VORWORT

Es ist uns ein Vergnügen, das Konferenzband "Interdisciplinary Management Research XV/ Interdisziplinäre Managementforschung XV" vorstellen zu können. Ein Buch aus dieser Reihe ist zum ersten Mal 2005 erschienen, als Resultat der Zusammenarbeit zwischen der Wirtschaftsfakultät in Osijek, Kroatien und der Hochschule Pforzheim, Deutschland, und insbesondere durch das Magisterstudium des Management. Die Zusammenarbeit der zwei genannten Partnerinstitutionen ist unter anderem durch jährliche wissenschaftliche Symposien gekennzeichnet, auf welchen interessante Themen aus verschiedenen Bereichen der Wirtschaft und des Managements vorgestellt und folglich in einem Band veröffentlicht werden. Jedes Jahr ziehen die wissenschaftlichen Symposien Akademiker anderer kroatischer, sowie ausländischer Universitäten, einschließlich Deutschland, Ungarn, Polen, Rumänien, Slovenien, Montenegro, Bosnien und Herzegovina, Serbien, Indien, Irland, Czechien, Israel, Italien, Sudafrica, Kanada, Litauen, Kosovo, Türkei, Belgien, Schweiz, USA, Slowakei, Dänemark, Mazedonien, Mexico, Zypern und Großbritannien an, die ihren wissenschaftlichen und professionellen Beitrag zur Diskussion über zeitgenössische Fragen aus dem Bereich des Managements leisten. Die Aktualität der behandelten Fragen, der internationale Charakter im Hinblick auf Themen und Autoren, die höchsten Standards der Forschungsmethodologie sowie die Kontinuität dieser Konferenzreihe wurden auch von der internationalen akademischen Gemeinde erkannt, weswegen sie auch in internationalen Datenbanken, wie Clarivate Web of Science, Thomson ISI, RePEc, EconPapers und Socionet, zu finden ist.

Die neueste Ausgabe von "Interdisciplinary Management Research XV/ Interdisziplinäre Managementforschung XV" umfasst 104 Arbeiten geschrieben von 257 Autoren. Der Erfolg früherer Ausgaben ging über die Grenzen der Länder hinaus, deren Autoren schon traditionell Teil der Reihe waren. Jedes der Autoren leistete einen bedeutenden Beitrag zu diesem fachübergreifenden Managementforum.

Als Herausgeber dieses Bandes hoffen wir, dass diese Reihe auch weiterhin Akademiker und Professionelle dazu bewegen wird, in Forschung und Beruf die höchsten Standards zu beanspruchen, und dass es weiterhin als Ansporn zu weiteren Formen von Zusammenarbeit unter Teilnehmern dieses Projektes dienen wird.

Dražen Barković, professor emeritus

Prof. Dr. Bodo Runzheimer

FOREWORD

It is our pleasure to introduce the book “Interdisciplinary Management Research XV/ Interdisziplinäre Managementforschung XV” to you. The first volume appeared in 2005 as a result of co-operation between the Faculty of Economics in Osijek (Croatia) and Pforzheim University (Germany), particularly through the postgraduate programme “Management”. The co-operation between these partnering institutions has been nurtured, amongst else, through annual scientific colloquiums at which interesting topics in various fields of economics and management have been presented and later published in the proceedings. Over the years, the scientific colloquiums have drawn the attention of academic scholars from other Croatian universities, as well as from other countries including Australia, Germany, Hungary, Poland, Romania, Slovenia, Montenegro, Bosnia and Herzegovina, Serbia, India, Ireland, Czech Republic, Israel, Italy, South Africa, Canada, Lithuania, Kosovo, Turkey, Belgium, Switzerland, USA, Slovakia, Denmark, Macedonia, Mexico, Cyprus and the United Kingdom each making a contribution in academic and professional discussion about contemporary management issues. Actuality and importance of the issues discussed, the international character of the book in terms of authors and topics, the highest standards of research methodology and continuity in publishing have been recognized by the international academic community, resulting in the book of proceedings being indexed in world-known data bases such as Clariavate Web of Science, Thomson ISI, RePEc, EconPapers, and Socionet.

The latest edition, i.e. ““Interdisciplinary Management Research XV/ Interdisziplinäre Managementforschung XV” encompasses 104 papers written by 257 authors. The success of former editions has echoed beyond the traditionally participative countries and authors.

As editors we hope that this book will continue to encourage academic scholars and professionals to pursue excellence in their work and research, and to provide an incentive for developing various forms of co-operation among all involved in this project.

Dražen Barković, professor emeritus

Prof. Dr. Bodo Runzheimer

GENERAL
MANAGEMENT

APPLICATION OF JOINTPOINT REGRESSION IN DEMAND FORECASTING ON THE EXAMPLE OF BAKERIES

Anna BORUCKA, Ph. D.

Military University of Technology, Faculty of Logistics,
Warszaw, Poland

E-mail: anna.borucka@wat.edu.pl

Abstract

A special place in the process of achieving competitive advantage and increasing product sales is occupied by demand forecasting. It allows not only to determine the level of interest in offered goods, but also to adjust its potential and resources to market expectations. Moreover, continuous analysis of sales data is an important element of company diagnostics. It enables to forecast the future values of the studied phenomenon, but also to get to know the relations taking place in it, to notice deviations from the norm and to react quickly to disturbing signals.

The subject of this article is a family business – a bakery that offers high quality traditional bakery products. The company's activity is based primarily on a regular group of customers, which are small local shops. Distribution takes place in the company's own vehicles, which deliver bread to customers six days a week. At some point in the successful company, as a result of the opening of a large supermarket in the area, sales started to fall. The dynamically changing situation required a quick reaction based on appropriate analyses, taking into account the important factors influencing demand and proposing new forecasts. Due to the specificity of time series under study, it was decided to apply jointpoint regression. This method enabled to define the existing dependencies and obtain reliable forecasts concerning product sales.

Keywords: jointpoint regression, demand forecasting, time series analysis

JEL Classification: E27, M11

1. INTRODUCTION

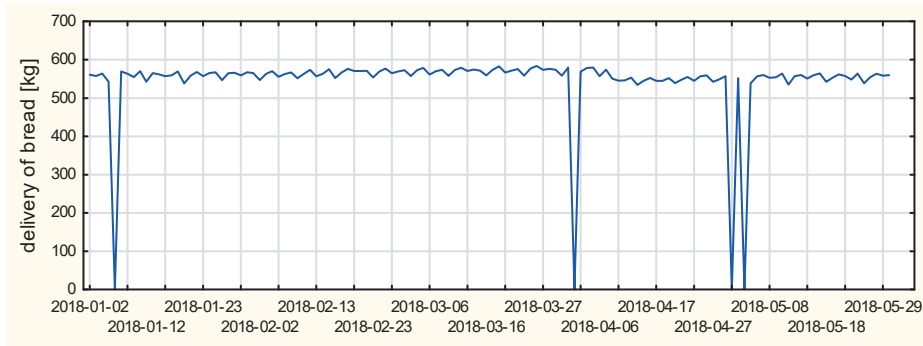

The company presented in the article is a small enterprise - a bakery, the competitive advantage of which is based primarily on high quality products. It offers bakery products made using the traditional method, based on natural ingredients and baked in a coal-burning oven. According to the owners, the popularity of the product is determined by the fact that it does not contain any preservatives, enhancers or other chemical additives. The company's reach is not large, among its customers are local grocery stores and several company sales points. The company gradually gained trust and popularity among customers, successively building a brand and reinforcing its position on the market, as evidenced by the constantly growing demand for its products. However, the market situation, subject to dynamic and sometimes unexpected changes, resulted in a sharp drop in sales of bread in local shops, which resulted in a drastic decrease in the number of orders placed with bakeries. The reason for this was the opening of a large hypermarket in the area, combined with an intensive advertising campaign and attractive offers. Apart from tempting attractions, many customers were drawn by the simple curiosity of the newly opened establishment. All this affected sales in the local grocery stores, forcing them to rebuild their strategy. This group also included the analyzed bakery. Analytical tools for forecasting future developments, based on time series analysis provide support for such decisions. This article presents an example of its application.

2. CASE STUDY

2.1. PRELIMINARY ANALYSIS OF THE GATHERED INFORMATION

The data provided by the bakery concerned sales of bread in the first half of 2018. An important step in the methodology making use of time series analysis is a visual assessment of the information collected, which was done first, so as to check how demand has developed in recent months. Deliveries take place from Monday to Saturday, therefore a 6-day time series was analyzed. The quantity of ordered goods (in kilograms) is shown in the graph below (fig. 1).

Figure 1. Graph of time series of bread sales

Source: own study

In the graph (Fig. 1) one can notice observations with a value of zero. These are 6 January (Epiphany), 2 April (Easter Monday), 1 May (Labor Day), 3 May (3 May Constitution Day), i.e. days which are free from work in Poland and on which deliveries did not take place. Since they disrupt the course of the analyzed series and can strongly influence the results, it was necessary to replace them. Due to the visible weekly variability in the number of orders, it was decided to use for this purpose the average value calculated for the selected day of the week, determined without the outliers (Table 1)

Table 1. Basic descriptive statistics for the examined variable

Day of the week	Number of observations	Mean [kg]	Median [kg]	Min. [kg]	Max. [kg]	Standard deviation [kg]	Coefficient of variation [%]
Monday	20	567.42	567.08	550.92	583.77	10.06	1.77
Tuesday	21	559.11	558.18	544.60	573.80	8.42	1.51
Wednesday	22	561.88	561.08	544.96	578.60	9.67	1.72
Thursday	20	567.66	568.48	552.02	579.51	7.15	1.26
Friday	21	547.35	546.40	534.32	559.32	8.66	1.58
Saturday	20	563.06	564.03	545.00	579.72	10.20	1.81

Source: own study

Although the time series in Figure 1 does not seem to be subject to any fluctuations other than those resulting from the day of the week, other changes are visible when the outliers are replaced (Figure 2). This also shows a strong influence of the atypical observations and the degree to which they falsify the results. They make it difficult and sometimes even impossible to carry out a correct analysis.

Figure 2. Graph of the time series after removing the outliers

Source: own study

The corrected graph (figure 2) clearly shows an upward trend and the existing seasonal fluctuations resulting from the number of orders changing during the week. What is also characteristic is the strong collapse in the trend, which results from the drop in sales related to the opening of the hypermarket in question.

2.1 ESTIMATION OF MODEL I PARAMETERS

In the first stage of the study, an attempt was made to describe the considered relationships by means of a function taking into account only the trend and the random fluctuations:

$$y_t = f(t) + \xi_t$$

Where:

$f(t)$ - the analytical form of the trend function

ξ_t - random fluctuations

An attempt has been made at fitting the linear function Fig. 3 and the polynomial function Fig. 4 however, in both cases the fit is not satisfactory, because - contrary to intuition, which suggests a general upward trend - the linear function decreases from the very beginning, while the values of the quadratic function also begin to decrease when the maximum is reached. Such results are influenced by a sudden drop in sales of bread.

Figure 3. Fitting the linear trend to the examined series

Source: own study

Figure 4 Fitting of the quadratic trend to the examined series

Source: own study

The form of the proposed functions of the trend, which does not reflect the actual implementation of the phenomenon, determined the application of the segmented trend, estimated on the basis of the recorded turning point (Sokołowski, 2010). To this end, two additional variables need to be introduced into the model: k and K . The variable k shall correspond to the appearance of competition by taking a zero value for the observation before the trend changes and a value of one after the change. The variable K is the product of the variable k and the variable t representing the linear trend. This makes it possible to estimate the parameters of the model:

$$\hat{y}_t = a_0 + a_1K + (b_0 + b_1)t$$

The idea behind this approach is that at the turning point the absolute term a_0 is modified by a_1 while the directional coefficient b_0 is modified by b_1 .

The parameters of such a model can be estimated in the way adopted for traditional jointpoint regression, using 2 exogenous variables. The results of this estimation are presented in table 2.

Table 2. Results of model 1 parameters estimation

N=128	R2= 0.51 F(2.125)=66.74 p<0.0000 Standard error: 8.03			
	b	Std. error of b	t(125)	p-value
	556.08	1.68	330.39	0.00
Absolute term				
t	0.23	0.03	6.83	0.00
k	-28.77	2.64	-10.88	0.00

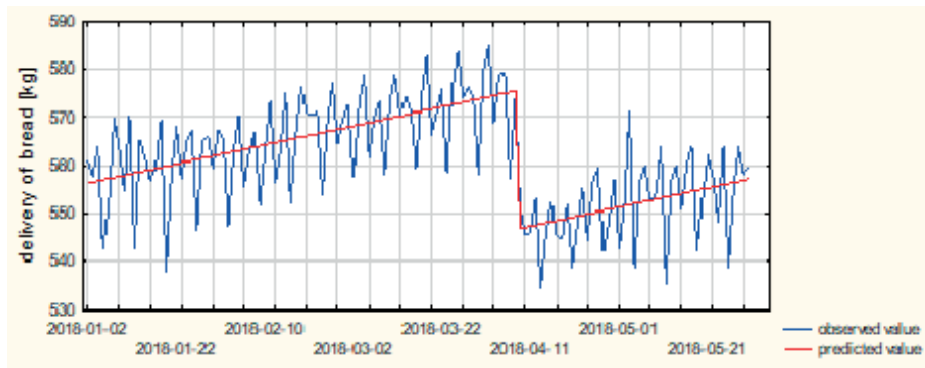

Source: own study

In this way, the following function was obtained

$$y = 556,08 - 28,77k + 0,23t$$

The graph of which, together with the course of real observations, is presented in Figure 5.

Figure 5. Linear trend functions and empirical observations graph

2.2 ESTIMATION OF MODEL I PARAMETERS

As Figure 5 shows, the proposed function reflects the upward trend well, but the seasonal fluctuations remain unexplained by the model, due to which the fitting of the model to the empirical data is insignificant, and the corrected coefficient of determination is only 51%. Therefore, their inclusion in the model is necessary. For this purpose, a new variable has been created, which is the difference between real observation and the segmented trend. A part of the values

determined in this way is positive and a part is negative, which confirms the seasonality, as shown in the autocorrelation function graph in figure 6, which clearly shows a strong relationship for the lag d=6.

Figure 6. Graph of the autocorrelation function of the seasonality variable

Source: own study

Since the autocorrelation chart suggests weekly seasonality, the next step is to confirm and clarify this relationship. A one-way analysis of variance (Dittmann at al., 2011) is helpful in assessing the deviations from the trend. This is done by testing the significance of average time differences for individual groups. However, it requires meeting the assumption of normality of distributions in all the analyzed data populations, in this case, weeks. In addition, they should have the same variance (StatSoft, 2006). Therefore, the compatibility of the distribution of the seasonality variable in groups for all days of the week was examined using the Shapiro-Wilk test. The obtained results of the calculated probability (*p-value*) are presented in Table 3.

Table 3. Shapiro-Wilk test results

No.	Day of the week	Value of S-W test statistics	Probability level p
1.	Monday	W=0.96769	p=0.68146
2.	Tuesday	W=0.96378	p=0.56931
3.	Wednesday	W=0.96685	p=0.63836
4.	Thursday	W=0.92108	p=0.09121
5.	Friday	W=0.97161	p=0.76844
6.	Saturday	W=0.95633	p=0.44554

Source: own study

For all days of the week, the value of the test statistic does not allow to reject the H0 null hypothesis informing that the distribution of the tested variable is close to normal, as evidenced by the values of test probabilities p presented above (table 3). Therefore, it was justified to verify another condition entitling to apply the Anova test, i.e. homogeneity of variance in the examined groups. The Levene test and the Brown-Forsythe test were used. In the H0 null hypothesis, both tests assume homogeneity of variance between the tested samples, which was confirmed by p-value results obtained at the significance level $\alpha=0,05$ (table 4).

Table 4. Results of homogeneity of variance tests

Levene test		Brown-Forsythe test	
Value of test statistic	p-value	Value of test statistic	p-value
F		F	
1.3506	0.2477	1.3054	0.2661

Source: own study

The obtained results allow for the utilization of the analysis of homogeneity of variance – ANOVA, the results of which are presented in table 5. At the significance level $\alpha=0,05$, the H0 null hypothesis concerning the lack of influence of the weekday factor on the analyzed dependent variable was rejected.

Table 5. Results of the analysis of homogeneity of variance – ANOVA

Variable	Analysis of variance							
	Selected effects are significant with $p < 0.05000$							
	SS Effect	df Effect	MS Effect	SS Error	df Error	MS Error	F	p
delivery of bread	6212.06	5	1242.41	10434.27	122	85.53	14.53	0.00

Source: own study

The result of a one-factor analysis of variance only informs about the fact that there are statistically significant differences in two groups. Further research is needed to gain precise information on which of the groups are different from each other. In order to do this, t-tests of the average difference for all possible pairs of groups were carried out, as illustrated in table 6

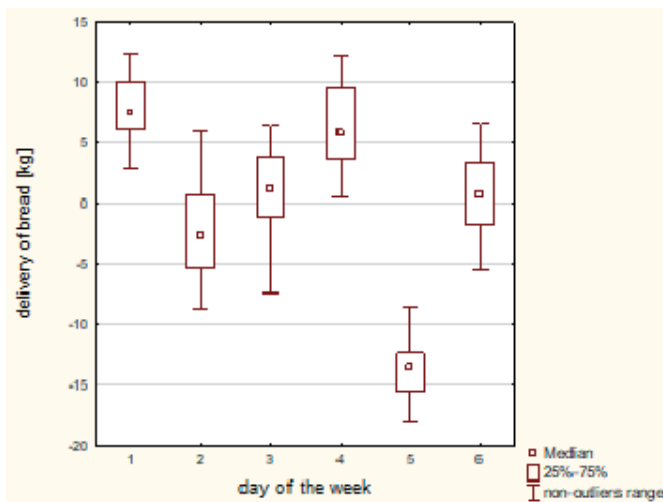

Table 6. T-tests for all days of the week

Pair of days	Mean Group 1	Mean Group 2	Standard deviation Group 1	Standard deviation Group 2	p-value
1Mon-2Tue	568.25	558.36	10.52	8.93	0.46
1Mon-3Wed	568.25	561.88	10.52	9.67	0.70
1Mon-4Thur	568.25	567.83	10.52	7.01	0.08
1Mon-5Fri	568.25	547.35	10.52	8.66	0.39
1Mon-6Sat	568.25	562.52	10.52	10.24	0.91
2Tue-3Wed	558.36	561.88	8.93	9.67	0.72
2Tue-4Thur	558.36	567.83	8.93	7.01	0.28
2Tue-5Fri	558.36	547.35	8.93	8.66	0.89
2Tue-6Sat	558.36	562.52	8.93	10.24	0.54
3Wed-4Thur	561.88	567.83	9.67	7.01	0.16
3Wed-5Fri	561.88	547.35	9.67	8.66	0.62
3Wed-6Sat	561.88	562.52	9.67	10.24	0.79
4Thur-5Fri	567.83	547.35	7.01	8.66	0.35
4Thur-6Sat	567.83	562.52	7.01	10.24	0.10
5Fri-6Sat	547.35	562.52	8.66	10.24	0.46

Source: own study

The obtained results indicate that there are significant differences between most days of the week, which is also confirmed by the frame diagram shown in Fig 7

Figure 7. Frame diagram of seasonality occurring on individual days of the week

Source: own study

The conclusions from the above analyses allowed for the construction of a new model, taking into account not only the segmented trend but also the weekly seasonality. Since in this case, the dependent variable is a qualitative variable, it is necessary to re-code it into binary variables (zeros and ones), corresponding to the individual days of the week, marked from D_1 to D_6 . Since their number is limited, they cannot be treated in the way adopted for continuous variables in regression, therefore the estimation of the model must be carried out with the exclusion of one of them. The excluded variable is then the reference level for the others. In this case it was decided to remove the variable D_5 from the model, which corresponds to Friday, and carry out the process of parameter estimation, the results of which are presented in the table 7

Table 7. Results of model 2 parameters estimation

N=128	Adjusted R2=0.90063424 F(7.120)=165.44 p<0.0000 Standard error: 3.6089			
	b	Std. error of b	t(120)	p
Absolute term	541.92	1.05	516.78	0.00
t	0.24	0.02	15.44	0.00
k	-29.27	1.19	-24.59	0.00
D_1 Monday	21.86	1.11	19.58	0.00
D_2 Tuesday	11.89	1.10	10.79	0.00
D_3 Wednesday	15.18	1.10	13.78	0.00
D_4 Thursday	20.71	1.11	18.59	0.00
D_5 Saturday	14.93	1.11	13.40	0.00

Source: own study

In this way the following function was obtained

$$y = 541,92 - 29,27k + 0,24t + 21,85 + 21,86D_1 + 11,89D_2 + 15,18D_3 + 20,71D_4 + 14,93D_6$$

The graph of which is presented in Fig. 8.

