARKOVIĆ BOJANIĆ, Ph. D.

J. J. Strossmayer University of Osijek,
Faculty of Economics in Osijek

E-mail: ibarkovic@efos.hr

Abstract

Population aging is a demographic certainty that is happening in all six geographic regions in the world. The world population 60 and over is growing faster than any other group. The projection of 3.1 billion people in 2100 (UN World Population Prospects: the 2017 Revision) is representing a big challenge for policymakers particularly if one considers that older people are changing their behaviors and expectations of retirement and later life. This paper discusses the population aging and policy responses to it. After presenting and analyzing descriptive statistics of population aging, the paper focuses on the baby boomers as a particular group of the older population who will have a significant effect on economy and society. Finally, the paper discusses challenges for policymakers in managing the effects of population aging and offers selected policy suggestions. By recognizing and understanding a variety of demographic, behavioral and policy forces behind graying of the world, one can work on policy and institutional setting that will consider aging population inevitable part of society that still can contribute to socio-economic development.

Keywords: *population aging, demographic trends, baby boomers, public policy*

JEL Classification: J11, N30

1. INTRODUCTION

“With mirth and laughter let old wrinkles come.”

Merchant of Venice
William Shakespeare

There is a growing trend worldwide that the number of elderly population is dramatically increasing due to the increase in life expectancy. According to data from *World Population Prospects: the 2017 Revision*, the number of older persons — those aged 60 years or over — is expected to more than double by 2050 and to more than triple by 2100, rising from 962 million globally in 2017 to 2.1 billion in 2050 and 3.1 billion in 2100. World population aged 60 or over is growing faster than all younger age groups. This increasing longevity is a result of numerous factors such as improved nutrition, sanitation, improved healthy behaviors (better eating habits, more physical activities etc.) as well as better medical care. In addition to this, one has to acknowledge the role of higher education, income and trends regarding health in contributing to living longer.

The share of older persons in a total number of population will be increasing due to *baby boomers* (born between 1946-1954), who are in or are close to retirement. This generation has different age-specific behaviors with respect to employment, consumption, and savings as they are in better medical and economic shape than previous generations. Thus, their behaviors will have a significant impact on the economy as well as on policy and institutional environment.

When it comes to the European Union (EU), one expects that the age structure of the European population will change significantly over the next decade, and by 2060 the share of persons aged 65 and over will increase from 18% to 30% compared to the present, while the share of persons over the age of 80 will more than doubled. This explains why the EU has launched the term *Silver Economy* in relation to the economic activity of the population aged 50 as well as there is increased interest of academic scholars and policymakers related to their impact on different sectors of the national economy (see, for example, Zsarnocky and Gyorgy, 2016, Barković Bojanić and Erceg, 2017). While elderly have been for a long time perceived as a fiscal burden, there has been a significant shift in considering that this negative demographic trend can represent as a market opportunity for new products, services, jobs, and consequent growth.

Three helixes – academia, government, and industry – recognize population aging as a new demographic reality. There is an increased number of academic scholars researching in theory and practice the economics of aging. Particularly evident is the shift from studying individual aging to the collective problem of aging economy and society. The field of age-specific economic theory has been progressing in the last thirty years with more and better data available more analysis that differentiates the economic circumstances of different elderly sub-groups, more and better longitudinal data sets and the like (Infield, 2002: xv).

There is an increased number of authors discussing various issues related to economics and aging either from macroeconomic or microeconomic point of view. For example, Disney (1996) states the economics of aging raises the macroeconomic issues that influence economy as a whole, while microeconomics deal with the individual prospects for consumption and income over lifecycle associated with longevity and lower fertility. Schulz (2001) discusses the economic status of age, retirement planning etc. Ipparaguire (2018a and 2018b) offers modelling frameworks, that have become central tools in studies of economics and aging, including the life cycle, the overlapping generations, the perpetual youth and dynastic models, as well as various economic approaches to valuing later life, including economics of long-term care, caregiving demand to questions around insurance and so-called sandwich generation.

When it comes to the economy and the market in general, companies are becoming more aware of the aging market place and they start to innovate products and services in order to serve their aging customers as result of intersecting “market pull” and “technology push”. The term *Silver economy* has been developed in order to capture the influence of the aging population as a new consumer market for products and services designed for them. It includes all activities performed in the economic sector, which are focused to deliver products and services to satisfy elderly’s needs in the area such as media, fashion, tourism, education system, robotics, culture, local markets etc. (Zsarnocky and Gyorgy, 2016). The list of companies is becoming longer and longer – Harley Davidson, Intel Corporation and General Electric, Saga, etc. (Barković Bojanić *et al.*, 2018). All of them are beginning to see the elderly consumer as an important market. Take, for example, the Harley-Davidson. The famous US producer of motorcycles recognized the potential in older people as well as shifting the focus from the age to the values. Namely, the baby boomers have been the most loyal buyers’ age of Harley’s and as they are getting old they still want to hold on the

feel by driving Harley motorcycle. That is why the Harley-Davidson offered an innovation in a motorcycle – the *Three Glide*. The innovation included a three-wheeled motorcycle that has added stability and the triangle wheel-based that has become very popular among older riders (Barković Bojanić *et al.*, 2018)

Legal and institutional framework, financial support and other incentives have been increasing lately in order to help the aging population to find its place in the socio-economic development of the country based on its expectations and abilities. For example, Equal Treatment Directive (2008), European Disability Strategy (2010-2020) accompanied by European Disability Act; Ambient Assisted Living Program etc. (see for more details European Parliament Research Service, 2014).

The purpose of this paper is to discuss the global trend of population aging in order to point out that policymakers need to take into consideration different expectations of older people today when it comes to quality of life and sustaining activities when faced with retirement and aging process itself. The paper is structured in five sections. After the introduction, section 2 presents population aging as a unique global trend. Section 3 focuses on baby boomers as a particular group of people who were born between 1946 and 1964. They have emerged as a significant age group who will change the way people look at older age and retirement since they tend to show different expectations of older age, consumption patterns, technology use and the like which significantly affects the way private sector, as well as policymakers, need to react towards this large age cohort. Section 4 discusses the importance of policy and institutional environment in managing the effects of population aging and offers selected policy suggestions. Section 5 offers a brief conclusion.

2. POPULATION AGING: UNPRECEDENTED AND IRREVERSIBLE GLOBAL TREND

*“The aging and declining of the population will have far-reaching impact.
Declining fertility rates will possibly increase immigration.
The structure of family and society will inevitably change.”*

Toshihiko Fukui

According to the United Nations, the Department of Economic and Social Affairs, Population Division (2017), population aged 60 and over in 2017

counted 962 million people, which is more than twice the number of population 60+ in 1980. The further projections suggest that by 2050 the number of persons over the age of 60 will again be twice as high and should amount to 2.1 billion people (see figure 1).

Figure 1 Number of people age 60+ from 1980 to 2050 (in million)

Source: United Nations (2017). World Population Prospects: the 2017 Revision.

Ten countries with most population in the world are coming from following regions: one from Africa (Nigeria), five from Asia (Bangladesh, China, India, Indonesia, and Pakistan), two from Latin America (Brazil and Mexico), one from Northern America (United States of America), and one from Europe (the Russian Federation). Amongst these, Nigeria’s population, currently the seventh largest in the world, is growing the most rapidly and is projected to surpass that of the United States shortly before 2050 (UN, World Population Prospects 2017 – Data Booklet). Projects suggest that in 2050 the population in six of the ten largest countries will exceed 300 million - China, India, Indonesia, Nigeria, Pakistan, and United States of America (see table 1).

Table 1 Ten countries with the largest populations (2017 and 2050)

Rank	Country	2017 Population (millions)	Country	2050 population (millions)
1	China	1410	India	1669
2	India	1339	China	1364
3	USA	324	Nigeria	411
4	Indonesia	264	USA	390
5	Brazil	209	Indonesia	322
6	Pakistan	197	Pakistan	307
7	Nigeria	191	Brazil	233
8	Bangladesh	165	Bangladesh	202
9	Russian Federation	144	Dem.Rep. of the Congo	197
10	Mexico	129	Ethiopia	191

Source: United Nations, Department of Economic and Social Affairs, Population Division (2017). World Population Prospects 2017 – Data Booklet (ST/ESA/SER.A/401)

The population statistics reveal that there is no geographic region that is immune to getting old. From 2017 to 2050 all world regions will face an *absolute increase of population* aged 60 and over in various percentages: Africa will experience the fastest grow where the population aged 60+ will increase from 69 to 226 million; Latin America and the Caribbean are projected to face an increase from 76 to 198 million, while Asia will see an increase from 549 to nearly 1.3 billion. The slowest growth will be in Europe with a projected increase of 35% in the stated period (United Nations, Department of Economic and Social Affairs, Population Division (2017). World Population Ageing 2017 – Highlights). The dynamics of absolute aging of the population are not equal in all regions of the world. The reasons for this are different from the number of people living in this area, fertility, morality, and social opportunities.

Aging influences various sectors of economy and society, including health and social care, transport, housing, entrepreneurship etc. When researching those influences, *relative demographic aging of the population* is helpful since it shows aging of population related to the population as a whole. In another word, relative demographic aging shows various age groups within the entire population. This is quite important as it shows the impact of population aging on social activities, the economy of a given area, and the pressure on social security systems - through the prism of “pressure” of the older population on the younger, working-active population. According to UN projections, the year

of 2050 will bring increase in percentages of population aged 60 years in all geographic regions: older persons are expected to account for 35 % of the population in Europe, 28 % in Northern America, 25 % in Latin America and the Caribbean, 24 % in Asia, 23 % in Oceania and 9 % in Africa (figure 2).

Figure 2 Percentage of population aged 60 years or over by region, from 1980 to 2050

Source: United Nations, Department of Economic and Social Affairs, Population Division (2017). World Population Ageing 2017 – Highlights.

At the global level, one can notice that the number of older persons is growing faster than the number of all younger age groups. Some time ago, in 1980, children aged 0-9 years substantially outnumbered persons aged 60 years or over with 1.1 billion versus 0.4 billion, while one expects that by 2030 the global number of older persons will surpass the number of children under age 10 with 1.41 billion versus 1.35 billion (figure 3).

Figure 3 Global population by broad age group, in 1980, 2017, 2030 and 2050

Source: United Nations, Department of Economic and Social Affairs, Population Division World Population Aging 2017: Highlights.

To emphasize, the population will be getting older in all six major geographic regions across the world in both absolute and relative terms. This global demographic reality puts the pressure on government across the world to create public policies that will tackle the issues related to older people – from medical and health care to various forms of inter-generational solidarity.

This inevitable increase has been the result of a decline in fertility and improvement in survival, which are the major features of demographic transition. According to Bloom *et al.* (2008), there are three major demographic drivers of population aging: (i) *declining fertility rates*, which are reducing the number of young people while at the same time increasing the share of old people in the total population. The total fertility rate fell from approximately 5 children per woman in 1950 to just over 2.5 in 2005 and this trend is expected to continue by 2050 falling to 2 children per woman. This will seriously affect the old-age dependency ratio, which is the number of working individuals to people age 65 and over; (ii) *increases in life expectancy* whereby the current global life expectancy is the age of 65 and projected to be 75 years by 2045; (iii) *past variations in birth and death rates are the third factor* behind population aging. This relates to, for example, baby boom occurred in developed countries after the World War II whereby these baby boomers are becoming “older boomers” or in developing countries where fertility temporarily increased due to reduced child mortality.

Aforementioned selected statistics point out that the population aging is a global phenomenon that will continue to affect all geographic world regions of

the. We are talking about an unprecedented era in history with various economic and social implications. Increased number of older population, as well as the shift in the size of age group, puts calls for the different allocation of economic and financial resources that affects the entire population at the end. Thus, it does not surprise that academic scholars are interested in understanding and policymakers in reacting to economic and social implications of aging society (see, for example, Lloyd-Sherlock, 2000, Harper, 2014, Yenilmez, 2014)

The most mentioned economic implications of an aging population are mostly related to the following (Global Risk Insights, 2018):

- ✦ Pressure on social insurance programs and pension systems meaning that many nations will be forced to increase their budget allocation for social security;
- ✦ Increasing health care costs since the health declines with age and elderly require more medical attention such as visiting doctors, hospital stays, surgeries and the like. In addition, there is an increase in illnesses such as cardiovascular problems, cancer or Alzheimer's since people are living longer and medical treatments are better. These illnesses put significant pressure on public health expenditures in order to provide human (medical) resources to provide required health care to those in need;
- ✦ Shortage of skilled labor trained to provide care for aged patients (e.g. lack of registered nurses);
- ✦ Impact on economic growth while there are fewer workers on the labor market, which translates into a problem for firms to make products and provide services. Further, this shrinking labor force means an increase in the age dependency ratio as well as the fact that fewer workers need to support a greater number of older retired people. Needless to say that this will also increase.

There are academic scholars that consider the aging population not solely as a burden. For example, Prettnner (2012) and Lee *et al.* (2011) have suggested that there is a positive interaction between aging and economic growth since the older people tend to save more and thus providing more resources for investment. However, this does not eliminate the prevailing thought that demographic revolution, that is currently taking place in the world, will be a serious burden to economic growth without adequate strategy and policy response.

3. BABY BOOMERS: REDEFINING EXPECTATIONS OF ELDERLY

“Age is an issue of mind over matter. If you do not mind, it does not matter.”

Mark Twain

To have a better understanding of challenges we are facing with the population aging in an economic, social and policy sense, it is useful to consider baby boomers as a particular group of the older population who will have a significant effect on economy and society.¹

The baby boomer is a term that describes a person who was born between 1946 and 1964. The baby boomer generation makes up a significant proportion of the world population, especially in developed nations. Looking back in history, not all countries experienced the baby boom in that period. USA, Canada, and countries like Great Britain, Italy or France did, but many others did not such as countries in Africa, Australia and New Zealand. According to the Pew Research Center (2018), there were an estimated 74.1 million baby boomers in the USA in 2016.

Baby Boomers have been attracting the attention of numerous scholars. They are particularly interested because they are large age cohort starting to enter the age of retirement and later life with different lifestyle and attitudes than the previous generation, which calls for different social and public policies (Biggs *et al.* 2007, Phillipson *et al.* 2008, Wilson and Simpson, 2012). Baby boomers see themselves as a generation that bridges the gap between old ways of their parents and significantly different views of the next generation (Leach *et al.* 2013).

What makes this generation different from previous generations? According to various researchers (e.g. Young and Tinker, 2017, Leach *et al.*, 2008, Kahana and Kahana, 2014, Siren and Haustein, 2016, Chambré and Netting, 2016) a term ‘baby boomers’ denotes following (selected) characteristics:

¹ Generation names and age spans are defined somewhat differently depending on country and/or region but this roughly holds true (names and age spans): globally: Baby Boomers: 1946–1964, Generation X: 1965–1980, Millennials: 1981-1996, Post-Millennials/Generation Z: after 1997. See for more details: https://www.catalyst.org/research/generations-demographic-trends-in-population-and-workforce/#footnote22_25ne5s3 (accessed 17.03.2019.)

- ✦ high level of education technological proficiency and a youth self-image;
- ✦ longer working lives as well as increased level of employment at an older age;
- ✦ higher rates of home ownership and desire to live at home independently as long as possible;
- ✦ higher rates of divorce as well as less high rates of childless;
- ✦ a higher level of consumption and different consumption patterns focusing on products that enable them active and healthy aging;
- ✦ a higher level of independence and mobility.

Identifying and researching these characteristics of baby boomers is extremely important because they reflect their needs and priorities in later life. This impact is not a solely an individual issue but has business and policy implications. For example, a high level of childless and the fact that they own their own house may be a signal to entrepreneurs to offer innovative housing solution for elderly, which provides a significant business opportunity. This is already happening. Namely, smart homes for the elderly is a new step in adapting the living space to the needs of elderly people. By combining various home appliances in a creative way (audio and video systems, lighting, window blinds, air conditioning heating, and cooling systems, anti-theft systems and other security systems etc. these homes offer longer independent living of aged placing a less burden on the government to secure solution for elderly housing and care.² Another example related to baby boomers desire to be independent and mobile as long as possible is the question of car use. Traditionally, retirement means less car use as a consequence of it. Yet the research suggests that baby boomer will continue to use it for leisure purposes, which increases with retirement. It is likely that this generation will affect demand for transport in a different way that the previous generation had done it (Siren and Haustein, 2016, Chambré and Netting, 2016).

Even though this paper does not provide a thorough analysis of baby boomer' characteristics and their impact on the various economy sector, it is still very

² Deutsche Telekom believes that 100 million homes worldwide will be conceived as smart homes, and that number will triple over the next ten years. Strategy Analytics, a market research firm, believes that the smart home market will be worth 15.5 billion EUROS by 2019, and will account for almost a quarter of world market value estimated at 55.8 billion Euros. For more details see Forbes, <https://www.forbes.com/sites/freddiedawson/2015/09/30/smart-home-sector-could-be-worth-hundreds-of-billions-in-next-five-years/#5c266da96a20> (accessed 19.3.2019.)

much clear that business sector and policymakers cannot respond it in a way they have been used to. As baby boomer generation changes the way they look at aging and their working and lifestyle past the traditional age of retirement, so should policy makes. According to Bloom *et al.* (2008), it seems that the problem of population aging is not so much problem of demographic change but rather of rigid and outmoded policies and institutions.

4. CHALLENGES FOR POLICY MAKERS

“Every industry is going to be affected by the aging population. This creates tremendous opportunities and tremendous challenges.”

Pat Conroy

Institutions and policy environment is extremely important when it comes to the aging population (Pifer, 1986, Paterno, 2011, Naaldenberg *et al.*, 2012, Keyes and Dicke, (2016). One has to bear in mind that the aging population is still on the way and that the majority of the aged population increase will happen in years to come. That gives a chance to policymakers to create a policy environment, i.e. institutional and legal framework, just in time to exploit the potential opportunities and manage risks of projected demographic upheaval.

Several policy suggestions should be in the focus:

1. *Evidence-based policies:* population aging is a multidimensional challenge. Thus, intensive and continuous multidisciplinary research on aging population is a *condition sine qua non* for government to create policies that will be better aligned with realities of an aging population which will promote aging as an opportunity, not a threat. Generations that will become retirees are changing in terms of what they expect and plan for their old age. Thus, it is necessary to have more data systems, research capacities and coordination between various cross-cutting themes across policies such as health policy, tax policy, labor policy etc. Results, i.e. evidence obtained will be important policy input for government and policymaking.
2. *Retirement, Social Insurance System and Economic Security:* changes in retirement incentives represent a policy response to people who desire to work at older age assuming they have mental and physical abilities

to do so. Also, it would be useful to consider more flexible pension arrangements as well as increasing the official age of retirement. One has to think of the economic security of older people through various incentives for older to continue to work, tax incentives for workers or tax incentives for individuals retirement savings.

3. *Lifelong long learning and education programs*: if older people want to remain in the workforce they need to adapt their knowledge and skills to ever-changing the economy. Academia can play a significant role in it by providing, for example, the concept of the university for the third age with lifelong learning programs adjusted to the labor market demands.
4. *Demographic renewal*: having children today seems to be rather demanding due to numerous pressures coming from continuous changes, increased competition at workplace etc. Improving conditions to child-bearing and having a family would mean, among else, to have policies encouraging a balance between work and family life by e.g. state-funded childcare, more flexible working hours for parents etc.
5. *Supporting older worker to remain active as workforce*: older workers are often a target for discrimination and stigma, thus the policy should be focused on eliminating all age-based discrimination at the workplace. With proper lifelong learning education and potential changes in the workplace itself, older people can still be valuable human resource considering their important characteristics such as loyalty, experience, wisdom, no need for changes in career etc.
6. *Eliminating cultural and societal bias towards old(er) population*: one should not forget that older people are often stereotyped as grumpy, fragile, sluggish and the like, thus the policy effort should be focused on changing a cultural mindset towards elderly. Increased media attention should be paid to proactive seniors, who are getting more involved in volunteerism or become entrepreneurs, who travel and experience in order to change a collective sentiment that older people are a burden. Policymakers themselves should be aware of changes in demographics in communities they serve and start to think strategically on how to support the growing number of older people with limited public resources they have.

7. *Supporting family caregivers*: many family members have a responsibility to provide caregiving to their older family members which put a lot of pressure on their personal and professional life. It would be useful to consider help for family members in terms of financial relieves for caregiving, tax credits and the like. Finding for more health care professionals is also an indirect way to help families in providing long-term care for their needed ones.
8. *Considering immigration as demographic corrective*: since the aging process does not occur at the same pace across the world regions, and the wealthier regions are aging faster than poor ones, migrations seems like a way to reveal the pressure on the economy and labor market. Namely, immigration from developing world to developed countries can mitigate that negative effect which calls for politically feasible migration policies. Immigration should be a part of the solution to population aging.

These selected policy challenges serve as a highlight of issues for (future) policymaking. Since population aging is a multidisciplinary challenge, policy-makers should focus on creating and/or innovating health, social and economic institutions to serve better the needs and expectations of the elderly.

5. CONCLUSION

“Age is not lost youth but a new stage of opportunity and strength.”
Betty Friedan

Population aging is a global trend with far-reaching economic, social and policy implications. The way older people look at themselves and the society look at them is changing. This is due to the series of improvements in living conditions and lifestyle as well as changes happening in science, technology, medicine etc. All of that represents a challenge for policymakers as older people have different values and pursuit different social and work engagements, as well as lifestyles, from generations that preceded them.

Efficient public policy regarding the aging population means understanding well the demographic changes that are taking place and what they bring to the economy and society. One has to be aware that demographic changes require the change of mindset of policymakers themselves in order to create policies

that will meet the needs and expectations of the elderly. Demographic context, as well as political and economic system, will also play an important role in creating a policy environment. The practice across the globe show that some countries rely on state-run programs aimed at elderly while in the other the state has less of the role. Whether private or public, beneficial aging policy is the only solution to handle aging with deserved care.

Abstract

In April-May 2018 an online questionnaire survey with a sample of 1,085 respondents was implemented in order to get an insight into the attitude of the Hungarian population concerning tourism, in a breakdown by generations. The survey was representative of the Hungarian population aged 15-74 as regards gender, age groups (10-year intervals) and the region of the place of residence. Five indices were applied in the analysis: gender, generations, settlement category of the place of residence, level of school education and subjective assessment of the income position. The paper analyses those findings of the research that are related to the impact of tourism on the quality of life. We are looking for the answer to important questions like how much tourism, an extremely important social phenomenon of our age, is seen by consumers as a factor significantly influencing their quality of life, and to what extent tourism is the source of happiness for them. During the analysis, we use statistical methods to find out whether there are statically verifiable (so-called significant)

differences in the responses to certain questions by the respective demography groups and the different consumer groups designated by the different variables analyzed. The research findings give us useful information for the organization of human resources management and tourism management, both as regards the Hungarian businesses and tourism destinations.

Keywords: *tourism, quality of life, happiness, generational differences, age groups.*

Jel Classification: L83, Z32

1. INTRODUCTION

In the second half of the 20th-century tourism became a global societal phenomenon. Tourism activities have almost become part of the basic human needs of the inhabitants living in developed countries; they must be seen as a dominant means of passing leisure time. It has become so significant that it has a considerable impact on general wellbeing, living standards and the quality of life, and also the happiness of people. The complex examination of this issue was a selected topic of tourism researches in Hungary in the first decade of the new millennium; it was given significant attention by academics. Using the research findings of this period, as a sort of organic follow-up, we started to survey the issue again. The possibility of achieving new research findings was given by a questionnaire survey using a representative sample, implemented with the financial assistance of the European Union. The quick analysis of the research findings was done (Csapó et al. 2018), the detailed in-depth analyses will be constant work for the members of the research team. This paper too was written as part of this work process. In the case of several tourism product types the connection to the quality of life is evident – just think of health tourism where the primary motivation is the preservation of the good health condition (wellness tourism) or the alleviation of the severity of illness, or rehabilitation (medical tourism). Also, good well-being and thereby improved quality of life are offered by the aesthetic and intellectual experience that we can get from cultural tourism, but ecotourism that can be pursued as part of living a healthy life (see the LOHAS lifestyle group) can also be mentioned as a kind of tourism improving the quality of life. The present research is an abstraction from the concrete tourism products: we sought the answer to the general question of how people judge the impact of tourism on their quality of life and happiness.

2. LITERATURE REVIEW

The surveys of the quality of life started as soon as in the 1960s and 70s. In the different international researches, the issue was looked at from several aspects: psychology, economics, sociology, and politics (Diener 1984). At this time the role and significance of tourism were not included in the examinations (Michalkó 2010), although the number of international tourism arrivals ran into hundreds of million by that time, and its continuous and dynamic growth projected its increasing social importance. A major part of the examinations of the first research period was the interpretation of the quality of life, but, approaching the new millennium, researchers started to reach a consensus inasmuch as the quality of life can be seen as the joint dimension of objective factors determining human existence, on the one hand, and the subjective reflections of them, on the other hand (Kiss 2015, Diener et al. 1999). The first papers on the relationship between tourism and the subjective quality of life were published in the academic literature in the 1990s (Dobos & Jeffres 1993, Richards 1999).

The research of the connection between quality of life and health has significant traditions and a considerable volume of professional literature in Hungary (Kopp 2008, Kopp-Kovács 2006), however, the relationship between tourism and the quality of life was given little attention within Hungarian tourism researches, apart from a case or two or a few research programmes. Several types of research and papers were made in the topic of the quality of life, the authors made attempts to comprehensively interpret and approach the concept, but the positive impact of tourism on the quality of life did not seem to grab the attention of the researchers (Michalkó 2010). The research findings by Utasi (2006) were the first to feature the statement that several elements of subjective well-being were connected to tourism. Of the researchers implemented after the millennium, one that is of outstanding significance for our topic is the OTKA (Országos Tudományos Kutatási Alapprogramok, i.e. Hungarian Scientific Research Fund) research programme led by Gábor Michalkó (Michalkó 2010), and his previous researches connected to our topic to some degree (Michalkó 2005, 2007, Michalkó-Lőrincz 2007, Michalkó et al 2009, Kovács et al 2006). It was only after the millennium that political decision-makers started to focus on the correlation between tourism and the quality of life. One of the main objectives of the The National Tourism Development Strategy approved in 2005 was the optimization of the impacts of tourism on the quality of life (Turizmus Bulletin 2005 special edition, Govt. Decree 1100/2005 (7 October)).

Probably this was the foundation of the representative survey of a sample of 11,500 respondents, implemented by the Hungarian Central Statistical Office, in cooperation with State Secretariat of Tourism of the Ministry of Local Governments and Regional Development, Hungarian tourism Inc. and the Geographical Institute of the Hungarian Academy of Sciences (Michalkó 2010). The research focused on the impact of traveling on happiness (i.e. travel as a source of happiness) and the impacts of travel activities on the quality of life.

Research on the quality of life had been done before as well, and the Hungarian literature on this issue is quite extended too (Sebestyén 2005, Ágoston 2007, Utasi 2006); however, the HCSO survey of 2007 and the parallel research programme mentioned above, led by professor Michalkó were pioneer works. The positive impact of the change of environment on regeneration and on the satisfaction of different human needs had been researched before, and tourism science had discovered the issue to the necessary depth (Puczko-Rátz 1998, Michalkó 2007). Nowadays the tight connection between experience and tourism is evident for the professionals, as the modern definition of tourism is “change of the environment coupled with gaining experiences” (Michalkó 2007). This definition has directly led us to the connection between tourism and happiness. In his work, Csíkszentmihályi describes happy moments as a flow experience, and he chooses an example from tourism to illustrate this: skiing (Csíkszentmihályi 2001). We firmly believe that every experienced traveler can come up with beautiful examples reinforcing happiness from their own previous for experiences. This is exactly why we find it important to examine to what extent active participation in travel activities, i.e. “being a tourist” increases the happiness of the participants, whether it impacts their quality of life and if there is a discrepancy among the generations in this respect. The survey of this issue cannot be indifferent to political decision-makers, either, as the continuous improvement, upgrading of the quality of life of the population is a task of selected importance for modern governance work (Bianchi 2007). In the surveys of the connection of tourism and quality of life, it is not only travelers but also local inhabitants and tourism service providers that must be taken into consideration (Andreck et al. 2007.) Despite all these, in Hungary, this topic was not in the mainstream of tourism researches, although a “society where happy people live is much more open to the world and sensitive to environmental issues” (Michalkó 2010. p. 108). This is why we found it important to focus again in this research on the relationship between tourism and the quality of life, of tourism and happiness

in the framework of an attitude survey. In line with the issue, we also look at consumer habits visible in the changes of impulses related to tourism. We know it from the theory of the development of tourism products (Gonda 2016) that the same person can prefer both slow and fast tourism products, depending on his/her situation in life. As a reinforcement of the known trends of tourism (Töröcsik-Csapó 2018), the findings of our research also supported that tourism activities are basically no longer about the sweetness of doing nothing, as almost half of the travelers are characterized by physical efforts and dynamic consumer behavior.

3. METHODOLOGY

The findings of the research were gained by the use of three methods: by a questionnaire survey personally and online, using a nationally representative sample, and the implementation of three focus group discussions. We conducted an *online questionnaire survey with a sample of 1,085 respondents* in April and May 2018 in order to examine the attitudes of the Hungarian population concerning tourism, in a generational dimension. The survey was representative of the Hungarian population aged 15-74 as regarded gender, age groups (10-year intervals) and the region of the place of residence. The processing of the findings was done in two steps: first the primary (frequency) analyses are demonstrated. This paper too was made as a part of this work phase. This work will be followed by a demographical background analysis. During this, SPSS programme, statistical methods will be applied whether there are statistically verifiable (so-called significant) disparities among the responses of the respective age groups to the questions. The variables included in the analyses were gender, generations, settlement category of the place of residence, higher finished school education, and the subjective judgement of the incomes.

Personal questioning of 2,001 respondents was implemented in April and May 2018 with the objective of examining the behavior and opinion of the Hungarian population concerning several topics. These topics were as follows: aging, health innovations, tourism, eating habits, cultural activities, and lifestyle. The survey was representative of the Hungarian population aged 15-74 as regarded gender, age groups (10-year intervals) and the region of the place of residence. In this survey, tourism had an inferior role, but these findings are also taken into consideration for drawing the right conclusions.

At the survey of the connection between tourism and the quality of life, respondents were asked to read 7 statements, and they had to indicate to what extent they agreed with the respective statements, quantifying their level of agreement in a 5-point Likert scale. Respondents who chose 1 definitely rejected, the ones opting for a two rejected to a smaller extent the statement, i.e. they disagreed with it. Those indicating a value “four” agreed to a smaller extent (rather agree) and the ones choosing value “five” totally agreed with the answer. It is problematic, on the other hand, to interpret the personal attitudes of those who opted for value “three”. We can doubtlessly say that they did not reject the statement, but they did not commit themselves to accept it, either. Whether this dilemma means that they are more likely to reject or to accept the statement will be revealed by a more in-depth analysis of their responses in the questionnaire, using the methodology of subjective Likert scale. This, however, will only be done in the following phase of the research.

4. RESULTS

The first question was used to detect how the population judged the importance of tourism in their own lives – whether it makes people’s life more complete, or they do not feel such a strong correlation between tourism and the quality of life. The respective statement that travel/holiday makes their life more complete was fully agreed with 50.9% of respondents, whereas 21.4% of them indicated the “rather agree” option (value four on the scale). The very high proportion of those who agreed (72.3%) is a clear-cut indication of the fact that tourism plays an important role in the lives of almost three-quarters of the Hungarian population, it is a significant factor in their quality of life. The very low level of disagreement with this statement is another indicator of the fact that respondents, in general, consider tourism as a societal phenomenon important in making their lives more complete. There were only 3.6% who totally disagreed with the sentence, and another 4.4% chose the option “rather disagree”, i.e. value 2 on the scale. The combined share of those rejecting this statement did not reach more than 8%. The exact percent values of the responses given to this question are featured in Figure 1.

Figure 1: Breakdown of responses to the question “Travelling/holiday makes my life more complete”

Source: edited by the authors.

Our second question was asked to detect the subjective judgment of the correlation between happiness and tourism. As we have already discussed in the theoretical summary, the examination of the connection between happiness and tourism is not a new thing, and our research reinforced the formerly already discovered strong relationship. Almost 80% of respondents believe that they are made happier by the experience of the travelling/holiday (the proportion of those who totally agreed was 55.6%, that of respondents who rather agreed was 23.9%). Accordingly, the rejection of the statement is very low: only 5.1% think that traveling does not influence happiness – 2.6% definitely and another 2.5% rather disagreed with this statement (Figure 2)

Figure 2: Breakdown of responses to the question “The experience of the travelling/holiday makes me happier”

Source: edited by the authors.

After learning from the previous two questions that a dominant part of the Hungarian population think that tourism makes life more complete and happier, the third question was used to examine to what extent traveling/holiday becomes part of one's life. Unfortunately, almost 10% of respondents (9.2%) are probably excluded from being actively involved in tourism, as they totally rejected this statement. Another 11.1% shoes value 2 on the scale, i.e. also disagreed with the statement that tourism is part of their lives. If we compare the findings of the first two questions with those of this one, we can draw the conclusion that even those respondents in whose lives traveling and holiday are important parts at all agree that tourism can make one's life more complete and tourism can contribute to the to increase the feeling of happiness. Over half of the respondents believe that to a smaller (18.9%) or greater extent (36.9%) traveling/holiday has already become part of their lives (Figure 3).

Figure 3: Breakdown of responses to the statement “Travelling/holiday is part of my life”.

Source: edited by the authors.

The survey also supported that tourists, stepping out of the daily routine of their everyday lives, want to have completely different experiences when traveling. Only 6.4% of the respondents were of the different opinion (2.7% and 3.7%, respectively), as opposed to almost half of them (48.1%) who totally agreed with this statement and another 26.8% who rather agreed with it (Figure 4).

Figure 4: Breakdown of responses to the statement “I want to have experiences totally different than the weekdays when I travel”

Source: edited by the authors.

What comfort do people expect during their travels? Should the comfort level be similar to what they get at home, or do people like versatility and react flexibly to the given circumstances when traveling? This was the question to which we sought the answer. We presumed that getting experiences is what matters the most and the aspects of comfort are less important compared to this. The research findings, however, do not fully support this. More than half (53.4%) of respondents agree with this statement, i.e. they expect that the comfort level and the quality of service should reach at least the level that they are used to at home (Figure 5). A very large proportion of respondents cannot decide whether to agree or disagree with this statement (which is indicated by 29.9% of them giving a value “three” on the scale). The proportion of those who definitely do not need the comfort level of their home is only 13.8%.

Figure 5: Breakdown of responses to the statement “During my travel the comfort and the quality of services should be the same as at home”.

Source: edited by the authors.

When looking at the practice of tourism, the intention of consumers to change impulses is a striking phenomenon for the researchers. In many cases during the travels/holidays, participants change their rhythm: after the overburdened weekdays they slow down in their holidays, they are observing and enjoy the pleasure of the possibility of not doing anything, and after the boring office work they desire some physical activity, adventure, and days full of happenings. Depending on their life situations, the same person can develop needs for different types of activities. This is also supported by the evaluations of the responses given to the two questions below (Figure 6).

Figure 6: Breakdown of responses to the statement “During my travel/holiday I change the rhythm: I like slowing down, observing, having a rest, immersing, or I live more actively, more dynamically and adventurously”.

Source: edited by the authors.

The chart above demonstrates that slightly more people choose the possibility of slowing down during their travels/holidays (55.4%) than the increase in their activities (47.2%). At the same time, this also shows that using leisure time for tourism is no longer about the sweetness of doing nothing, only. Although 19% of respondents disagree with the statement that they speed up and become more dynamic during their travels, almost half of them occasionally choose the increase of their physical activity, speeding up when traveling. We can say that notwithstanding the increasing trend of physical activity, tourism is still more closely linked to having a rest, slowing down, contemplating and accordingly the rejection of this is at a very low level (the combined value of responses indicating values 1 and 2 on the scale is 15.7%.)

5. A BACKGROUND ANALYSIS OF THE QUESTIONS EXAMINING THE RELATIONSHIP BETWEEN TOURISM AND QUALITY OF LIFE, AND TOURISM AND HAPPINESS

The use of the IBM SPSS statistical software allows us to examine whether the responses of the persons questioned show significant correlations to the following factors examined: place of residence, gender, age, school education and subjective judgment of income. We are in the initial phase of these analyses, but during the analysis of the impact of tourism on the quality of life and hap-

piness we could justify the research hypothesis that it is primarily the financial situation and schooling of a person (we may not exaggerate when we talk about his/her cultural level) that determines what impact touristic activities will have on the life, happiness, and experiences of an individual. In the case of the first three questions (traveling makes life more complete; traveling increases happiness; traveling is part of my life), there is a very strong correlation between schooling and the financial position. The higher the level of school education and the better the financial situation, the larger the proportion of those who totally agree with these statements. The statement that traveling makes life more complete was totally accepted by 40% of those who had finished primary school, the same proportion as those with university diploma was 60.8%, i.e. they chose scale value 5 in a more than one and a half times larger proportion. Also, parallel to the increase of the schooling/cultural level, an increasing number of respondents say that the experience of traveling/holiday makes them happier. Of those with primary school education, 48.6% opted for value 5 on the scale, whereas college and university degree holders did so in proportions over 60% (61.7% and 63.4%, respectively). An even bigger difference can be seen in the evaluation of the statement "travel is part of my life": 20% of respondents with primary school education definitely agreed with this, while the proportion of college and university graduates who were of the same opinion was more than twice of that (44.3% and 44.9%, respectively). The correlation to the financial situation is even stronger: there is an evident and strong significant connection between the financial situation of a person and the impact of tourism on his/her lifestyle. Almost two-thirds of those really well off feel that tourism makes their lives more complete, while the same proportion at those struggling to make ends meet is less than one-third. The proportions are similar if we look at the impact of tourism on happiness. Of the five groups by financial situation, at the two in the best position, the place of residence of those of totally agree that tourism makes their lives happier is approximately 2/3, while only 1/3 of the respondents in the groups struggling with financial problems think so. However, even this result is worth attention, as the splendor of tourism and its societal significance is proved by the fact that one-third of even the poorest layers think that tourism makes their lives happier. The extent to which tourism can become part of one's life is clearly determined by the financial situation. The disparity between the smallest and largest proportion (14.9% and 58.9%, respectively) is almost fourfold.

6. CONCLUSION

Our research findings reinforced the connection between tourism and the quality of life, already discovered before. For the majority of the inhabitants living in Hungary traveling making holidays is important, as tourism makes their lives more complete and happier. Tourists, in search of new experiences, would like to break out from the daily routine but at the same time expect comfort, at least at the level that they are used to at home. The majority of them want to have rest, but a growing share of them choose different forms of active recreation.

When we looked at the answers to our questions by the features of the respondents, we found significant differences. In those questions where we examined the relationship between traveling and the quality of life, we found a strong correlation between the income position and the level of schooling. Respondents with more schools and in better financial situation agreed in larger proportions with the positive impact of tourism on the quality of life and on happiness. The research also demonstrated an evident correlation between the financial situation of tourists and the impact of tourism on the quality of life.

The findings of our research may contribute to the theoretical background of tourism management, especially to the development of the methodology of the analysis of target groups connected to the respective tourism products but also to the process of tourism product development. At the same time, when designing the human resources management policy of companies, important aspects are the improvement of the quality of life of employees and the promotion of their rest and recreation. In this, special attention should be paid to the different motivations and considerably diverging needs of persons with different levels of schooling and financial backgrounds.

Abstract

Increased industrialization leads to water pollution with heavy metal ions. Heavy metals in drinking water appear lately increasingly often. Drinking water contains them in small quantities that are permitted by the regulations in force, but as our knowledge about all the harmful effects of these substances is still incomplete, many believe that even a small quantity of harmful substances can be potentially dangerous. Due to the strict regulations and greater efforts to safeguard the environment by removing these ions from water is the subject of a lot of research. Today, different methods are used with the aim of is trying to achieve the effective removal of Cu, Zn, Pb, Cd, Ni, and Cr from the waste stream. The paper will describe the application of an adsorption process to remove heavy metal ions using the properties of natural zeolite, which according to previous research can effectively remove traces of heavy metal ions from the contaminated water by selecting appropriate settings. According to the published information, the method of adsorption with the use of zeolite can achieve efficient removal of Cu²⁺, Zn²⁺, Pb²⁺, Cd²⁺, Ni²⁺, Cr³⁺ ions. The most commonly used and most effective zeolite for removing heavy metals from water is clinoptilolite. According to recent findings and research results it

can be concluded that natural zeolite with an increased proportion of clinoptilolite as active components and their chemical modification has a great potential to remove the heavy metal ions during the final stage of water treatment.

Keywords: *water, pollution, heavy metal ions, adsorption, clinoptilolite*

JEL Classification: Q57, Q59

1. THE IMPACT OF INDUSTRIALIZATION AND URBANIZATION ON WATER

In urban areas, the quality of surface and groundwater is most endangered by industrial, municipal and precipitation wastewaters. Acute impacts are shown abruptly and intensively at the point of discharge of wastewater into natural recipients and are especially expressed in dry periods when dilution processes in surface water recipients are minimal. High concentrations of degradable organic matter, ammonia, and heavy metals, as well as pathogenic microorganisms, causing surface water and groundwater contamination, which are directly related to the contaminated recipient. The cumulative effects of wastewater discharges into surface recipients are seen by the gradual deterioration of water quality, which becomes apparent only after some of the quality parameters reach the critical value or maximum permissible concentration (MPC).

One of the most significant indicators of pollution is the content of dissolved oxygen, which is drastically reduced if there is organic contamination in the water. Organic pollution is also indicated by biological oxygen demand (BOD) that affects the amount of oxygen needed to biodegrade the organic substance by microorganisms. Although BOD is not the most reliable indicator of the number of organic substances or substances that hinder growth of microorganisms, it is still used to dimension the wastewater treatment plant.

The indicator of the amount of organic non-degradable substance in water is chemical oxygen demand (COD), calculated from the consumption of the oxidizing agent necessary for the complete degradation of the non-degradable substance. Along with various toxins, such as hydrocarbons and heavy metals, in wastewater there are more and more modern synthetic organic chemicals such as drugs and hormones.

2. HEAVY METALS IN WATER

Heavy metals as fine particles of dust come into the atmosphere, from where they are deposited in water and soil. In water they are rapidly diluted and deposited as carbonates, sulphates or sulphides at the bottom of the water surfaces. The circulation of heavy metals is particularly intensified through a process called biomethylation. Particularly toxic are metal-organic compounds of mercury, lead, chromium. As for chromium, unlike its trivalent form the hexavalent form is toxic and causes serious consequences such as liver and kidney failure, digestive tract damage and carcinogenic changes (Days, 1996).

It is known that heavy metals (mercury, lead, cadmium, chromium, arsenic) have a negative effect on the body, and their accumulation in the body over a long period of time can cause serious disorders and illnesses.

The ever-increasing presence of heavy metals in water is the biggest consequence of widespread use in the industry. Heavy metals are not degradable and are successfully implemented in soil and water sediments. Permissible concentrations of heavy metals in water are shown in Table 1 [32].

Table 1 Permissible concentrations of heavy metals in drinking water

Metal	U.S Environmental Protection Agency	World Health Organization
As	50 ppb	50 ppb
Cd	5 ppb	5 ppb
Pb	20 ppb	50 ppb
Hg	2 ppb	1 ppb

3. ZEOLITES

Zeolites, Picture 2 (Gottardi G. et al., 2008) are hydrated aluminosilicates, of a unique three-dimensional structure composed of primary and secondary SiO_4 and AlO_4 tetrahedra units, interconnected by oxygen atoms, the pores of which contain water molecules. The zeolite structure is characterized by a specific cross-linked structure with cavities that are interconnected by channels of a particular shape and size (Gottardi G. et al., 2008).

Picture 1 Electro - microscopic picture of zeolites

Source: Gottardi (2008)

For now, about 50 natural zeolites have been discovered, which differ in composition, mode of networking in a three-dimensional structure and pore dimensions. There are only six in the vast quantities in nature: habasit, clinoptilolite, mordenite, erionite, heulandite, and phillipsite. After discovering the catalytic ability of natural zeolites to increase activity and selectivity, a large number of these minerals with precisely defined pore size and selectivity were synthesized in laboratories. So far about 200 artificial zeolites have been synthesized.

About 25 years ago 300,000 tons of natural zeolites were produced annually in the world, today it is about 4,000,000 tons per year. In 1997, about 3,600,000 tons were produced, mostly clinoptilolite and habasit, of which 2/3 in China. Demand for natural zeolites as well as their application in the last decade is expanding very rapidly. The increase of 10 % in zeolite production is expected annually. Depending on the quality and purity, the price of natural zeolites ranges between 50 and 300 USD per ton. Zeolites, by their structural properties, belong to a group of porous crystals. The most important characteristics of zeolites are:

- ✦ high level of hydration and zeolite water,
- ✦ high thermal stability,
- ✦ ion exchange,
- ✦ channels, pores and cavities of molecular dimensions and
- ✦ molecular sieve effect.

Picture 2. Three-dimensional zeolite structure

Source: Vojnović et al., 2013; Baerlocher, 2001

Cavities and channels in natural zeolite contain water (up to 25% of their mass). The surface negative charge of the aluminosilicate structure was sampled by isomorphic substitution of Si_{14}^{4+} with Al_{13}^{3+} and was compensated by hydrated alkaline and alkaline earth cations (Baerlocher, 2001) which can be modified with ions (cations) from the solution in contact with the zeolite (Vojnović et al. 2013). The nature of the ionic link between these cations and the zeolite crystalline lattice allows their mobility, replacement with other ions or dehydration without decomposition of the silicate skeleton. Figure 3 (Vojnović B., 2011) shows us three-dimensional zeolite structure.

Silicon or aluminum atom, also called T atom, is in the center of the tetrahedron and is surrounded by four anions of oxygen. Tetrahedrons can be arranged in regular structures in an unlimited number of combinations, forming various three-dimensional creations with well-defined pores. Schematic representation of zeolite formation is shown in Figure 4 (Gottardi G. et al., 2008).