Figure 8. Graph of real data and forecast function according to model 2

Source: own study

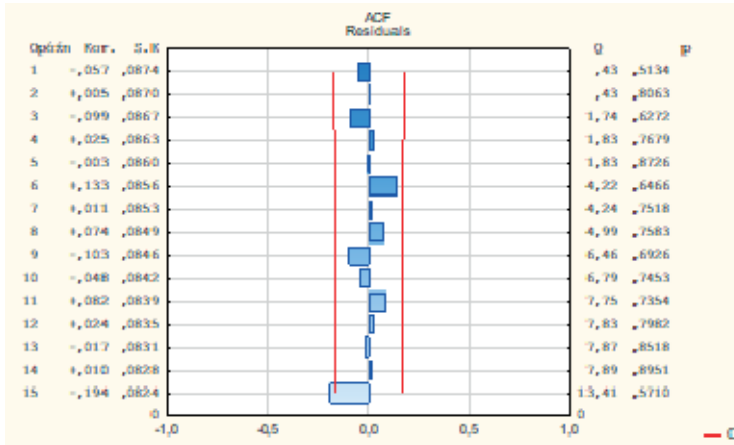

The fit of the forecast function is definitely better than in the case of model 1, the deviations are not large which can be clearly seen in the approximate graph in figure 9. This is also confirmed by the calculated coefficient of determination, which in this case equals 95%.

Figure 9. Approximate graph of empirical values and forecast function

The last element of the study is diagnostics of the proposed model, which boils down to the analysis of its residuals. In a properly constructed forecast, they should be random and have a normal distribution. For this purpose, the autocorrelation function of the residuals of the model has been determined. As Fig. 10 shows, there are no significant values of the autocorrelation function that could indicate the existence of dependencies unexplained by the model, so we can consider the distribution of residuals as a white noise process.

Figure 10. Autocorrelation function of the residuals of model 2

An equally satisfactory result was obtained from the normality test of the residuals of the model, which at the level of significance $\alpha=0,05$, with the $p\text{-value}=0.3$ did not allow to reject the H_0 null hypothesis on the normality of distribution. The histogram of the distribution of residuals together with the fitting to the theoretical distribution is shown in Fig 11

Figure 11. Histogram of distribution of the residuals of model 2

Source: own study

3. CONCLUSIONS

Properly constructed forecasts are one of the elements of gaining a competitive advantage on the market. They make effective adjustments of products sales strategy to the needs and expectations of customers possible. Demand forecasting is particularly complex when factors disrupting its stable course occur, such as seasonality, and sales are affected by factors that are difficult to predict or describe. In this case, econometric tools and methods are used to support the estimation of models taking into account such disruptions. The article presents the application of a jointpoint regression model taking into account the non-classical form of the trend which did not work in the analyzed case - namely the segmented trend. Such a description of the trend together with the weekly seasonality allowed to obtain a reliable model allowing to describe the sales of bread in the analyzed bakery. The survey also showed that even in a difficult market situation of the economic downturn it is possible to gradually rebuild the position on the market, especially when the company has been diligently building its brand for a long time.

Abstract

Opening a hotel is a complex project, which requires skilled participants. No matter the size of the hotel, there are certain phases and procedures that must be respected and followed. It is crucial to gain the best score at each phase. Since this is a project that involves many stakeholders, it is highly important to plan all steps carefully, in order to fulfil all the demands of the stakeholders. All aspects and potential risks must be considered and merged with strategy. In this case, an example will be shown of all the tasks and steps which are taken in the pre-opening phase. It usually takes between three to six months to implement all planned actions before the soft opening of a hotel. The pre-opening phase includes many challenges and opportunities. During this phase, all stakeholders face many operational issues. Considering the budget plan, the task force management needs to set up alternate plans, in order to backfill the critical period of the first year of operation. This is done in order to achieve financial objectives, as well as a return on investment. Therefore, management will adjust all procedures in the hotel pre-opening strategy and ensure the best approach.

The purpose of this paper is to point out the impact of the pre-opening hotel management on the whole project, and the influence on time determination of the next phase: soft opening. The aim of the research is to recognize the importance of crucial phases and procedures in the hotel business, which shows how to get tasks right. By analyzing steps of tasks which are performed regularly, the research will point out how the management of pre-opening hotel procedures are set up and represented and how strong an influence this has on the future of the new hotel on the market.

Keywords: hotel, management, pre-opening management, task force management, project

1. INTRODUCTION

Today's tourism industry is one of the most dynamic socio-economic phenomena, which is based on the permanence of change and is reflected in tourism supply and tourist demand. The hotel industry is the mainstay of growth and development of tourism, mostly because of its totality and volume of business. Since the very beginning of tourism development, hotel systems have been the most relevant providers of each destination. These days, hotel management is fundamentally different from the original concept, so modern hotel management encompasses the core functions of planning, organizing, staffing, controlling and leading of all interlaced activities in the business process. In order to function successfully, the foundations of the entire organization should be based on well-established phases even before the start of the hotel business. Every hotel can have a successful business only if all stages are met well prepared before opening the hotel.

In the last few decades, in all strategic plans, special attention was paid to the implementation, control, and improvement in the overall quality of performing the basic phases of the business, and the implementation of standards in all hotel phases agreed and established just before the soft opening of the hotel. Of course, there are certain specificities in terms of management and work in the hotel pre-opening segment. Accordingly, the two systems are diversified: the quality management of the works and the complete management of the hotel business. This makes the initial opening very important and should be made as easy as possible for hotel management.

Among the basic components of each enterprise is the organizational structure without which it cannot successfully manage. The organization is a framework, within which various activities operate (Medlik & Ingram, 2002, 157). Vision, purpose, mission, and goals, which are part of the core hotel strategies, are easier to accomplish when a predetermined organizational structure is in the place. At the same time, the organizational structure needs to be tailor-made to changes within the enterprise, i.e. aligned with human and material resources (Avelini Holjevac, 2002, 31). As one of the core functions of management is precisely the organization, this function involves designing and programming such organizational structure of hotel business, which is the most optimal for successful business operations and the realization of positive business results in the future. The organizational structure follows the entrepreneurial goals which derive from the entrepreneurial strategy (Sikavica & Novak, 1999, 140).

In this paper, the research is based on the formation of the underlying structure of the hotel system. This includes making strategic plans, budgeting, selection and staffing for the opening while fulfilling other tasks that hotel management in the hotel pre-opening deals with all stakeholders of the project. It is important to emphasize that in this case, this phase begins with the conclusion of negotiations in selecting business partners and ends at the moment of the soft opening of the hotel.

In this phase, it is crucial to monitor and identify successes, in order to enhance and maintain the quality of the business plan, as well as to ensure a successful opening of the hotel.

2. THEORETICAL BACKGROUND OF PRE-OPENING HOTEL PHASE AND PROCEDURES

2.1. DEFINITION OF MANAGEMENT AND HOTEL MANAGEMENT

For a better understanding of the importance of this research, it is essential to define what hotel management in the hotel industry represents. By defining hotel management, a better understanding will be made of how the importance of the pre-opening phase is equal to that of all other stages in the hotel's business cycle. The simplest definition of the term management is the definition of H. Weihrich and H. Koontz, also authors of the book "Management". Management

is a process of designing and maintaining an environment in which individuals, working together in groups, efficiently achieve the chosen goals (Wehrich & Koontz, 1998, 4). Such a definition is a wide observation that management is in essence leadership, which can be etymologically substantiated. However, a more precise framework of the concept of management is quoted by author Z. Cerovic. Management is the process of shaping, directing, and harmonizing all the factors of the production-service process in which individuals, working together in the enterprise, efficiently accomplish the selected goals in carrying out the planning, organizational, staffing, leadership and control functions (Cerović, 2003, 7). The so-defined concept of management points out the basic management function. Starting from this, it is easier to find out what constitutes hotel management. Hotel Management is a group of leaders (managers), of all levels of management who, through their work and work of other employees, plans, organizes, manages and controls the hotel business (Cerović, 2010, 82). There are various levels of management in a hotel system since a hotel can be a business system, as a hotel business or an economic entity. On the other hand, it can be part of a larger system, and as such, it functions as an object unit or subsystem of a global hotel system or a hotel chain. Since the topic of this work is the pre-opening phase of a hotel, the complexity of the management concept will not be discussed. After defining the concept of management and hotel management, the next step is to determine the life cycle model of a hotel. The life cycle consists of several phases, through which every hotel system passes. According to Kreitner, it consists of five phases (Kreitner, 1989, 192):

- i. Pre-commercialization phase - an innovative strategy
- ii. The Phase of introduction – Infiltration (launching phase)
- iii. Growth phase - progress
- iv. Maturation phase - defensive
- v. The Phase of decline - withdrawal

According to these general phases of the life cycle of the hotel system, it is easier to locate the pre-opening phase. This phase includes the first two aforementioned phases since everything ranges from the design and the existence of the strategy and is the successful infiltration of the hotel into the environment. It can be concluded that the pre-opening phase of the hotel starts and overlaps with the final part of the pre-commercialisation phase and ends in the middle of the introduction phase. As the pre-opening phase of a hotel ends, then most

things are defined and settled. Only the completion of new hotel management with their employees, which must be ready for the hotel's opening and the beginning of market growth, remains.

2.2. THE GENERAL REVIEW OF THE PRE-OPENING CHECKLIST

In order to start the hotel's pre-opening phase, it is essential to hire a responsible person who will be the hotel's general manager throughout the entire phase. A general manager is a person who works on behalf of a hotel home in front of a business partner, representing the owner, investor and hotel house to the public. The general manager at this stage together with all parties fulfils the set plans and tasks, following certain steps and procedures. All tasks must be completed within a specified period of time to finally reach the target date of the hotel's soft opening. This opening date of the hotel during this phase can normally be postponed, but it is important not to exceed the deadline for the execution of works and business activities. In the worst case, the date can be moved for a maximum of two to three months from the date originally planned. This depends on the assessment of the general manager, who is responsible for monitoring the execution of all tasks. In case the general manager estimates that the original date will not be possible, in agreement with the business partners, he will arrange the next potential date, and he must be careful about new potential losses, especially costs. In practice, plans and projections are always worked on for more opening dates, in order to reduce the risk of the overall project going in the wrong direction. Below are the initial steps that provide insight into the beginning of the hotel's pre-opening phase.

2.3. CRUCIAL STEPS TO BEGIN THE PRE-OPENING PHASE

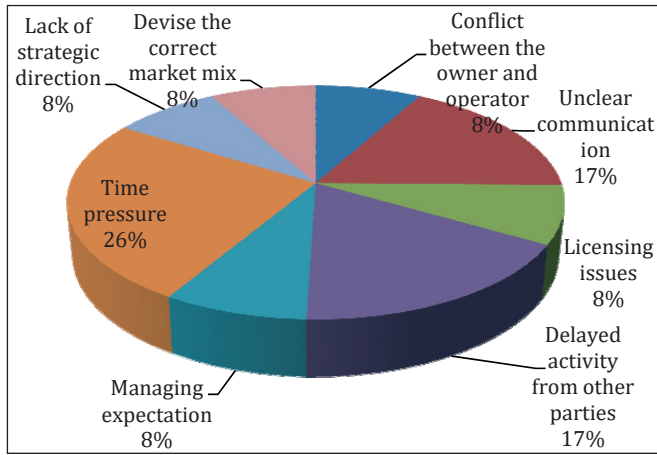

The hotel's opening phase begins half a year to a year before the soft opening of the hotel. The main prerequisite is the existence of a strategy, according to which the most successful opening of the hotel's opening phase must officially start one year before the opening. It includes the official part, not real actions. Of course, it depends on the size of the hotel, the structure of ownership and the manner of doing business. For small and family hotels, this time limit often overlaps with other previous phases. However, the emphasis of this research is on large hotels and it includes the proposition of the general model for opening a large hotel, which can be passed on to models of medium and small hotels. It

is important to emphasize that the concept of a large hotel includes over 150 rooms. The steps in preparing the hotel's pre-opening stage are:

- i. Research a new market niche (supply and demand conditions, location, other relevant factors)
- ii. Negotiating and contracting businesses with contract business partners (investors)
- iii. Selection of the hotel general manager for the pre-opening phase
- iv. Recruiting a Support Team for the General Manager
- v. Selection of hotel department managers

By completing each step of the preparation of the pre-opening phase, the pre-opening hotel phase starts, and it runs until the hotel's soft opening date. The first step in the process involves a huge knowledge and understanding of the tourism market, which has to be continually explored, in order to control and follow all changes in the demands and needs of the market. Mastering all challenges in the tourism market, it is important to constantly monitor all requests, needs, and motives, which make tourists travel to a specific tourist destination (Bruža & Rudančić, 2017, 20). Once the market is thoroughly explored, and all the relevant influential factors are established, then the negotiating and establishing of business partners follow. When concluding a contract between a hotel owner and an investor, it is important to determine who will be the general manager of the hotel at the stage before the opening. The next step is to form a general manager's assistant team, who will maximally assist and help with their knowledge, skills, and abilities. At that moment there is an officially formed pre-opening hotel management team. Then, along with the general manager, there is a selection of heads of departments, according to the needs and other conditions, which are results from the cooperation and agreement from the previous steps. Each of the included members has specific tasks, delegated and overseen by the hotel's general manager. A first step in the pre-opening phase of the hotel is the establishment of a checklist of tasks that must be accomplished by the hotel manager. In order to make it easier to determine when the tasks are performed, the execution of each task must be closely monitored and supervised. There are many challenges that a general manager faces at this stage, as indicated in the following chart.

Figure 1. Main Challenges Faced by General Managers During the Pre-opening phase

Source: <https://www.hospitalitynet.org/whitepaper/4071840.html> (access on 25-01-2019)

According to the chart, one of the most common challenges the general manager faces in the pre-opening of a hotel is time constraints, the delayed performance of delegated participants' tasks and communication problems. This refers to the previous claim that it is important to set a realistic timeframe to avoid the risk of delays, which usually cause unwanted financial aspects. In addition, the general manager must precisely determine who is doing what, when and where. To keep it under control, clear communication is needed, which is a challenge for each director at all stages of hotel opening and business continuation. Communicating is felt by the attitudes and relationships of the interlocutors and it causes various consequences, which can be manifested positively or negatively (Bruža & Rudančić, 2018, 20). Therefore, the general manager must continually pay attention to the quality of communication, delegate tasks clearly, control them, and ultimately counteract the risk of time constraints.

3. KEY FACTORS OF PRE-OPENING PHASE

3.1. REQUIREMENTS AND PREPARATION

By the time the hotel opens, there are several phases, some of which overlap in terms of time constraints. According to the author Baker, there are even five stages, among which as the fifth, the final stage for a successful opening of the

hotel is the stage that includes the pre-opening activities of the hotel. There are five critical phases in the hotel development process comprising (Faz, Veeramalla & Dang, 2015, 5):

- i. Conceptualisation
- ii. Site Appraisal and Feasibility Study
- iii. Design and Evaluation
- iv. Construction
- v. Pre-opening Activities

Each of these five phases, which are mentioned, are equally important for the hotel to begin operating. This paper is based on that final fifth stage, i.e. the sub-phases and the procedures that are required for the most successful opening of the hotel. Once the baseline requirements have been met and certain conditions are met, i.e. when the general manager is selected, then he can begin with his or her work. When the general manager of the hotel accomplishes of the set goals according to certain plans, then the pre-opening phase of the hotel officially begins. In order to be as successful as possible in his work, he must be a visionary, a motivator, ready to take over and manage all risks. However, he must also know how to manage the introduction of a new organization, to be open to changes that are frequent and constant at this stage. In short, a general manager needs to know entrepreneurial management thoroughly. He should be competent in creating an enterprising company, flexible and adaptable, environment-oriented, market-oriented, innovative, focused on tourists, competitors and suppliers (Stipanović, 2006, 194). The basic requirements for the successful completion of the hotel pre-opening phase are:

- i. Successful positioning
- ii. Staffing and training of new employees
- iii. Successful implementation of standard operating procedures and standards

According to PricewaterhouseCoopers (PwC) research, and what researchers Faz, Veeramalla and Dang also mentioned and stated in their paper, more than 60% of project failures arise during the fifth phase – the pre-opening stage (Faz, Veeramalla & Dang, 2015, 5). This means it depends on the general manager's skills and his experience in this stage. His actions, however, are visible at the point when he has his own task force team, which will support him and help

him in resolving all issues and minimizing all potential risks on the way to the opening date of the hotel.

The general manager is faced with a certain level of control and influence, which means that he can't make decisions alone, but must constantly be in contact with the contract partners, i.e. with the investor and the general board of the hotel's chain that he represents. It is important for investors to constantly control operational strategies, and reduce unnecessary costs while at the same time increasing the value of overall assets and thus affecting the strength of the financial performance. In addition to limiting the general manager's influence, he must take into account the implementation of all standards from the construction of the hotel, to equipping and training of employees. It is very important to follow standard operating procedures. There is also a budgeting process. The investor is the one who has to finance the construction and equipping of the hotel, but the general manager must propose a reasonable budget for each item. The budgeting process usually takes several months, usually up to four months, and the general manager must get permission from the investor to implement the planned budget plan in the upcoming period.

The budget for the pre-opening phase of the hotel is particularly planned, and it is officially called the pre-opening budget. It involves financing various activities. In order for the budget to be justified, it is best to assign a task to each head of a department to make the budget of the corresponding department. In a situation where there is a budget for each department, it is easier for the general manager to make a general budget plan for the entire hotel, thus reducing the potential risks of investor refusals to finance any item, if justified and reasonable. According to some estimates, the most expensive department in the hotel is the Sales and Marketing Department, followed by the Human Resources Department, which many hotel houses point out after budget analyzes have been carried out.

3.2. EXECUTION STEPS IN THE PRE-OPENING PHASE

In order for a general manager at this stage to successfully complete all tasks, it is important that he has a plan and execution schedule. In practice, a Gantt Diagram is often used as a tool for the visualization and execution of tasks in certain time periods. As a hotel is a complex system, a lot of tasks overlap each other in terms of time determinants. The Gantt Diagram can be successful if a

general manager follows his model for the execution of this phase. In this sense, a set of steps for the pre-opening phase of the hotel can be made, in which the author has designed during research and personal participation in the implementation of this phase. Execution steps in the Pre-Opening Phase are:

- i. Preparation guide setup
- ii. Configuring Pre-Opening Critical Path Checklist
- iii. Involving task force management team and HODs
- iv. Tasks delegation and resolving requirements
- v. Review of Critical Path Checklist
- vi. Finalizing operational tasks
- vii. Soft-opening

The first step which is called "Preparation guide setup" indicates the beginning of the pre-opening phase. In this step, it is important that the general manager review the content in detail and see what can be implemented for each element. Large hotel corporations usually have the same document, to ensure it is the same standard in all hotels within the hotel chain. Following the standard book and this document, the general manager can successfully negotiate all the necessary actions with the contractors and investors. This applies in particular to the information system and the installation of the hotel information system, which will be discussed below. Preparation guide implies that no deviations are allowed, since it is prepared in accordance with the standard book, and the standards must not be changed. They must be the same for every hotel within the chain. If there is a business need to change or supplement certain elements, (which also depends on the specifics of the facility), then the general manager must notify the board of the hotel chain and investors. The settings in this step are defined and are not eligible for amendments. Successful installation of the entire program requires the maximum engagement of all involved parties. The general manager must notify all parties of the beginning of the implementation, and when the time comes, it is imperative to inform the heads of departments and task force team members in detail. This document details how to execute the installation process for each department in the hotel, such as setup configuration, reservation configuration, profile configuration, property configuration, cashier configuration, and pre-installation and post-installation phases. For smaller hotels, this part is usually covered by the hotel owner, who is also the hotel manager. Also, in this step, the hotel chain and the investors should

already know details about the hotel departments and heads of departments (HODs). Also, it is a good idea to have a list of task force management. That will be explained further in the third step. The web site and online promotion should be already in progress, with some crucial information about the opening date, when and how to make a reservation, what the hotel will offer and whom to contact for further information.