Figure 3. Schematic representation of zeolite formation

Source: Gottardi G. et al., 2008

In addition to silicon, aluminium and oxygen, whose pores contain water molecules that form the basic structural unit, zeolites inside the pore may contain other cations: sodium, magnesium, calcium, potassium. The pores within the zeolite are of the molecule size, and the channels are arranged uniformly throughout the entire structure. Therefore, it is obvious why these materials are often referred to as molecular sieves (their pores are the size of molecules and are selective according to the size and shape of the molecule). Many of these materials can be found in nature, while synthetic zeolites are produced and used for commercial purposes or used in laboratories in which their features are examined and their possible application in industrial practice.

Various natural zeolites in the world have shown the ability of ion-exchange for cations such as ammonia and heavy metals. By introducing an active metal cation into the zeolite structure, which can be achieved by a direct method in the synthesis of zeolites or the ion exchange post-synthesis method, a significant increase in the activity of zeolite catalysts in the oxidation processes of organic pollutants in the aqueous phase is achieved.

Due to its high cation exchange capacity as well as molecular properties, natural zeolites are widely used as adsorbents for separation and purification in the last decades.

3.1 NATURAL ZEOLITE PROPERTIES

There are many identified natural zeolites in the world. Clinoptilolite, mordenite, stilbite are just some of the forms of natural zeolites found in nature. The most widely used and most widely used zeolites are clinoptilolite. Looking at the structure of zeolites we find three relatively independent components:

- aluminosilicate frame
- exchangeable cations
- zeolite water

General zeolite formula: $M_{x/n} [Al_x Si_y O_{2(x+y)}] \cdot pH_2O$

The primary structure of the zeolite is tetrahedron, the center of which is occupied by an atom of silicon or aluminium with four oxygen atoms on top. By substituting Si^{4+} with Al^{3+} , the negative charge of the framework is defined, which is compensated for with the monovalent or bivalent cations in the water. The aluminosilicate framework is a stable component that defines the structure of zeolites. Water molecules may be present in the cavities and connected with ionic frames by aqueous bridges. Water can also serve as a link for exchangeable cations. Significant characteristic of zeolite is the ability to exchange ions with the outer medium. The ion exchange balance is described by the following formula:

$z_B A^{z+A} + z_A B L_{zB} \Leftrightarrow z_A B^{z+B} + z_B A L_{zA}$ (Passaglia;2008) where: - z_A^+ and z_b^+ are valencies of the corresponding cations, - L part of the zeolite framework containing the negative charge.

The ionic exchange behaviour of natural zeolite depends on several factors that include the frame structure of the ion, size and shape, charge, density of the anionic framework, concentration of the external solution of the electrolyte. Regarding the influence of the surrounding environment, natural zeolites have a different chemical structure and cation exchange capacity (CEC). From Table 2 (Wang S. et al., 2010), it can be seen that the cation exchange capacity is between 0.6 and 2.3 meq/g.

Table 2 Chemical structure and capacity of cation exchange of zeolites depending on the site

Zeolite	Chemical composition (%)								CEC (meq/g)

Source: Wang S. and Peng Y., 2010

The adsorption characteristics of any zeolite depend on the detailed chemical/structural composition of the adsorbent. The ratio of silicon and aluminum, the type, number, and location of cations are factors that have a particularly strong influence on adsorption. Chemical treatments can change these properties to improve the efficiency of natural zeolite adsorption.

3.2 CLASSIFICATION OF ZEOLITES

The classification of zeolites according to Smith, Fischer, Meier, and Breck is based on grouping according to the topology of the crystal grid. The division consists of seven zeolite groups of different structures. Within each group, zeolites have a common structural unit with a specific tetrahedron arrangement (Al, Si) O₄. In some cases, the zeolite skeleton is represented as a polyhedron or ultimate octahedron. From Table 3 (Ordinance on Drinking Water Health OG 47/08) there is a visible zeolite classification based on secondary and structural elements with the representatives.

Table 3 Classification of zeolites based on secondary and structural elements

Group	Secondary structural unit	Representative
1	Single 4-ring	Analcime
2	Single 6-ring	Erionite
3	Double 4-ring	NaA
4	Double 6-ring	NaX, NaY
5	Complex of 4-1 units T5O10	Natrolite
6	Complex of 5-1 units T8O16	Mordenite
7	Complex of 4-1 units T10O20	Stilbite

Source: Ordinance on drinking water safety OG 47/2008

3.3 ACTIVE ZEOLITE CENTERS

The catalytically active centers on the surface of the zeolite have an acidic character and are mainly located on the inner surface of the zeolite. Brønsted's acid centers are donors of protons, and Lewis's acceptors of an electron-pair. Brønsted's acidity in zeolites is shown in Figure 5 (Gottardi G. et al., 2008).

Figure 4. Brønsted acidity in zeolites

Source: Gottardi and Galli, 2008.

Catalytically active centers can be classified into three groups:

- network hydroxyl groups that act as Brønsted acids or bases
- Lewis acid centers within a network such as (AlO)+
- cations in the zeolite network

Under certain conditions, there is a possibility of replacement of Lewis and Brønsted acid centers.

4. WATER TREATMENT BY USING ZEOLITES

The use of natural zeolites to remove heavy metals from water is still at the beginning. Most of the literature refers to isotherm modifications and corresponding equilibrium and thermodynamic data, but there is little testing of the removal of heavy metals from real wastewater or even from model solutions that simulate real wastewater.

The application of natural zeolites is based on four basic structural and physical-chemical properties:

- the existence of hydrated alkaline and alkaline earth cations that have ion exchange properties,
- the existence of structural cavities forming pores and channels of large internal specific surfaces,
- the existence of strong acidic sites in the structure of zeolites,
- similarities in chemical composition with composite materials.

In 1984, Blanchard et al. examined the selectivity of clinoptilolite for heavy metal cations in the presence of ammonium ions. Using low mass concentration solutions ($10\text{-}50\text{ mg dm}^{-3}$), the following range of selectivity was obtained (Passaglia; 2008):

In 1990 Zamzow and his associates investigated the removal of heavy metals and other cations from acid industrial wastewater. By treating wastewater from copper mines, they managed to lower Al^{3+} , Fe^{3+} , Cu^{2+} and Zn^{2+} concentrations below the concentrations permitted for drinking water. The experiments were conducted by colonization (Passaglia; 2008).

4.1 REMOVAL OF HEAVY METALS FROM WATER BY ZEOLITE

Removal and recuperation of heavy metals from the aqueous environment using natural zeolite is a cyclic process involving metal recuperation and regeneration of zeolites to be re-used. In addition, the mineral stability of zeolites and their structural changes within the treatment are very important for the potential use of zeolites as ion exchangers. Many scientists have explored several aspects of heavy metals removal from wastewater using the clinoptilolite, most commonly used natural zeolite (NA, K, CA) $4\text{Al}_6\text{Si}_{30}\text{O}_7_2$ (Passaglia;

2008) and other zeolites. The nature of the process, as well as the factors that influence the process, are very intriguing.

4.1.1 The process of removing heavy metals by zeolite adsorption

The chemical treatment of the zeolite starts by adding 0.25 L of 2M HCl and NH_4Cl solution in clinoptilolite fractions of 0.71-1.0 mm (15g). After 24 hours the solid phase is separated from the solution and Cl ions and are further dried at room temperature (Motsi T et al., 2008). The concentration of heavy metals present in the samples is correlated with the actual concentrations in domestic waters. Synthetic solutions are prepared by dissolving metal nitrates ($\text{Pb}(\text{NO}_3)_2$, $\text{Cd}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$, $\text{Cu}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$, $\text{Ni}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$) in deionised water (Motsi T et al., 2008). Exchangeable cations and heavy metals concentration in the adsorbent are determined by flame emission using the AAS800 adsorption spectrometer. The average deviation of measurement is from 0.01 to 0.1%. The standard deviation of repeatability is 0.1-3%.

In the first stage of the experiment, three fractions of clinoptilolite dried at room temperature, each weighing 0.5 g, mixing with 10, 20, 40, 400 and 800 mg/L Pb^{2+} , Cu^{2+} , Ni^{2+} and 1,2,4 and 80 mg/l solution of Cd^{2+} . After 48 hours, metal concentrations are analyzed. The metal adsorption equilibrium from the aqueous solutions is defined by the formula:

$$q_t = m_s / m = (C_0 - C_e) V / \mu \text{ for which:}$$

- q is the amount of sorbed metal ions (mg/g),
- m_s is the mass of sorbed metals (mg),
- m is the mass of adsorbent (g),
- C_0 is the initial concentration of metal ions (mg/L),
- C_e is the concentration equilibrium of metal ions (mg / l),
- V is the volume of solution with adsorption (L)

The efficiency of sorption is calculated by the formula [31] $E = 100m_s / (VC_0)$ (Tunali et al., 2006) where:

- E is the efficiency of sorption expressed in percentages,
- m_s is the mass of sorbed metals (mg),
- C_0 is the initial concentration of metal ions (mg/L),
- V is the volume of solution with adsorption (L)

The equilibrium test results are used to estimate the coefficient distribution by equation [31]. The distribution coefficient shows the selectivity, capacity, and affinity of the ion for the ion exchange $K_d = q_e / C_e$ (Bish and Ming, 2001) where:

- K_d is the distribution coefficient (L/g)
- q_e and C_e are solid and liquid concentrations (mg/g and mg/l).

The specific area of clinoptilolite ($S, m^2/g$) occupied by interchangeable cations and adsorbed metals is determined by the equation (Motsi T et al., 2008) and $S = qN\Omega$ (Erdem et al., 2004) where:

- q is the number of exchangeable cations (mmol/g)
- Ω is the area occupied by only one cation,
- N is Avogard's number.

The conversion of heavy metal ions with natural zeolite was carried out using a serial method. Adsorption experiments were carried out with 10g adsorbents in 500 ml of the solution containing the desired heavy metals concentration at a constant temperature of 25°C in plastic bottles. The particle size of the sample (clinoptilolite) used is in the range of 63 -106 μm . The bottle composition is filtered through Whatman's filter paper. The exact amount of heavy metal ions is determined by the spectrophotometer). The method of adsorption and distribution relationship (K_d) is calculated using the equation (Motsi T et al., 2008):

(Dal Bosco et al., 2005) where: - C_i and C_f are concentrations of metal ions in the initial and final solution (Jusoh et al., 2005) where:

- V volume of solution (ml),
- m weight of adsorbent (g).

Adsorption of Cu^{2+} , CO^{2+} , Zn^{2+} and Mn^{2+} on natural zeolite was studied at 30°C but the concentration of metal changes from 100 to 400 mg/l while other parameters remained unaltered. The percentage of metal adsorption is reduced by increasing the concentration in the solution. The results indicate that by increasing the concentration of metal ions in the solution, they include energy-adverse agents that reduce the percentage of adsorption.

Clinoptilolyte is an active component in sorption and ion-exchange processes. The tested samples were chemically and thermally processed. Chemical modification of natural zeolite, which affects the efficiency of sorption processes, was performed using inorganic salts (2 M NaCl, 0.1 M $FeCl_3$ in acetate buffer) and 0.1 M HCl. Chemical and mineral experiments were performed on

the prepared samples of natural (NZ) and modified zeolites (NaZ, NaFeZ and HNaFeZ).

Samples of natural (NZ) and modified zeolites (NaZ, NaFeZ, and HNaFeZ) were thermally treated at temperatures of 25 to 900 °C for 1 hour. Structural changes in zeolite samples occur at the temperature of 900 °C, and the clinoptilolitic phase is no longer present, as demonstrated by mineralogical X-ray analysis in mass fractions of 8.6% PZ, 10.7% NaZ, 12.5% NaFeZ and 12, 6% HNaFeZ. Table 4 (Motsi T et al., 2008) gives us data on kinetic parameters for heavy metals adsorption on zeolites.

Table 4 Kinetic parameters for heavy metals adsorption on zeolites

Zeolite	Metal ion	Reaction order	First-order rate constant (min ⁻¹)	Second-order rate constant (g/mg h)
Clinoptilolite	Cd ²⁺	First-order	0.0137	
	Pb ²⁺		0.0532	
	Ni ²⁺		0.0158	
	Cu ²⁺		0.0200	
	Zn ²⁺		0.0210	
Clinoptilolite	Pb ²⁺	First-order	2.9 × 10 ⁻⁴	
Chabazite	Pb ²⁺	First-order	4.3 × 10 ⁻⁴	
Clinoptilolite	Pb ²⁺	First-order	0.0053	
	Ni ²⁺		0.1419	
Clinoptilolite	Pb ²⁺	First-order	3.5 × 10 ⁻⁴	
Scolecite	Mn ²⁺	Second-order		0.0155
	Cr ³⁺			0.0365
	Ni ²⁺			0.0248
	Cd ²⁺			0.0503
Clinoptilolite	Cu ²⁺	Second-order		0.00113
	Cd ²⁺			0.0226

Source: Motsi, Rowson and Simmons, 2008

Modification of natural zeolite (NZ) in sodium form increases the Na₂O by weight of 3 to 5% in modified zeolite samples, and iron-form modification increases the Fe₂O₃ by 7% relative to the natural zeolite.

Zeolite modification with CH₃COON and NaCl may increase Ni²⁺ adsorption by 25-30%. For better elimination of Cu²⁺ by the use of zeolite from the wastewater, the presence of copper hydroxide has been shown to be effective, and the presence of Ca²⁺ and Mg²⁺ does not significantly influence the adsorption of Cu²⁺.

The results of the efficiency of the removal of arsenic ions show that at lower concentrations of the initial arsenic solutions (0.1-5 μg/L), arsenic concentra-

tions in the eluates are very low, i.e. below the detection limit. The efficiency of the removal depending on the presence of arsenic compounds and the pH value of the solution is 90 to 100%.

At higher concentrations of arsenic initial solutions (10-300 μ g/L), arsenic concentrations in the eluates, after the contact of the modified zeolite and the solution, resulted in higher values in the eluates relative to lower initial concentrations with the efficiency of removal of arsenic compounds from 90 to 95% depending on pH value of the solution. By chemical processing of natural zeolite, by translating it into Na form, its affinity to chromium ions increases. The chromium mass in different ionic forms, which was bound to the natural zeolite and the modified Na-zeolite, determined spectrophotometrically with diphenylcarbazide (as an indicator), was obtained from the difference of the initial concentration of the chromium ion and the concentration in the solution after equalization depending on the starting mass of the zeolite.

If necessary, oxidation of trivalent chromium with potassium permanganate was performed. After establishing the optimal conditions for determination of zeolite chromium, the definition of the total capacity of zeolite samples started, as well as studying how different types of chromium ions bind to zeolite samples, depending on the initial concentration of chromium ions and contact time and chemical processing of zeolite samples (Na-form). Na-form (NaZ) has 18% higher total conversion capacity, which amounts to 11.38 mg of Cr³⁺/g zeolite, compared to the natural zeolite which amounts to 8.32 mg of Cr³⁺/g zeolite. Natural zeolite converted to sodium form, NaZ, proved to be more effective than chemically untreated zeolite when binding and chromium sorption. From Table 5 (Motsi T et al., 2008) we can see the success of adsorption of heavy metals with different zeolites.

Table 5 Adsorption of heavy metals with different zeolites

Material	Metal	Adsorption (meq/g)	Reference
Sardinian clinoptilolite	Cu ²⁺	0.34	[78]

5. CONCLUSION

The natural environment has limited resources that require human protection. Endangering nature is not just a diminution of the beauty of a landscape, but a direct threat to life itself. As for heavy metals, it is quite clear that we are in some way constantly and fatally exposed to the action of various ecological contaminants.

Natural zeolites, low-cost materials that have the ability to purify wastewater from heavy metals, are very important. Due to the nature of the cation exchange, zeolites exhibit high efficiency in the adsorption of heavy metal ions.

From recent findings and rich own experience based on the results of the research it can be concluded that natural zeolites with an increased proportion of clinoptilolite as an active component and its chemical modification have great potential for application in the final stage of water treatment and removal of

chromium, arsenic metal ions and serve as highly effective means for removing metal ions from drinking water and wastewater.

Based on the scientific and research experience and the significant results obtained on the Eureka E4208 PUREWATER project (2008-2011 Slovenia-Croatia-Serbia), a new natural material for removal of toxic ions has been obtained, the material that has acceptable properties for its application and above all financial justification for its use, which is in line with a large number of current research and patents in the application of these environmentally acceptable materials.

Acknowledgments

This paper describes the results of research being carried out within the project “Centar održivog razvoja”/”Center of sustainable development”, co-financed by the European regional development fund and implemented within Operational Programme Competitiveness and Cohesion 2014 – 2020, based on the call “Investing in Organizational Reform and Infrastructure in the Research, Development and Innovation Sector”.

Abstract

The growth of the human population along with the accelerated development of economic activities, globalization and dynamic processes of internationalization of the enterprises, increasingly determines the needs and dependence on natural resources, which consequently leads to negative effects on the environment and ecological sustainability. Environmental incomes have a fundamental function of preservation and protection of the human environment and represent the basis of green growth policies and impacts on the preservation of the human environment. Environmental incomes include, along with taxes, fees and various forms of non-tax benefits that combine fiscal instruments of action to change consumer behaviour towards environmentally sustainable standards. In this paper, the authors attempt to analyse the persistence, as well as the possibilities of environmental incomes influencing the improvement of the economic and ecological effects of environmental protection on the example of Slavonia

region. Recommendations of the paper, in accordance with the given objectives, are aimed at protecting the human environment through more efficient tax and fiscal policy from the standpoint of studying sources of environmental protection funding. The objective of the research is derived from the analysis of the regulation and analysis of environmental incomes at the level of the Republic of Croatia and other European Union Member States, which are considering current and future assumptions about the economic and environmental effects of preservation and sustainability of the human environment.

Keywords: *environmental incomes, taxes, fees, budget, environmental protection.*

JEL Classification: Q50, Q56

1. INTRODUCTION

The human environment is every natural and any other environment composed of living organisms and their communities that together with humans allows their existence as well as their further development, especially evolutionary and ecological development. The human environment includes air, sea, water, soil, earth's crust, energy and material goods and cultural heritage. All of these resources are a part of the environment in which man lives and which, regardless of the present forms of state development and other vertical state sovereignties, should represent the primary state sovereignty in the form of general principles of thinking and realization of state activities. Along with the development of human civilization, cities, regional states, states and other larger institutional state entities have developed. All of the above-mentioned entities have largely caused, along with human activity, negative environmental activities and environmental pollution and are obliged to undertake certain activities of the protection of the human environment in the present and future times.

Environmental pollution is a process of changing the state of the environment due to a series of unauthorized activities such as: unauthorized emissions of harmful substances, secondary harmful effects, lack of necessary proactive action and current control effects of interventions that need to maintain existing level of environmental quality. On the other hand, pollution is the process of direct or indirect introduction of harmful substances generated consequently due to human activities, which can adversely affect human health or the quality of the environment and may further lead to destruction and thus usurp the potential and ways of using the environment.

In the Republic of Croatia, according to the Sustainable Development Strategy (NN, 30/2009), the main elements of the environment include segments such as: nature protection, natural resources, sea, forests and agricultural areas. The concept of nature protection includes the protected areas which cover about 9% of the total area of the Republic of Croatia, of which about 5% are national parks and nature parks. Also, there are 461 protected areas in the Republic of Croatia. Natural resources cover the entire area of the Republic of Croatia, which is 87,661 km², with 56,594 km² of land area and 31,067 km² of the sea. In the structure of the mainland, the majority consists of agricultural and forest areas. Agricultural areas account for about 52%, with about 80% of agricultural land being privately owned, while 20% of agricultural land is state-owned. In the structure of total agricultural land in the Republic of Croatia, 27% of agricultural land is not arable land due to ecological problems. Sea is one of the most important forms of environment in the Republic of Croatia, where special attention should be paid to environmental protection within the current and future functions of environmental protection and ecology, and with regard to biodiversity. On the other hand, forests account for 47% of the territory of the Republic of Croatia, with 74% of state-owned forests and 26% of forests being privately owned.

In the last few decades, the problem of environmental protection has been one of the more important topics of reflection and state policies, which is becoming increasingly important subject in the national economies. The activities of the state and regional and local governments from the standpoint of care and protection of the human environment are based on public services. The basic territorial division of public services is based on public and regional / local public services. The segment of public and regional / local public services that cover the area of protection of the human environment, includes: water services, renewable energy sources, protection of air, ozone layer and mitigation of climate change, electricity and other energy sources, greenhouse gas emissions and research and development in the field of environmental protection.

From the standpoint of public services, which are in the domain of regional / local government activities, there are these forms of public services: utility services, water protection, air quality monitoring and protection, waste management, horticulture, protection and maintenance of forests and soil, energy management, noise protection, research and development in the field of environmental protection and protection of biodiversity and landscape. The above-mentioned

types of public and local public services have many years of defined legal regulations as well as sources of funding, so there is a certain range of activities that are primarily focused at preserving and protecting the human environment.

Consistent with the traditional economic determinism of the welfare state of the national and the regional / local economies to measure them with the size of GDP, it is possible to include the consumption of natural resources and goods as a variable, in this case, a category that encompasses everything in the segment of the human environment. For example, activities such as pollution reduction or better health care are considered an important indicator of a positive impact on GDP. However, the greatest effects of the protection of the human environment can be measured through financing, which is most often based on certain forms of environmental taxes, environmental fees, and other forms of environmental compensation.

2. ENVIRONMENTAL TAXES AND FEES IN THE FUNCTION OF ENVIRONMENTAL PROTECTION

With the growth of the human population along with the accelerated expansion and development of economic and social changes, globalization as well as internationalization of the enterprises, there is a growing exploitation of natural resources, which consequently negatively affects the environment and ecological sustainability. The global challenges cannot adequately respond to the challenges of economic growth and ecological development of the environment, given the growing trend and rapid rise of the world's population. Such dynamics point to the need for the consolidation of strategies and programs towards more concrete environmental preservation and protection activities, mostly from the standpoint of redefining the sources of funding. It is necessary to undertake additional activities to ensure the preservation of air, ocean and water resources, sustainable use of land and ecosystems, and maintaining climate change at appropriate levels and ecological standards. Accordingly, cooperation and harmonization are necessary within all EU member states, but also all countries of the world. In order to ensure the level of appropriate ecological standards and sustainability concepts, it is necessary to ensure the adequacy of financial resources, which at this moment primarily depend on the national economies' budgets and the fiscal policies of individual countries.

The primary sources of funding are taxes and fees. Secondary sources of funding are derived from European Union funds and other categories of funding sources such as subsidies and grants. Taxes are among the most important fiscal instruments of the environmental protection policy. In the usual theoretical context of study there are 3 forms of environmental taxes (Jelčić, 2003, p.312), which are: Pigou taxes or green taxes, Para-Pigou taxes, and bilaterally beneficial taxes. The main characteristics of these tax forms are based on the internalisation of external costs and the purposefulness of financing. Environmental Taxes represent fiscal pricing instruments that encourage the possibility of implementation in order to reduce environmental pollution, primarily from the standpoint of cost. Such taxes provide incentives for further increase of efficiency, green investments and innovations, as well as advances in consumption distribution models. They are included in indirect taxes and are intended to influence the following factors:

- behaviour of the economic policy holders
- organization and individuals in the exploitation of natural resources
- legislative regulatory framework for the regulation of the emissions of harmful gases
- improving the quality of the environment as well as human health.