The second step “Configuring Pre-Opening Critical Path Checklist” presents a unique step for each opening project. A special checklist is made for each and every hotel. There is one general template, but it does not include all the necessary elements. So, in order to fulfill all the requirements, a general manager has to complete it. This should be completed usually by the first step, during preparation guide setup, in order to proceed it to this, second step. The checklist includes all the important elements. This document should provide the following information:

- i. Hotel’s name (general information)
- ii. Pre-opening start date
- iii. Opening date
- iv. Current date (when is being completed)
- v. Team section
- vi. Name of responsible person
- vii. Number of tasks
- viii. Percentage Completed
- ix. Overall progress

The pre-opening start date indicates the date when this Pre-Opening Phase has begun. It is official and it includes the date when the general manager has finished the setup of the preparation guide, which is named as the first step of this phase. The opening date of the hotel means the official start of the hotel or the soft-opening date. This is the moment the hotel opens towards the market, starting with its standard operating procedures. In this case, a date is originally agreed upon and can’t be changed, except in exceptional circumstances. The current date means the date when each of the involved parts makes any changes in this document. It has to be registered, in order to have precise overall progress. Overall progress is presented at the bottom of the first page of this document. The team section includes all members of hotel management, such as the gener-

al manager, sales, marketing, revenue, communication, PR, meetings and events operations, front office and switchboard, housekeeping, food, and beverage department, as well as information technology and all other hotel specifics. Next to this part should be the name of the responsible person and the total number of tasks which have to be done. At the end of this document, the percentage of completed tasks should be clearly shown, so that each head of department and task force team member can know how much they did and how much they still need to accomplish. Also, the overall progress should be presented, so that the whole hotel management can be sure where they are currently, regarding the opening date. There are some more details that this document can have, such as the duration in days for each task, start and finish date, including proposed and actual finish date, remarks, etc.

The third step, named “Involving task force management team and HODs” presents a moment in which the general manager includes the task force management team and HODs. A general manager can continue with specific requirements and tasks. The task force management team includes members from the same hotel chain, which are experts in their departments. Usually, they are chosen from the main Human Resources Department of a hotel chain. A successful hotel can send their best employees on request from the hotel chain HR general department. They are like assistants to the pre-opening general manager. With the knowledge and experience they have, they can help to set up each department, respecting all standards and procedures. They also help the heads of departments in resolving all issues. Task force members easily detect all potential risks, communicate with a general manager, offer all possible options to avoid any gap during the pre-opening phase. They also participate in the recruitment of new employees, organize all the training and prepare new employees for a smooth start in the new hotel. They present the hotel brand and standards. Besides that, task force members are involved in further activities, such as controlling purchases, implementation of the preparation guide and detecting critical points in the critical path checklist. Heads of departments (HODs) are new hotel managers, responsible for setting up their own department, following the general manager’s instructions. They have the support of the task force members at all times.

After introducing all task force members and heads of departments, the general manager presents and delegates tasks. That is the next step in the pre-opening phase. They follow the Critical Path Checklist and during this phase,

they need to fulfill all requirements. For example, the general manager needs to communicate the status and the expectations and pre-opening business plan with all the heads of departments, schedule training for all employees, provide guidelines for all the head of departments on policies and procedures, refer to the brand and internal audit questionnaire, meet with task force members to brief them on all objectives, prepare a business plan for the first year operation and a budget, verify with owners and investors all parts of the agreement, etc. For the heads of departments the tasks are specific, so for example, the head of front office should obtain drawings and get familiar with Front Office areas, review room rates and room types, develop job descriptions, prepare standard operating procedures, help the human resource department with the recruitment of the front office department, establish a training plan, make a checklist of purchases, communicate with the general manager, prepare uniforms for this department, etc. During this step, all potential clients who will be working with a hotel should be doing site-inspection with heads of sales and marketing departments.

The next step is the review of the Critical Path Checklist. This step indicates what is done, what should still be done and where a hotel currently is. Each department has its own specifics and tasks, which are mentioned in the Checklist document. After completion, it should be marked in that document, so the progress of the phase can be visible. The general manager does reviews every day and supports other members in achieving requirements. Task force members are very important in this step since they can detect some potential issues faster than others. During this step, the Pre-Opening Phase should be at least 75% in progress. Equipment should be delivered, employees should be attending training, heads of departments should be available to complete almost everything and the general manager should present achievement to the stakeholders. The IT hotel system should be set up by this moment.

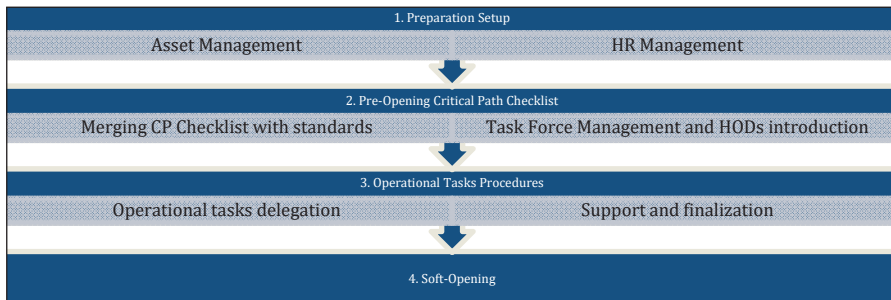

Finalizing operational tasks means that the Pre-Opening Phase is almost finished. There should be some technical details left, like managing the new hotel IT system, detecting some elements which should be done when the hotel opens. At the same time, the reservation system should function. A general manager has to do permanent control and inform stakeholders of the soft-opening date, in a way that is possible in order to proceed with that final step as it was planned or if there is still some time needed to fulfil some tasks. The last step, soft-opening, means the Pre-Opening Phase is complete. It finishes with

the opening date of a hotel to the public and the receipt of its first guests. Now, after detecting the main steps which have to be followed, a new model of the Pre-Opening Phase can be presented from a new perspective.

3.3. PRE-OPENING CRITICAL PATH MODEL

By defining the time determinant of the Pre-Opening Phase and explaining the flow and all the important steps of execution, a model can be formed. By following this model, one can easily fulfil all actions required for the pre-opening phase and easily transition to the next scope of work. The focus of this paper is to formulate and propose a new model that would ensure that a certain protocol meets the goals set out in the strategic plan and that the agreement signed between the stakeholders and that this phase is successfully completed, with minor deviations. The following is a suggested model, based on the research done by the author, comparing scientific knowledge and practical insights during personal participation in such a demanding project.

Figure 2. Model of Critical Path for Pre-Opening Hotel Phase

Source: Authors' analysis according to research

According to the above pre-opening phase implementation model, it is possible to detect at which point a certain step and task are needed to proceed to the successful completion or opening of a hotel, which is the ultimate goal of this phase. It is important to have a thorough preparation and permanent control of each phase and step to make the model successful. The general manager must ensure the requirements in the first step, in a manner that meets the requirements of the investor, i.e. all stakeholders, but also forms a successful team that will follow it at this stage and will continue to work and after the opening. This involves the formation of future hotel management and a task force

management team, which will assist him until the moment the hotel is opened. When one meets these requirements, then the next step is to set up a checklist, identify all the key elements of the Control Path Checklist and standardize the hotel standards that must be implemented. After merging the Critical Path Checklist with standards, a general manager has to introduce Task Force Management and Heads of Departments in an effective way. When he does, then he controls the execution of all necessary actions. The General Manager assigns tasks, delegates tasks to the Heads of Departments, and permanently supervises them, correcting and finalizing all activities. When all the required tasks are completed, the final step is followed by the Soft-Opening. This step ends with the Pre-Opening Phase and begins with a new phase, the beginning of the hotel.

4. CONCLUSION

By defining what management really means, and then pointing out the meaning of hotel management, the role, and importance of the pre-opening phase of the hotel can be recognized, which is extremely important in order to make the hotel and business more successful. This is the phase that is the hardest part of the business cycle of the hotel system since the most critical moments appear at this stage. In the past few decades, in all strategic plans, special attention is paid to the implementation, control, and improvement of the overall quality of performing the basic phases of the business and the implementation of standards in all hotel phases agreed and established just before the soft opening of the hotel. In this paper, the research is based on the formation of the underlying structure of the hotel system, in terms of making strategic plans, budgeting, selection, and staffing of the best employees for starting work, while fulfilling other tasks that the hotel management in the hotel pre-opening deals with all stakeholders of the project. The key part is related to identifying and monitoring success in this phase, in order to enhance and maintain the quality of the business plan, as well as to ensure the opening of the hotel on the market.

In order to start the hotel's pre-opening phase, it is essential to hire a responsible person who will be the hotel's general manager throughout the entire phase. The hotel's opening phase begins half a year to a year before the soft opening of the hotel. The main prerequisite is the existence of a strategy, according to which the most successful opening of the hotel's opening phase must

officially start one year before the opening. When the general manager of the hotel enters into the realization of the set goals according to certain plans, then the pre-opening phase of the hotel officially begins. In order to be as successful as possible in his work, he must be a visionary, a motivator, and be ready to take over and manage all risks. However, he must also know that with the introduction of a new organization, he must be open to changes that are frequent and constant at this stage. In order for a general manager at this stage to successfully complete all the tasks, it is important that he has a plan and execution schedule. By defining the time determinant, by observing certain knowledge, with respect to certain scientific knowledge, it would be easier to know which are the critical points of the implementation of this phase and to which the most attention should be paid.

Following the research, several facts have come to light. This highlights the definition of the Critical Path Checklist, the creation of the task force management, the execution of a whole set of tasks, the permanent control and the provision of feedback. As a result of the research, a proposal for a new model for the implementation of this phase, which could serve as a guide to opening a hotel, is also mentioned, as well as providing new information that might have been omitted in future business and strategic plans. This also gives new insights to increase performance, while reducing the risk of completing the hotel opening plan.

Abstract

The purpose of this paper is to re-examine the correctness of the current relationship between working and leisure time. For many economists, leisure is the period in which people consume and so consumption is the main aspect of free time they are studying. However, leisure is also the period in which people create. If we accept the thesis that the time that comes after the end of the working day has more significant economic implications than the consumption itself, we will have to consider other potential benefits associated with shorter working hours. Therefore, the paper seeks to explore contemporary perceptions about the effects of shorter working hours. Also, this paper tries to re-examine the correctness of the current relationship between work and time remaining after work. Emphasis has been put on the creative potential of free time, and in this regard, the directed development of hobby culture as a catalyst for entrepreneurship. The relationship between work and leisure goes beyond the issue of entrepreneurship development, so this paper questions the further consequences of shorter working hours. Contemporary knowledge suggests that shorter working hours could cause significant positive economic effects and lower social security costs. The liberation of leisure time and the development of hobby culture are also complementary to concepts of the knowledge-based economy and the concept of lifelong learning. Relevant research, for now, does not link the shorter working hours and employment growth, but there are serious indica-

tions of productivity growth. It is our opinion that it would be desirable, even in our economic environment, to look more in-depth into the effects of shorter working hours, both through social experiments and through scientific research.

Keywords: entrepreneurship, hobby culture, leisure time, time management.

JEL Classification: J01, J81

1. INTRODUCTION

If we accept the idea that the development of *hobby culture* can strongly contribute to the development of entrepreneurship¹, we also must wonder what changes are needed to encourage an average person to actively participate in spare time activities? Unfortunately, the necessary changes are significant, and it is difficult to imagine that public authorities will involve in such serious reforms in order to help stimulate entrepreneurship indirectly. The tragedy lies in the fact that reforms that would stimulate the *hobby culture* are necessary for several other economic and social reasons, and the development of *hobby culture* would be just a cherry on top of the cake of positive social changes. In other words, encouraging *hobbyism* should only be part of a major reform aimed at the sustainable development of a more meaningful and more successful economic and social system.

We can identify five key circumstances that prevent hobbies in taking on a stronger role in our society:

- 1) Lack of free time of appropriate quality
- 2) Invasion of employers on employee free time
- 3) The outdated model of education
- 4) Institutional obstacles which prevent hobbies' transition to entrepreneurship
- 5) Domination of passive mode of free time consumption

The first point assumes a **shorter working time**. The issue of working time has far greater implications than the development of entrepreneurship by creating policies which will enable the growth of hobby culture. This section aims to present the main beneficial consequences of such reform. Other points will be addressed in a

¹ For more details about that hypothesis see Komljenović, N., Rančić, N. & Pilipović, O. (2018)

section called **institutional change**. These changes represent a systematic upgrade to work-time reform, and the goal is to create the conditions in which an active way of spending free time will produce multiple benefits for society.

2. SHORTENING OF WORKING TIME

The problem of the lack of adequate free time is best summarized in a quotation: “It is difficult for an individual to remain in the mood for active and energetic engagement, and to separate from previous experience and future expectation. After hard and stressful work, he is not eager to think about ways to spend his free time. Exhaustion and tiredness lead him to passive lethargy, drinking or involving in small but exhausting housework.” (Artić 2009, p. 287). At the same time, the same author also emphasizes that mass culture does not direct the individuals towards an active way of spending free time. “Free or spare time in the context of” mass culture “does not stimulate and develop the creativity of an individual in a way he would transcend and develop this culture in order to enrich it with new contents. ... Therefore, in this and another similar context, work becomes a dungeon of the human creative spirit and loses its focus on innovation and creativity.” (Artić 2009, p. 288). Considering the issue of free time Artić refers to Marx’s thesis, which in the present context visibly underlines the link between hobby and entrepreneurship. “Marx’s opinion is that the solution to the workers’ ability to turn work into their own choice would happen only when a worker becomes aware of his ability to turn, willingly accepted work, into self-interest and pleasure. Furthermore, when an individual accepts happily the activities by which he or she will fulfill his or her existence, they will be able to choose their own free time without external conditioning.” (Artić 2009, p. 288). In these assumptions we can clearly recognize the course of modern social relations because capital does not exclude free time, it rather protects it. Free time is the central issue for the development of *hobby culture*. The day has only 24 hours and man has limited energy potential. The available time and energy should be utilized in a way to maximize social benefit. If a person is exhausted by working, they will fail in other fields as well. Isn’t this problem in its core economizing? Isn’t the purpose of the economy to meet human needs by balancing between the scarcity of natural resources and the scarcity of available workload? Time as a unique economic resource which depends more than any other on economizing. Since we cannot accumulate it, compensate, stop or accelerate it, it is necessary to spend it rationally and efficiently.

Eight hours per day and forty hours per week of working hours are not based on the knowledge of economic science. Lawmakers promote such or similar solutions, but there is no scientific evidence to suggest that it is the ideal choice. Therefore, an eight-hour working day is nothing more than a rooted tradition. Working fewer hours does not mean that a person is lazy and consequently unsuccessful. That can be confirmed by the data of Eurostat (2018) which indicates that workers in the leading European economies, work considerably shorter than their fellow workers in economically less developed parts of Europe. On average, the least the time spent on work are Dutch, which works only 30.3 hours per week. The list of countries with an average of fewer than 37 hours a week includes Denmark, Norway, Switzerland, Germany, Ireland, Sweden, Austria, the United Kingdom, Finland, and Belgium. Apart from the United Kingdom and Austria, in these countries workers generally work less than the rest of Europe, considering only full-time employees. The highest number of working hours per week on average have Greeks, more than 42.3. Over 40 working hours per week on average, also have Slovaks, Czechs, Poles, and Bulgarians.

Such data direct us toward two conclusions; the economic success of a country is not related to the quantity but to the quality (labor productivity) of the working hours, and workers under certain conditions decide to work less. The theory of choice, in terms of relative scarcity, explains why workers decide to work shorter or longer. Economists consider the issue of choosing between work and free time as a choice between income and free time. One must sacrifice one to gain another, and it is more difficult to give up on the good which is scarcer. There is also a significant influence on cash income generated by one-hour work. If the hourly wage increases, we decide to buy more goods. If we consider free time as good, we can assume that people will be willing to change income for a time, therefore they decide to work less. By doing this we increase the cost of free time. This triggers the opposite effect; we decide to buy a little less free time and therefore work a little longer. The outcome ultimately depends on the relative strength of these two effects. It should be considered that purchasing additional goods encourages less work because goods are combined with time (consumed in a timely manner) in order to carry the usefulness. Employer behavior should also contribute to the shortening of working hours. The employee's work is considered as a cost, and employers will decide to lower this cost when productivity increases, which undoubtedly happened in

the past. History teaches us how these impacts created a process of continuous reduction of average hours until the mid-20th century, after which stabilization took place. There is no scientific consensus about the cause of stabilization (McConnel, Brue 1994, p.14-81), however, shortening of working hours through legislative changes in some of the most developed countries of Europe, shows that such a policy does not hold back the economy.

2.1. WORK EFFICIENCY

Raising of work efficiency, for employers is the most interesting effect of shortening of working hours. The one-year survey of 332 workers in one call-center in the Netherlands suggests that any prolongation of working hours results in a decline in productivity. According to their results, the prolongation of the work by 1%, results in an increase of “output” by 0.9%. The main reason for the decline in productivity is exhaustion. As surveyed employees worked on average only 4.6 effective hours per day, it is concluded, that the result is even worse when only full-time workers are observed. The conclusion of the decline in productivity is in line with most studies conducted to investigate working hours and productivity (Collewet, Sauermann 2017, pp. 5-8,21,22). Such research results are supported by various real-life experiments. In the Swedish town of Gothenburg, at the nursing home of Svartedalen, two-year testing of the six-hours working day confirmed that working time reductions have a positive impact on productivity. These results prompted some employers in Sweden to shorten their working hours. One such example is the orthopedics department at the Gothenburg City Hospital, two hospital departments in the city of Umeå, but also several small Swedish companies. The six-hour workday pioneer is certainly Toyota’s service center, which has been working six-hour work for past 13 years. According to their data, this model resulted in a 25% profit growth (Crouch 2015). There are many reasons why employers should seriously consider the possibility of shorter working hours. John Pencavel, in his work entitled “*The productivity of working hours*”, concludes: “Not only does long work result in tiredness and stress, which then manifests a decline in productivity, but also increases the probability of workplace failures, workplace accidents, and illness of the employees. All of this causes the employer additional costs. Though this is not a novelty, employers should know how to cut down on working hours without reducing the output.” (Pencavel 2014).

2.2. COST OF THE WELFARE STATE

Reducing working hours is directly related to reducing the costs of the welfare state. A Swedish experiment with a six-hour working day at a nursing home resulted, among other things, with 10% fewer sickness leaves among tested nurses (Oltermann 2017). Even better results have been achieved when the orthopedics department at the Gothenburg City Hospital has decided to switch 89 nurses and doctors to six hours working time (Eisenberg 2016). The significance of these results suggests that nurses participating in the six-hour experiment used less sick leave than all nurses employed in Gothenburg, and not just those in the control experimental group (Greenfield 2017). Such conclusions are no news, there are several types of research that link the working hours and the cost of the health system. One such study was carried out in the context of France's 1998 reform, which reduced the working week from 39 to 35 hours. The study confirms the correlation between shortening the working week and improvement in workers' health. Reducing working time also causes direct consequences on health, but also indirect, i.e. it directs people to a healthier lifestyle (Barniell, Bietenbeck 2017). The synthesis of many medical types of research, that are dealing with this topic, confirm the connection between long working hours and a range of medical conditions: lack of sleep, anxiety, depression, cardiovascular disease (Bannai, Tamakoshi 2014, pp. 14,15). Not only are hobbies a form of mental relaxation, but a large part of the hobbies is based on sports, healthy nutrition and generally healthy life. Also, the development of the *hobby culture* would not only stimulate traditional and corporate entrepreneurship but social entrepreneurship as well. Social entrepreneurship can be defined as a way of thinking, i.e. the process of creating and developing economic activities, by combining risk, creativity and/or innovation with a dependable management structure, within a new or existing organization whose primary objective is to create new social values. If this process generates profits then it is used to accomplish the mission of the organization (Vincetić, Babić, Baturina 2013, p. 259).

2.3. LIFELONG LEARNING AND KNOWLEDGE-BASED ECONOMY

Croatia, driven by the experience of other advanced economies, has accepted education as a *condition sine qua non* of progress. Unfortunately, implementing this idea has not produced significant results so far. The country's project has

increased the number of highly educated people but has also led to the degradation of criteria in higher education (Vranjican 2007, p. 105). The biggest failure of this reform was its incompatibility with the needs of the economy. The idea of lifelong education has proved even more problematic. In practice, it has not raised the quality of human resources, instead, it has mostly turned into a performance that does not aim to improve the knowledge and skills of employees, but to provide them and the companies that employ them with various necessary certificates. This criticism is based on the common model of lifelong learning implementation. The employee is sent by the employer to a course with a goal to obtain a specific certificate. Tired from business and private obligations, the worker is usually uninterested in various lectures that he attends in order to pass the required exam which will release him from this work-related obligation. The fundamental problem of the concept of lifelong education derives from the nature of time. The day lasts only 24 hours. It is impossible to include a new activity in these 24 hours, which should take place on a regular basis, while not being disassociated from another area of its activity. If such an expectation is really imposed, it is necessary to shorten the working time. Not only to gain new knowledge but also to keep the employee's energy potential and the enthusiasm required to acquire that new knowledge, since motivation and time is a prerequisite for successful implementation of the idea of lifelong learning.

Hobbyists' experiences in this area are very useful; the concept of lifelong learning by the nature of things is implemented in the idea of a hobby. Hobbyists are stimulated by the passion of the activities that represent their hobby and are constantly investing their free time in the development of new knowledge and skills that would elevate their hobby activity to a higher level. The power of the hobby lies in the fact that using its main feature, entertainment, solves the underlying problem of education - motivation. Of course, it should also be noted that many of the hobbies at their core represent learning, such as mastering new languages. Reducing working hours would also, given the precondition of proper institutional support, encourage employers to use the opportunities offered by practical tuition programs to partially compensate the work of absent employees with hours of work performed by students for the purpose of acquiring practical knowledge.

2.4. UNEMPLOYMENT

At the theoretical level, shortening of working time is often linked to the problem of unemployment. During the crisis in 1993, Volkswagen has decided that instead of firing excess workers, to cut their working time by 20%, with a 4% increase of hourly wages. All employees retained their jobs and solidarity suffered a gross wages reduction of 16%. The net loss of earnings was lower than 16%. (It was estimated at 10-11%) (Boersch-Supan 2002, p. 20) Thanks to the German progressive tax model, workers have generally fallen to a lower tax bracket. This measure proved more than successful. Volkswagen achieved financial savings and maintained human capital. This experience encouraged the company to maintain the policy of flexible working hours to this date. Although it has proved to be a time-saving measure and very effective mean to fight against dismissals, serious indications have shown that this measure is not equally effective in creating new jobs. Explicitly, at the surprise of the administration, when in 1994 the number of employees fell by 5,000, thanks to the retirements and departures of workers who had found a better job, Volkswagen still did not solve its problem of surplus workers, caused by productivity increases brought by shortening working hours (Seifert, Trinczek 2000, p 3-7). According to the report that the company presented in the period from 1992 to 1995, productivity has increased by 10 to 20% (Boersch-Supan 2002, p. 20).

Axel Börsch-Supan, based on the Volkswagen case and other German experiences, questions the practical implementation of theoretical settings that links unemployment reduction with shorter working hours. According to him, such an effect is unlikely if employers, workers, and consumers have room to react to such measures. The decrease in unemployment will not occur if workers look for additional jobs, employers replace work with capital assets, and consumers look for less expensive goods. According to him, the result that an employer achieves by productivity growth has been eliminated by the growth of labor costs, although it allows the possibility of different conclusion because after the mid-90s the cost of labor has experienced a certain decline. He concludes that shortening of working hours has resulted in greater efficiency of the workforce, giving them more free time with little revenue cuts. This is a great success, but there is no evidence that shorter working hours are an efficient way of encouraging employment. It also suggests that earlier research by Köning, Pohlmeier, and Entorf was correct. They studied employment in Germany in the period from 1962 to 1986 and concluded that reducing working time by 6.25% (40 to

37.5 per week) reduced unemployment by only 0.2%. This result is confirmed by the 1993 research carried out by Kraft, which concluded that the main effect on employment growth is a decrease in labor costs (Boersch-Supan 2002, pp. 14, 15, 22, 23).

3. INSTITUCIONAL CHANGES

3.1. PROTECTION OF FREE TIME

For the past decade, the awareness about the employer's invasion on employee's free time is being raised. The development of communication technology enabled all day availability of workers and extension of workers obligation on parts of the day during which workers should have for their other social roles. Off-hours availability, in most cases, is not regulated, forced "call duties" are not paid, and more and more employees are suffering in silence considering them as a part of modern working relations. The words of Benoit Hamon, the former French minister of education, simply summarize the problem: "The workers physically leave the office, but they do not leave their jobs behind. They remain connected with their work obligations through invisible electrical leashes, just like dogs. Messages and e-mails colonize the private life of a person until she or he ultimately breaks." (Wang 2017).

The problem of the balance between private and professional life is clearly described by the words of former German Minister of Labor Ursule von der Leyen, used during a campaign which aimed to establish clear rules on employers' access to a German worker's free time: "Modern techniques such as smartphones contributed to the flexibility of conducting the business, however, downside is that people can no longer find the balance between work and free time. The company must learn to deal with these technologies in a way that technology does not control and dominate our lives- instead, it should manage it. Companies should protect their employees from over-exposure." Von der Leyen, therefore, suggests the implementation of "crystal clear rules" when using official mobile phones and emails. "It should be clearly identified, by appropriate contracts, which employees must be available and at what time. It must be clearly defined that workers do not have to control or respond to electronic mail and that the official phone may be turned off" (Jutarnji.hr, 2012). The German

“information campaign”, during which companies were contacted in an attempt to address the items in the *German Occupational Safety Act*, which already contained the elements that should guarantee the mental and physical health of the staff, has resulted in positive outcomes. In Germany, many companies have established their own code of conduct in order to reduce the stress of employees, including some of the world’s renowned companies such as Volkswagen, BMW, Daimler, Allianz, Heinkel, Bayer, and Puma. As a result, the Volkswagen car maker does not forward electronic mail to mobile phones half an hour after the end of working hours. However, there are also companies that do not want to follow such examples, and employees depend on the goodwill of the administration (Vasagar, 2013). The discussion on the invasion of the employer on the free time of workers remains ongoing in Germany.

France decided to approach the problem in a traditional way - through legislative changes. Recently an amendment to the French *Code du travail* was adopted, which should guarantee respect for free time and annual leave, as well as private and family life. In this way, it tries to respond to the unpaid overtime and the more significant problem of the threat to the mental health of workers. According to the new legal text, an employer employing more than 50 employees, is obliged to enter negotiations with workers in order to agree on ways in which the workers’ private time will be protected. If the negotiations prove to be unsuccessful, the employer is required by its own act to regulate the issue of contacting the employee after working hours, the reasons justifying such treatment and compensation for the worker. Prior to the adoption of this Act, the employer is obliged to consult the workers’ council (Agence France-Press, 2016, Ducorps-Prouvost, 2016). In this way, France upgrades the right to disconnection (*le droit à la déconnexion*). This human right was confirmed by the French Cour de Cassation in 2001², concluding that the workers are not obliged to accept work from home, nor do business at home, and that workers’ inaccessibility after the end of working days is not a breach of duty (Ducorps-Prouvost, 2016).

The phenomenon of work from home is becoming increasingly dangerous for the employee’s free time. The international work organization has warned in the study entitled “*Working anytime, anywhere: The effects on the world of work (2017)*” about the dangers of work from home. Such a regime, despite

² For more details see: Cour de Cassation, Chambre sociale, du 2 octobre 2001, 99-42.727

the strengthening of worker autonomy, leads to an extension of effective working hours and more frequent work on weekends and holidays. Workers work longer than the agreed working hours, and as a rule, such overtime is unpaid. In order to avoid such negative effects, it is necessary to develop regulation and good business practices that will ensure the achievement of positive impacts by minimizing negative (Eurofound-ILO, 2017, pp. 21-25, 57-60). In order to realize the creative potential of free time, it is necessary to develop an appropriate protection system. We have previously mentioned the German and French model of dealing with this problem. Both showed to be partially successful, but still insufficient. It is, therefore, necessary to take both examples and to upgrade them. Creating a quality legal framework and court practice is a necessity. It is, therefore, necessary to go a step further than the French example. There is a need to develop a system that will enable the worker to protect the rights without having to enter a legal battle with a financially more powerful employer. Furthermore, it is necessary to develop a system that will encourage employers to implement rules that protect workers' leisure time, and a system that will discourage opposing behavior. Applying the German model of building awareness of the importance of respecting employee free time is necessary. Legislative changes are, as a rule, limited in scope if they are not in line with cultural movements. If employers and workers do not develop awareness of the importance of respecting these new rules, the situation cannot be significantly improved. The campaign that happened in Germany is the right way, but it needs to be more long-lasting and more embedded in other media content.

3.2. REFORM OF EDUCATION

The current education system in Croatia almost completely ignores the development of creativity; especially innovation and entrepreneurship. We can go a step further and conclude that the educational system obstructs the creativity of children. An illustration of Gillian Lynne, used by Sir Ken Robinson, one of the most famous contemporary critics of education, can be used to illustrate this problem. He claims that people are most successful when they do what they have natural capacity for, and when they develop a passionate attitude toward that activity (Robinson & Aronica, 2009). If we accept this simple thesis, then the education system should strive to recognize and develop talents, but this is not enough; Modern schools should stimulate empirical learning, personal activity, and inner motivation. In this way, we can develop a passion for certain

areas. The human population is characterized by an extremely wide range of talents, unfortunately, most of them are undiscovered. As a rule, creativity is identified with art. Art subjects certainly deserve a better position in our education system, but creativity has a role in every area we taught in schools (Robinson, 2001).

The approaches to creativity have changed over time from the early 19th century when creative individuals were considered geniuses, and creativity was considered to be characteristic only of selected individuals, to a more scientific orientation that links creativity with divergent thinking. Today, the perception of creativity as a feature of selected individuals is gradually abandoned. Creativity is increasingly becoming a common human potential. Unfortunately, despite the tendencies and demands of modern society and modern pedagogy, schools still largely stimulate and value memory and analytical skills, convergent thinking and conformism, and don't encourage creative and critical thinking skills. We should be aware that creativity is obstructed by lack of respect for originality, limitation, lack of autonomy and resources, inappropriate norms, negative feedback, lack of time, competition and unrealistic expectations. Every child deserves to develop its creativity; therefore, the teaching of all subjects should be directed, to a certain extent, to encourage creativity, and teachers should be the one who will encourage creative thinking and expression. The teacher's task is to identify the potential creativity of each student and to encourage it because the educational system should provide students with the means to develop creative potential (Kunac, 2015).

The role of extracurricular activities is extremely important in encouraging and developing the creativity of young people. Such activities, according to their characteristics: freedom, diversity, dynamism, freedom from rigid curricular plans and programs, rigid discipline, appraisal, fear, etc., have a great potential for developing students' creativity. Unfortunately, their potential is not used enough in schools. Often, organization and implementation of extracurricular activities are "assigned" activities to teachers that are not interested in those subjects. Extracurricular activities often represent an extension of regular teaching hours and even worse, additional schooling, so they become a place for competitions of gifted students. They are also limited by the material resources of the school and the workload of the teachers, which does not meet the different needs of students; (Mlinarević, Gajer, 2008, pp. 50, 51). Many types of research that question students' interest are confirming that it is necessary to carry out

empirical learning through various practical activities in order to find additional ways to involve children. If students are offered interesting practical topics during their extracurricular activities, having in mind their different interests, it will increase their intrinsic motivation and will lead to greater involvement in the offered extracurricular activities (Kostović-Vranješ, Bulić, Novoselić, 2016). Creative abilities are not something absolute and static, but dynamically and voluntarily, they evolve throughout life, therefore society must build institutions that will encourage the development of creative thinking (Kunac, 2015). Unless we approach creativity-based reforms, we cannot expect from the coming generations to create new technologies, new jobs and generally new solutions. We will either develop our human potential, or we will be condemned to recycle foreign ideas with decades of delay.

3.3. SIMPLIFYING THE TRANSITION FROM HOBBYISM TO ENTREPRENEURSHIP

One of the fundamental obstacles in transforming hobbies into enterprises is psychological nature. Hobbyists who choose to try to monetize their experience, as a rule, have not yet decided to become entrepreneurs. The decision to enter an entrepreneurial adventure follows only after the first profit from the services or products is gained. If such first market survey proves to be profitable, hobbyists generally convince themselves that it is the time to transform the hobby into a business venture. This is the most sensitive phase in the desired transformation. Therefore, it is of utmost importance to introduce changes in the legal system that will recognize the order in which hobbyist becomes entrepreneurs. The existing legal framework discourages people to start their own business even before they really attempt to try it. Fulfillment of all legal requirements at the very beginning does not pose a problem for people who have a clear business vision and plan. However, in a period when people are just getting acquainted with the commercial potential of their hobby, these demands are extremely demotivating. Those who enter into a battle of complying with these legal requirements have, in most cases, already tested their product in an unofficial way, by avoiding the said regulations. That is why it is necessary to consider the legal framework that will enable the launch of trial business ventures. Hobbyists should be allowed to commercialize their activities in a way that they are not overburdened by the payment of taxes and contributions, requirements of special education and other similar obstacles, as long as they count as small

profitability activities. After a simple registration hobbyist should be able to try the market. The experience gained in this beginner's model should be motivating and enable the gradual development of a more serious entrepreneurial plan. During this period, a hobbyist could gradually prepare to fulfill the conditions required when opening a simple Limited Liability Company. As long as we don't adopt such reform, Croatians will start their initial entrepreneurial phase on the black market (Čatipović, 2014), or will be discouraged by the demands placed on them by the entrepreneurial venture.

3.4. PROMOTION OF ACTIVE FREE TIME ACTIVITIES

If we observe the phenomena of active and passive free time from the perspective of economic science, we can conclude that a balance is needed between these two forms of human behavior. It is easy to notice the economic significance of passive free time activities as it is directly related to the phenomenon of consumer culture, and in some ways represents a triumph of materialistic values. The active pursuit of free time, on the other hand, has no apparent economic implications, but more detailed observation will reveal that it indirectly and significantly affects the economic indicators of a country. It is closely related to education and the creation of new ideas, products and „healthy living“. Each of these categories stimulates the economy or reduces the public's costs. It is especially important to note that active free time is not in opposition to consumption, it even encourages it. Such thinking leads us to the conclusion that consumerism itself is not a social problem, which is a common conclusion within the humanistic scientific circles (Dadić, 2013, pp 100-106). The problem is passive consumerism, which behavioral pattern is based on consumption itself. If the consumption, after the fulfillment of basic living needs, is focused on products and services that promote education, development of critical consciousness and creativity, or some other desirable form of behavior, then the consumerism will be perceived as an investment in social advancement.

Recent research shows that free time is the area of everyday life in which young people get involved in the earliest and where their autonomy is greatest (Mlinarević, Gajer, 2008, pp. 50-51). For this reason, it is necessary to create the habit of active free time during childhood and adolescence. In this process, the school and the family should play the most important role, but the precondition for their success is the active role of the state policies. Behavioral patterns are

primarily transmitted from parents to children. This phenomenon is confirmed by numerous research and scientific papers (Družinec, 2016). Unfortunately, a positive contribution of the family can only be expected when such a reform really takes place and lasts for a long time. In this way, the generations raised in the society which has developed *hobby culture* will be able to transfer the patterns of the behavior that they have acquired to their children. The school today is to a large extent traditional or overloaded with content, tasks, tests, and evaluation. For the free time activities, the most important is their positive orientation, and it can be achieved by pedagogically designed activities that provide socially and culturally valuable contents in order to meet the individual needs of young people.

The state, local and regional government systematically supports a variety of socially beneficial activities conducted by private persons (less frequently business entities) joined in the legal form of *Associations* (Zakon o udrugama, article 4). State financially supports, depending on the classifying activity (or part of the activity) the association's program, or project, of general interest (Zakon o udrugama, article 32). The legal framework is rounded up the *Decree on the criteria, criteria, and procedures for financing programs and projects of general interest provided by associations* (Narodne Novine 26/15) and the *Law on Financial Operations and Accounting of Non-Profit Organizations* (Narodne Novine 121/14). Such a system should continuously be supported. It is of crucial importance to the wider understanding of projects that are of interest to the common good. Although the *Zakon o udrugama* (Narodne Novine 74/14, 70/17) uses an open definition, in societal consciousness this concept is still relatively narrowly understood. In the past few years there were some improvements which made a significant step towards preventing abuse of public funding, however, it made the funding system more complicated. It is important to emphasize that educating younger generations about opportunities and ways of organizing to promote common goals and enhance common interests is more important than financial aid. Also, the state, local and regional government units should pay more attention to the promotion of active involvement in various activities of public interest.

4. CONCLUSION

This paper tries to re-examine the state of the current working hours and time that remains after work. Emphasis has been placed on the creative potential

of free time. In that context, we promote the idea of *hobby culture* development as a catalyst for entrepreneurship. The relationship between work and free time goes beyond the theme of entrepreneurial development, so this paper questions the other consequences of shorter working hours. Modern economic science suggests that shorter working hours could cause significant improvements and reduce the costs of the welfare state. The liberation of free time and the development of *hobby culture* are also complementary to concepts of knowledge-based economy and lifelong learning. Relevant researches, currently do not link the shorter working hours with employment growth, but there are serious indications of productivity growth. Since this topic was researched experimentally in the last few years, it would be desirable in our economic environment, to look more profoundly and deeper into the effects of shorter working hours: both through social experiments and through scientific considerations. The program of developing *hobby culture* as a catalyst for entrepreneurship should create jobs in the long run, as well as a healthier and more sustainable way of life. Unfortunately, long-term programs are difficult to turn into political votes with the conclusion that the great success lies in shorter working hours, greater efficiency of the workforce and additional free time on the account of a small reduction in revenue. In a country of low income, this really sounds painful, but it certainly isn't impracticable. The only thing that is required is giving up of consumption of a relatively small number of products and/or services, in exchange for undeniably true values such as efficiency, health, and future prosperity.

THE PERCEPTION OF ENTREPRENEURIAL CLIMATE IN THE REPUBLIC OF CROATIA

Abstract

One of the most important roles of the government is to provide a positive entrepreneurial climate that allows clearly defined market conditions, thus attracting entrepreneurs (Vehovec, 2002). By focusing on the characteristics important for entrepreneurial growth, governments can develop policies and programs in a targeted manner to help entrepreneurs. In order to examine the entrepreneurial climate in the Republic of Croatia, the Entrepreneurial Climate Questionnaire was completed by 761 leaders from various Croatian companies. The three-factor structure of the entrepreneurial climate was obtained. The first factor, described as the strategic postulates of the country and their impact on the market (clarity of the vision of development and the vitality of the country systems that support it, such as science, education, legislation, financial strategy and justice), the respondents estimated as very unfavorable for successful business development in Croatia. The second factor, described as the behavior of the country on an operational level (public administration services), respondents rated somewhat more favorable than the first factor, though still far from optimal. The third factor, described as the country's impact on competition, was also assessed by the respondents as unfavorable (primarily, they are dissatisfied with the high level of corruption, numerous public administrations demands, unregulated grey labor market and high prices of the financial services). Significant differences in estimates with respect to the form

of ownership have been established, e.g. the state-owned companies estimated the entrepreneurial climate as the most favorable, private foreign companies as less favorable, and private domestic companies estimated it as the most unfavorable. At this point, it seems that the Republic of Croatia does not stimulate, instead, it is a major obstacle to the serious development of entrepreneurial climate and competitiveness. The results show that the situation could easily change with clear strategic guidelines and determination to make changes.