In addition to taxes, fees are also considered a very effective instrument in shaping behavioural changes of consumers and environmental pollutants towards more environmentally sustainable directions. In defining the concept of fees (Karačić, 2011, p.193), within the meaning and content of the term fees and its basic characteristics, the theoretical basis of the concept of fees is not uniformly defined even today. The interweaving of the practice in which the fees is used in relation to the theoretical aspect of the concept of fees is a common case which leads to the fact that the fees represent the type of financial instrument of revenue collection that has all similarities with the tax, but in classification it falls into the category of other public revenues.

Environmental taxes¹ are increasingly used to influence the behaviour of economic entities, whether they are producers or consumers. The governments of the European Union member states can direct collected environmental tax revenues on potential increase of expenditures in the area of environmental pro-

¹ According to Eurostat: "European statistics distinguish four different environmental tax categories related to energy, transport, pollution and resources; Value Added Tax (VAT) is excluded from the scope of ecological taxes."

tection and efficient management of natural resources. Table no. 1 analyses the European Union member states that have the highest share of environmental tax revenues in their gross domestic product.

Table 1. Environmental tax revenues (% of gross domestic product)

geo\time	2010	2011	2012	2013	2014	2015	2016	2017	Average	St. deviation	Coefficient of variation

Source: Authors' calculation according to Eurostat data

Observing the data shown in Table no. 1 it is evident that the highest average share of environmental tax revenue in percentage of GDP is in Denmark (3.97%), with an average deviation from the average of 0.11. Next, Slovenia has an average share of the environmental tax revenue of 3.78% and the standard deviation of 0.15, followed by Turkey (3.49% of GDP) and the Netherlands (3.34% of GDP). Among high-ranking EU member states, according to the share of environmental tax revenues lies the Republic of Croatia, with an average environmental tax revenue of 3.07% of gross domestic product.

Table no. 2 shows Total environmental investments (% of GDP), Environmental protection expenditure (% of GDP), GDP per capita (in PPS) and Greenhouse gas emissions (tons per capita) for Croatia.

Table 2. The trend of observed parameters for the Republic of Croatia

	Total environmental investments (% of GDP)	Environmental protection expenditure (% of GDP)	GDP per capita in PPS	Greenhouse gas emissions (tons per capita)
2002	0.04	0.12	51.01	6.6
2003	0.06	0	53.25	6.9

Trend				

Source: Authors' calculation according to Eurostat data

Observing the data shown in Table no. 2, a growing trend of total environmental investments (% of GDP) and environmental protection expenditure (% of GDP) is visible during the observed period. Over the observed period, the average investment in the environment is 0.10% of GDP, while the average environmental spending is 0.14% of GDP. Gross domestic product expressed in purchasing power standards during the observed period grew till 2009 and since then falls, with mild oscillations. The greenhouse gas emissions amount to an average of 6.73 tons per capita.

Table no. 3 shows correlation of selected independent and dependent variables.

Table 3. Correlation of values of Total environmental investments (% of GDP), Environmental protection expenditure (% of GDP), BDP per capita (in PPS) and Greenhouse gas emissions (tons per capita)

	Total environmental investments (% GDP)	Environmental protection expenditure (% GDP)	GDP per capita in PPS	Greenhouse gas emissions (tons per capita)
Total environmental investments (% GDP)	1			
Environmental protection expenditure (% GDP)	0.848622995	1		
GDP per capita in PPS	0.254115434	0.32457194	1	
Greenhouse gas emissions (tons per capita)	-0.116426911	-0.363409188	-0.034962359	1

Source: Authors' calculation according to Eurostat data

Observing the results of the analysis in Table no. 3 it can be concluded that there is a positive statistical link in the correlation of the *Total environmental investments*, *Environmental protection expenditure* and *Gross domestic product per capita*, while in the observed variable *Greenhouse gas emissions* correlation is negative.

Strong positive link was noted between *Total environmental investments* and *Environmental protection expenditure* (0.85), while there is a weak and at the same time negative link between *Greenhouse gas emissions* and *GDP per capita*. Per capita GDP indirectly affects the reduction of greenhouse gas emissions through environmental protection expenditure. Medium strong, but still negative correlation is present between *Greenhouse gas emissions* and *Environmental protection expenditure*. The biggest impact on *Greenhouse gas emissions* is the *Environmental protection expenditure*, as larger environmental protection expenditure will reduce greenhouse gas emissions.

Table no. 4 shows a model of three-dimensional linear regression.

$$Y = a + b_1 \cdot X_1 + b_2 \cdot X_2$$

where:

Y = *Greenhouse gas emissions* (dependent variable)

X1 = *Real growth of GDP*

X2 = *Total environmental taxes (% of GDP)*

Table 4. Results of regression analysis of influence of the *Real growth of GDP* and *Total environmental taxes (% of GDP)* on *Greenhouse gas emissions*

Source: Authors' calculation according to Eurostat data

Three-dimensional linear regression of impact of the *Real growth of GDP* and *Total environmental taxes (% of GDP)* on the intensity of *Greenhouse gas emissions (kg per capita)* is significant because the calculated multiple correlation coefficient of 0.90 indicates a strong correlation between the dependent variable and the two chosen parameters of the independent variables. In the observed period, the average *Greenhouse gas emissions* was 4,734 kg per capita with a standard deviation of ± 410 kg per capita.

The determination coefficient indicates that 81% of the deviations from the average of *Greenhouse gas emissions* can be interpreted with the level of *Gross domestic product* and the level of *Total environmental taxes*. The F-test says that the interpreted values are 15 times larger than the non-interpreted ones, which is less than 5% of significance. P-values for independent variable parameters are less than 0.01, which means that calculated values are accurate. Parameters indicate that GDP growth of 1% increases *Greenhouse gas emissions* by 82 kg per

capita, while *Total environmental taxes* growth by 1% reduces emissions by 954 kg per capita. The analysed results indicate a significant impact of GDP and *Total environmental taxes* on *Greenhouse gas emissions*.

Table no. 5 shows the values of the parameter required to compare real GDP trends with the difference between the realized and the value of the linear regression model for *Greenhouse gas emissions* conditioned by environmental taxes at the level of the Republic of Croatia.

Table 5. Comparison of real GDP trends with the difference between realized and the value of the linear regression model for *Greenhouse gas emissions* conditioned by environmental taxes in the Republic of Croatia

Linear trend equation for *Total environmental taxes* and *Greenhouse gases*:

$$Y = -758.5x + 7027.2$$

Chart 1. Comparison of the real GDP trend with the difference between the realized and the value of the linear regression model for *Greenhouse gas emissions* conditioned by environmental taxes

Source: Made based on the authors' calculation

Chart no. 1 shows the result of the developed GDP trend analysis and the difference between the realized value and the value of the linear regression model of *Greenhouse gas emissions* which are conditioned by *Total environmental taxes* over the observed ten-year period in the Republic of Croatia. Namely, the primary analysis of the correlation between *Greenhouse gas emissions* and *Total environmental taxes (% of GDP)* shows differences that are attributed to seasonal oscillations. The observed seasonal oscillations are the result of changes in GDP, hence the analysis of the impact of the change of the *Gross domestic product* on the difference between the realized and the values of the linear regression model of *Greenhouse gas emissions*, which leads to the conclusion that there is a significant impact.

3. FINANCING ENVIRONMENTAL PROTECTION IN THE REPUBLIC OF CROATIA

From the standpoint of existing sources of fiscal instruments, environmental protection in the Republic of Croatia is based on regulatory and legal regulations defining a number of fees such as permits, quotas, licenses, concessions, user fees, usage taxes, access fees, performance fees, bonds, deposits, claims rights and financial insurance. Such structured fees have a dual role. On the one

hand, they are important for and focused on resource users or existing polluters. On the other hand, they are important and necessary in the form of subsidizing regular or sudden transfers to primary and secondary environmental protection projects. The whole situation around the environmental protection analysis in the Republic of Croatia can be read in the document, which is called the National List of Indicators. The National List of Indicators (Law on Environmental Protection, 2018, a.2) is a set of data tables for the development of the environmental status indicators for each particular thematic area based on national and EU regulations and international regulations for environmental state recordings in the country. Another document that further defines the issue of environmental protection, as well as predictions about environmental burden, is a reference document on best available techniques. This document (Law on Environmental Protection, 2018, a.2) further describes the applied techniques, current emission and consumption levels, techniques considered in the determination of the best available techniques and conclusions and is entirely a result of the exchange of data and experiences of the member countries of the European Union.

The most important thing in the environmental protection planning is to timely anticipate potential environmental risks as well as damage from the standpoint of liability in case of new pollution. Within the scope of the existing law, the so-called “emerging technologies” are defined (Law on Environmental Protection, 2018, a.2), which include current and new industrial activities, with the aim of pre-determining the optimal level of environmental protection and thus sublimating the future negative financial effects of environmental pollution. Precisely these documents represent a framework for defining sources of funding, where environmental protection should be coordinated with those subjects that cause pollution according to the permitted standards. It is also necessary to ensure the level of environmental burden standards so that resource users or polluters pay a fair price for the purpose of consumption or permissible pollution.

The financing of environmental protection in the Republic of Croatia (Law on Environmental Protection, 2015, a.209 and 39) is legally regulated and is determined by the types of institutional entities and certain ways of collecting revenue. Institutional entities include the following: The Ministry of Environmental Protection and Energy, the Environmental Protection and Energy Efficiency Fund, the Croatian Agency for the Environment and Nature, the

Meteorological and Hydrological Service and the Croatian Waters. From the standpoint of ways of collecting revenue, primary funding is stipulated, based on direct financial resources from the state, regional and local government budgets. Secondary sources of funding are stipulated through the private sector participation in the form of concessions, public-private partnerships and other forms of cooperation involving a stronger connection but also the responsibility of both the public and private sector. Other sources of funding do not have a continuous funding dynamic as they include non-permanent methods of collecting revenue, including donations, loans, aid and investment funds, and resources from the European Union funds programs and other international organizations and institutional entities. Sources of environmental protection financing in the Republic of Croatia are explained in only one legislative article (compared to 270 other legal articles), which indicates that this issue is not sufficiently elaborated and that the stability of revenue collection depends on the amount of appropriations from the budget, which falls into the category of political risks. The allocation and redistribution of budget revenues is based on the main taxes, where none of the above-mentioned taxes is an environmental tax.

According to the Law on Environmental Protection and Energy Efficiency Fund (Law on Environmental Protection, 2015, a.39), the sources of financing are stipulated that directly regulate the categories of payers for pollution incurred, and for which a certain amount of money is allocated, which are called fees. Fees are a dedicated revenue and as such have all tax characteristics. In the Republic of Croatia, there are the following types of compensation: environmental polluter fees, environmental user fees, environmental burden fees, and special environmental fees for motor vehicles. Total revenues of the Ministry of Environmental Protection, which include aid and grants, revenues from administrative fees and fee revenues, amounted to more than HRK 1 billion in 2016, while in previous years they were considerably smaller.

Precisely this kind of revenue structure points to the fact that there is no more significant revenue form that could have a significant impact on fiscal capacities in terms of funding sources, but also in terms of ensuring the necessary continuity in the segment of higher quality implementation of environmental programs and activities.

Chart no. 2 shows expenditures of the state budget of the Republic of Croatia that were intended for environmental protection during the observed period

Chart 2. Expenditures of the state, regional and local budgets in the Republic of Croatia that were intended for environmental protection

Source: Authors' calculation according to data of the Ministry of Finance of the Republic of Croatia

The state budget expenditures, as well as the budgets of local and regional government units, within the field of environmental protection are focused primarily on financing waste management activities, wastewater management, pollution reduction activities, biodiversity and landscape protection, research and development in the field of environmental protection, and other environmental activities and services. The increase in waste represents the largest item in the overall environmental protection allocation structure, whereby these expenditures range between 40% and 45% of allocations. Furthermore, in the structure of expenditures about 35% to 40% is allocated for waste water problems, for waste water treatment and construction and reconstruction of existing sewage systems. Other minor allocations are directed to the protection of biodiversity and landscape and to research and development of environmental protection. Both state and regional as well as local budgets have a similar structure of allocating funds for environmental protection. The share of total environmental protection allocations is materially less significant compared to total revenues of the state, regional and city budgets and other components of public service allocations such as education, defence, health care and other categories.

Table no. 6 shows expenditures for environmental protection, environmental protection revenues and investments over selected time periods, referring to the counties belonging to Slavonia and Baranja, the so-called Slavonia region.

Current expenditures for environmental protection include all expenditures on goods, services and investments that are directly aimed at the prevention, reduction and elimination of pollution or any form of environmental pollution. In the observed period in the region of Slavonia the current expenditures on environmental protection in the period 2014 to 2015 have significantly increased as a result of more intensive activities related to adjustment to directives and standards of the European Union in the field of environmental protection. Increased expenditures represent activities aimed at building regional landfills by funding through EU funds, but not in each county. Environmental protection revenues include income from activities regulated by law and investments and from future savings. In the observed period in the region of Slavonia, specifically in the period 2014 to 2015, the highest growth in revenues was generated by investments that were part of state transfers in the form of rehabilitation of the existing landfills.

In 2016 to 2017 period there is a decrease in expenditures and revenues, although there is a strong growth in investments in some counties, which is based on the financial resources of the European Union funds. At the level of the Republic of Croatia, the indicators are constant and inadequate, and compared to the total revenues and expenditures of the state budget, they have no significant material value. Priorities placed before the Slavonia region for environmental protection are focused on the establishment of an integrated waste management system and modernization and construction of communal infrastructure. Other problems affecting the region and other regions of the Republic of Croatia are identical to those at the state level as they cover the issues of environmental protection in the segment of transport, optimal utilization of agriculture and industry, and protection of water and soil. Sources of funding for environmental protection activities are based on local taxes, fees and volatile state transfers which have not changed for many years, and it is apparent that existing sources of funding are insufficient for basic environmental protection programs at regional and local levels.

4. CONCLUSION

Croatia's accession to the European Union has brought significant progress in the field of environmental protection management. The basic doctrine of the goals and activities of the European Union stems from the promotion

of sustainable development which includes a smart, sustainable and inclusive economy based on a range of activities, policies and measures that need to follow guidelines for a low level of carbon dioxide, as well as more efficient use of natural resources. Environmental protection expenditures at the level of the EU member states according to the basic economic and budgetary indicators are not at a satisfactory level. They also point to the need to strengthen fiscal capacities towards the environmental protection segment, although some progress is visible in certain tax efforts and the classification of more specific sources of funding from the standpoint of implementation of fiscal and tax policies. Certain research carried out by the European Commission based on the COMETR project have shown that the implementation of tax reforms with an emphasis on environmental taxes has led to positive externalities. It also points to the role and importance of taxes in further definition of activities, policies and measures for preservation and protection of the environment. The perception of the existence of a unique environmental tax is not recognized and most states avoid thinking about implementing it. Even more so, because taxes that affect the financing of health, pensions, or defence at this time are more important than taxes that finance the environment. The environment in which people live is becoming more and more inhabited, experiencing dynamic changes in the climate, as well as changes in the management of renewable and non-renewable energy sources.

The structure of environmental protection financing in the Republic of Croatia is dispersed and unconnected, as it represents a combination of funding, consisting of insufficient local, regional and state environmental revenues and fees. The aforementioned hybrid of diverse income is insufficient for quality care of the environment. The allocation of environmental protection expenditures is based on certain obsolete functional and economic classifications of state, regional and local budgets, which ultimately fail to provide a concrete insight into the structure of sources of environmental protection funding and they are insufficient to carry out and finance environmental protection activities. For the above reasons, it is necessary to carry out the following pre-phases and phases of realizing activities:

- creating a unique environmental tax
- modernizing the processes of administrative and fiscal decentralization regarding powers and concerns about environmental protection within the state and regional and local government units

- ♦ more coherent linking of state, regional and local interests of achieving environmental protection activities (e.g. strategies, investments, standards and norms, etc.).

The recommendations in this paper are aimed at more concrete implementation activities regarding the achievement of fiscal policies in the form of better planning of existing and future financial resources directed at environmental protection.

EFFICACY OF LAW IN THEORY AND PRACTICE: THE EFFECTIVENESS OF THE ADJUDICATION

Mario KREŠIĆ

Faculty of Law, University of Zagreb

E-mail: Mariokresic3@gmail.com

Abstract

The efficacy of the law is a crucial topic in legal theory and legal practice. The theoretical problem relates to different understandings of the concept of the efficacy, and this research addresses specifically the meaning of that concept as the application of the law in adjudication. A more detailed analysis of this term is further developed into a theoretical framework that can serve to explore the adjudicative effectiveness in particular positive legal systems. Among the various elements that fall under the underlying concept of adjudicative efficacy, this article will pay specific attention to the issue of the effectiveness of the initiation of adjudicative proceedings. The first practical problem refers to the question how the (in)effectiveness of the adjudicative application of the law in various elements of this concept, and in particular regarding the aspect of initiating adjudicative proceedings, affects economic and political relations in the political community. The second practical problem is how to improve the efficiency of the initiating of adjudicative procedures to achieve the effectiveness of the law and thus the specific economic and political goals. Based on the theoretical framework and the answers to practical questions in this research we will look at the issue of the efficiency of the initiation of adjudicative proceedings in the Republic of Croatia.

Keywords: *adjudication, efficacy, initiation of adjudicative procedures, legal theory*

JEL Classification: K00, K20

1. INTRODUCTION

The efficacy of the law is one of the fundamental concepts in the theory of law, and its importance for the understanding of practical legal issues can be recognized in public policies of states and supranational associations. The approach to the term 'efficacy of the law' in this paper is one of the possible approaches presented in Alf Ross's theory, i.e. understanding this concept as the effectiveness of the law before courts. This understanding of the term refers to different elements necessary for the effectiveness of adjudication, and one of such elements is the central topic of this paper. It relates to the effectiveness of the initiation of adjudicative proceedings. After the conceptual analysis, two practical issues related to the effectiveness of adjudication will be covered: its importance for political and economic goals and measures through which it can be increased. Finally, the focus will be directed on the efficiency of the initiation of adjudicative proceedings in the Republic of Croatia indicating some areas for possible further research. This research will be conducted on the basis of conceptual analysis of the law and using reports that point to practitioners' discourse in this issue.

2. THE CONCEPT OF MATERIAL EFFECTIVENESS OF THE LAW AS THE APPLICATION OF THE LAW IN ADJUDICATION

In the theory of law, the efficacy of the law can be defined in several ways. The law can be considered effective a) when it contains norms on the creation and application of the law under the assumption, without further determination of the realization of this assumption, that such norms are actually implemented by the bodies whose decisions are adhered to by the citizens; b) when citizens apply the law in reality, because it is present in their consciousness; c) when the law is applied by the law-applying bodies, primarily judges, because it is present in their consciousness.

When the law is viewed as a normative system, we can discuss formal effectiveness of the law. The state of the system of norms created when this system introduces secondary norms authorizing someone for adjudication can be called 'formal effectiveness of the law'. This, however, does not mean that the system of norms is indeed effectively applied in society, and it can, in fact, remain just

the law in books. Building on formal effectiveness with regard to the system of norms, the effectiveness of the law expressed in real life will be referred to as material effectiveness and it is the topic of this paper which is the basis for further elaboration.

Given that the sociological-psychological approach explores what happens in people's real lives, according to this theoretical approach, to understand the law, it is not enough to establish the existence of legal norms through the fulfillment of the formal criteria for the membership of norms to the legal system; it is rather necessary to establish whether this system of norms is applied in real life. What are the social facts that, as a legal phenomenon, form another realistic side of legal norms? Ross considers them to be court decisions and that the effectiveness of the law, which he equalizes with the validity of the law, should be sought in adjudication itself (Ross, 2004, p. 35). Therefore, in order to discuss (materially) effective law, legal norms should be indeed used by judges in the same way they exist in their consciousness. They exist in the judges' consciousness when they feel them to be socially obligatory and therefore comply with them (Ross, 2004, p. 35). "To realistic view, the validity of the law is in the last resort a manifestation of certain socio-psychological facts. For the genesis and development of these, however, the regular 'enforcement' by the courts of law is of decisive importance [...] (Ross, 2006, p. 80) Is the existence of legal norms in citizens' consciousness necessary for material effectiveness of the law? Ross defines 'law in action in a broader sense', in the way that it includes court acts and legal acts of private persons in legal relations. However, the 'law in action in the narrower sense' – such as the application of the law in courts – is the only decisive social fact for determining the validity of legal norms in the society. "The effectiveness which conditions the validity of norms can, therefore, be sought solely in the judicial application of the law, and not in the law in action among private persons" (Ross, 2004, p. 35)

Ross, therefore, defines the effectiveness of the law only as the effectiveness of the court in making decisions on the law, while the behavior of individuals in the society is irrelevant for his understanding of the effectiveness of the law. "It makes no difference whether the people comply with or frequently ignore the prohibition. This indifference results in the apparent paradox that the more effectively a rule complies in the extrajudicial legal life, the more difficult it is to ascertain whether the rule possesses the validity because the courts have that much less opportunity to manifest their reaction." (Ross, 2004, 36) The impor-

tance of adjudication for the effectiveness of the law was similarly highlighted by John Chipman Gray. Gray is aware that there can be cases when citizens act in compliance with the rules, not because of court rulings, but because of their moral considerations. Also, an individual can adjust his/her behavior due to the execution of force by an administrative body. "But in all such cases, the rules are Law because, in the ultimate resort, judges will apply them [...]" (Gray, 1909, p. 102). For Gray, even if the persons do not follow court decisions, they still remain the law. Also, the rule on a behavior ban becomes the law only when courts deliver a judgment in a case (Gray, 1909, p. 102). According to Gray, it is not important for law whether the members of the society comply with court decisions because the law is what the courts lay it down to be.

Although there are objections to realistic theories that emphasize this crucial role of courts for the concept of law, the hypothesis on the primacy of adjudication for the effectiveness of the law points to two important insights. Firstly, court decisions are necessary to determine the content of the law in a particular society. Such a hypothesis does not necessarily contradict the hypothesis on the existence of citizens' legal consciousness of the law; different emphasis has been placed on each of these two hypotheses. In the process of determining 'material effectiveness in a narrower sense', the emphasis is on the determination of the content of the law in the consciousness of the judges, while in matters of material effectiveness in a broader sense, the emphasis is on how the law affects the consciousness of individuals. Why is the law in the consciousness of judges necessary to determine the contents of the law?

Unlike individuals in a society, only institutions – whose legal authority is recognized in society – can authoritatively determine the contents of the law. In this process, while the legislator can in her consciousness define abstract legal provisions for regulating the interests in a society, only judges can determine the exact meaning of such a behavioral regulation on specific interests in the society. Since members of the society cannot know all their rights and obligations, nor the rights and obligations of other members of the society, courts are necessary for the effective application of the law. "If every member of the State knew perfectly his own rights and duties, and the rights and duties of everybody else, the State would need no judicial organs; administrative organs would suffice. But there is no such universal knowledge. To determine, in actual life, what are the rights and duties of the State and of its citizens, the State needs and establishes judicial organs, the judges. To determine rights and duties, the judge

settles what facts exist, and also lay down rules according to which they deduce legal consequences from facts. These rules are the Law” (Gray, 1909, p. 101).