Keywords: *entrepreneurial climate, competitiveness, state strategies, public companies, private companies*

1. INTRODUCTION

The role and influence of the government have been changing over time, and one of the most important roles in the contemporary world marked by the globalization trend is to provide a positive entrepreneurial climate. The positive entrepreneurial climate provides clearly defined conditions for market functioning and thus attracts entrepreneurs (Vehovec, 2002). To achieve this, the government of a certain country should support entrepreneurial policies in line with market trends, because such an initiative directly enables certain industries or companies to obtain a competitive advantage. Such example is the so-called Asian Tigers, for whom the governmental assistance was crucial to achieving a considerable competitive advantage, and even after that intervention, the governments continued to play a very important role. Best (1990) cites the example of the Japanese Ministry of International Trade and Industry (MITI) and its role in Japan's development after the Second World War. The creation of Japanese industries has been encouraged by many policies of this ministry, and the restructuring policy in the early stages of growth of certain industries can be seen as the focal point of creating Japanese competitive advantage. Lerner (2009) cites the examples of Silicon Valley in the United States, Tel Aviv in Israel and Singapore, which have succeeded thanks to their governments' stimulus.

The desire to stimulate the growth of economy and employment through entrepreneurship and innovation is a common theme in governmental policies since the 1970s. The key message of David Birch's from the MIT in "The Job Generation Process", published in 1979, is that new jobs in the United States are being created in small independent companies, not in the big ones, as it

was believed previously. Birch then recommended government policymakers to turn to indirect strategies, with a greater focus on the role of small businesses (Mazzarol, 2014). A public administration can choose between the following possible approaches (Penezić, 2008):

- ♦ A passive approach, the changes happen by themselves and create new conditions,
- ♦ An active approach, it responds to changes and succeeds in trying to improve side effects and outputs, and
- ♦ A proactive approach, the contemporary trends are noticed, and they cause change.

Public administrations are often slow to implement reforms that would enable the right tools and improve the economy (OECD LEL, 2015). Each country has a different policy in place to encourage and help enterprises and entrepreneurs. Legislation of the countries, which want to achieve the economic advancement, tries to do it in a variety of fields - from research and development to professional assistance, and involvement in the processes themselves (Short, 2012). Entrepreneurs deal with a variety of economic activities and cover a wide range of business. By focusing on characteristics that are important for entrepreneurial growth, governments can develop policies and programs to help entrepreneurs. These policies and programs are often dispersed through various governmental activities in different areas, such as agriculture, tourism, small and medium-sized enterprises, industrial zones establishment, communal infrastructure development, environmental protection, social protection enhancement, etc., so they rarely succeed in encouraging entrepreneurial growth (Rubel and Paladino, 2000). It seems that governments forget that strategic planning is a choice between a variety of options, in line with available resources and a chosen vision of development. Since no public or local government has enough resources to develop on all desired projects, it means that action plans that follow these widely set strategies often contain a list of measures and projects that cannot be implemented due to limited resources available to local governments.

The traditional approach to government influence tends to increase the total number of enterprises through start-ups programs and financing through investment in capital and technology transfer (Mazzarol, 2014). One of the most famous centers of entrepreneurial activity is Silicon Valley, which serves as a model for many governments in pursuit of stimulating economic growth. To-

day, many technological parks can be found throughout the world, following the pattern on which their model was created. Universities and development centers are situated in close proximity, and investors are welcome to be acquainted with the activities being undertaken. Such “entrepreneurial ecosystems,” despite the significant investments of governments and entrepreneurs, often mark poor performance (Mazzarol, 2014).

For financing their operations, governments can no longer rely solely on stable tax revenues, remittances from abroad, easy credit line opportunities, or speculative development schemes. In order to generate additional sources of revenue, it is necessary to identify problems and become better in identifying the requirements of potential investors, which increasingly require good and well-formulated investment projects. Successful economies develop different approaches to investment planning to raise and attract capital, build capacity and create new jobs. Broadly, there are three ways governments and their leaders can successfully retain entrepreneurs, investors, growth, and attractiveness (OECD LEL, 2015):

- ✦ By providing targeted support to employers and entrepreneurs. A government can organize a number of activities directly targeted at employers in order to boost their growth, improve their impact and direct capital investments
- ✦ By improving the business climate or developing the country or some of its parts. Governments intervene to improve the entrepreneurial environment. The government can improve the economic climate as well as the quality of the environment in which businesses, but also people, work.
- ✦ By promoting good business experiences, governments can improve the perception of the business climate. An economy with a high-quality business climate can fail to attract employers and investors if they are unaware that there is a good business climate, so efforts are needed to make this information reach the right place.

Isenberg (2010) developed a concept of “entrepreneurial ecosystems”. The author believes the countries are trying to achieve some unattainable ideals and seek for the successful examples in economies that are completely different from theirs. Today, most effective practices often come from the most remote parts of the world, where resources, legal frameworks, transparent management, and

democratic values are sometimes very weak. Based on lessons learned in countries such as Rwanda, Chile, Iceland, Israel, and Colombia, Isenberg defines nine principles for building a successful entrepreneurial ecosystem:

- To stop emulating Silicon Valley,
- To shape the ecosystem around local conditions,
- To engage the private sector from the start,
- To select existing companies, industries, and activities and build entrepreneurial ecosystems on their foundations, skills, and abilities,
- To make significant progress as soon as possible,
- To start immediately with changes in organizational culture,
- To change the established ways of doing business,
- To help clusters to reach organic development rather than quick and artificial,
- To reform legal, regulatory and bureaucratic frameworks.

The government's role needs to be indirect and focused on their alignment instead of management. Each of the nine principles mentioned above is key to entrepreneurship - but separately insufficient for its maintenance. They are of key importance only if integrated into the holistic system. Achieved success will become a paragon to others who are in the vicinity of this kind of change.

Acemoglu and Robinson (2008) claim that institutions are the root causes of different economic growth and development across countries. Douglass North (1990, p. 3, according to Acemoglu and Robinson, 2008) defines institutions as "rules of the game in the society or, the restricting conditions designed by humans shaping the human interaction." There are three important features of the institutions that can be seen in this definition:

- They have been designed by humans, which is contrary to other causes of economic growth and development outside human influence, such as geographic position,
- They are the "rules of the game" setting the "restrictions" to human behavior and,
- Their main influence is rewards-based.

International Data Corporation (USA) has reached a similar conclusion after conducting an analysis of the data from the period 2012-2016. The results

have shown that there is a set of factors with constant statistical significance impact on business efficiency throughout the study period. These factors are fiscal policy, institutional framework, social framework and education (Bris and Caballero, 2017). The second part of the study, related to business productivity, has shown that the single factor which has a consistent impact on productivity throughout the entire period is the institutional framework. These results indicate that “institutional competitiveness” plays a significant role in defining business efficiency and productivity.

Bris and Caballero (2017) confirm that the quality of the legislative and regulatory system is a key driver of efficiency and productivity. Increased transparency of government policies and the simultaneous reduction of corruption induce business efficiency and productivity. The adaptability of government policies to changes in the economy is equally important.

2. METHODOLOGY

In order to examine the perception of the entrepreneurial climate and its impact on the efficiency of companies in the Republic of Croatia, a questionnaire was prepared to contain 21 assertions, representing various areas important for the entrepreneurial climate. With respect to each assertion, the respondents evaluated them on a 7-tier Likert scale, 1 meaning complete disagreement with the assertion, and 7 meaning full agreement with the assertion.

For this research, an online survey method was used, and respondents were invited to participate via e-mail. The sample was occasional. The data was collected in June 2018. The participants first got the instruction in which the research goal was described, and it was emphasized to them that the survey was voluntary and anonymous, that there was no time limit, although the time needed for completing the questionnaire was approximately 20 minutes. Data were collected from 866 persons, and the incomplete and inconsistent responses were left out of further processing. The final sample of 761 persons in leadership positions in Croatia was obtained, of which there were 273 female and 483 male participants.

3. RESULTS

3.1. THE ENTREPRENEURIAL CLIMATE IN WHICH THE ORGANIZATION OPERATES

The exploratory factor analysis was made on the data collected to obtain clear information on the specific characteristics of the entrepreneurial climate on the Croatian market and its impact on business operations. As a factor extraction method, the main component method was used. After the factor extraction, based on a Scree plot (Figure 1), showing the characteristic roots of all factors, it was decided to retain three factors.

Figure 1. Screen plot of characteristic roots of individual factors (N = 761)

Table 1 shows the percentages of the explained variance of the retained factors.

Table 1. Display of the percentage of explained variance in retained factors before and after rotation and their characteristic roots (N = 761)

Factor	Initial characteristics root			Characteristics root after rotation		
	Characteristics root	% of variance	Cumulative %	Characteristics root	% of variance	Cumulative %
1	7.82	26.95	26.95	5.61	19.34	19.34
2	1.98	6.82	33.77	3.34	11.51	30.85
3	1.98	6.74	40.52	2.81	9.67	40.52

Varimax rotation was used to obtain a factorial clear structure, and three obtained factors explain 40% of the total variance, with as much as 20% explaining factor 1. Table 2 shows the structure of the retained factors and only significant factor loads are shown.

Table 2. Factor structure view after factor rotation (N = 761)

Assertion	Factor		
	1	2	3
<i>FACTOR 1 - Strategic determinants of the country</i>			
Scientific-research institutions focus research on entrepreneurship needs	0.75		
The level of cooperation between entrepreneurship and scientific research institutions is high	0.73		
The judicial system is independent of external influences	0.71		
The education system is geared towards the development of a competitive economy	0.71		
The judicial system is fast and efficient	0.70		
The government is spending taxpayers' money in the right way	0.57		
The regulations allow a fair market game	0.51		
The legislation and laws stimulate foreign investment	0.54		
The judicial system protects private property	0.52		
The customs procedures are implemented in the right way	0.51		
The company may easily dispute the procedures or regulations of the public administration	0.48		
Laws and regulations allow flexible employment and dismissal of employees	0.47		
It is easy to obtain a business credit line regardless of the company size	0.41		
Laws allow the transition to digital business models	0.40		
Croatian residents are mobile when for a job	0.33		
The financial market in Croatia is stable	0.32		
<i>FACTOR 2 - Operational activity of public administration</i>			
Laws and regulations are tailored to business trends		0.83	
Changes in laws and regulations are announced in time so that we can prepare for them		0.80	
We have all the resources needed to track changes that come from the state administration		0.69	
Public administration officials are skilled for the work they do		0.67	
The entrepreneurship climate in Croatia is stimulating for the company I work in	0.43*	0.68*	
<i>FACTOR 3 - Government influence on competitiveness</i>			
Enterprises financed by public funds distort the market competitiveness			0.61
The licenses and approvals needed to work make it difficult for doing business			0.55
The level of corruption in Croatia badly affects business			0.53
Incentives and tax deductions distort competitiveness			0.53
Meeting the demands of public administration is a huge burden			0.52
The judicial system causes business problems			0.51
The prices of financial services in Croatia make business more difficult than in other countries			0.49
Unregistered or informal companies/individuals distort the market competitiveness			0.49

* the assertion is saturated with two factors with greater saturation by factor 2

Based on the factor structure, factor 1 represents assertions that point to the perception of the government strategy and its impact on the market through the vision development clarity and the ability of vital country systems (science, education, legislation, financial strategy, and justice) to support this strategy.

Factor 2 is represented by the assertions that point to the behavior of public administration towards business entities at an operational level, and factor 3 is represented by the assertions describing the government's influence on competitiveness.

Based on these factors, subclasses were created as simple linear combinations of results on their constituent assertions. Higher scores in factors 1 and 2 indicate a more positive attitude towards the Croatian entrepreneurial climate, and in factor 3, higher scores mean a more negative attitude. Table 3 shows the average results for the whole sample, ranked by the assertion size within each factor, to see how Croatian companies generally evaluate each of them.

Table 3. Overview of the average of results and their distribution on the questionnaire on the environment ranked within each factor (N = 761)

Assertion	M	Doesn't	Neither-	Agrees
		agree (1-2)	Nor (3-5)	(6-7)
<i>FACTOR 1 - Strategic determinants of the country</i>				
The judicial system is fast and efficient	1.64	85%	14%	1%
The judicial system is independent of external influences	1.76	80%	19%	1%
The education system is geared towards the development of a competitive economy	1.94	76%	23%	1%
The government is spending taxpayers' money in the right way	1.98	75%	23%	2%
R&D institutions focus research on entrepreneurship needs	2.23	66%	32%	2%
The legislation and laws stimulate foreign investment	2.32	64%	34%	2%
The level of cooperation between entrepreneurship and R&D institutions is high	2.33	62%	36%	2%
The company may easily dispute the procedures or regulations of the public administration	2.39	63%	35%	3%
Laws and regulations allow flexible employment and dismissal of employees	2.48	59%	36%	5%
Croatian residents are mobile when looking for a job	2.60	59%	33%	8%

The customs procedures are implemented in the right way	2.77	45%	53%	2%
The regulations allow a fair market game	2.80	46%	52%	2%
It is easy to obtain a business credit line regardless of the company size	2.80	46%	51%	3%
Laws allow the transition to digital business models	3.17	38%	57%	5%
The financial market in Croatia is stable	3.30	34%	56%	10%
<i>FACTOR 2 - Operational activity of public administration</i>				
The entrepreneurship climate in Croatia is stimulating for the company I work in	2.41	62%	35%	3%
Public administration officials are skilled for the work they do	2.69	51%	44%	4%
Laws and regulations are tailored to business trends	3.08	45%	44%	11%
We have all the resources needed to track changes that come from the state administration	3.30	36%	53%	12%
Changes in laws and regulations are announced in time so that we can prepare for them	3.54	35%	48%	17%
<i>FACTOR 3 - Government influence on competitiveness</i>				
The level of corruption in Croatia badly affects business	5.61	6%	30%	64%
Meeting the demands of public administration is a huge burden	5.33	5%	42%	52%
Unregistered or informal companies/individuals distort the market competitiveness	5.21	6%	45%	49%
The prices of financial services in Croatia make business more difficult than in other countries	5.04	8%	46%	46%
The judicial system causes business problems	4.94	16%	35%	49%
Enterprises financed by public funds distort the market competitiveness	4.90	6%	54%	40%
The licenses and approvals needed to work make it difficult for doing business	4.69	11%	53%	36%
Incentives and tax deductions distort competitiveness	4.18	23%	49%	29%

From Table 3 almost all respondents perceive that the strategic determinants of a country that have an impact on the Croatian market, described by Factor 1,

are currently very poorly set. If we take into consideration that assertions were evaluated on a scale of 1-7, the average results below 2 can be viewed as an alarm signal. The worst rated assertions are related to the effectiveness and independence of the judicial system, which were given the lowest rates by more than 80% of respondents, while only 1% of them gave it good rates. Equally bad rated are the assertions related to education (76% of respondents rated this system as a very poor) and science (66% of respondents rated this system as a very poor) as tools necessary to achieve effective economies, and the government's policy of spending taxpayers' money in the wrong way (75% of respondents believe this). Third, there are several assertions pertaining to the legislative framework, which was assessed as an obstruction to the development of a competitive economy. In the total number of assertions that describe this factor, the best-ranked ones are those relating to the stability of the financial market and the legislative framework of digital business models, but their average means are below 4, which is only an average rating.

These results clearly indicate that respondents almost unanimously agree that the Government of the Republic of Croatia should urgently adopt a clear strategy for the development of entrepreneurial climate and, accordingly, define guidelines for the development of the judicial system, education system, science and an adequate legislative framework that would support the systematic development of a competitive economy. At this point, it seems that Croatia is not encouraging but is a major obstacle to serious development of an organization's competitiveness.

Assertions of Factor 2 are slightly better rated than those of Factor 1. These assertions describe situations in which companies and public administrations meet each other on an everyday, operational level. They refer to the promptness in obtaining the necessary information, the expertise of officials, specific regulations and the like, where the general deviation in quality of individual services is much greater, so many meets both positive behaviors or positive individual good practices, which necessarily raises ratings of Factor 2. Their highest average score is below 4, which leaves enough room for possible progress. The results on the assertions of this factor could probably be improved systematically further just by defining a clear strategy, which is described by Factor 1, i.e. without some additional targeted activities, though they are also desirable.

Ratings of the assertions in Factor 3 are interpreted opposite than ones of the first and second factors. Higher ratings mean poorer results, so they are

ranked like that. This factor describes the impact of the public administration on competitiveness and, it can be concluded that public administration, by its own performance or by refraining from performance, has set a number of challenges that may be insurmountable to many businesses. Therefore, companies may have problems not only to run a successful business but to survive in general.

On the first place is a high level of corruption, with which the public administration has obviously not yet coped in a strategic and systematic way leaving many companies in disrepair due to this significant problem of the economy. On the second place are obviously numerous public administrations demands, which cause problems for most enterprises in conducting business. Then there is a problem of still insufficiently regulated grey market and the problem of high prices of financial services. Lastly, the poor functioning of the judicial system and the disloyal competition of publicly financed companies are mentioned again. They jeopardize the business operations of the companies that need to find their own source of funding to achieve their goals and in addition to that, fight with everyday liquidity or public administration requirements. In this set of assertions, it seems that respondents are generally the least dissatisfied with tax reductions and incentives.

All of the above is an objective set of problems that could easily begin to change with clear strategic guidelines and determination to make changes. It can be stated that companies in Croatia are founded only by those who are very proactive, have a clear vision and enough courage to do business despite the limitations of the entrepreneurial climate. Environmental stimuli are, obviously, only theoretical, and companies are being obstructed by real problems such as the poor judiciary, corruption, poor science, and education strategies, etc. The only question is how long they will be able to fight the negative impacts of the environment and how much more successful they would be if, instead of constantly fighting with obstacles, they could operate on the wings of opportunities, because their goals and goals of the country should be identical.

It is no surprise that many Croatian small and medium-sized enterprises consider the market globalization as salvation, so they direct their business to foreign markets in a form of closer cooperation with them or distribution of products to them, so they see globalization not as a threat but as a great opportunity.

3.2. IMPACT OF ENTREPRENEURIAL CLIMATE IN TERMS OF OWNERSHIP STRUCTURE

To respond to this problem, a multivariate analysis of variance was used, followed by a canonical discriminatory analysis. First, the assumptions for the implementation of the multivariate variance analysis (checking the univariate normality of the distribution, the homogeneity of covariance of the matrix (Leven's test), and test of covariance matrices - covariance (Box's test) was carried out. Multivariate variance analysis has shown that enterprises with different ownership structure statistically significantly differ from the point of view of entrepreneurial climate perception (Wilk's $\lambda = 0.95$; $F(6,1504) = 7.16$; $p < 0.01$). Given this result, a subsequent canonical discriminant analysis was carried out in the next step. Two functions were obtained, of which the other is not significant (Function 1 - Wilk's $\lambda = 0.94$; chi-square (6) = 42.42; $p < 0.01$; Function 2 - Wilk's $\lambda = 1.00$; chi-square (2) = 0.19; $p > 0.05$). Table 4 shows the matrix of the structure of the function obtained.

Table 4. Display of a matrix of the structure after conducted canonical discriminant analysis (N=761)

Entrepreneurial climate Function 1	
Factor 1	0.92
Factor 2	0.70
Factor 3	-0.60

The first function is significantly associated with all three factors, there is a positive correlation with the first two, and negative with the third, since the third, as it was already explained, is being interpreted opposite than the first two. This function represents the overall view of the entrepreneurial climate in Croatia. Greatly linked to it is the first factor, which describes the strategic determinants of the country, then the second one, which refers to the country's operative activities, and finally the third, which is about the country's influence on competitiveness. The higher the score, the more positive view of the entrepreneurial climate. In this function, the highest result was achieved by the respondents employed in state-owned enterprises (M=0.50), followed by those in the foreign-owned enterprises (M=0.22) and, finally, leaders from domestic-owned enterprises (M=-0.20). This means that the companies operating the easiest on the Croatian market are the state-owned companies, then the foreign private companies, which are likely to have both size and foreign expertise in their favor,

which helps them to cope easier with the country challenges. Domestic private companies see operating in such a climate as very hard.

In order to gain a more detailed insight into these differences, a comparative analysis of the average results for individual assertions represented by each factor of the entrepreneurial climate, given the ownership structure of the company, was conducted and presented in Table 5.

Table 5. Display of group average results on the questionnaire assertions and their comparison to the average results of the organization with respect to the ownership structure

Assertion	MU	MPDO	MPSO	MDO
<i>FACTOR 1 - Strategic determinants of the country</i>				
The judicial system is fast and efficient	1.64	1.61	1.62	1.89

The level of cooperation between entrepreneurship and R&D institutions is high	2.33	2.28	2.38**	2.36
The company may easily dispute the procedures or regulations of the public administration	2.39	2.27	2.55	2.58
Laws and regulations allow flexible employment and dismissal of employees	2.48	2.33	2.57	3.02
Croatian residents are mobile when for a job	2.60	2.57	2.62	2.76
The judicial system protects private property	2.76	2.64	2.89	3.00
The customs procedures are implemented in the right way	2.77	2.64	2.90	3.04
The regulations allow a fair market game	2.80	2.62	3.01	3.07
It is easy to obtain a business credit line regardless of the company size	2.80	2.59	3.12**	2.91
Laws allow the transition to digital business models	3.17	3.11	3.18	3.60
The financial market in Croatia is stable	3.30	3.13	3.61**	3.22
<i>FACTOR 2 - Operational activity of public administration</i>				
The entrepreneurship climate in Croatia is stimulating for the company I work in	2.41*	2.18*	2.63*	3.02*
Public administration employees are skilled for the work they do	2.69*	2.47*	2.82*	3.65*
Laws and regulations are tailored to business trends	3.08*	2.79*	3.42*	3.58*
We have all the resources needed to track changes that come from the state administration	3.30*	3.01*	3.66*	3.82*
Changes in laws and regulations are announced in time so that we can prepare for them	3.54	3.39	3.75**	3.73
<i>FACTOR 3 - Government influence on competitiveness</i>				
The level of corruption in Croatia badly affects business	5.61	5.63	5.60	5.38
Meeting the demands of public administration is a huge burden	5.33	5.42	5.30	4.91
Unregistered or informal companies/individuals distort the market competitiveness	5.21	5.35	5.00	5.18
The prices of financial services in Croatia make business more difficult than in other countries	5.04	5.23	4.76***	4.87
The judicial system causes business problems	4.94	5.04	4.87	4.53
Enterprises financed by public funds distort the market competitiveness	4.90	4.99	4.83	4.44
The licenses and approvals needed to work make it difficult for doing business	4.69	4.85	4.53	4.33
Incentives and tax deductions distort competitiveness	4.18	4.27	4.05	4.02
*** the lowest rating that was not given by respondents from private domestic companies				
** the highest ratings that were not given by respondents from state organisations				
* items with the greatest differences between the best and worst rating				
MU - arithmetic mean per each assertion for the whole sample				
MPDO - arithmetic mean per assertion for private domestic organisations				
MPSO - arithmetic mean per assertion for private foreign organisations				
MDO - arithmetic mean per assertion for state organisations				

From the results shown in Table 5, it can be seen that the highest rates were given by the leaders of state-owned enterprises, then by leaders of private foreign companies and finally by leaders of private domestic companies. This table confirms the results of variance analysis and discriminant analysis,

which marked statistically significant differences between these three groups of companies with respect to the ownership structure. The following can also be read from the data:

- ✦ In comparison to domestic companies, the foreign private companies gave worse rates to the assertions related to the poor educational system, given that it is not directed to the development of a competitive economy. These companies often find themselves dissatisfied with the Croatian labor market, in terms of lack of expertise and competence to carry out various jobs, so it would be good to make the necessary reforms as soon as possible so that our workforce becomes more competitive in the market, especially for more demanding jobs.
- ✦ The foreign private companies also give the worst rates to the price of financial services in Croatia, which makes business operations more difficult than in other countries. It would be good to make analyses, which would reveal in detail key elements upon to which to act to attract and retain as many foreign organizations as possible in Croatia.
- ✦ It is interesting to note that the private foreign companies give the highest marks than all to the financial stability of the Croatian market, the ease of obtaining business credit lines regardless of the size of the organization and the timely announcement of changes or the introduction of new laws and regulations. It is possible that these assessments generally came as a consequence of the level of general business literacy of private foreign companies, which may in these settings see more opportunities than threats, as opposed to private domestic companies. The recommendation would be a continuous work on entrepreneurial literacy for private domestic enterprises so that they could see more opportunities than threats in the existing entrepreneurial climate, which would have a positive impact on their business operations (perhaps even on better management of financial performance indicators).
- ✦ The foreign private companies rated the cooperation between entrepreneurship and scientific-research institutions with the highest marks, which may indicate the existence of some systemic factors that enable them to do so, compared to domestic companies. It would be good to examine that as well and teach state-owned and private domestic companies how to gain greater benefit for themselves in this area.

- ♦ The greatest differences between the maximum and the minimum rates are observed on almost all the assertions that are included in the factor of so-called operational public administration activities, and the Factor 1 assertion, which assesses whether the government spends public revenue on the adequate things. This means that leaders of state-owned enterprises give higher rates to the assertions related to the operational operations of public administration (employee expertise, prompt informing, business environment encouragement, adjustment of legislation and regulation to the business trends) than their colleagues in private domestic companies.

Two conclusions can be drawn here. The first is that the overall operation of public administration is more tailored to a state-owned company than to the private ones. If this is the case, it is important to make a good analysis and adequate changes in accordance with them. The other is that there are numerous parameters of public administration that could be more favorable to smaller domestic private companies, but leaders of those companies are not familiar with them, which requires urgent action. A similar conclusion can also be applied to the statement that the government does not spend public revenue on adequate things. Perhaps systematic information on how the selected investments could fit into the development strategy could increase their overall understanding and affection towards them. In addition, the government should listen to the market needs of all participants, not just some, and respond promptly and adequately to them.

The Croatian market seems to be the most favorable to the state-owned enterprises, while systematically ignoring the problems of domestic private companies, which is why they suffer significantly. In other words, the healthiest and most vital part is encouraged the least, which is mostly determined to succeed, and it does succeed, in spite of all these obstacles. It raises the question of how long they will manage to do so and at what costs. The next question is how many entrepreneurs with excellent ideas have given up or failed, and how many potential entrepreneurs do not dare to start because of the obviously unfavorable entrepreneurial climate.

4. CONCLUSION

Numerous theoretical research and contemporary business practice point to the great importance of stimulating an entrepreneurial climate for the development of the country's competitiveness and the important role of the government to enable this through its strategic engagement. The aim of this research was to find out how the leaders of Croatian companies perceive the entrepreneurial climate in Croatia and does their perception differ due to the ownership structure of the companies they work in.

The factorial analysis of the obtained data showed the existence of three factors that describe the entrepreneurial climate in Croatia. The first relates to the perception of the country strategy and its impact on the market through the development vision clarity and the ability of vital country systems (science, education, legislation, financial strategy, and justice) to support that strategy. The second factor relates to the perception of public administration behavior towards business entities on an operational, daily level, and the third to the perception of country influence on competitiveness.

The results of the tests indicate that all respondents are very dissatisfied with all factors, and mostly with the first, where average results below 2 (on a scale of 1-7) can be seen as an alarm signal. The worst rated assertions are related to the effectiveness and independence of the judicial system, rated with the lowest grades by more than 80% of respondents, while only 1% of them rated them as well. Equally bad rated got the assertions related to education (76% of respondents rated this system as a very poor) and science (66% of respondents rated this system as a very poor) as tools necessary to achieve effective economies, and the government's policy of spending taxpayers' money in the wrong way (75% of respondents believe this).

Evaluations on the second factor are somewhat higher than those on the first - their highest average value is below 4, which is a result that still leaves enough room for improvement. Ratings on the third factor are also very bad. On the first place is a high level of corruption, with which the public administration has obviously not yet coped in a strategic and systematic way, leaving many companies in disrepair due to this significant problem for the economy. On the second place are obviously numerous public administrations demands, which cause problems for most enterprises in conducting business. Then there

is a problem of still insufficiently regulated grey market and the problem of high prices of financial services.

In order to answer the question of whether companies value entrepreneurial climate in Croatia different in terms of their ownership structure, a canonical discriminant analysis has been conducted. One significant discriminatory function has been obtained, which can be described as a general perception of the entrepreneurial climate in Croatia, and greatly linked to it is the first factor, which describes the strategic determinants of the government, and then the second, which refers to the government's operative activities, and finally the third talking about the government's influence on competitiveness. The higher the score, the more positive view of the entrepreneurial climate. In this function, the highest result was achieved by the respondents employed in state-owned enterprises ($M=0.50$), followed by those in the foreign-owned enterprises ($M=0.22$) and, finally, leaders from domestic-owned enterprises ($M=-0.20$). This means that the companies operating the easiest on the Croatian market are the state-owned companies, then the foreign private companies, which are likely to have both size and foreign expertise in their favor, which helps them in some ways to easier deal with the state challenges. Domestic private companies express most problems regarding operating in Croatia.

The Croatian market seems to be the most favorable to the state-owned enterprises, while systematically ignoring the problems of domestic private companies, which is why they suffer significantly. In other words, the healthiest and most vital part is encouraged the least, which is mostly determined to succeed, and it does succeed, in spite of all these obstacles. All of the above is an objective set of problems that could easily begin to change with clear government's strategic guidelines and their determination to make changes.

Abstract

The circular economy is an economic model that promotes closing the loop, i.e. encourages the 3R principle: reduce, reuse and recycle. However, the transition from a linear economy to a circular economy is not straightforward and implies a set of indicators that determine and measure the development of the circular economy. With the purpose of supporting that transition, this paper elaborates eco-innovations as one of the indicators sets, including business operation activities toward adapting business models according to the principles of a circular economy. Eco-innovations reduce our environmental impact and make better use of resources. They also bridge the gap between research and the market. As such, they comprise of developing products, techniques, services and/or processes that reduce CO2 emissions, use resources efficiently, promote recycling and so on. After providing a relevant theoretical framework, this paper outlines Croatia's eco-innovation profile and then continues with a more specific analysis – presenting a case study regarding eco-innovations related to waste tyre rubber in Croatia. The study focuses on recent examples that already had certain commercialization attempts as well as those that are in their initial research phase, developing new innovation. Indeed, this paper does not analyses all indicators significant for circular economy development. The

reason for that is the authors feel the subject would be too broad for a single article. Nevertheless, this paper contributes to closing the loop by reviewing the most important issues related to eco-innovation as well as by demonstrating examples that indicate the direction of Croatia's development in the field.

Keywords: eco-innovation, circular economy, waste tyre rubber, Croatia

JEL Classification: Q57, Q53

1. INTRODUCTION

According to the World Bank's data, the annual growth rate of the entire human population has been 1.2% for the last decade (World Bank, 2018). Perhaps that information is even more stunning when presented in nominal numbers: the current world population of 7.6 billion is expected to reach 8.6 billion in 2030 and 9.8 billion in 2050 (UN, 2017).

In addition to that, it should be noted that global wealth is increasing, too. Although there are countries in which per capita wealth declined or stagnated, average global wealth grew significantly over the past two decades (Lange et al., 2018). Davies, Lluberas & Shorrocks (2016) give interesting in detail information about the improvements of the estimation methodology and about the level and distribution of global wealth for the 14-year period (2000-2014). Unfortunately, as it is highlighted by Lange et al. (2018) emphasize that some countries rely mostly on tracking economic progress through gross domestic product and do not give enough attention to the wealth (to assets as infrastructure, forests, minerals, human capital etc.), although wealth provides countries to be sustainable in their development.

Taken together, such a growing and increasingly affluent population directly cause a significant increase in demand. Since available resources are limited, demand expansion compounds challenges on the resource side (EMF, 2013). Fundamental challenge concerns the fact that traditional linear consumption patterns ('take-make-dispose') are coming up to constraints in terms of resources scarcity (Ness, 2008).

As a response to those (and other) challenges, the European Commission launched a European strategy for smart, sustainable and inclusive growth: Europe 2020 (Europe 2020). As part of the strategy, it has been chosen to respond to the named issues by moving to a more restorative economic system. Such a

stance on a strategic and multi-national level has been the strong support to the concept known as circular economy, which has been facing intensified realization attempts in many different areas.

One of those areas are eco-innovations, that have been defined as any new or significantly improved product (goods or services), process, organisational change or marketing solution that reduces the use of natural resources (including materials, energy, water and land) and decreases the release of harmful substances across life-cycle (EIO, 2012,8).

As such, eco-innovations are the primary focus of this paper. Therefore, the aim of the study presented has been to identify eco-innovation principles as well as to detect relevant causalities and implications, all in order to support their generation and realization, which is dependent on the cooperation of scholars, businesses and public authorities.

2. THEORETICAL FRAMEWORK

2.1. CIRCULAR ECONOMY

The concept of circular economy originates from the work done by English born American economist Kenneth E. Boulding in 1960s, who discussed “open economy” and “closed economy”. Boulding introduced his revolutionary ideas saying: “The closed economy of the future might similarly be called the ‘space-man’ economy, in which the earth has become a single spaceship, without unlimited reservoirs of anything, either for extraction or for pollution, and in which, therefore, man must find his place in a cyclical ecological system.” (Boulding, 1966).

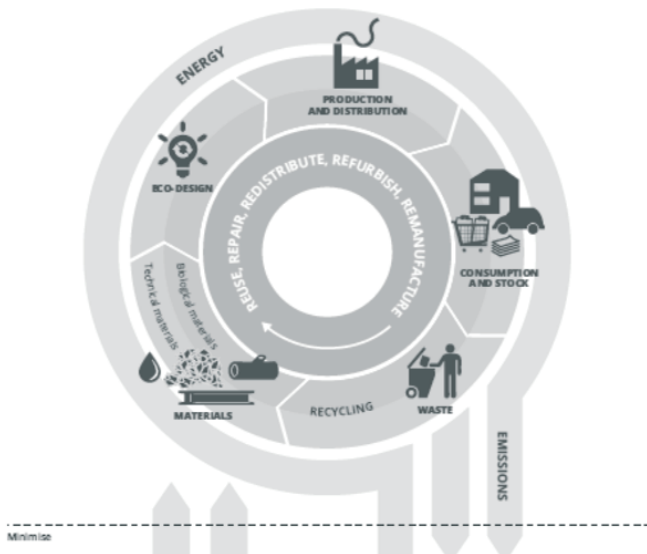

However, the term *circular economy* itself was raised by British environmental economists David Pearce and Kerry Turner (1989), who emphasized that a traditional open-ended economy thinks of the environment as of an inexhaustible pool of resources, which is in the same time a convenient waste reservoir. In such a system, there is no thinking about recycling or sustainability.

But, the emergence of the circular economy idea can hardly be traced back to one precise date or an author. It is an economic model that encourages the so-called 3R principle: reduce, reuse and recycle (Andrews, 2015) and as such can

be recognized in different schools who share the idea of closed loops, resulting in resource and energy savings as well as waste prevention. All of them imply a mindset change that considers waste as a potentially useful resource and not as a problem to manage and dispose of in landfills, as in linear economy.

European Environment Agency in its 2016 report called Circular Economy In Europe (EEA, 2016) presents a simplified model of the circular economy, incorporating several concepts whose joint idea is that eco-design, repair, reuse, refurbishment, remanufacture, product sharing, waste prevention, and waste recycling are important. The model is shown in Figure 1, whose outer circle represents the overall energy flows, emphasizing the need to increase both the total energy efficiency and the share of renewables, in comparison to the linear model. The middle circle represents the material flows in the recycling loops, distinguishing between technical and biological materials. Finally, the inner circle represents reuse, redistribution, repair, remanufacture and refurbishment, as the only means for minimal natural resources input, thus being the very core of the circular economy concept.

Figure 1. Circular economy model

Source: EEA 2016, p.10

By promoting the adoption of closing-the-loop production patterns within an economic system circular economy aims to increase the efficiency of resource

use, with a special focus on urban and industrial waste, to achieve a better balance and harmony between economy, environment, and society (Ghisellini et al., 2015).

During the last two decades research regarding circular economy has been significantly intensified but also policymakers recognized it as the key for achieving economic development within increasing environmental constraints (EEA, 2016). However, economic, environmental and social effects circular economy could bring have yet to be fully assessed. Additionally, the transition to a circular economy will need to involve all stakeholder groups: governments, scholars, businesses and finance, civil society and citizens.

2.2. ECO-INNOVATION

There are several determinants in carrying out the transition from a linear to a circular system of production and consumption. Among those, eco-innovations have been recognized as a key element of the process (de Jesus et al., 2018).

Importance of eco-innovations has been underlined by the Eco-Innovation Initiative, which is part of the EU's Entrepreneurship and Innovation Programme (2008), aiming to support innovation among SMEs and to improve their competitiveness. Even before that, European Commission defined eco-innovations in its Competitiveness and Innovation Framework Programme 2007 to 2013 as any form of innovation aiming at significant and demonstrable progress towards the goal of sustainable development, through reducing impacts on the environment or achieving more efficient and responsible use of natural resources, including energy (2007).

Definitions that can be found in academic sources emphasize the same key points:

- Eco-innovation is the process of developing new products, processes or services which provide customer and business value but significantly decrease environmental impact (Fussler & James, 1996).
- Eco-innovation is the production, assimilation or exploitation of a product, production process, service or management or business method that is novel to the organization (developing or adopting it) and which results, throughout its life cycle, in a reduction of environmental risk,

pollution and other negative impacts of resources use (including energy use) compared to relevant alternatives (Kemp & Pearson, 2008).

- Eco-innovations are innovation processes toward sustainable development...which develop new ideas, behavior, products, and processes, apply or introduce them, and contribute to a reduction of environmental burdens or too ecologically specified sustainability targets (Rennings, 2000).

Presented definitions suggest that sustainable economic processes do not involve short-term value creation at the expense of long-term wealth. In that sense, the term 'eco-innovation' has been increasingly used in the course of environmental management and policy development in recent years. But, since eco-innovations, in general, take into account the whole system - it's social, ecological and economic aspects, the term appears in diverse contexts (Carillo Hermosilla et al., 2009). To be exact, there are five main strands to eco-innovation initiative (de Jesus et al., 2018):

- Greening business
- Food and drink sector
- Sustainable building products
- Materials recycling and recycling processes
- Water efficiency, treatment, and distribution.

Those strands have been officially determined by the European Commission, by its Eco-innovation policy mapping (2013) as:

- eco-innovation and blue growth
- eco-innovation and food & drink sector
- eco-innovation and sustainable construction
- eco-innovation and waste directive
- eco-innovation and water framework directive

Therefore, the structure of eco-innovation projects is diverse, too. The latest Analysis and reporting of the results achieved by CIP Eco-innovation market replication projects (2016) shows the structure of conducted projects along five priorities, as presented in Figure 2.

Figure 2. Structure of conducted eco-innovation projects from 2008-2011

Source: Analysis and reporting of the results achieved by CIP Eco-innovation market replication projects, 2016, p. 1

It has been estimated in the Analysis (2016) that the full portfolio of conducted projects shown in Figure 2, reached an annual savings of 1.2 billion EUR through eco-innovation projects, in terms of money that would be needed to avoid or repair the effects of damages to the environment.

In addition to the above-noted remarks on the diverse nature of eco-innovation, also a multiplicity of stakeholders should be appreciated. Klemer et al. (1999) say that eco-innovations are all measures of relevant actors - firms, politicians, unions, associations, churches, private households, which develop new ideas, behavior, products, and processes, apply or introduce them and which contribute to a reduction of environmental burdens or too ecologically specified sustainability targets.

But, with many actors, there is always a question of responsibility and initiative. Important findings regarding specific roles of different actors have been provided by the recent study (Gliedt et al., 2018), suggesting especially the importance of innovation intermediaries, such as incubator and accelerator centers, at linking local, state and business actions in order to scale-up and influence green economic development in a politically feasible manner.