Indeed, from the viewpoint of law beneficiaries, court decisions are very important for knowing what the law is, in the sense of adjusting our behavior to the norms adopted by the court or those expected to be adopted. “If anyone asks what in regard to a given matter is valid law, at the present moment he undoubtedly wants to know how current disputes will be decided if they are brought before the courts” (Ross, 2004, p. 40). “When a client asks his solicitor what is ‘the law’ in a certain situation, the practical import of this question is how legal proceedings, if instituted, will be judged by the courts” (Ross, 2006, p. 80). Moreover, if the court does not deliver judgments, it is difficult to know what the law in real life really is. As pointed out by Ross, court decisions are the pulse of legal life (Ross, 2006, p. 80).

Another insight, originating from the hypothesis on the primacy of adjudication for the effectiveness of the law, refers to specific demands placed upon the community to ensure the effective functioning of adjudication.

3. THE EFFECTIVENESS OF ADJUDICATION

Research of the effectiveness of adjudication is an integral part of the sociological-psychological theory of law. These theories attempt to empirically examine the impact of the law on the society and the operation of judicial institutions fits into the basic subject of their research. Thus, for example, as part of the sociological jurisprudence programme, Roscoe Pound, among other things, also explained the importance of studying the real social effects of legal institutions and the ways which would make legal standards for the behaviour of individuals more effective in real life (Pound, 2000a, pp. 350-358). Similarly, speaking of the ‘law and society’ academic movement, Brian Tamanaha points out questions of interest to this school in studying the relationship between legal institutions and the social context (Tamanaha, 2010, p. 371). Some issues relate to the actions within the legal institutions, and others to how the actions of legal institutions relate to the social environment in which they operate (Tamanaha, 2010, p. 372). When studying the institution-society relationship, Tamanaha states that there are issues such as: “Do legal actors indeed enforce stated legal norms?” “Who invokes the legal apparatus and why?” “Whose interests are served by the actions of legal institutions?” “How do people in society react to

the actions of legal institutions?“. Tamanaha’s research topics are, for example, the following: 1) the gap between the declared norms and what legal officers really do (Tamanaha, 2010, p. 372); 2) the gap between the declared norms and norms followed in social life; thus, the focus of the research is more on social behavior than the norms declared or carried out by official legal bodies (Tamanaha, 2010, p. 373); 3) the gap between real behaviour and the general image of the law (Tamanaha, 2010, p. 374); 4) why individuals in the society are not willing to turn to legal institutions (Tamanaha, 2010, p. 373).

If we single out only the topics related to the effectiveness of adjudication from the area of social-psychological theories of law, then the theory of law in the context of understanding the law itself can point to an understanding of the conceptual apparatus necessary for a study of the effectiveness of adjudication. In this context, it is important for the effectiveness of adjudication that the courts have the capacity to effectively carry out their decision-making function, which sets the requirements for the study of elements necessary to perform such a function, such as material working conditions of judges, appropriate organization of court work, and professional qualities of judges. In addition, for example, court decisions must be published – publicly declared and harmonized. It is also fair to mention the importance of witness and victim participation in the proceedings and, in general, the importance of securing evidence before the court.

On the other hand, for the effectiveness of adjudication, the efficiency of courts alone is insufficient. It is equally important for the effectiveness of the initiation of adjudicative proceedings. There are two main types of adjudication which can be differentiated based on the empowerment for initiation of the adjudicative proceedings. The first one is adjudication which is initiated only when both parties agree to resolve the dispute before the court. The second one can be named the ‘adjudication on demand’. The term is coined based on the Dworkin’s concept of legal rights defined as rights “enforceable on demand in an adjudicative political institution such as a court.” (Dworkin, 2011, p. 404). The members of the community are entitled to enforce legal rights in the adjudicative institution on demand without further legislative intervention (Dworkin, 2011, p. 406). Besides the members of the community, in some cases, legal systems empower official organs to unilaterally initiate proceedings for the protection of individual rights and collective interest.

The ideal model of the adjudication on demand satisfies all formal and substantive conditions required for the initiation of adjudicative proceeding whenever the protection of legal rights and collective interest is needed according to the officially proclaimed values or the existing needs in the community regulated by law. In reality, there is a gap between the ideal model of the adjudication on demand and the existing situation of the initiation of the adjudication proceedings.

4. EFFECTIVENESS RELATED TO THE INITIATION OF ADJUDICATIVE PROCEEDINGS

Three groups of problems can be detected as the source of the gap between the ideal and existing model of the adjudication on demand with regards to the initiation of the adjudicative procedure: 1) organs or citizens do not recognize the need for proceedings; 2) there is a need for proceedings, but there are limitations in the society that discourage the citizens from initiating proceedings; 3) there is a need for proceedings, but the authorities do not initiate them.

(1) Firstly, it is possible that court proceedings are not initiated because there is no need for them in the community. Although such a situation does not really question the effectiveness of adjudication, it still remains questionable what the law according to which individuals can direct their behavior really is, regardless of whether they agree with such a law or not. These situations are possible, especially in cases when new legal institutes are still not supported by the community but are nevertheless transplanted into the community. The extreme example is provided by Brian Tamanaha to describe the situation when citizens carry on with life on the basis of a normative order wholly different from that of the state (Tamanaha, 2001, p. 145). It is also possible that some legal regulations have no direct connection with citizens' attitudes of interest or lack that interest; or that citizens cannot recognize such a connection although it exists, and habitually accept other normative arrangements outside of the law. In this case, cultural consciousness affecting the consciousness of the law comes into focus (Ross, 2004, p. 376).

The other way around, the community can officially proclaim some values while at the same time organs do not establish the practice which realizes these values in the community life. Sometimes the existing community practice opposite to the practice proclaimed as the value can corrupt or contaminate, if not

the whole law, at least some of its segments to the level that it cannot be considered as law at all (MacCormick, 2007, p. 271).

(2) Another situation is when citizens recognize a need for adjudicative proceedings, but they refuse to initiate them. There are two different cases here. In the first case, it is a situation in which there are no external obstacles for citizens to initiate proceedings, but they avoid them due to internal attitudes of no interest in adjudication. Another reason for the inefficiency of initiating the proceedings may arise if the individuals cannot initiate proceedings although they wish to do so for reasons of external limitations. These two reasons can be recognized in some authors' theories of law. The importance of citizens' motivation for the initiation of court proceedings takes a special place in Jhering's theory of law. He pointed out that the law is implemented in reality if public officers perform their duties and individuals protect their rights.

„The existence of all the principles of public law depends on the fidelity of public officials in the performance of their duties; that of the principle of private law, on the power of the motives which induce the person whose rights have been violated to defend them: his interest and his sentiment of legal right. If these motives do not come into play, if the feeling of legal right is blunted and weak, and interest not powerful enough to overcome the disinclination to entering into a controversy and the indisposition to go to law, the consequence is that the principle of law involved finds no application” (Jhering, 1915, p.72).

According to Jhering, the work of the state bodies is a minor problem, because it is their duty to initiate proceedings. “[W]hile the realization in practice of public law and of criminal law is assured, because it is imposed as a duty on public officials, the realization in practice of private law is presented to individuals under the form of their legal rights; that is, it is left exclusively to them to take the initiative in its realization, left exclusively to their action” (Jhering, 1915, p. 71). It is much more important that individuals fight for their subjective rights and initiate proceedings, which is their duty to themselves, but also their social duty (Jhering, 1915, p. 69;70). Jhering correctly pointed out how important it is for the individuals to protect their subjective rights before the court. However, Pound noticed serious limitations regarding the level of interest of individuals to highlight their rights and protect them in court. According to Pound, the reasons for individuals' inactivity may be material in nature, because citizens lack the means to cover court costs or simply do not want to spend their time.

“Jhering urged the duty of the good citizen to go to trouble and expense to vindicate his legal rights, even on small occasions, as his contribution to maintaining the legal order. But in the busy world of today men are less and less inclined to pursue their legal rights even in matters of no little moment at the expense of time, money, and energy, they can more profitably employ in their everyday work. Hence, we have to deal in new ways with the subject of making legal precepts effective. We must study the limits of effective legal action. We must determine what we may expect to go through law and what we should leave to other agencies of social control. We must examine our armory of legal weapons, appraise the value of each for the tasks of today, and ask what new ones may be devised and what we may expect reasonably to accomplish by them when devised. There is a serious limitation upon the possibility of social progress through law” (Pound, 2000b, p. 372).

As a follow-up to Jhering and Pound’s insights, one can point out other external reasons for inactivity of individuals in the protection of their rights before the court. The reasons can be found in the fact that citizens are insufficiently informed of the law, and therefore do not know how to initiate a proceeding. Limitations can also be of political nature, e. g. if the citizens feel threatened to take part in the proceedings or if they do not believe in the independence of judicial institutions.

(3) As a follow-up to the first two cases – the lack of interest for court proceedings and the absence of civil initiative – the third, much harder case is when court proceedings are not initiated because the official bodies authorized for the initiation of adjudication – the police, state attorney’s office, examining magistrate – do not process the cases for which the adjudication proceeding should be initiated. Ross pointed out that the term ‘court’ is used in its broad sense to include all authorities administering criminal prosecution: the police, the state prosecution, and the court. “If the police regularly omit to investigate certain breaches of the law, or if the prosecuting authority regularly omits to bring a prosecution, the penal law loses its character of valid law, notwithstanding its application at rare intervals in the courts” (Ross, 2004, p. 35; in note 1) Considering the fact that the state attorney’s office has the power to initiate certain procedures when the law is violated, their inefficiency may jeopardise the application of the law where there really is a need to concretize the regulation of some social relationships. This is why it is important from the aspect of material effectiveness that, if there are any third bodies for the official initiation of the

proceedings on behalf of the community such as for example state attorney's office, additional requirements necessary for this body on which the initiation of adjudication proceeding depends are fulfilled so that it can function effectively. Such requirements may relate, for instance, to legal, political, and material conditions that have to be such that the state attorney's office can function effectively.

A precondition for the fulfillment of the requirements of material and political efficiency – of both official bodies and private persons – is, naturally, an adequate normative solution that regulates the power and obligation to initiate a proceeding. From the legal theory aspect, these norms can be recognized as the special sort of the power-conferring norms. Effectiveness in this sense requires the authorization of as many entities as possible for the initiation of proceedings. In cases where a particular authority is authorized to initiate a proceeding, especially in societies where this is the only option, control is required of the interested parties in the decision to initiate proceedings by this body and that this body bases its decision on the initiation of the proceedings on the law.

International law is facing the same challenges regarding the effectiveness of the initiation of adjudicative proceedings. The effectiveness of the European Commission, which can initiate adjudicative proceedings alongside the individuals and the states themselves with the procedures of consultation and conciliation that may precede the initiation of the court proceedings, certainly had an impact on the level of adoption of European legislative standards in the conduct of states and individuals. On the other hand, difficulties related to the initiation of proceedings before the International Court of Justice, before which, except in certain limited circumstances, one state cannot initiate a proceeding without the consent of the opposing state, challenge the effectiveness of international law. It is worth to mention the legal regulation for seeking the legal opinion of the International Court of Justice according to which only certain bodies may request the opinion of the court, among which the UN General Assembly. A state's success in winning the support of other member states of the UN General Assembly depending on the majority vote in the Assembly to initiate the procedure of seeking a legal opinion of the International Court of Justice surely depends on many 'non-legal conditions'.

5. THE RELATIONSHIP OF THE EFFECTIVENESS OF ADJUDICATION AND ECONOMIC AND POLITICAL RELATIONS

In political and economic discourse, the effectiveness of adjudication is often referred to as one of the fundamental goals of a successful political community model. One of the fundamental conditions for the accession of countries to some international or transnational associations is the effectiveness of adjudication. A special negotiation chapter that the countries have to fulfill to become member states of the European Union refers to adjudication in particular. The Council of Europe body, the European Commission for the Efficiency of Justice (for example CEPEJ, 2016), measure and compare the situation in the justice systems of its member states. The Organization for Economic- Cooperation and Development reports (for example OECD, 2013) and the World Bank reports (for example World Bank, 2010) covers the situation in the justice systems in different countries.

The interest in the adjudication of supranational organizations can be explained as follows. As noticed by scholars of the European integration, this process has made national citizenship less parochial and more universalistic by limiting what national governments can award or deny, not just to the citizens of other European countries (Streck, 1997). We can add to this insight that it is not only the avoidance of the discrimination between the citizens of the different states which are members of the same inter-states association that are forbidden, but the national systems have to increase the capacities so to provide equal conditions for the citizens of the association in all state members. The transnational integration, in both versions of unity or community vision, rejects the classical model of international law which celebrates state sovereignty and it provides neutral, more or less limited, an arena for states to prosecute their own goals (Weiler, 1991, p. 2479). Depending on the kind of integration, economic or social-political, the intensity of some integrative factors could be different but they are always potential factors for realization as the result of transnational human intercourse. How do these integrative factors influence the effectiveness of the adjudication?

On the one hand, state-members in supranational associations demand that their citizens have an equal and effective opportunity to protect their rights, regardless of where they are located within the association of countries. We

can say that in the context of political integration, effective adjudication contributes to the conviction of citizens: a) that community members have equal chances of realizing their personal choices without the interference of arbitrary decisions; b) that subordination of citizens to the community empowered to legitimately use force against its members, is not perceived as a 'robbers act', but as a result of cooperation of community members; c) and that the community seeks to preserve the integrity of individuals and the community. On the other hand, effective adjudication enables the citizens who appear as economic agents that, regardless of the state in which they perform economic activities, they can perform these business activities in an equal, predictable and competitive way, which is guaranteed by effective adjudication. This is the result of economic integration.

Based on the introductory considerations of theories on effectiveness, the legal-theoretical aspect should also be added to the political and economic aspect of studying the importance of adjudication effectiveness. Namely, if we accept the view that without court proceedings, we cannot reliably claim what community law really is (Ross. 2004) and that without court decisions there may be discrepancies between the official understanding of the law and the law that is really valid in the community, adjudication effectiveness also becomes an essential element for the concept of the law. This insight is not only theoretical but also reflects the political and economic aspect of the consideration of the law. Namely, without law before the courts, it may occur that official description of the law loses touch with reality and that the gap between upholding institutions and political morality of the citizens in relation to what this law produces is such that it endangers the proclaimed political and economic models of the functioning of the community. From this aspect, the effectiveness of initiating proceedings is the key element for both the effectiveness of adjudication and the political and economic goals of the community.

There are elaborated models in the professional discourse on how the effectiveness of adjudication can be achieved. For the purpose of this paper, we will outline the model that has been developed through the process of countries' accession to the European Union through the fulfillment of the requirements from Chapter 23, Judiciary and Fundamental Rights, for the part relating to the effectiveness of adjudication. The progress reports of the EU accession countries alone cannot provide full insight into the measures that need to be fulfilled, but the reports should rather be viewed in the context of projects financed from

the EU funds in order to meet the requirements of Chapter 23. Based on this analysis (for example UNDP, 2012), it is possible to summarise that the model includes the following elements: strategic management of adjudication and project management of reforms, the system of appointments and promotions in judicial sector and the implementation of disciplinary actions, judicial training systems, rationalisation of the network of courts and state attorney's offices, organisation of processes in courts and state attorney's offices, infrastructure and equipment, enforcement of court decisions, judicial inspection, alternative dispute resolution, court proceedings and file management, court organisation and court services management, probation service, prison infrastructure and living conditions in prisons, court jurisdiction in administrative matters, and free legal assistance. In such a model, there is an element that relates to the effectiveness of the initiation of adjudication. It is the element of the accessibility of adjudication to citizens which concept is unfortunately reduced to measures of free legal assistance. Although the possibility to initiate the proceedings is recognized as an important element, it is evident from the previous chapter that free legal assistance is not the only element important for the initiation of proceedings and effectiveness of adjudication.

6. EFFICIENCY OF INITIATING PROCEEDINGS IN THE REPUBLIC OF CROATIA

As previously stated, the effectiveness of initiating proceedings can be considered from the following aspects of the gap between the ideal and existing model of the adjudication on demand: a) the unconsciousness of the existence of real needs of the citizens and the community organs to initiate proceedings; b) the existence of social internal and external barriers to initiating proceedings for the citizens who could protect their interests; c) the existence of obstacles for the institutions to officially initiate proceedings, although there are needs for their initiation.

Regarding the first aspect, it is possible that the law provides a regulation aiming to achieve certain officially published values, but that community members simply do not perceive such normative regulations as relevant for their lives. For example, what is the awareness in the Republic of Croatia of the understanding of certain manifestations in the community such as corruption, degrading treatment, mobbing, discrimination, or abuse of power? According to

the study of discrimination in the Republic of Croatia, 1/5 of the respondents are not familiar with the concept of discrimination (Ombudsman, Center for Peace Studies, 2017).

Another aspect of the effectiveness of initiating adjudicative proceedings relates to internal attitudes towards the initiation of court proceedings and external obstacles that prevent citizens from initiating proceedings, although they might wish to do so. On the one hand, there are factors that can contribute to the negative attitude towards the initiation of proceedings, although citizens believe that there are social needs for the initiation. One of the reasons may be distrust of citizens in judicial institutions. According to a survey of the perception of entrepreneurs on judicial independence, Croatia is ranked 120th of 140 countries (World Economic Forum, 2015).

On the other hand, there are factors that can be external obstacles for imitating the court proceedings. One of the important preconditions for the initiation of proceedings by the citizens is financial resources. As stated before, Croatia participates in the measuring of the effectiveness of adjudication including the free legal assistance system. For example, in 2016, among forty-one analyzed countries, the Republic of Croatia was 18th according to the budget spent on free legal assistance per capita. In comparison with the average funds spent for free legal assistance per capita that amounts to 6,5 EUR, with 2,6 EUR per capita, Croatia is in the mid-range group of countries (CEEPEJ, 2018, p. 78). The statistical data on the free legal assistance can be interpreted by someone as the Croatian system being in accordance to the European trends, but also used by others to require the more efficient free legal aid system. More important is to notice that, as mentioned before, this data refer only to one segment of the whole picture on the effectiveness of the initiation of adjudication proceedings.

Also, lack of proceedings may be conditioned by specific forms of pressure in areas and situations that are considered risky for pressure on individual autonomy, such as, for example, in the prison system. Based on several cases in which problems were reported in the filing of complaints by prisoners, the CPT recommended to the authorities of the Republic of Croatia to provide all prisoners with confidentiality in filing a complaint and to examine any threats to prisoners for filing a complaint (CPT, 2014, p. 45) Such complaints can have an impact on the initiation of the proceedings for the protection of prisoners' rights.

The third aspect refers to obstacles faced by the very institutions that initiate proceedings. There is no doubt that human and material resources are one of the important preconditions for the institutions to initiate proceedings. Insufficient capacities, which may include insufficient expert knowledge to process complex criminal offenses can lead to a situation where such acts are not processed. Based on the data from the Central Bureau of Statistics (Central Bureau of Statistics, 2016/2017) we can make some insights regarding the crimes committed against the economy. In the period from 2016 to 2017, only one person was sentenced to more than five years in prison, nine persons were sentenced to three to five years in prison, 24 persons to two to three years in prison, 123 persons to 1 to 2 years in prison, and 1128 perpetrators to a prison sentence of up to one year, most of whom got a suspended sentence. These statistical data point to a small number of verdicts for the most serious violations of economic law considering the pronounced sentences, and there are no verdicts whatsoever in this period for some criminal offenses such as money laundering. Such a situation can also be caused by the inefficiency of initiating court proceedings for such, most serious crimes. This assumption, of course, need not necessarily be correct, but it points to the importance of additional investigation of the situation and causes of initiation of criminal proceedings.

Moreover, the effectiveness of investigation is one of the standards according to which the European Court of Human Rights decides on violations of citizens' rights. Violation of this standard may also indicate a lack of institutional capacity to conduct effective investigations, which may have a negative impact on the initiation of the proceedings. By 2014, the European Court of Human Rights issued 13 decisions against the Republic of Croatia in which it found a violation of principles of effective investigation with regard to only two types of violations prescribed by the European Convention on Human Rights (Turković, Omejec, 2016. p. 2016). One of the examples of the problem can be the case of *D.J. v. Croatia*. (ECtHR, 2010).

The victims and witness support can also influence the effectiveness of the initiation of adjudication. The assessment of the witness and victims' support system in 2007 (Turković et al., 2007) detected some severe shortcomings in providing assistance to victims through the criminal proceeding. Although serious progress has been made since then, the assessment of the same quality is missing to describe the current situation.

A special area of research may also be the discretion of authorities to decide on the initiation and conduct of proceedings. Although this discretion is necessary for effective adjudication, there is a question of effective monitoring of such discretion (Davis, 2007).

7. CONCLUSION

This paper outlines the theoretical concept of the effectiveness of the law by focusing on one of the understandings of this term. It is the understanding of the effectiveness of the law as the effectiveness of adjudication. One of the key elements for such an understanding of effectiveness is the effectiveness of initiating adjudicative proceedings. Without such an element, there are no court proceedings, and without court proceedings, we do not know what is the real community law. Three groups of problems can be recognized as the source of the gap between the ideal and existing model of the adjudication on demand regarding the initiation of the adjudicative procedures.

Afterward, we focused on practical issues: to what extent is the effectiveness of adjudication important for economic and political relations and how it can increase the effectiveness of adjudication. The answers to these questions are based on the reports of supranational associations that show interest in the effectiveness of adjudication in all member states. It has been pointed out that measuring the element of the effectiveness of initiating adjudicative proceedings is often oriented to free legal assistance, while a comprehensive analysis would also require the inclusion of other elements.

Finally, we have highlighted some areas that might be interesting for the studies of the effectiveness of initiating adjudicative proceedings in the Republic of Croatia. The areas are systematized under the three groups of issues outlined in the theoretical framework. Based on the analysis in the sixth chapter, we can mention several hypotheses for further researches and initial suggestions for legislative and institutional changes. Firstly, in some areas of the Croatian law, public and official legal consciousness cannot recognize the connection between existing legal norms and needs the law should serve according to the Croatian culture. This problem could be addressed by the normative and non-normative influence on the openness of the communication channels for the public debate and presentation of relevant experiences, as well as for strengthening the strategic litigation. Secondly, internal and external obstacles exist in the Croatian

legal system for citizens when initiating the proceedings. The negative attitude towards the judiciary makes citizens feel helpless when their rights are endangered. Although the free legal aid was conceptualized in a way to be in line with the European requirements for the EU accession, the model does not meet the needs of disempowered citizens. The problem of the internal obstacles can be improved by a political decision that independent and efficient judiciary presents the core value of the Croatian society. Following this decision, the strategic planning, implementation, and financing of the measures, as well as monitoring of the reforms, should be improved and perceived as equally important as before Croatian accession to EU. The external obstacles can be removed by the development of judicial and extra-judicial services oriented to facilitation of the approach to the administration of justice and to the empowerment of deprived categories of citizens. The supervision of the places where persons are deprived of liberty should be intensified with the aim to ensure equality in using the legal remedies. Thirdly, detection and prosecution of the breach of law do not respond to some deviations in the society. The normative and institutional influence should be aimed at increasing the independence and efficiency of police and state prosecutor's office with the adequate civil and parliament supervision of the correspondence between social trends and track records of successful prosecutions. The professional standards of the effective investigation, as well as prosecutor's discretion, should be developed and monitored. One of the concrete measures for improvement of the effective investigation is the finalization of the establishment of the victims-witness support system.