Continuing to different actors, also taking different levels into account is important. The impact of innovation can be analyzed not only on the level of an individual company, product or service (micro level) but also as a technology field, product system or on a subnational level (mezzo) as well as on the level of

an entire economy or national innovation system (macro). It should be kept in mind, however, that incremental innovations analyzed on the macro level are in fact aggregated material savings due to incremental changes at the micro level (EIO, 2012).

Despite an extensive literature on eco-innovation, and a growing body of research exploring the circular economy, little information can be found concerning whether and how eco-innovation can facilitate the change to a circular economy. Research conducted by Jesus et al. (2018) shows that an eco-innovation-driven techno-economic transition to a circular economy requires specific solutions, i.e. different forms of eco-innovation-driven “clean congruence” at distinct levels of operation. That is why authors of this paper find it relevant not just to outline Croatia’s macro-economic profile, but also to explore different examples on the micro level, involving different combinations of innovations and organizational set-ups.

3. METHODOLOGY AND METHODS

Literature research is being used as the primary method in 19% of studies on the circular economy (Ghisellini et al., 2018). This paper has been no exception, primarily for the purpose of theoretical framework compilation, but also in the course of macro-level empirical analysis.

In addition to literature research, content analysis method has been applied to consume the existing body of knowledge on eco-innovation and circular economy. Synthesis method has been used to summarize the previous findings, in order to notice relevant causalities and implications and create starting assumptions needed for the factual, empirical part of the research.

For the empirical part of the analysis, the authors of this paper have chosen a case study as the dominant research method. Since it allows the exploration and understanding of complex issues, they have found it the most adequate, especially for the micro-level part of the analysis. In that research phase, authors did several interviews with managers and employees of the company in question and observed business operation activities themselves, during visiting the company.

Case study method enabled researchers to go beyond the quantitative statistical results and data series analyzed at the macro-level and to conduct a holis-

tic, in-depth investigation, which made it possible for them to understand the behavioral conditions through the actor’s (Gumiimpex) perspective. As such, it helped them explain both the process and outcome of eco-innovation phenomenon through complete observation.

4. RESULTS AND DISCUSSION ON CROATIAN ECO-INNOVATION PROFILE

4.1. MACRO-LEVEL ANALYSIS

Croatia still has a long way to go in the transition from a linear to a circular economy, but adjustments of Croatia’s policies with EU regulations are in progress and significant improvements have been made in the past two years.

To gain a broader perspective, Croatia’s eco-innovation performance should be analyzed within the EU context. Such an analysis can be done using the Eco-innovation composite index presented in Figure 3.

Figure 3. Eco-innovation performance composite index

Source: Croatia EIO profile, 2017, p.3

The Eco-innovation index demonstrates the eco-innovation performance of a country compared with the EU average and with the EU top performers. As shown in Figure 1, Croatia achieved a performance score that is 28% lower than the EU average, which places it 8th from the bottom in the EU-28 eco-

innovation ranking. This ranks Croatia within the group of member states that are catching up on eco-innovation practices compared to the rest of Europe.

Nevertheless, compared to 2015 when Croatia scored 61% of EU-average and was the fifth worst performing EU member, in 2017, Croatia rose 4 places with 18% improvement in eco-innovation.

Eco-innovation index is a composite index that is based on 16 indicators which are aggregated into five components: eco-innovation inputs, eco-innovation activities and eco-innovation outputs as well as environmental outcomes and socio-economic outcomes. Croatia's scores regarding different components are presented in Figure 4.

Figure 4. Components of the Eco-Innovation Index for Croatia

Source: Croatia's EIO profile, 2018, p. 4

All measured components except for eco-innovation outputs increased in performance ranking since 2015. Socio-economic outcomes more than doubled their value and eco-innovation inputs, even though well below the EU average, rose by 67%. In fact, with a score of 95, socio-economic outcomes are the area where Croatia performs relatively better compared to others and where the score comes close to the EU-average of 100 points. Within socioeconomic outcomes, two indicators - "Employment in eco-industries" and "Turnover in eco-industries" were not available for the 2015 report. In 2017, these indica-

tors are well above the EU average, which explains the significant increase in performance in this area. Finally, the indicator “Exports of products from eco-industries” is slightly above half of the EU average (Croatia’s EIO profile, 2017).

On the other hand, the worst part of this composite index comes from the area of eco-innovation inputs, where Croatia has an index 75% lower than the EU average. Particularly low scores are seen under the indicator “Governments environmental and energy R&D appropriations and outlay” where Croatia scored only 13% of the EU average. A relative number of “Total R&D personnel and researchers” measured in percentage of total employment in Croatia is around half of the EU average (Croatia’s EIO profile, 2017).

A recent study revealed results on another eco-innovation measure applied in different countries including Croatia, called ecological footprint - a tool for measuring and monitoring the sustainability of the new information society and the higher degree of openness in the European economy powered by the globalization process. It was the study conducted by scientists at the Bucharest University of Economic Studies in Romania, who found out that eco-innovation index will have a significant direct influence on the variability in the ecological footprint. Additionally, they constructed the model which has shown that non-EU member countries or newer EU member countries are predominantly assigned low ecological footprint scores (Ghita et al., 2018).

They classified different European countries by categorical levels of the eco-innovation index as shown in Table 1.

Table 1. The distribution of the European countries by the categorical levels of the eco-innovation index

Categorical Levels	Index Values	European Countries
1—Catching up with Eco-Innovation	Lower than 85%	Bosnia and Herzegovina, Bulgaria, Cyprus, Czech Republic, Estonia, Greece, Hungary, Latvia, Lithuania, Macedonia, Malta, Montenegro, Poland, Romania, Slovakia
2—Average Eco-Innovation performers	Between 85% and 115%	Austria, Belgium, Croatia, France, Ireland, Italy, Netherlands, Portugal, Slovenia, Spain, Switzerland, United Kingdom
3—Eco-Innovation leaders	Higher than 115%	Denmark, Finland, Germany, Luxembourg, Norway, Sweden

Source: Ghita et al. 2018, p.13

Additionally, their analysis identified three statistically significant determinants of ecological footprint: eco-innovation index, share of employment in

foreign controlled enterprises (it represents openness of the economy, and in Croatia is lower than 19%) and spatial component regarding being part of the EU or not (they defined three categories within this determinant: non-EU-member, newer EU-member group: countries joining after 2004 and older EU-member group: countries joining before 2004) (Ghita et al., 2018). Taking those three determinants into account, they came up with interesting results shown in Table 2.

Table 2. The probability of ecological footprint change

Country Profile	Component Countries	Characteristics	The Average Probability of Changing the Ecological Footprint from one Category to Another (%)
Profile 1	Bulgaria, Macedonia, Montenegro, Cyprus, Croatia, Greece, Bosnia and Herzegovina, Romania	<ul style="list-style-type: none"> ✓ low ecological footprint level (very low or low), ✓ mostly non-EU or new EU-member countries, ✓ low eco-innovation level, ✓ low share of employment in foreign-controlled enterprises (below the EU average) 	17.2%
Profile 2	Malta, Italy, Portugal, Spain, Switzerland, France, Germany, Ireland	<ul style="list-style-type: none"> ✓ low or moderate ecological footprint level, ✓ mostly old EU-members, low level of employment in foreign-controlled enterprises (below the EU average), ✓ high eco-innovation level (above the EU average) 	25.76%
Profile 3	Lithuania, Hungary, Poland, Slovakia, Czech Republic, Latvia, Estonia, Slovenia	<ul style="list-style-type: none"> ✓ high variability in the ecological footprint, ✓ former socialist countries, ✓ less developed, ✓ slightly higher level of employment in foreign-controlled enterprises (slightly above the EU average), ✓ but low eco-innovation level. 	20.41%
Profile 4	Belgium, Finland, Netherlands, United Kingdom, Norway, Austria, Denmark, Luxembourg, Sweden	<ul style="list-style-type: none"> ✓ high ecological footprint level (high or very high), ✓ mostly old EU-members, ✓ highly developed countries, ✓ high level of employment in foreign-controlled enterprises, ✓ high eco-innovation level, above the EU average. 	28.74%

Source: Ghita et al. 2018, p.17

Since eco-innovations are the focus of this paper, only that aspect of the above-shown table shall be commented on. Obviously, countries with low eco-innovation index have the lowest probability of their ecological footprint change, and therefore the lowest chance of decoupling of economic growth from environmental exploitation. Unfortunately, Croatia is among those countries, so expected development trends should be influenced as soon as possible.

After becoming aware of the situation, it is reasonable to look for the main obstacles of eco-innovation and circular economy development in Croatia. Four types of barriers have been identified by the latest report on Croatia's EIO profile (2017): cultural, technological, market and regulatory. Although all of them are interrelated, perhaps the market barriers are the most important since they

directly undermine transitioning towards a circular economy. An example of market barriers is a limited Green Public Procurement (GPP) funding/support, which results in limited funding for green/circular business models since firms may not be able to demonstrate convincingly that there is a market for their products in the absence of such procurement. On top of that, there is a significant lack of investments in R&D: in 2016, R&D expenditure in Croatia represented only 0.84% of GDP. And it's certainly not helping that there is a lack of awareness and/or willingness to engage in circular economy principles from the general population.

However, certain factors that can be recognized as drivers for the development of eco-innovation and circular economy do exist. Croatia's EIO profile listed external government pressures, financial subsidies, technological capabilities, environmental organizational capabilities, a market-based instrument, competitive pressures, and a demand for greener products (2017) as such factors. Among those, external government pressures and financial subsidies have been outlined as especially important for the expansion of the circular economy and eco-innovation. From that perspective, the most incentivizing institutions are The Environmental Protection and Energy Efficiency Fund (EPEEF), Croatian Agency for the Environment and Nature (CAEN) and The Croatian Chamber of Economy (CCE).

4.2. MICRO-LEVEL ANALYSIS

Eco-innovation should be analyzed from the micro-economic perspective, as well. In Croatia, there are several eco-innovative companies/projects whose products/services/processes boost the transition towards a circular economy (Croatia's EIO profile, 2017). Some of them are presented in Table 3.

Table 3. Eco innovative companies in Croatia

Company name	Product/service
Centar za razvoj održivih tehnologija d.o.o.	Biogas production
Ducati components d.o.o.	Sustainable mobility
Ecology 108 d.o.o.	Ecological detergent
Ekomobile d.o.o.	IT solutions for the environmental protection service (remote reading)
Fabula	A pencil from recycled, organic waste

Freeway project d.o.o.	Eco bottle, web and mobile application
Gumiimpex d.o.o.	Recycled car tires
iCat d.o.o.	Energy efficient and environmentally friendly ships
Include d.o.o.	Smart bench
MikroGoran d.o.o.	IT solutions for the environmental protection service
MiPlast d.o.o.	Recycling, biopolymer development projects
Mobile Vehicle Technologie d.o.o.	GRUNNER, smart electric bicycle
Mobilisis d.o.o.	IT renewable solutions
Rimac automobili d.o.o.	e-vehicles, batteries, infotainment, solutions
Solvis d.o.o.	Solar tree, solar bench
Spectra media d.o.o.	Toner recycling machine
Tehnix d.o.o.	Technological solutions for waste management
Visiobike d.o.o.	e-bike

Source: authors after Croatia's EIO profile, 2017. p.10

All of these companies actually belong to three distinctive circular economy and eco-innovation areas: waste management, eco-labeling and/or renewable energy.

Out of them, and for the purpose of this specific study, company Gumiimpex, focusing on the waste tyre rubber, could be singled out. Authors of this paper find their activities especially important for the purpose of circular economy development since they not “just” produce eco-innovative products, but they take part in eco-innovative projects joining market efforts with scholar and public institutions’ ventures.

During an interview with the company’s management, it has been found out that Gumiimpex was founded as a vulcanizing craftsman workshop by Rudolf Kirić in 1970 in Varaždin. Since 1975, the workshop has continually expanded its own production of rubber technical products. The owner has noticed the opportunities for growth and development of his business that have been enabled by the transition to a market economy, so he was among the first who registered a trading company. Thus, in 1990 he founded Gumiimpex ltd. Varaždin, a company with 15 employees.

The emphasis is on production, so in 1993 a new facility with modern, high-tech equipment was opened. In the new millennium, Gumiimpex continued to invest in business space and equipment. ISO standards 9001 and 14001 have been introduced for quality management and environmental management. Sys-

tematic follow up of technological achievements as well as listening to customers' needs and market changes are the basis of continuous development. After nearly 5 decades of successful existence, today the company has nearly 400 employees and is the holder of many awards.

Gumiimpex produces more than seven thousand different rubber-technical products, recycles waste tyres, renews cargo tyres, markets car tyres for all types of vehicles, and provides vulcanization services in Varaždin and Zagreb. It is the first company in Croatia that started recycling used tyres in 2005. Through recycling, it processes waste tyres and produces useful secondary raw materials as well as final products of rubber granules.

They have also recognized the potential in renewable energy sources. In accordance with the company's ecological orientation, 4 solar plants have been built on the roofs of their premises in Varaždin and Trnovac Bartolovečki. Power Plant at Trnovec Bartolovečki is one of the largest integrated solar power plants in Croatia.

In terms of social responsibility, Gumiimpex finds developmental innovation projects an important way to participate in the community. Together with Brodosplit, the company participated in one of the largest construction projects in the history of Italy, the project "Doors of Venice", which aimed to save Venice from floods caused by seahigh. For this project, Gumiimpex produced over 300 pcs of rubber buffers, weighing in total impressive 920 kg. Buffers have been installed on steel castings.

By participating in the scientific project "RUCONBAR", together with the company Beton Lučko and Faculty of Civil Engineering in Zagreb, a composite product has been produced of concrete as well as of absorbing and supporting layers. Rubber granules have been obtained by recycling old automotive tyres and then 40% of the absorbent layer has been produced by those granules. In that way, an innovative product in the field of noise protection has been obtained. As such, the product is unique in the market.

Another interesting and important recent co-operation has been the participation of Gumiimpex in the consortium of the project ANAGENNISI - "Innovative Reuse of All Tire Components in Concrete", implemented within the FP7 program of the European Commission. The aim of the project was to develop innovative solutions for the reuse of all tyre components in high-value innovative, specific applications with reduced environmental impact. Under the

leadership of the University of Sheffield, other partners from Croatia have participated in the project, too: University of Zagreb, Arkada ltd. and Dulex ltd. As far as the international consortium members are concerned, the project involved Imperial College London and Twincon Limited from the UK, then Gradmont ltd. from Bosnia and Herzegovina, the Gheorghe Asachi Technical University from Romania, the Technology University of Cyprus, The European Tire Recycling Association-ETRA, as well as Comsa S.A.U. and Fhecor Ingenieros Consultores S.L. from Spain.

Currently, Gumiimpex is a partner on the project led by Faculty of civil engineering and Architecture Osijek, called Development of Reinforced Concrete Elements and Systems with Waste Tire Powder (ReCoTiP). The main goal of the project is to develop the new material which would be applicable to load-bearing reinforced-concrete structures with improved earthquake resistance. The material shall incorporate a share of recycled car tyre powder, in order to reduce the use of natural aggregate.

Gumiimpex continuously participates in scientific and research projects and strives to contribute to the improvement of sustainable development for the benefit of present and future generations. As its financial records are continuously positive, it is a fine example for the assertion made by Zhang, Sun, Yang, and Li: Environmentally proactive organizations are found to have more balanced dynamic capability development than those that are more reactive. To optimize green innovation, therefore, organizations need to embrace an ecological strategy and engage employees in learning (2018).

This example also provides a reasonable hope that eco-innovation development and its support to transition process towards a circular economy has a better chance of success in Croatia than predicted by the facts listed in this paper. The hope is reasonable because Gumiimpex is more than an individual contribution. It is a valuable benchmark that might provoke other cases of the kind.

5. CONCLUSION

Closing the loop depends largely on generation and implementation of eco-innovations. In a world whose population and aggregate wealth are both rapidly increasing, the only possible answer to resource scarcity is the adoption of the reduce-reuse-recycle principle. This is the core of the circular economy concept.

As the transition from a linear to a circular system is not straightforward, there are several determinants of the process, eco-innovations being one of them. This paper presented eco-innovations as the mean of economic and social development, decoupling the growth from environmental exploitation.

Results of the presented study demonstrated the importance of eco-innovation for the transition towards a circular economy model and supported the poor development expectations of Croatian economy by the eco-innovation index and the probability of changing the ecological footprint.

However, the micro-level investigation detected several companies successfully pioneering eco-innovations in their everyday business operations. Among those, the case of waste-tyre rubber recycling and use through the cooperation of private companies, public authorities and faculties have been outlined as a potential benchmark, providing hope that positive change in Croatia is possible after all.

6. ACKNOWLEDGMENTS

This work was supported by the Croatian Science Foundation under Grant number UIP-2017-05-7113, a project entitled Development of Reinforced Concrete Elements and Systems with Waste Tire Powder – ReCoTiP

Abstract

After a long-lasting decline in the construction sector, which resulted in enormous losses, the downfall of the majority of market leaders at that time and large-scale layoffs, there have been some positive developments in this branch. However, civil engineering companies face numerous issues, the largest of which is finding a sufficient amount of work and a competent workforce. In Slavonia, one of the least developed Croatian regions, and in Osijek-Baranja County, the largest county in Slavonia, the impact of such negative trends has been even more severe. This paper analyses changes in the number of entities, employees, income, profit, salaries, and investments for companies classified under division 42 – Civil Engineering of the National Classification of Activities 2007 for Osijek-Baranja county in 2017. These changes are compared to the same type of indicators for the entire Republic of Croatia for the purpose of drawing specific conclusions about their status and significance.

Keywords: civil engineering, Osijek-Baranja county, income, profit, employment, salaries

JEL Classification: L74, L70

1. INTRODUCTION – CIVIL ENGINEERING IN GENERAL

Apart from being the most significant branch of engineering, civil engineering is also the oldest branch of engineering. It comprises activities related to the construction of all types of buildings, bridges, tunnels, roads, railways, sewers and water supply systems, development of watercourses, utilization of water power, construction of soil improvement facilities, power plants and other facilities used in the production of all goods. A civil engineer is a person who practices civil engineering. Construction technique relates to the use of natural and processed resources that allows people to intentionally build new structures that are fixed to the ground. Civil engineers use both natural materials, such as wood, rock or soil (clay), and artificial materials, such as concrete, lime, brick or steel. Natural and artificial materials allow civil engineers to purposefully combine all these elements and incorporate them and the underlying land to form a whole, i.e. a structure.

1.1. DISCIPLINES OF CONSTRUCTION ENGINEERING

Based on the characteristics and type of work activities, construction engineering can be divided into two main disciplines or branches. The first discipline is called building construction, which, as the name suggests, is related to the construction of buildings. Buildings are high-rise structures and their main part is located above the ground. The term “building construction” comes from a translation of an internationalized Greek word “arkhitekton” (ἀρχιτεκτονική), meaning “architecture”. In Croatia, building construction is most commonly referred to as architecture.

The other major discipline of construction engineering is civil engineering. Civil engineering comprises the construction of roads, bridges, railways and tunnels and the construction of hydraulic engineering structures: sewers, water supply network, soil improvement facilities, water management structures, works for increasing the navigability of rivers, construction of canals and utilization of water power. Majority of these facilities are constructed at the near-ground level, but this is not always the case.

It is important to know that architecture and civil engineering cannot be clearly separated because architecture, on the one hand, comprises only archi-

tectural design of buildings, whereas civil engineering, on the other hand, comprises a large number of works for all types of structures. For example, bearing capacity and stability of a structure is verified by civil engineers at a later stage of project design development and also architects are often involved in civil engineering works. Nevertheless, such division does exist. However, in the past, civil engineering and building construction were not as separated as today because architecture comprised all civil engineering works and related techniques. Nowadays, works pertaining to one or the other branch are separated and their number has increased. Consequently, civil engineering has become a separate branch and its achievements and tasks often surpass those of architecture, particularly in terms of their diversity and significance for overall progress. Furthermore, in some countries, a person qualified as a civil engineer who can build roads and bridges is still called an architect.