Abstract

The State's Attorney Office of the Republic of Croatia is an autonomous and independent judicial body which proceeds against the perpetrators of criminal acts, initiate legal measures to protect the property of the Republic of Croatia and applies legal remedies for the protection of The Constitution and the laws. The State's Attorney Office of the Republic of Croatia (hereinafter referred to as State's Attorney Office of the Republic of Croatia) is a unique judicial body that has authority over the whole territory of the Republic of Croatia. State Attorney General of the Republic of Croatia (hereinafter referred to as State Attorney General) is at the head of the State's Attorney Office.

The organization of State's Attorney Office comprises 39 state's attorney offices (Central State Attorney Office, Croatian State Prosecutor's Office for the Suppression of Organized Crime and Corruption (USKOK), 15 county's and 22 municipal state's attorney offices) with the total of 1731 employees. The organization of the State's Attorney is strictly hierarchical, so municipal state's attorney offices are subordinated to the county state's attorney offices while county offices are subordinated to the State's Attorney Office of the Republic of Croatia in Zagreb.

The State's Attorney General as Head of the body supervises the work of the entire state's attorney organization, takes care of duly and timely execution of tasks in the state's attorney, solves tasks related to the court's applications and complaints to the work of state's attorney, takes care of professional education of all state's attorneys, deputy state attorneys, consultants, legal trainees and other state's attorney officers and employees, keeps statistics and perform other duties as prescribed by the law and state attorney Rulebook.

In order to improve its functionality, the management of state's attorney offices requires the application of principle and methods of business management. Management of state's attorney offices is becoming an activity which enables the fulfillment of the basic tasks and goals of the state's attorneys to work in the best (quality) and most efficient (efficient and cost-effective) way.

The aim of this analysis is to establish how much a good organization of the state's attorney management, the motivation of deputy state's attorneys and other employees, efficient work organization and prompt reactions and decision-making in a complex situation impacts the entire state's attorney organization as well as the strength of the legal state as a whole.

Keywords: *the judiciary, state attorney, management, efficiency, management tools*

JEL Classification: K00, M10

1. INTRODUCTION

In light of the demands for more stronger legal security in Croatia, the state's attorney, as well as the judiciary as a whole, is under the stronger social and political pressure. The management of the state's attorney has become an activity which enables the fulfillment of basic tasks and goals in the best (quality) and most effective way (efficiency and cost-effectiveness). When a person takes on the role of a state's attorney, he/she is confronted with the challenge to achieve the most efficient results for which professionalism and respect in the legal community need not necessarily be a guarantee. The underlying reason is that the position of a state's attorney as the head is very often assumed without a special training, management knowledge and skills.

The traditional model of public administration of which state's attorney offices are an integral part requires a minimum of planning. The role of state's attorney as the leader of the organizational process is not envisaged as a managerial position. Strategy development is within the jurisdiction of Ministry of justice so those planned for managerial positions as civil servants, in fact, implement the instructions received from the Ministry with no opportunity to, aside from the existing strategy, develop the efficient management model.

As it has already been mentioned, in most of the countries of the European Union, the new public management represents the philosophy of management

aimed at modernizing the public sector of which the state's attorney office is also the part. Planning, vision, and forecasting are introduced in the politics of management. The concept of public management in the judiciary, i.e. in the state's attorney presupposes, among the other, building-in the implementation of behavior based on market principles, the realization of efficiency through better management, by providing confidence, managerial strength and operative freedom with increased responsibility.

There is no systematic education for the area of management of a state's attorney office, thus the heads in the state's attorney are on their own, i.e. they manage their organizational units based on their own active approach they invest in the realization of the results - in the number and ratio of the cases solved, financial and material operating, the introduction of IT technology, upgrading the system for statistical monitoring of the work, improvement of administrative proceedings and alike.

In this analysis, the notion of the management of the state's attorney is used in the sense of managing the Central State's Attorney Office in which a key role belongs to the State's Attorney General.

In such a context a concise definition which defines the management of state's attorney as the management both within the state's attorney office and out of the cases is acceptable. It encompasses the management (leadership) within a state's attorney office, relations between the state's attorney, deputy state's attorney, advisory and administrative staff, allocation of cases, appraisal (evaluation) of deputy state's attorney and advisory staff, management of the budget and real estate, maintenance and security of building, use of new technologies, human resources management and communication with other judicial staff and citizens.

2. MANAGEMENT FUNCTIONS AND LEGAL FRAMEWORK FOR MANAGEMENT OF STATE'S ATTORNEY

The management functions comprise all the activities by means of which managers manage the organizations. Traditionally this includes the following activities: planning, organization, leadership and control, and in the new literature human resources management is often included as it is logically linked with

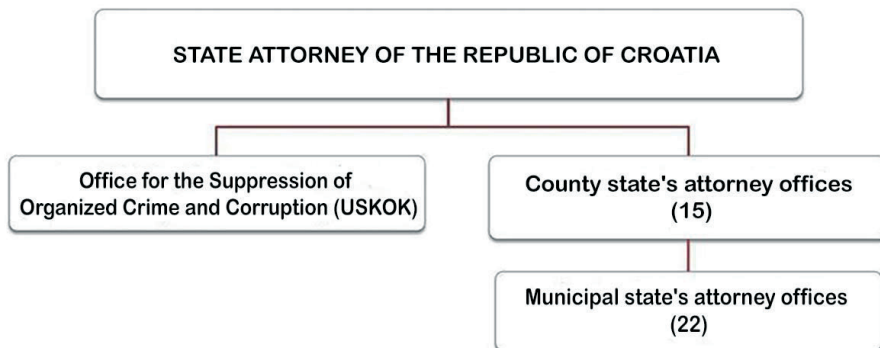

the organization. The aforementioned functions are inherent to the management of the judiciary, the courts and state's attorney office, it is only the question of how much attention is invested into this segment or whether those who run the state attorney's office have sufficient knowledge and managerial skills to respond to the challenges that are present in each state's attorney system.

The space for the realization of the main management functions and the application of managerial skills and knowledge in the management of the judiciary and state's attorney office is defined by the legal framework defined by the Law on State's Attorney Office of the Republic of Croatia and by the Rules of Procedure of the State Attorney Office.

The position and the role of state's attorney as an independent judicial body are defined by The Constitution of the Republic of Croatia, Art. 124, para 1.¹ The State's Attorney's Office is authorized to proceed against perpetrators of criminal and other criminal offenses, undertake legal actions to protect the property of the Republic of Croatia and submit legal remedies for the protection of the Constitution and the rights.

In the Republic of Croatia state's attorney, offices are the following: The Central State Attorney of the Republic of Croatia, county's state attorney offices (15) and municipal state's attorney offices (22) including permanent services in individual municipal state's attorney offices.

¹ (Official Gazette, no. 56/90., 135/97., 8/98. – revised text, 113/00., 124/00. revised text, 28/01., 41/01. – revised text and 55/01. – changes and amendments, no. 76/10.) – in Article 125 –in revised text published in Official Gazette, no. 85/10, further in the text: The Constitution)

State Attorney of the Republic of Croatia undertakes legal actions from its jurisdiction for the protection of The Constitution of the Republic of Croatia and the legality before The Constitutional Court of the Republic of Croatia, undertakes actions from its jurisdiction before The Supreme Court of the Republic of Croatia, High Commercial Court of the Republic of Croatia and High Administrative Court of the Republic of Croatia. State's Attorney Office of the Republic of Croatia undertakes legal actions from its jurisdiction before international and foreign courts and other bodies and at the request of state bodies issues opinions about draft proposals of the law and other provisions.

State Attorney of the Republic of Croatia consists of the four departments: Criminal department, Civil-administration department, Department of Internal Supervision and Department for International Assistance and Cooperation.

Graph 2. Organization of the State Attorney's Office

Source: <http://www.dorh.hr/Default.aspx?sec=632>

The county state's attorneys' offices are formed for the area of jurisdiction of the county's commercial courts and for the area of jurisdiction of county's administrative court. The county's state attorneys' offices represent the Republic of Croatia in the legal actions before the county's court and before the commercial and administrative courts unless otherwise provided by law or by the decision of a competent state body based on the law.

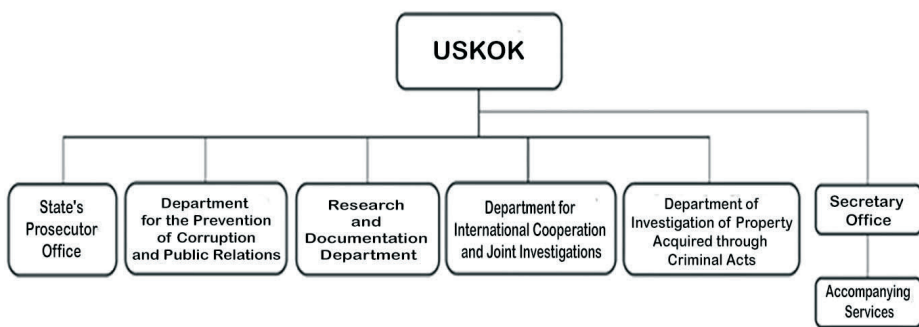

Municipal state's attorney offices are established for the area of jurisdiction of one or more municipal courts. The Municipal state's attorney offices represent the Republic of Croatia in proceedings before the municipal court and be-

for the administrative bodies unless otherwise provided by law or by a decision of a competent state authority based on the law.

Heads of departments and sections are heads of departments and sections.

State's Prosecutor Office for the Suppression of Organized Crime and Corruption (abbreviation in the Croatian language: USKOK) is a specialized body within the State Attorney Office of the Republic of Croatia, responsible for persecuting corruption and organized crime. USKOK headquarters are in Zagreb and the Office has jurisdiction over the entire Republic of Croatia. The office is managed by a director, appointed by the State Attorney General of the Republic of Croatia, with the previously obtained opinion of the Minister of Justice and the State Attorney Collegium. Senior counselors, advisors and professional associates assist the director and deputy directors in their everyday work.

Source: <http://www.dorh.hr/Default.aspx?sec=606>

According to the provision of Article 31 of The Law on the State's Attorney Office, the actual and local jurisdiction of state's attorney office is determined according to the provisions of laws that are applicable to the jurisdiction of the courts before which they exercise their powers unless otherwise stipulated by the Law.

Municipal state's attorney offices proceed before municipal and misdemeanor courts, i.e. administrative bodies and they file a lawsuit before the Administrative court, county state's attorney offices before the county and commercial courts, the state's attorney office before the Constitutional Court, Supreme

Court, Administrative Court, High Misdemeanour Court, High Commercial Court and international and foreign justice and other bodies, unless otherwise determined by law or the provisions based on the law.

State Attorney General is a key figure and main body responsible for carrying out the activities of the court's administration.

2.1. PLANNING

Planning is the management function which includes defining the goals and defining the direction of future activities with the aim of achieving these goals. Planning is the process of several levels: definition of the goals, definition of the actual position of the organization in relation to the defined goals (scanning of the environment), forecasting the future events (challenges to be addressed), drafting a precise plans for the realization of the defined goals and ensure the conditions necessary for the implementation of the plan. With regard to the time aspect, the planning can be short-term, medium-term and long-term, and from the point of view of the scope of work to be undertaken, usually operational, tactical and strategic planning differ (Sikavica & Bahtijarević-Šiber, 2004, p. 75).

The State Attorney General represents the State's Attorney Office and is responsible for the work of the state's attorney office; he/she manages the State's Attorney Office, performs tasks of state's attorney administration, cares for the professional relations and actions of officials and other State's Attorney Office employees towards clients, the court, other state bodies, and legal entities as well as for relations between the state's attorney office employees. He/she convenes sessions of the collegium and meetings of other employees, provides mandatory instructions for work and procedures when necessary for the purposes of uniform application of the laws, as well as orders and instructions for resolving a particular case, evaluates the exercise of the state's attorney duties and gives public statements related to the state's attorney office activities, drafts annual work schedule, etc.

2.2. ORGANIZATION

The organization, as the function of management, is the next step of the planning process and consists of drafting the organizational structure and al-

location of human resources in order to ensure the realization of the goals. The structure of the organization is a framework within which tasks to be performed according to the plan are coordinated. Organization means to determine the assets and methods for performing the planned activities. Management of human resources (staffing) is logically linked with the organization (Buble, 2009, p. 13) and, due to its importance, is often referred to as an independent function of the management. It is accomplished by identifying available staff, recruiting and selecting them, planning of the career, retaining and motivating (rewarding) quality employees and their training and improvement. The main goal of the human resources management is to deploy the right people to the right jobs. (Sikavica & Bahtijarević-Šiber, 2004., p. 77).

The state's attorneys structure is such that, as a rule, it has criminal and civil-administrative departments, however, the State Attorney General may, for reasons of purposefulness and cost-effectiveness, decide that representation in a certain type of civil and administrative cases is carried out by one state's attorney for an area where there are more local and actually authorized courts. For the purpose of performing the tasks of the state's attorney administration, the Department for Internal Control and the Department for International Legal Assistance and Cooperation is established.

Sections may be established within the departments, as expert bodies of at least three deputy state's attorneys specializing in a particular type of cases (e.g. sections for general crime, homicide, white-collar crime, juvenile delinquency, first instance and second instance criminal offenses, actual judicial relation, obligatory legal relations, administrative proceedings, labor relations, protection of natural resources and the environment, and alike). Sections within departments are usually organized only in the largest state's attorney offices.

Senior state's attorney may take over certain tasks assigned to a lower state's attorney (avocation) and may, in accordance with the law, authorize lower state's attorney office to proceed in a particular case or to perform certain actions from the jurisdiction of another lower state's attorney (delegation).

2.3. LEADERSHIP

Leadership as the management function comprises the direction and motivation of employees for the tasks, they perform to achieve the desired orga-

nizational goal. The degree of employee's enthusiasm for the realization of the goals depends on the efficiency of the manager. Managers must first get familiar with the personality, values, attitudes, and feelings of employees to know how best to encourage them to work more efficiently (first and foremost with a persuasive communication) and how to adapt management styles to specific situations. Leadership is the only real and one of the most important functions of the management that deals with its interpersonal aspect (Sikavica & Barjaktarević-Šiber, 2004, p. 77).

Although the State Attorney's Office is hierarchically structured, the way of leadership, understanding of the personality of its associates, deputies, counselors, and staff leaves enough space to encourage labor productivity. The state attorney as a system manager must be aware that expertise, up-to-date work, and performance at work should be the main parameter in the work. Ability to change and adapt to new opportunities should be the basic conditions for advancement within the State Attorney's Office

2.4. CONTROL

The control comprises measuring the success of achieving goals and implementation of plans and also facilitates the correction of deviations from the standards. It enables the realization of plans by ensuring that the realized tasks do not deviate from the standards. The main control functions are demonstrated in setting the standards for implementation of the planned, in measuring the implementation in relation to the set standards and undertaking corrective measures when it is assessed to be appropriate (Buble, 2009, p. 13). By comparing the achieved with the planned, control integrates the entire management process (Sikavica & Barjaktarević-Šiber, 2004, p. 77).

The state's attorney performs supervision over the orderly and timely execution of all activities in the state's attorney office, while the heads of departments and sections, under the authority of the State Attorney General, and perform supervision over the orderly and timely execution of all assignments in their respective departments and sections (Article 7 of the Book of Regulations).

The state's attorney, or the head of departments and sections, supervises the work:

- ♦ by getting insight into the work of officials and other staff members of the state's attorney office, which he/she obtains through examination of files for which he/she or the deputy has requested consultations,
- ♦ by inspecting files and decisions, thereby controlling the work of the deputy if s/he has knowledge about work deficiencies,
- ♦ by reviewing the decisions of the courts issued on the occasion of an indictment or a lawsuit i.e. second statement, and in particular by obtaining insight into decisions made by second-instance courts and decisions on extraordinary legal remedies,
- ♦ or by reviewing registers, directories, supplementary books and lists, and the like.

Pursuant to Article 56 of the Law of the State's Attorney Office of the Republic of Croatia, in exercising the right to oversee the work of state attorneys, is obligated to take appropriate measures and in particular to get an immediate insight into the entire work and operations of each county state's attorney office. Paragraph 2 of this Article obligates county state's attorneys to review the overall work of district state attorneys once every two years.

Article 20, paragraph 2 of the Rules of Procedure stipulates that the State Attorney General shall, in accordance with the work program, individually or with the aid of certain officials and other professionals, conduct an overview of all operations or their individual parts of the county state's attorney office every two years. During the review of the county state's attorney office, full or partial reviews of municipal state attorneys in the county state's attorney office may be conducted. Examination of the work of certain municipal state attorneys can be done separately.

The review can be general and partial. The state's attorney office whose work has been reviewed is made familiar with the results of the review and the measures taken, by stating briefly the most important observations made, at the final meeting, while the written report states in detail what was established during the review. The county state's attorney offices also send a copy of the minutes and reports to the State's Attorney Office of the Republic of Croatia.

Mandatory (general) reviews, carried out every two years, comprise the work of the state's attorney and the deputy on the cases, but also a review of the work of all public prosecution services, including the writing office and the state's attorney office. General reviews may also be carried out on a number of occa-

sions when deemed necessary as result of disruption in the work of the state's attorney office.

Partial reviews may also be limited to individual departments, ancillary services (accompanying services), or to a review of individual state's attorney decisions, areas of crime i.e. civil or administrative cases.

The Rules of Procedure regulate the actions of the head of a department or section (Article 8, paragraph 2 of the Rules of Procedure) in the event of noticing an unequal treatment or conduct contrary to the established practice of a higher-level state's attorney office.

Reviews of the work of lower level state's attorney offices or the work of individual officials are regulated by the Law on the State's Attorney Office and the Rules of Procedure.

The mandatory (general) review is carried out by the state's attorney alone or with the deputies appointed by him and may be done by the deputies themselves. The review of the work of the ancillary services under the supervision of the deputy state attorney shall be carried out by officials (this will be regularly the case with the scrutiny of the writing office, the public prosecutor's office and with financial supervision).

Articles 19 to 21 of the Rules of Procedure prescribe the duty to carry out reviews, the deadlines, and types of reviews. Article 21 paragraph 1 of the Rules of Procedure relating to the review of the work of counselors and officials prior to their appointment to another duty or reinstatement at the beginning has the following words omitted: "The review is carried out...", and although it is clear that this paragraph specifies exactly what type of review, it is necessary to indicate it until the Rules are corrected. In order for the examinations to be carried out in a single way, the State Attorney General issued a Review Task No. O-7 / 06-1 of 20 February 2006.

3. ROLE OF THE STATE ATTORNEY GENERAL IN THE WORK MANAGEMENT OF THE STATE'S ATTORNEY OFFICE

The State's Attorney Office is a vertically-hierarchically structured organization headed by the State Attorney General of the Republic of Croatia. The sub-

ordination stems from the Law on the State's Attorney Office, which stipulates that municipal state attorneys' offices are subordinated to county state attorneys' offices, and the latter is subordinated to the State's Attorney Office of the Republic of Croatia. Subordination is particularly pronounced in the administration of the state's attorney office. A senior state's attorney may issue to a lower level state's attorney mandatory instruction for work and following a procedure when it is necessary to ensure uniform application of the law and a unified procedure of state's attorneys.

The power of the state's attorney is limited by the powers of the higher judicial administration bodies as well as by the operations of the state's attorney office administration in which the State's Attorney General is the highest body. Despite such limitations, the state's attorney is the key figure in the state's attorney administration as regards his/her role in planning the work of the State's Attorney Office (short-term planning that needs to be included in the frameworks set out in the strategic documents), its organization (annual work schedule), guidance (orderly relations between its employees as well as their effects depend on the manner of communication that the state attorney develops with his/her deputies and other employees) and control (overseeing the orderly and timely execution of all assignments, establishing the fulfillment of state-level duties). His/her role, however, is most pronounced in terms of strengthening work efficiency. In that context, within the framework of leading as a managerial function, he/she would have to devote his/her utmost attention to his/her communication with state attorneys, deputies, counselors, and other employees in order to improve their motivation for increasing work efficiency. The state's attorney should also have more initiative and influence on the training and professional development of the deputy as well as on shaping the budget of his/her state's attorney office.

4. CONCLUSION

The activities of the state attorney's office are increasingly complicated and diverse every day. International contacts, participation in drafting laws and other documents, joint work with prosecutors of other countries are just a part of these new jobs. Intensity and dynamism increase not only in relations with prosecutors in other countries and in changes in the state attorney's office. Ac-

cepting change and the ability to learn and change becomes crucial for the work of state attorneys.

Criteria for the success of state attorneys are increasing. The state attorney must be expert, educate, supervise the work of the state attorney's office and the lower state attorney's office, but also have to know and supervise important matters. Therefore, the increase in interdependence in the work of some state prosecution departments, new activities, and various forms of international cooperation and assistance require teamwork, within the state attorney's office, but also at the level of state attorney's office. The team in which the state attorney is primarily a coordinator, not a state attorney who decides everything for everything and everything is the basis for effective and quality work. The ability of teamwork and the ability to acquire permanent learning is a prerequisite for selecting a state attorney, but also the condition of recruiting trainees, counselors, and in particular deputy state attorneys.

There is no doubt that the modernization of the judicial system is unimaginable without the strengthening of management knowledge and skills in the function of improving the state's attorneys work efficiency. The results of scientific research of judiciary management (in the sense of managing a state's attorney office aimed at greater efficiency) confirm the necessity of applying managerial knowledge and skills through which the state's attorney office administration also performs its fundamental management functions. We particularly emphasize the importance of education and raising the level of professional development standards, the significance of planning for the purpose of establishing (short-term and long-term) goals and prioritization, as well as characteristics that a state's attorney is expected to exhibit as a good manager (communication capability, leadership, and vision).

The existing legal framework of the state's attorney office provides enough room for change, so there is no need to delay undertaking concrete measures.

PURPOSE OF PUNISHMENT AND LEGALITY OF PARTIES' AGREEMENT IN CRIMINAL PROCEEDINGS

Igor BOJANIĆ, Ph. D.

E-mail: bojanic165@gmail.com

Abstract

This paper deals with practically important issue whether the court in the context of reviewing the legality of the agreement of the parties in the Croatian Criminal Procedure is authorized to assess whether the negotiated punishment will meet the expected purpose, as well as to evaluate whether all relevant circumstances for determination of punishment are taken into account. Based on such evaluation, the court should decide whether the proposed agreement in the present case will be accepted or refused.

When it comes to the purpose of punishment, it is especially important to point out the interest of achieving the so-called positive general prevention. Bearing in mind the clear and unambiguous substantive legal provisions on sentencing and the content of procedural provisions on court proceedings when assessing the legality of a parties' agreement, it is right to conclude that only a court in each particular case can resolve any unpleasant antinomy between justified demands for efficiency of criminal proceedings and just punishment. Limiting the role of a criminal court in assessing the legality of the proposed punishment only to control compliance with the prescribed limits for the mitigation of punishment is in fact illicit abolition of one of its basic functions (sentencing) and at the same time completely unacceptable favoring the state attorney as a criminal policy maker. For the purpose of a more appropriate harmonization of the parties' agreement in criminal proceedings, which justifiably seeks to strengthen its effectiveness, with the basic substantive (guilty principle) and the procedural law (principle of the search for material truth) principles, the paper proposes amendments to the legal provisions on the agreement of the parties obliging the state attorney to present to the court the evidence he has, other than the defendant's confession, and to explain the negotiated punishment. This would

make the parties' agreement in the criminal proceeding more transparent, and the possibility of unfair punishment as well as convictions of innocent persons would be reduced.

Keywords: *purpose of punishment, parties' agreement in criminal proceedings*

JEL Classification: K14, K49

1. INTRODUCTION

The 2008 Criminal Procedure Act (further in the text: CPA) introduced provisions on the negotiation of parties on the terms of guilty plea and the agreement on punishment and other measures that allow judgment on the basis of the parties' agreement, regardless of the severity of the criminal offense and with the significant passivation of the court (Tomičić & Novokmet, 2012, 149, 178). They represent the answer of the Croatian legislator to the challenges arising from the need to accelerate and simplify criminal proceedings, to reduce the costs of criminal justice system and to increase its effectiveness. The introduction of provisions on the possibility of completing criminal proceedings by a judgment under the agreement of the parties may also be justified by the need for the humanization of criminal law and the re-socialization of perpetrators of criminal offenses (Krapac, 2012, 87). Changes in the area of criminal procedural law are also strongly supported by the provisions of the Criminal Code (further in the text: CC), which, in the case of a parties' agreement, substantially extend the limits of mitigation of punishment.

The reform of the criminal procedure that was carried out by the CPA 2008 and which included, *inter alia*, the introduction of a judgment on the basis of the parties' agreement as one of the forms of consensual completion of the proceedings, was pursued in accordance with the principles established in 2007 by the working group of the Ministry of Justice. The principles were directed towards the adoption of a new system of criminal procedure rules that must guarantee the protection of human rights, reliable determination of the truth, in a speedy, simpler and more cost-effective manner that will take into account the nature and severity of the criminal offense, the person of the defendant and the victim, as well as the need to protect society from criminal offenses (Pavišić, 2008, 518).

With regard to the content of the procedural provisions on the agreement of the parties, it should first be noted the provision of the CPA related to the defendant's statement of his guilt and the agreement on punishment and other measures. This provision defines the subject of negotiation and the defendant's obligation to have a defense counsel during the negotiations (Article 360, paragraph 1 of the CPA), the possibility for the court (indictment panel) to briefly postpone the session in order for the parties to conclude the negotiations (Article 360, paragraph 2 of the CPA), the proceedings before the indictment panel (Article 360, paragraph 3 of the CPA), the conduct of the State Attorney after the signing of the statement and his obligation to obtain the consent of the victim of an agreement for more serious criminal offenses against life and limb and against sexual freedom (Article 360, Paragraphs 5 and 6 of the CPA).

Concerning the subject of agreement and its boundaries (negotiation on terms of guilty plea and agreement on punishment and other measures), it is a key obligation of the State Attorney to act on the principle of legality, excluding the negotiation on modification of the indictment through the mitigation of the qualification or withdrawal from persecution for particular criminal offenses in the purpose of obtaining the defendant's guilty plea (Ivičević Karas & Puljić, 2013, 835; Tomičić & Novokmet, 2012, 178-181).

The State Attorney may not negotiate a less severe punishment or other measure for the possible use of the defendant as a witness in another criminal proceedings because in such a case it is his inadmissible manipulation and abuse by replacing the procedural roles of the perpetrators of criminal offenses to secure the conviction and to strengthen the evidence against the co-defendants (Turudić et al., 2016, 150-151; Ivičević Karas & Puljić, 837; Đurđević, 2009, 790-791).

The provisions of the CPA (Articles 361 to 364 of the CPA) relating to the making of a judgment based on parties' agreement (plea bargaining) govern the conduct of the indictment panel following the receipt of the statement for making that decision, the content of the judgment based on plea bargaining, and the exceptional possibility of rebutting such a judgment by appeal. With regard to the subject of this paper, it is particularly worth mentioning the provision concerning the judicial control of the legality of the parties' agreement referred to in Article 361, paragraph 3 of the CPA, according to which the indictment panel will not accept the statement for making a judgment based on plea bar-

gaining if, under the circumstances, the acceptance of such a statement is not in accordance with the determination of punishment prescribed by the law or the agreement otherwise is not lawful. In that case, the indictment panel shall refuse the statement for making the judgment on the basis of a parties' agreement by a decision against which an appeal is not allowed. Following the decision to refuse the statement for the judgment on the basis of the plea bargaining, the indictment with the case file must be submitted to the presiding judge of the trial panel to determine the hearing (Article 361, Paragraph 4 of the CPA). If it accepts a statement for making the judgment on the basis of a parties' agreement, the indictment panel shall pronounce the punishment or other measure to the accused under Article 360, paragraph 4 of the CPA (Article 361, paragraph 2 of the CPA). In the manner described, the president of the trial panel at the preliminary hearing (Article 374 of the CPA) may also act upon submission of the statement for making the judgment on the basis of the parties' agreement.

Acceptance of any model (type) of plea bargaining and any other form of consensual justice is difficult to reconcile with the achievement of more important procedural principles (Damaška, 2004, 19). Therefore, in the Croatian literature on criminal procedure law, after the introduction of the institute of the judgment on the basis of the parties' agreement, ideas emerged that seek to eliminate the perceived shortcomings of the current legal solution.

Following some of the solutions from the comparative criminal procedural law, they are primarily aimed at excluding the possibility of making agreements in the most serious criminal offenses, the more active role of the court when deciding on accepting a statement for making the judgment based on plea bargaining statement and a more transparent procedure, and should reduce the possibility of conviction of the innocent and to contribute to the realization of the victim's interest (Ivičević Karas & Puljić, 2013, 841-843; Tomičić & Novokmet, 2012, 186).

This means in particular that the court should have a wider opportunity to not accept the agreement after a public contradictory hearing if it considered that the existing evidence was insufficient for the conviction or that the proposed punishment was not determined in accordance with the legally prescribed purpose of the punishment (Ivičević Karas & Puljić, 2013, 847). In the context of making the judgment on the basis of plea bargaining, fair punishment is also emphasized as the fundamental task of the court, the connection

between the guilty principle and the duty to investigate (substantive) truth and the necessity of finding a balance between the aspiration for efficiency and the way of acting (transparent, public) that creates and strengthens the trust of citizens in the legal system as a whole (Turudić et al., 2016, 146, 149-151). The latter refers to the problem of the relationship between the legal regulation of parties' agreements in criminal proceedings and the theories about the purpose of punishment (especially those that emphasize positive general prevention).

Contrary to the theoretical approaches advocating strengthening the role of the court when deciding on the legality of a party's agreement, the Supreme Court of the Republic of Croatia in several recent decisions represents a very dubious standpoint, which considerably narrows the judicial control of the legality of the negotiated punishment because it eliminates the possibility of refusing the parties' agreement because the proposed punishment is not determined in accordance with the purpose of punishment and the circumstances relevant for determining the punishment, leading to an even greater marginalization of the court.

The purpose of punishment in Croatian criminal law, the relation of the parties' agreement in criminal proceedings and the positive general prevention, as well as the judicial control of negotiated punishment are discussed below. The conclusion sets out the main guidelines for future amendments to the legal provisions on plea bargaining that can contribute to more appropriate pursuit of certain purposes of punishment, in particular positive general prevention.

2. THE PURPOSE OF PUNISHMENT IN CROATIAN CRIMINAL LAW

The Criminal Code usually does not have an explicit rule on the purpose of punishment. This is understandable because it is a controversial theoretical question on which consensus is difficult to reach, and it is even more difficult to express it with a simple formula required by the legal text. However, the Croatian legislator has explicitly defined the purpose of punishment in Article 41 of the CC. This provision reads: the purpose of punishment is to express public condemnation for a criminal offense committed, raise the confidence of citizens in the legal order based on the rule of law, exert the influence on the perpetrator and all others so that they do not commit criminal offenses by raising awareness of the perils of committing criminal offense and of the fairness of punishment,

and allow the perpetrator's reintegration into society. This provision is shaped in accordance with contemporary mixed (uniting) theories that seek to balance retribution and prevention (Novoselec & Bojanić, 2013, 376), and its elements have primarily preventative content (Horvatić et al., 2017, 222).

Defining the purpose of punishment does not solve the problem of possible antinomy of certain purposes of punishment because it is not the legislator's task, but it provides guidelines for practice, which should be taken into account when determining the sentence. Article 41 of the CC is dominated by a positive aspect of general prevention which comes to the fore in the section on strengthening the public confidence in the legal order based on the rule of law and the impact on all the others not to commit criminal offenses by raising their awareness of the danger of criminal offenses and fairness of punishment. The idea of special prevention is contained in the influence on the perpetrator not to commit criminal offenses, and such influence is also achieved by strengthening the perpetrator's awareness of the perils of committing criminal offenses and of fairness of punishment. The purpose of punishment is also to enable the perpetrator to re-engage in society. This is a reflection of the idea of re-socialization, which is dominant in the execution of punishment. For realization of special prevention, it is especially important that the perpetrator himself accepts the punishment as fair. The emphasis on fairness as the object of awareness of perpetrators and all other citizens makes it possible to link special and general prevention with retribution, which is also the purpose of punishment in Croatian criminal law, since Article 41 of the CC also mentions the public condemnation for a criminal offense committed. A just (fair) or deserved punishment is only a punishment based on the guilt of the perpetrator and which is limited by the degree of his guilt. That is why the purpose of the punishment is derived from the principle of (individual) guilt, according to which no one shall be punished unless found guilty (culpable) of the committed criminal offense (Article 4 of the CC), and the severity of punishment shall not exceed the degree of culpability (Article 47 § 2 of the CC). Only such punishment can strengthen the public confidence in the functioning of the legal order and direct the perpetrator to life without committing criminal offenses. Such social condemnation should be perceived as a social-ethically-based disapproval (censure), which is the core of perpetrator's guilt towards normative theories that accept Croatian criminal law. Since guilty is the foundation of punishment, and its degree limits the severity of punishment, the expression of social condemnation is closely related

to the retribution or the requirement that punishment must be fair (Novoselec & Bojanić, 2013, 376-377).

The model of unifying (mixed) theory on the purpose of punishment which treats retribution, special and general prevention as equal punishment purposes and which comes to light in Article 41 of the CC deserves approval. Retribution as a purpose of punishment is acceptable in terms of expressing a social-ethical censure for perpetrated criminal offense and in the sense of deserved punishment which corresponds to the degree of perpetrator's guilt. The sense of justice, which is of great importance in stabilizing the general legal consciousness, requires no one to be punished more than he deserves, and just punishment is the only one that is based on the perpetrator's guilt and is limited by the degree of guilt. The severity of punishment must never exceed the degree (measure) of guilt (Bojanić & Mrčela, 2006, 439-440). Fair cannot be a drastic punishment if the degree of guilt is low (Novoselec & Bojanić, 2013, 370), as well as excessively lenient punishment if the degree of perpetrator's guilt is high. Only a just punishment can strengthen the public confidence in the functioning of the legal order (positive general prevention) and the training of perpetrator for life without the commission of criminal offenses (special prevention) is not possible if he does not accept the punishment as just. The punishment may also go below the level of the established degree of guilt when this requires special prevention interests, but only if the minimum requirements for general prevention are met with such punishment. The punishment, however, should not be over-reduced due to special prevention effect, since such punishment would no longer be seriously understood by citizens; such a punishment could shake confidence in the legal order and encourage the imitation of the perpetrated criminal offense. The concept of retribution as shown here is also useful for achieving preventive goals (Bojanić & Mrčela, 2006, 439-440).

Accepting unifying (mixed) theories in Croatian criminal law is consistent with modern concepts that wish to align the idea of censure and the requirements of prevention, especially positive general prevention. The element of censure in punishment should act as an appeal to existing beliefs that conduct which is prohibited by criminal law deserves a condemnation. The appeal contained in the punishment indirectly and in the long run can contribute to the prevention of criminal offenses, even if such effects cannot be quantified or measurable. The principle of proportionality of punishment must be strongly emphasized in the area of the determination of punishment. The measure of

punishment reflects the measure of condemnation, so that the higher punishment expresses the stronger and the lower the weaker censure (Hörnle & von Hirsch, 1995, 270, 279). The punishment cannot be justified by the one-sided emphasis of preventative purposes or by the exclusive emphasis of socio-ethical disapproval of perpetrators' conduct, but merely on the basis of a combination of both elements (von Hirsch, 2011, 44). Such a combination tries to overcome the sharp contradiction of absolute (retributive) and relative (consequentialist) theories of the purpose of punishment.

The definition of the purpose of punishment referred to in Article 41 of the CC is not contrary to the understanding that the purpose of punishment is seen only in (special and general) prevention, but also point out that the severity of punishment is limited by the offender's guilt. And such a concept of prevention that is limited by the guilty of the perpetrator is based on the knowledge that neither guilt nor prevention take for themselves (alone) cannot legitimize the punishment. The need for the preventive necessity of punishment, as well as its limitation to the just measure of guilt, is laid down in the foundations of democracy that respects human rights. The „mixed“ theory, which in this way links prevention and fairness, does not represent the eclectic connection of heterogeneous approaches, but by its insistence on cumulative justification, it is the only convincing possibility of sufficient justification for the state power of punishment (Roxin, 2006, 95). According to the concept presented, guilt is derived from the purpose of individual punishment and requires an extension with regard to preventive aspects, since punishment does not only depend on guilt but on the requirements of prevention. When the punishment depends on its preventive necessity and, moreover, on the perpetrator's guilt and guilt degree, the punishment has a double limit. It must not exceed the measure of guilt, but it must not be severe than necessary. For example, a punishment may be measured below the measure (degree) of established guilt measure if this is desirable because of re-socialization or it can be waived if it is not preventive necessary. In this way, the traditional term of guilt is supplemented by the condition of preventative necessity for punishment, and their cumulating forms the notion of responsibility (Roxin, 2011, 680, 684-686). The punishment serves all in the individual case for the relevant purposes of positive and negative special and general prevention, and responsibility assumes the perpetrator's guilt and is limited by its measure. In such a concept, the dispute between absolute and relative theories about the purpose of punishment ceases. The punishment

serves for all purposes of (positive and negative) special and general prevention relevant to the individual case, and responsibility assumes the perpetrator's guilt and is constrained by its measure. In such a concept, the dispute between absolute and relative theories about the purpose of punishment ceases (Roxin, 2015, 202).

3. PLEA BARGAINING AND POSITIVE GENERAL PREVENTION

Since the conclusion of the criminal proceedings by the judgment based on plea bargaining primarily meets the interests of the parties and contributes to the cost-effective use of funds intended for the criminal justice system, it can rightly be asked whether the particular purposes of punishment referred to in Article 41 of the CC can be met at all in the case of the negotiated punishment (compatibility of plea bargaining and the theories about purpose of punishment) or what is the relationship between the legal provisions on the parties' agreement in criminal procedure and the purpose of punishment?

The proportionality between the punishment and the guilty of the perpetrator is in the case of an agreed sentence in the second plan, the mitigation of punishment may be appropriate to the interests of special prevention and re-socialization, while the degree of mitigation should not jeopardize the interests of general prevention. Since Article 41 of the CC, as has already been emphasized, is dominated by positive general prevention, it is only in this work to discuss the interaction of legal provisions on parties' agreement in criminal proceedings and positive general prevention.

3.1. THE IMPORTANCE OF POSITIVE GENERAL PREVENTION

The theory of general prevention today is very influential, thanks to its positive aspect of preserving and strengthening public confidence in the functioning of the legal order, the constant demonstration of the inviolability (sanctity) of the law or norm validity, and thus the strengthening of general legal awareness and loyalty of citizens to legal norms. Such a concept of general prevention criminal law theory gives precedence over intimidation, although these two aspects cannot be completely separated, because trust in the power of functioning of the legal order depends in part on the intimidating (threatening) effect of

criminal law (prescribed punishments). The theory of positive general prevention appears in various variants and can be considered almost prevalent in the German criminal law theory (Jescheck & Weigend, 1996, 68). It is interesting to note that positive general prevention is also discussed by Anglo-American authors, which this aspect of general prevention, together with the theory of legal goods, consider as the most important achievement of German criminal law dogmatics (Dubber, 2005, 679-707).

Some German authors describe positive general prevention through its effects. Thus, for example, they emphasize the socio-pedagogical motivated effect of learning, according to which the criminal law and court decisions make it clear that the social values are respected, the effect of confidence (trust) that arises when everyone is convinced that the law is respected and the effect of satisfaction, which calms the public that is disturbed after the perpetration of the offense, and who, after the pronouncement of the sentence, considers the conflict with the perpetrator to be resolved (Roxin, 2006, 80-81).

It is the task of punishment to insist on voluntary compliance with the norm, so that the threat of punishment affects the processes of personal development and learning, instead of focusing only on the short-term behavioral adjustment. The punishment should have a moral and educational impact, and positive general prevention should not contribute to the general respect of norms through intimidation, but through strengthening internal links with social norms and by promoting internalization and acceptance of norms (Baurmann, 1994, 368).

The aforementioned standpoint links the positive general prevention and the socio-ethical function of criminal law that advocated in German criminal law theory 50 years ago. The primary task of criminal law is not to protect the current legal goods because the criminal law usually comes to the scene when these goods are already violated but respecting the positive social-ethical values in the actions of individuals. By punishing murder, criminal law calls for respect for human life, it shapes the socio-ethical judgments of citizens and strengthens their loyalty to the law (Welzel, 1969, 2). However, criminal law does not want to impose any conviction, but only respect for the legal goods protected by criminal law and recognition of norms. There is no doubt that stabilizing norms in society, as a positive general prevention, falls under criminal law tasks (Roxin, 2006, 48). By prosecuting and punishing behaviors that deviate from fundamental legal values, the criminal law in the most impressive way avail-

able to the state clearly shows the invulnerable validity of the positive values of human actions, shapes the socio-ethical beliefs of citizens and strengthens their loyalty to justice. Ensuring respect for legal goods is more important than achieving a positive result in the current individual case. Only in such a way is it possible to achieve a lasting and truly thorough protection of legal goods. The socio-ethical function of criminal law guarantees deeper and stronger protection of legal goods than is possible through the very idea of the protection of legal goods (Welzel, 1969, 3-4). Almost at the same time, the socio-ethical function of criminal law was emphasized in Croatian literature. It manifests itself in the continuing action of the criminal law that is increasingly being developed by citizens in their positive attitude toward the social values that are protected by the law. It is not the purpose of the Criminal Code that only citizens of fear of punishment refrain from disturbing or endangering elementary social values, but that these values are respected in their own beliefs and that they enter them into their moral code (Zlatarić & Damaška, 1966, 305).

The effects of positive general prevention are difficult or almost impossible to empirically check because general trust in the functioning of the legal order is influenced by many factors. General prevention also justifies punishment in situations where there is no longer a danger of repetition of a criminal offense for a particular perpetrator, and that is its advantage over special prevention theories. The fundamental objection, as well as the objections to special prevention theory, consists in the fact that general prevention theories do not have a criterion to determine the severity of the sentence. They generally meet the form of criminal policy that committing criminal offenses is considered to be an indicator that past penalties were not sufficient for efficient general preventive action, and the solutions to these are more severe punishments. The idea that more severe punishments have a more intimidating effect has historically proven to be the most common cause of excessive punishment. Overestimation the measure needed to stabilize the legal order contains the threat of state terror. More severe punishment for general-purpose reasons calls into question a human dignity.

In addition to the most powerful point of criticism of positive general prevention that is reflected in the fact that its assumptions are not empirically provable (Hörnle & von Hirsch, 1995, 262), it should be particularly emphasized here that general prevention ignores the guilty of the individual perpetrator and questions his human dignity because the perpetrator is used as a means of

achieving preventative goals of others (Novoselec, 2016, 364). In this connection, it is necessary to provide a convincing explanation as to why the perpetrator is not punished solely for his offense but also for the others to believe in the real validity of the norm (Weigend, 2011, 33) achieving the preventative goals of the state? It is considered that the perpetrator within the scope of his responsibility must also bear the burden arising from the general preventive purposes of the punishment. In other words, he should accept that an example of his punishment will also affect others not to commit criminal offenses and that his punishment will strengthen public awareness of the need to punish incriminated behaviors (the effect of learning), that it will strengthen public trust in the implementation of the law (confidence effect) and that the ending of the disorder arising from the perpetration of the criminal offense would be deemed appropriate (the effect of satisfaction). All this covers the perpetrator's responsibility, which is the result of a culpable conduct. Responsibility for unlawful conduct is contained in the disapproval (censure) of the act. At the same time, it requires that the perpetrator faces his responsibility and that he must assume what is preventively necessary to re-establish legal peace (Roxin, 2015, 198).

Positive general prevention comes to the fore when punishment is imposed and within the prescribed limits can justify a higher or lower penalty. The modification of punishment (pronouncing more or less severe punishment, suspended sentence or community service) based on the requirements of positive general prevention comes into consideration only in exceptional cases. As a general rule, it should be assumed that general prevention should only be considered when the imposed punishment sufficiently expresses the perpetrator's guilt. The punishment in which its proportionality to the perpetrator's guilt is at the center of attention is likely to be considered by the public as fair and therefore it is realistic to expect to be accepted as the correct form of norm validity confirmation (Meier, 2001, 182; Jescheck & Weigend, 1996, 881).

Situations in which the demands of positive general prevention appear as corrections of more or less severe punishment also appear in court practice. For example, mitigation of punishment from the standpoint of positive general prevention would be justified in the case of lengthy proceedings that were not delayed by the accused, as well as that also there will be a need for more severe punishment in case of unacceptable mild negotiated punishment.

However, the importance of positive general prevention should not be overestimated. In this connection, criticism of radical functionalism is justified (Ambrož, 2018, 21-22), which in the design of criminal law terms puts the purpose of punishment in the foreground, as in the example of a functional perception of guilt that guilty defines and measures (estimates) according to the requirements or needs of positive general prevention (Jakobs, 1976, 8-9). In the context of such an understanding of guilt, it is also wrong to assess the view that the defendant's guilt due to the need for positive general prevention in case of agreement should be assessed differently than in other cases with similar or equal criminal content (Schmitz-Remberg, 2014, 72).

3.2. THE IMPACT OF THE LEGISLATION ON PLEA BARGAINING ON POSITIVE GENERAL PREVENTION

An agreement on punishment may, to a certain extent, create a positive impression among citizens. Judgments based on a parties' agreement in criminal proceedings will not undermine public confidence in the functioning of the legal order if they are perceived as a quick and effective response to the perpetrated criminal offense, which does not at the same time compromise the fairness of punishment. However, adequate substantive and procedural legislation can contribute to the achievement of desirable effects from the standpoint of positive general prevention. Some previous research on the compatibility of legal provisions on plea bargaining and positive general prevention seeks to identify key points in normative content that need to be addressed in order to realize certain aspects of positive general prevention in the best possible way (Schmitz-Remberg, 2014, 62, 82-121). The results of such investigations are also useful for Croatian criminal procedural law in view of the modalities and desirable modifications of the provisions on plea bargaining *de lege ferenda*.

The following questions should be answered: Is it justifiable to exclude the plea bargaining for the most serious criminal offenses from the point of view of positive general prevention? What role in plea bargaining belongs to the principle of seeking material truth? Is it possible to improve the transparency of the proceedings leading to a judgment based on parties' agreement? To what extent should the limits of the punishment mitigation be extended in the case of parties' agreement on mitigated sentence?

In this connection, it is especially worth pointing out the standpoint of the German Federal Constitutional Court in which that court states that search for truth, determination a (fair) punishment that is proportionate to the perpetrator's guilt, as well as the fairness and transparency of proceedings constitute important values of the criminal justice system that also must be respected in the context of plea bargaining (BverfG - Federal Constitutional Court, Judgment of March 19, 2013, §§ 67, 95-96, 104-105).

3.2.1. Exclusion of parties' agreement for the most serious criminal offenses

Despite the interest of the judiciary for the quickest possible completion of the criminal proceedings and the aspirations of the defendants for the slightest possible punishment, judgments based on parties' agreement should be an exception and not a rule. A common practice of negotiating may weaken or even nullify the threat of punishment, and unequal treatment of offenders can also be considered. The level of certainty in determining the guilt of the accused in the case of a judgment based on agreement of the parties is, in principle, lower than in the case of the defendant's conviction after a public and transparent hearing that was conducted with formalities guaranteeing all the rights of defense and reducing the probability of conviction of the innocent. Therefore, support should be given to proposals that, based on the insight into comparable solutions in continental law, for the protection of the defendant's rights and respect for the interests of the victim and the public, advocate the exclusion of plea bargaining for the serious and most serious criminal offenses (Tomičić & Novokmet, 2012, 181-182; Ivičević Karas & Puljić, 2013, 843-844). The reasons behind the above-mentioned proposals are also sufficient from the point of positive general prevention to justify exclusion of plea bargaining for the most serious criminal offenses.

3.2.2. The search for (material) truth and parties' agreement

The duty to seek (material) truth is an indispensable precondition for the realization of the guilt principle, or the principle of proportionality between the punishment imposed and the established degree of perpetrator's guilt. Although the principle of guilt belongs to substantive criminal law, it has procedural implications because it obliges the court to establish the facts necessary

to determine the degree of the accused's guilt. Moreover, if the punishment is mitigated only for the sake of acceleration of the proceedings and the reduction of the number of cases and therefore remains below the level reflecting the accused's guilt, the imposition of such a sentence constitutes a breach of the guilt principle (Weigend & Turner, 2014, 82, 84-85).

In the German literature on criminal procedure law, it is particularly insisted that the plea bargaining does not affect the principle of seeking truth and that the duty of clarification the facts undoubtedly is higher than the possible completion of the proceedings. Giving up (withdrawal) from the duty to search for truth cannot be supported under any circumstances for the reasons of positive general prevention. The most important consequence of such waiver would be the loss of confidence. In the end, the public should have doubts whether the defendant actually committed a criminal offense. It would also no longer be recognizable to the public whether the law or the mere agreement had actually come to light in the proceedings. In addition, the effect of satisfaction could not be fully realized because it would remain unclear whether a pronounced sentence resolved a conflict with the actual or alleged perpetrator. It is reasonable to fear that without this principle a much more innocent would be punished, which could cause problems with respect to maintaining / ensure social cohesion.

Positive general prevention therefore requires that the principle of seeking the truth also applies within the framework of the plea bargaining, and in the event of any contradiction between the acceleration of the criminal proceedings generated by parties' agreement and judicial determination of the truth, such a duty of the court must always take precedence (Schmitz-Remberg, 2014, 90).

Affirmation of the search for material truth is also needed in the context of possible change of the provisions related to making a judgment based on parties' agreement in Croatian procedural law. Since the court does not assess the existence of the defendant's guilt at all before pronouncing the verdict, it is necessary to create mechanisms that will enable it (Tomičić & Novokmet, 2012, 186), i.e. to ensure effective judicial control of the legality of the agreement, it is necessary to ensure effective judicial control of the lawfulness of the agreement, which would include not only verifying whether the punishment was measured in accordance with the legal rules on determination and the purpose of the punishment, but also to ascertain whether the existing evidence is sufficient for the

conviction (Ivičević Karas & Puljić, 2013, 842). In the latter case, it is about strengthening the court's inquisitorial powers and the connection between the inquisitorial principle and the duty of the court to investigate material truth. The necessity of prescribing a procedure in which truth will be established arises from Article 1 of the CPA, which requires that procedural rules ensure the release of the innocent and lawful punishment of the guilty. The search for the truth and its determination give legitimacy to criminal proceedings and criminal judgments (Đurđević, 2013, 341).

3.2.3. Transparency of the bargaining

Control of the legality of the parties' agreement (negotiated punishment and evidence justifying the conviction) should be conducted at a public hearing instead of *in camera*, to ensure transparency and as far as possible avoid the risk of superficial ratification of the agreement by the court (Ivičević Karas & Puljić, 2013, 842). In this way, it would be possible to remove the justified objection (Turudić et al., 2016, 142-143) that the current provisions on the parties' agreement in criminal proceedings are not harmonized with the guidelines contained in the Recommendation of the Council of Europe Committee of Ministers concerning the simplification of criminal justice no. R (87) 18 of 17 September 1987. The guidelines relating to the guilty plea proceedings require that it be carried out before a court at a public hearing, that there should be a positive response of the accused to the charge against him and that before the conviction of the defendant exists the opportunity for the judge to hear both parties.

Determination of the punishment is in the hands of a state attorney who thus exercises a strong influence on the judicial punishment policy because the court can only refuse the proposed punishment after checking its compliance with the legal rules on punishment determination. Transparency of the proceedings here requires that the circumstances that a state attorney should take into account when measuring the sentence should be regulated by law (Ivičević Karas & Puljić, 2013, 840) instead by instruction of the Chief State Attorney and that the law should also prescribe the obligation of the State Attorney to explain the proposed punishment. Because of the impression that the judgments based on the parties' agreement can be made in public, it is a convincing proposition that the prosecutor should briefly present what evidence he still has, other than the confession of the accused (Damaška, 2004, 18-19). The

publicity and transparency of the negotiation procedures is certainly necessary from the standpoint of positive general prevention, as this creates and strengthens the public confidence of citizens in the functioning of the legal system as a whole (Turudić et al., 2016, 151).

3.2.4. The limits of mitigating the negotiated punishment

Regarding other practices that shorten the procedure, confession of the accused is of special importance because the accused in a special way assumes responsibility for his conduct; in the end, at least in relation to the public, he recognizes a violated norm and values that are protected by the norm, which is still more than the usual savings of funds. His assumption of responsibility is a significant contribution to re-establishing the legal order and proof of the of the norm validity. It is a contribution to faster determination of facts, shortening of the proceedings and saving of the resources of the judiciary, which is generally recognized by the court as a mitigating circumstance in the determination of the sentence. However, the question may be raised whether the special provisions of the Penal Code on the limits of mitigating the negotiated punishment are justified by which the court may impose a milder sentence than prescribed for a particular criminal offense when a state attorney and defendant are agreed upon the mitigation of the punishment (Article 48, § 3 of the CC). Namely, for such a case, the Croatian legislator provided that the punishment may be reduced to half the lowest punishment obtained by mitigation according to the rules of regular mitigation cases without the agreement of the parties but may not be less than three months in prison (Article 49, § 2 of the CC).

The literature states that the parties should be provided with a maneuvering space in the sanctions negotiation in order to fully apply the parties' agreements in criminal proceedings and that the defendant will be motivated to confess only if he is offered a less severe punishment than he could receive during the proceedings. In addition, the provision that provides significant benefits in determination of the sentence should contribute to greater use of alternative sanctions, as further mitigated punishment open the possibility of applying suspended sentence and community service. It is also considered that disputes related to the mitigation of punishment do not call into question the rational punishment policy (Turković & Maršavelski, 2012, 814). In the latter view, however, it is the

erroneous interpretation of the finding of another author (Damaška, 2004, 15) that appears in a context that suggests the opposite conclusion.

Rational punishment policy will certainly be called into question if the negotiated punishment is not transparent because of the absence of an obligation to state the reasons for the mitigation of the punishment or because the degree of perpetrator's guilt and other circumstances relevant to the determination of punishment other than the defendant's confession are completely ignored. The use of substantially extended mitigation limits can be extremely sensitive to the most serious criminal offenses where significant mitigation of punishment can hardly be theoretically justified. Thus, for example, a criminal offense of genocide referred to in Article 88, paragraph 1 of the CC, which is punishable by imprisonment for at least ten years in prison or a long lasting imprisonment, may be punished by imprisonment for a term of one year and six months in prison, only on the basis of the fact that such a reduced sentence was agreed by the state attorney and the defendant.

In addition to the conviction of the innocent defendant, which has nothing to do with the purpose of punishment, the main problem of the judgment based on the parties' agreement in the context described above may be the imposition of excessively mild sentences that are contrary to the requirements of positive general prevention, but also to the demands for retribution if the punishment imposed is obviously unjust with regard to the degree of perpetrator's guilt (Bojanić & Barković Bojanić, 2015, 758). It is therefore certainly necessary to re-consider very significant benefits in determination of punishment that the legislator prescribed for punishment mitigation resulting from the parties' agreement.

4. JUDICIAL CONTROL OF THE NEGOTIATED PUNISHMENT

In the introductory part of this paper, a provision from Article 361, paragraph 3 of the CPA has already been highlighted that relates to the judicial control of the legality of the agreement of the parties, according to which the indictment panel will not accept the statement for making a judgment based on the parties' agreement if, its acceptance is not in accordance with the determination of punishment prescribed by law or the agreement otherwise is not lawful. That provision clearly sets out the reasons why the court will not accept the statement of the parties for making a judgment based on plea bargaining: either

because the acceptance of such a statement (negotiated punishment included) would be contrary to the law on determination of punishment (purpose of punishment included), either because the parties' agreement is unlawful because it violates other provisions of the CC or CPA on plea bargaining (TPBB, 2016, p. 145). Such control powers of the court in the Croatian literature on criminal procedure law are not questioned by anyone. Moreover, there are several suggestions for their extension. There is, however, a misinterpretation (Cambj, 2013, 672) that Article 361, Paragraph 3 of the CPA should be interpreted so that the court is empowered to assess the compliance of the negotiated punishment with the penal policy of the courts. This is not about harmonization of the negotiated punishment with the penal policy of the courts, but about the compliance of such a punishment in the concrete case with the legal provisions on the determination of punishment.

Contrary to the foregoing, several recent decisions of the Supreme Court of the Republic of Croatia (hereinafter: the SRCR) show, however, a clear desire to restrict the judicial powers of controlling the negotiated punishment by multiple dubious reasoning. In this connection, it is probably the most famous case in which the SCRC ruled on two occasions on the request for protection of legality filed by the State Attorney against the decision of the first instance court (Zagreb County Court) on the refusal to accept the parties' agreement proposing the pronouncement of a suspended sentence (for a term of one year imprisonment and a probationary period of 4 years) to the accused who confessed the commission of the criminal offense of bribing in the amount of 100,000 Euros. The court of first instance (the president of trial panel) twice refused to accept the statement of the parties for making a judgment based on plea bargaining, arguing that the negotiated punishment was inappropriately low or that it was not in accordance with the purpose of punishment prescribed by law and the circumstances relevant to the determination of punishment. Contrary to such a position of the court of first instance, the SCRC in its decisions advocates a very restrictive stance that judicial control of the negotiated punishment covers only the strictest control, i.e. whether there is a negotiated sentence in accordance with the prescribed punishment for a particular criminal offense, the limits of punishment mitigation, as well as with other legal provisions by which the legislator has arranged the negotiation of the parties on punishment and other measures, assuming that an agreed punishment is appropriate to all circumstances of the particular case.

In the explanation of the first decision of the SCRC (Kzz 38 / 16-3, judgment of 21 September 2017) it is stated that accepting the position of the court of first instance would lead to arbitrariness in the proceedings of that court, because the court did not know the circumstances which the parties had in mind when they negotiated punishment. The SCRC states that the law does not oblige the parties to state such circumstances in the statement and the court in a procedural stage deciding on (no) accepting the statement of the parties (preparatory hearing) cannot determine or evaluate such circumstances. Acceptance of the position of the first instance court would also mean that, within the preparatory hearing, decided upon by the president of the trial panel, that court has greater powers than the indictment panel making the judgment on the basis of the parties' agreement or the second instance court.

In his second decision in the same case, accepting the statement for making a judgment based on parties' agreement and pronouncing the accused conditional sentence, the SCRC (Kzz 17 / 2018-5, judgment of 9 May 2018) reiterated the arguments set out in the first decision and supplemented them with the assertion that the SCRC in another decision (Kzz-2 / 2018-3), in a completely different composition of the panel, also found that the court has no power to refuse the negotiated punishment by considering this punishment as too lenient if the proposed sentence is within the limits legally prescribed. This fact confirms that the stated position is the result of reasoning of a very large number of judges of the SRCR, not just individual judges. The SCRC, however, does not mention the fact that one of the judges of that second panel had a dissent opinion and assumed a completely opposite position. Furthermore, the norm governing the court's control powers over the legality of the negotiated punishment is considered by the SCRC to be insufficiently clear and invokes its authority in the interpretation of the law stemming from its constitutional duty to care for equal application of the law to all citizens. In advocating a very restrictive interpretation of Article 361, paragraph 3 of the CPA, the SCRC is still not completely consistent, as it does not exclude the possibility of refusing a statement for making a judgment based on the parties' agreement for the protection of the defendant if the proposed excessive sentence is the result of inadequate assistance of his defense attorney. The SCRC also refers to the provisions of Article 48, paragraph 3 and Article 49, paragraph 2 of the CC, which explicitly prescribe the right of the state attorney and the accused to negotiate the amount (severity) of the punishment, with the

application of the provisions on the punishment mitigation, which are not at all available to the court if there is no such agreement.

In the aforementioned dissent opinion of one of the members of the Panel, it is emphasized that a clear provision of Article 361, Paragraph 3 of the CPA does not open any doubts because its simplest language interpretation unambiguously leads to the conclusion that the court is not only authorized but also obliged to refuse the statement for making a judgment on the basis of a parties' agreement if it considers that the type and range of the sentence to which the parties have agreed does not correspond to the degree of guilt of the offender, the purpose of the punishment, as well as any mitigating and aggravating circumstances affecting the severity of the punishment by type and measure. The dissent opinion also states that there is no doubt that data on such circumstances are already contained in the file (factual description of the criminal offense and data on the accused) and that they cannot be unknown to the court. A misreading of Article 361, Paragraph 3 of the CPA by the majority of members of the Panel is illustrated by a hypothetical example of a serious murder with several qualifying features for which a sentence of imprisonment for a period of one year to six months may be imposed by respecting the provisions on limits of the punishment, but such a sentence is obviously not fair.

In addition, according to a dissent opinion, accepting the view that the legislature excluded the authority of the court to examine whether the negotiated punishment is in accordance with the provisions of Article 47 of the CC would mean accepting the full arbitrariness of the State Attorney when measuring the sentence and lead to inequality of citizens before the law.

Standpoints from a dissent opinion on the aforementioned SCRC decision deserve approval. Indeed, there is no doubt that Article 361, Paragraph 3 of the CPA refers to a determination of punishment prescribed by law that primarily encompasses the general rule of Article 47 of the CC, which specifically points out the degree of guilt and the purpose of punishment as the starting point for each punishment determination, and lists the typical mitigating and aggravating circumstances, as well as special provisions for mitigating the punishment. There is no legal provision that would exclude the power of the court to assess in a concrete case whether or not the purpose of the punishment is to be reached through parties' agreement, whether it corresponds to the degree of

perpetrator's guilt and whether it is appropriate in view of the existing mitigating and aggravating circumstances.

A court controlling the legality of negotiated punishment does not take part in the determination of its type and measure, but the imposition of a punishment is solely in its power and only that court can adequately resolve the problem of possible antinomy between efficiency and fairness. The practice of narrowing the power to control the legality of an agreed punishment imposed by the SCRC constitutes a flagrant violation of the clear provisions of the CPA and such practice marginalizes the role of the court and promotes the State Attorney's Office to the main creator of the punishment policy.

The view of the SCRC that taking into account the circumstances relevant to the determination of punishment allegedly unknown to the court leads to arbitrariness, irrespective of whether or not the court accepts or refuses an agreement, effectively conceals the real problem arising from the insufficient legal arrangement of the negotiation process as well as from the deficient content of the statement for making a judgment on the basis of the parties' agreement, which does not require explanation of the proposed negotiated punishment. It is a legislator's omission that allows the arbitrariness of the state attorney, which can only be effectively countered by the court's power to refuse an agreed punishment, considering that such a punishment is not in accordance with the purpose of punishment prescribed by law and the mitigating and aggravating circumstances known to the court.

The standpoint of the SCRC that the presiding judge of the trial panel, who at the preparatory hearing decides on (non) acceptance of the parties' statement for making a judgment based on the plea bargaining on the basis of the circumstances relevant to the determination of punishment, would have greater powers than the indictment panel or the second instance court is also wrong, since the control authority of the court when deciding on the negotiated punishment does not include the possibility of imposing a sentence not proposed by the parties. Furthermore, the correctness of the standpoint on any problem does not depend on the number of its advocates, rather than from the persuasiveness of the arguments supporting it.

The existence of special provisions which, in the case of the parties' agreement, allow the mitigation of punishment in broader terms in relation to the regular punishment mitigation also cannot be any argument in favor of a nar-

row interpretation of Article 361 Paragraph 3 of the CPA. Such a possibility testifies only to the criminal-politically motivated decision of the legislator to support the parties' agreement as the most desirable way of completing the criminal proceedings and has no particular theoretical foundation.

Finally, it must be concluded that the court that decides on the legality of the negotiated punishment, due to the narrow interpretation of Article 361, Paragraph 3 of the CPA, supposedly advocated by an extremely large number of judges of SCRC, is brought to an almost paradoxical situation in which, due to the pragmatism of the process economy, has to pronounce a punishment that considers unjust because its level is significantly below the degree of the perpetrator's guilt and is evaluated as harmful from the standpoint of positive general prevention because the measure of punishment (or the modification of punishment in the case of suspended sentence or community service) scandalizes the public rather than strengthens its trust in the functioning of the criminal justice system.

5. CONCLUSION

Article 361, paragraph 3 of the CPA prescribes not only the right but also the duty of the court to refuse the parties' statement for making a judgment based on bargaining, if its acceptance, under the circumstances, is not in accordance with the statutory rules on determination of punishment. According to these rules, the court will assess all the circumstances that may influence the type or size of the sentence (mitigating and aggravating circumstances), starting from the degree of guilt and the purpose of the punishment. Sentencing rules also include provisions on the limits of the punishment mitigation, which are, in the case of a parties' agreement, much more favorable to the accused than in the case of regular mitigation. Therefore, for the judicial control of the legality of the negotiated punishment, it is of special importance to assess whether such a punishment meets the purpose of punishment prescribed by law. Despite the fact that the primary objective of parties' bargaining is to quickly and cost-effective completion of criminal proceedings in the pre-trial stage, the agreed sentence should meet the requirements of special and general prevention, resocialisation, and retribution. This is not a simple task, especially from the point of view of retribution, because the negotiated penalties are, in principle, not proportionate to the defendant's guilt, and excessive mitigation questions the

principle of guilt and the requirements of positive general prevention. Significant discount in the determination of punishment issued by a state attorney to an accused in exchange for his confession may be justified by special prevention or re-socialization, but it is still closer to the breach of the guilty plea or trade with justice which, in the interest of faster and more cost-effective proceedings, must sacrifice the proportionality of punishment and full determination of the facts. In addition, the promise of a sentence that prompts the confession may in some cases induce the innocent defendant to a false confession of the criminal offense.

Negotiated punishment must in particular comply with the requirements of positive general prevention, which is dominated by the statutory provision for the purpose of punishment. The parties' agreement on punishment may, to a certain extent, create a positive impression in public. Judgments based on a parties' agreement in criminal proceedings will not undermine public confidence in the functioning of the legal order if they are perceived as a quick and effective response to the perpetrated criminal offense, which does not at the same time compromise the fairness of punishment. However, adequate procedural and substantive legislation can contribute to the achievement of desirable effects from the standpoint of positive general prevention. Therefore, with regard to possible changes in the future legislation, support should be given to ideas advocating the exclusion of bargaining for the most serious offenses, the more active role of the court when deciding on legality of statement for making a judgment based on plea bargaining, the strengthening of the inquisitorial powers of the court and the related principle of the search for material truth, which enables the realization of guilty principle, a more transparent negotiation procedure on guilty plea and punishment as well as a thorough review of the limits of mitigation of the agreed punishment.

Contrary to justified demands for the expansion of the court's control powers when examining the legality of the parties' agreement in criminal proceedings, decisions of the SCRC, which deprives the court of the right to assess the purpose of the punishment and the circumstances relevant to the imposition of a sentence when deciding on accepting the parties' statement for making a judgment based on plea bargaining, can be evaluated as unsustainable. The practice of narrowing the power to control the legality of an agreed punishment imposed by the SCRC constitutes a flagrant violation of the crystal clear provisions of the CPA (Art. 361 paragraph 3 of the CPA) as well as substantive provisions on

determination of punishment (Article 47 of the CC), and such practice, based on a scarce, unconvincing and misleading interpretation of legal provisions on plea bargaining, marginalizes the role of the Court deciding on the lawfulness of the negotiated punishment (the Indictment Panel, the President of Trial Panel) and promotes the State Attorney to the main creator of the punishment policy.

The reasons for the restrictive interpretation of Article 361 (3) of the CPC by the SCRC are not easy to explain. However, it can be assumed that they are at least partially rooted in the development of the Croatian criminal procedural law since 2008, when the State Attorney became a *dominis litis* or a key figure in the pre-trial proceedings, and the inquisitory principle is the main characteristic of his action with simultaneous passivizing the court. The dominant position of the State Attorney in relation to the court is practically preserved even in the case of a judgment based on the parties' agreement, since he must take into account only the limits of the punishment mitigation. Such a situation is also unsustainable because the court decisions on the guilt of a defendant cannot be based on the blind faith or the presumption that the State Attorney correctly assessed the purpose of the punishment and the circumstances relevant to the determination of the sentence. The position of SCRC is ultimately contrary to the constitutional provision (Article 29 paragraph 1 of the Constitution of the Republic of Croatia) according to which everyone has the right to have an independent and impartial court established by law fairly and within a reasonable period of time decides on suspicion or accusation of a criminal offense. Therefore, only the court is empowered to decide on the charges for the criminal offense committed, and in the case of the defendant's guilt, only the court has the authority to measure and pronounce punishment. The arguments raised in this paper against the unacceptable attitude of the SCRC are also an appeal for its change.

Taking into account the serious problems in the practical application of Article 361, paragraph 1 of the CPA, as well as the previously outlined ideas on possible changes in the normative content relating to the agreements of the parties in the criminal proceedings *de lege ferenda*, after the desirable corrections of the actual provisions, one can hope for a more successful and a more balanced implementation of the principles for the design of a new system of criminal procedure law from 2007, which were highlighted in the introduction to this paper. These are the rules that need to guarantee the protection of human rights, reliable determination of the truth in fast, simpler and more cost-effective proce-

dures that will take into account the nature and gravity of the criminal offense, the defendant and the victim, as well as the social need to protect against criminal offenses.