1.2. CONSTRUCTION ENGINEERING CLASSIFICATION

1.2.1. Building construction

- ♦ **Residential structures**, i.e. residential construction: semi-detached structures, family houses, residential buildings, residential blocks, etc.
- ♦ **Commercial structures**, i.e. commercial construction: agricultural and industrial structures.
- ♦ **Public (social) structures**, i.e. public (social) construction: cultural buildings, hospitality buildings, health facilities, stores, administrative buildings, transport buildings, etc.

1.2.2. Civil engineering

- ♦ **Transportation engineering** relates to road design.
- ♦ **Construction engineering** relates to designing and constructing structures and/or dimensioning (tunnels, bridges, silos, water towers, dams, commercial and other buildings).
- ♦ **Geotechnical engineering** relates to planning and carrying out various types of works on the surface of or within the ground, such as tunnels, dams, landslides, levees, cuts, excavations, supporting structures, excavation support, and landfills. Geotechnics is essential for constructing

nearly all ground-based structures and it comprises almost all related construction activities. As an engineering discipline, geotechnics relies on mechanics and soil mechanics.

- ♦ **Hydraulic engineering** relates to the construction and maintenance of water supply, water management, and sewer facilities. Hydraulic engineering is important for water resources management. Hydraulic engineering comprises flow control structures and soil improvement practices. Hydraulic engineering is concerned with hydro systems, hydraulic engineering structures and utilization of water power, but it also takes environmental protection into account. To construct hydraulic engineering structures, it is extremely important to be familiar with hydrology as a scientific discipline, as well as with hydromechanics, i.e. fluid mechanics.

2. CIVIL ENGINEERING AND CIVIL ENGINEERING COMPANIES IN OSIJEK-BARANJA COUNTY

Naturally, civil engineering has always been practiced in Croatia as well. In the last 10 years, civil engineering had both the highest and the lowest recorded share in Croatian GDP. The highest share in GDP, 7.2%, was recorded in 2008, whereas the lowest share, 4.42%, was recorded in 2017. This indicates a continuous decline of civil engineering and its significance for Croatian GDP, as well as an increase in GDP stimulated by other industries. This is clearly presented by the main indicators in Table 1 below.

Table 1: Value of completed construction works, share in GDP, number of employees and number of active companies in the period from 2007 – 2017

Year	Total income (in HRK million)	%	Value of work done (in HRK 000)	%	Share in GDP (%)	Number of active companies	%	Number of employees	%
2007	57,951	100%	29,773,626	100%	6.90	9,063	100%	104,142	100%
2008	69,230	119%	34,915,314	117%	7.20	11,244	124%	108,260	104%
2009	58,462	101%	30,714,772	103%	6.90	15,090	167%	97,503	94%
2010	47,713	82%	22,808,572	77%	5.80	15,781	174%	91,052	87%
2011	44,820	77%	20,821,802	70%	5.30	14,784	163%	83,607	80%
2012	40,104	69%	19,226,934	65%	4.70	15,497	171%	78,579	75%

2013	39,736	69%	18,950,827	64%	4.50	16,643	184%	73,832	71%
2014	41,598	72%	17,527,688	59%	4.30	17,947	198%	72,028	69%
2015	40,311	70%	19,152,159	64%	5.00	19,240	212%	68,676	66%
2016	42,623	74%	19,870,379	67%	5.13	12,990	143%	68,653	66%
2017	45,454	78%	20,180,147	67.78%	4.42	13,852	152.84%	67,307	64.63%
2017/2016	1.07	107%	Increased by:	2%	-0.14	Increased by:	7%	Decreased by:	-2%

Source:(FINA, processed: HGK)

As shown in Table 1, it can be concluded that civil engineering in Croatia reached its peak in 2008 and that it has been in constant decline ever since. What is particularly interesting is the fact that this trend started to reverse in 2016 as the value of works and total income started to increase in spite of a decrease in other indicators, particularly in the number of active companies. The severe crisis lasted for a very long time and had a particularly strong impact on civil engineering. When we compare 2008 (the peak of civil engineering in Croatia) and 2017 (last available data), it is shocking how many workplaces in civil engineering were lost.

In 2017, there was an increase in investing activities, mostly due to the use of EU funds, which represents the major incentive for reviving the construction sector. At the same time, due to fiscal consolidation, public sector investments were somewhat restricted, with borrowing by citizens and companies being limited by increased investment loans and loan indebtedness. Due to such circumstances, since 2016, the physical volume and value of construction works have been increasing. Such an increase has not been recorded since 2008. Also, since 2016, the number of issued construction permits has been increasing as well, whereas the value of commissioned works has achieved a double-digit growth rate, the highest since 2007. In 2017, the number of issued construction permits and the value of work done continued to grow. Therefore, we can definitely expect that this positive trend will continue to grow in the future as well. All indicators of construction activities confirm subtly, but positive changes, as presented in Table 1. (HGK,2018)

Since Osijek-Baranja county is an integral part of the Republic of Croatia, its civil engineering activities also contribute to overall results and trends in the state. In 2017 in Osijek-Baranja county, 509 companies who are income taxpayers submitted annual statements pertaining to their construction activities. Their total income, which is shown in Table 2, amounted to approximately HRK 2.12 billion and were by 14.67% lower than in 2016 when they amount-

ed to approximately HRK 2.48 billion. Their share in total income generated by all industries at county level amounted to 8.5%, whereas in 2016 this share amounted to 10.2%.

Table 2: Income generated by construction companies in Osijek-Baranja county in 2017 in 000 HRK

Code and explanation (National Classification of Activities 2007)	Total income			
	2016	2017	Index for 2017/2016	Share
F Construction	2,479,177	2,115,607	85.33	8.50%
County total – all industries	24,336,723	24,838,813	102	100%

Source: (FINA, processed: HGK)

It is obvious that there were some abnormalities in 2017, due to which the positive shift that began in 2016 was prevented from developing further. Thus, it was impossible for the area of construction to maintain the growth trend. Authors of this paper believe that the main cause for such outcome is political instability, i.e. the “fall” of the Government, followed by extraordinary parliamentary elections. Due to these circumstances, all larger public investments were practically suspended for more than one year.

Table 3: Profit and loss of construction companies in Osijek-Baranja county for 2017 in 000 HRK

Activity code	Activity	Profit for the period				The loss for the period				Consolidated
		2016	2017	Index for 2017/2016	Share	2016	2017	Index for 2017/2016	Share	
F)	Construction	107,605	109,857	102.09	9.90%	202,544	387,968	191.55	28%	-278.111
	County total – all industries	1,140,733	1,110,990	97.39	100%	635,794	1,383,842	217.66	100%	-272.852

Source: (FINA, processed: HGK)

Profit of construction companies in 2017 (Table 3) amounts to approximately HRK 110 million and it increased by 2.09% in comparison with 2016. Investing activities, which are largely dependent on using EU funds, continued to increase. Due to loan indebtedness of both citizens and companies, consolidated financial results continued to decrease.

Table 3 also shows that the consolidated financial result was negative due to the limitations of any significant borrowing or investment being restricted by the indebtedness of both citizens and companies. Furthermore, investments in the public sector were also restricted. Finally, 2017 was the year of a large-scale market clean-up, marked by a negative impact of events related to Agrokor, the largest economic system in Croatia. (HGK,2018)

Table 4: Number of employees by working hours and investments of construction companies in Osijek-Baranja county in 000 HRK

Code and explanation (National Classification of Activities 2007)	Number of employees			Investments in fixed assets		
	2017	Index for 2017/2016	Share	2017	Index for 2017/2016	Share
F Construction	4,945	96.21	12.62%	17,167	50.54	1.80%
County total – all activities	39,184	103.21	100%	950,537	82.72	100%

Source: (FINA, processed: HGK)

In 2017, construction companies in Osijek-Baranja county (Table 3), had 4,945 employees, or 3.8% of employees less than in 2016, which represents a share of 12.6% in the number of employees hired by companies in all industries of Osijek-Baranja county.

When compared to 2016, investments in fixed assets in the area of construction saw a decrease of 49.5% in 2017. Investments in fixed assets amounted to HRK 17 million, which represents merely 1.8% of total investments of companies who are income taxpayers in Osijek-Baranja county. Without any doubt, it can be assumed that one of the main reasons for this drastic decrease in investments in fixed assets was the Agrokor crisis. (HGK,2018)

Table 5: Average net salary in HRK according to data from 2017 annual statements:

Activity	2016	2017	Index
F Construction	4,087	4,449	108.9
County total – all activities	4,134	4,453	107.7

Source: (FINA, processed: HGK)

Average monthly net salary per employee in the area of construction in Osijek-Baranja county for 2017 (Table 5) amounted to HRK 4,449.00, which represents an increase of 8.9% in comparison with 2016. Slightly above-average

salaries are definitely a positive factor for the development of construction, particularly due to the fact an increase by as much as 8.9% was achieved in only one year. This will undoubtedly contribute to the reduction in the emigration of workers, which is currently one of the major issues of construction in Croatia, including Osijek-Baranja county.

Table 6: Issued construction permits by type of structures in 2016 and 2017

	Total		Index	Buildings		Index	Other structures		Index
	2016	2017		2016	2017		2016	2017	
Republic of Croatia	8,018	9,418	117.46	6,418	7776	121.16	1,600	1642	102.62
Osijek-Baranja county	596	581	97.48	355	411	115.77	241	170	70.54
Share:	7.43%	6.17%		5.53%	5.28%		15.06%	10.35%	

Source: (FINA, processed: HGK)

As shown in Table 6, 581 construction permits were issued in Osijek-Baranja county in 2017, which is 15 permits (2.5%) fewer than in 2016. The number of issued permits in Croatia increased by 1,400, or 17.40%. From a total of 581 permits, 411 permits pertain to buildings (increase by 15.77%), whereas 170 permits pertain to other structures (29.46% less than in 2016). Of all construction permits issued in Croatia in 2017, 6.17% of permits were issued in Osijek-Baranja county. This share was higher in 2016 and amounted to 7.43%, which, in comparison with 2016, represents a decrease of 1.26%.

Although 2017 did not prove it entirely, the area of construction has seen some positive trends and slightly positive changes. Value of commissioned works and the number of issued construction permits increased, meaning that positive trends in construction activities can be expected to develop and grow further in the future. Undoubtedly, increased use of EU funds has greatly contributed to such developments. Energy efficiency renovation projects are conducted and new infrastructure projects are started. Besides that, reductions in citizens' and companies' tax burden and the creation of a more encouraging business environment give the opportunity of increasing investments in the private sector. Furthermore, new measures increase the demand in the area of residential construction. All these new circumstances lead to an increase in the number of jobs related to the civil engineering sector, which must be adjusted to the changing structure of work in terms of both technology and organization. Besides that,

there is a lack of workforce and there are no workers with specific qualifications and professions required to perform construction activities. Also, on the one hand, workers are emigrating to other EU countries, and on the other hand, the quota for importing foreign workers is too low and the educational system does not meet companies' requirements. All these issues must be resolved and it is also necessary to address the growing pressure of foreign competition on the national market.

Adequate state aid in the form of more efficient use of EU funds, verification of the implementation of the labor law and reductions in the tax burden on income would surely improve the overall state of civil engineering. In that manner, companies could ensure adequate employment for workers, as well as higher salaries and better working conditions, which would also reduce the emigration of professional staff. (HGK,2018)

3. RESEARCH ON CIVIL ENGINEERING COMPANIES IN OSIJEK-BARANJA COUNTY AND THEIR BUSINESS OPERATIONS IN 2017 (NATIONAL CLASSIFICATION OF ACTIVITIES 2007, DIVISION 42 – CIVIL ENGINEERING)

This paper focused on determining the entities referred to in division 42 – civil engineering in Osijek-Baranja county and assessing their significance for civil engineering in the Republic of Croatia. From a total of HRK 13.64 billion of income generated in 2017 by companies classified under division 42 of the National Classification of Activities 2007, the share of Osijek-Baranja county amounted to 4.26% (HRK 582.36 million). When comparing companies in Osijek-Baranja county classified under division 42 with all companies in the county, the former contributed to the overall county's performance by generating 2.4% of its income and employing 3.4% of the total number of employees in the county. This data shows that this share and the resulting impact is fairly insignificant for both the county's performance and the performance of all companies in the country classified under division 42. Nevertheless, it is important to analyze this data because civil engineering has been identified as one of the branches of strategic importance in the Republic of Croatia.

3.1. DIVISION 42 – CIVIL ENGINEERING

According to the National Classification of Activities 2007, division 42 – civil engineering, this area includes general construction works on civil engineering structures. It includes works on new structures, repairs, additions, and alterations, construction of pre-fabricated structures on the site and construction of temporary civil engineering structures.

It also includes the construction of massive structures, such as motorways, streets, bridges, tunnels, railways, airfield runways, harbors, irrigation systems and other water projects, industrial facilities, sewerage systems, pipelines and electric lines, sports facilities, etc. This work can be carried out on own account or on a fee or contract basis. Portions and sometimes even entire works can be subcontracted.

42.1 Construction of roads and railways

42.11 Construction of roads and motorways

This class includes:

- construction of motorways, streets, roads, other vehicular and pedestrian ways
- surface work on streets, roads, highways, bridges or tunnels:
 - ♦ asphalt paving of roads
 - ♦ road painting and other markings
 - ♦ installation of crash barriers, traffic signs and the like
- construction of airfield runways

This class excludes:

- *installation of street lighting and electrical signals*
- *architectural and engineering activities (urban planning, structure design and other)*
- *project management for construction*

42.12 Construction of railways and underground railways

This class includes:

- construction of railways and underground railways

This class excludes:

- installation of lighting and electrical signals
- architectural and engineering activities (urban planning, structure design and other)
- project management for construction

42.13 Construction of bridges and tunnels

This class includes:

- construction of bridges, including viaducts and elevated highways
- construction of tunnels

This class excludes:

- installation of lighting and electrical signals
- architectural and engineering activities (urban planning, structure design and other)
- project management for construction

42.2 Construction of utility projects (distribution lines, electricity lines, and telecommunications systems)

42.21 Construction of utility projects for fluids

This class includes the construction of distribution lines for the transportation of fluids and related buildings and other structures that are an integral part of these systems.

This class includes:

- construction of:
 - ✦ long-distance and urban pipelines
 - ✦ water main and line construction
 - ✦ irrigation systems (canals)
 - ✦ reservoirs
 - ✦ sewerage systems
 - ✦ sewage disposal facilities

- ♦ pumping stations

This class also includes:

- water well drilling

This class excludes:

- *project management activities related to civil engineering works(NKD 2007,201)*

42.22 Construction of utility projects for electricity and telecommunications

This class includes the construction of distribution lines for electricity and telecommunications and related buildings and other structures that are an integral part of these systems.

This class includes:

- construction of:
 - ♦ long-distance and urban communication and power lines
 - ♦ power plants

This class excludes:

- *project management activities related to civil engineering works*

42.9 Construction of other civil engineering projects

42.91 Construction of water projects

This class includes:

- construction of:
 - ♦ waterways, harbor and river works, pleasure ports (marinas), locks, etc.
 - ♦ dams and levees
- dredging of waterways

This class excludes:

- *project management activities related to civil engineering works*

42.99 Construction of other civil engineering projects n.e.c.

This class includes:

- construction of industrial facilities, except buildings, such as:

- ♦ refineries
- ♦ chemical plants
- construction of structures (other than buildings) for outdoor sports

This class also includes:

- land subdivision with land improvement (e.g. utility infrastructure, construction of access roads, etc.)

This class excludes:

- *installation of industrial machinery and equipment*
- *land subdivision without land improvement*
- *project management activities related to civil engineering works (NKD 2007,2018)*

3.2. RESEARCH METHODOLOGY

The main source of data for this research was Bisnode's Smart Vision, a "unique macroeconomic tool for monitoring the situation in Croatian economy". Essentially, this tool uses the data that all companies in Croatia must submit to FINA. Companies are legally obligated to submit this data on an annual basis as a part of their annual statements. Last available data is the data for 2017. Authors decided to analyze the data for 2017 and focus on key indicators, such as income, operating results, number of employees and average salary.

Therefore, by using the Smart Vision tool, the authors selected division 42 and set the following criteria (filters):

- ♦ Show only entities with registered head office in Osijek-Baranja county
- ♦ Show only entities with income above HRK 10,000.00 in 2017
- ♦ Show all entities with 1 or more employees (because labor costs cannot be analyzed if the company has no employees).

Entities filtered in this manner represent 99.65% of the county's income generated from operations classified under the division 42. It can be said that this is undoubtedly a representative sample for drawing relevant conclusions. Based on these filters and their results, it can already be concluded that it is impossible to conduct business activities classified under division 42 if there is no workforce. Table 7 shows all filtered entities for 2017 sorted by company in-

come (in descending order). Also, as shown in Table 7, the 24 companies comprising this sample had 1,308 employees in 2017, generated net profit in the amount of HRK 24 million (profit margin of 4.14%), generated added value in the amount of HRK 159 million and paid average gross monthly salary in the amount of HRK 6,750.64, or average net salary of HRK 5,079.79. The fact that all analyzed entities had positive operating results in 2017 is particularly encouraging. The only exception is the company Werks, but its negative operating result is understandable due to the fact that it initiated bankruptcy proceedings in 2017.

Osijek, as the county center, also dominates in terms of the number of construction companies in the county with a registered head office in Osijek. Namely, of 24 entities comprising this sample, 13 are registered in Osijek, 4 in Đakovo and 3 in Našice, whereas other settlements are represented, if at all, by no more than 1 entity.

Research methods used in further data processing are comparison and observation.

Table 7: Overview of all companies classified under division 42 in Osijek-Baranja county in 2017 by set criteria (in HRK)

3.3. HYPOTHESES

Main hypotheses that this research aimed to examine were the following:

- a) The share of gross annual labor costs in relation to annual income is below 15% of the amount of generated income
- b) Average net annual salary is lower than the average net salary in Croatia in 2017
- c) The lowest amount of revenue per employee is HRK 100,000.00 or more per year
- d) Companies from the observed group with more than 30 employees are surely profitable
- e) Companies from the observed group generate more than 20% of added value per income item

In the following sections, these hypotheses were examined and particular conclusions were drawn.

4. RESEARCH RESULTS

4.1. THE SHARE OF GROSS ANNUAL LABOR COSTS IN RELATION TO ANNUAL INCOME IS BELOW 15% OF THE AMOUNT OF GENERATED INCOME

The hypothesis is the following: to generate HRK 1.00 of income, the amount of HRK 0.15 or less must be invested in labor costs for generating that income. Namely, due to the technological advancement, the volume of required work has decreased, i.e. labor is increasingly substituted by automation. Thus, labor costs have been decreasing for decades, but that is not the main subject of this research. In civil engineering works, in particular, major expenses pertain to construction materials and machinery depreciation. Gross labor costs are much more relevant in this sense because they represent costs incurred by the employer, thus being much more adequate than net labor costs (the amount that workers eventually receive).

Based on the data obtained from the analyzed sample, annual labor costs for each employer can be easily calculated by multiplying the average gross monthly salary with the number of employees, and then by multiplying the product with

12, i.e. the number months in a year. Therefore, the ratio between annual gross salary expenses and total annual income is the final and key indicator for this hypothesis. Table 8 shows all these indicators calculated for the sample.

Table 8: Share of annual salary expenses in income for division 42 in Osijek-Baranja county

NO	COMPANY	INCOME	NUMBER OF EMPLOYEES	GROSS SALARY	AVERAGE MONTHLY GROSS SALARY	AVERAGE ANNUAL GROSS SALARY	SHARE OF SALARY EXPENSES IN TOTAL INCOME (IN %)

	TOTAL	580,356,418.00	1308		8,873,118.00	106,477,416.00	32%

Source: database research: <https://www.bisnode.hr/proizvodi/bisnode-smart-vision/> 30.01.2019.

Based on this analysis, it can be concluded that the aforementioned **hypothesis was not confirmed**. Namely, in 2017, all companies comprising the sample incurred total labor costs in the amount of HRK 106.5 million and the share of labor costs in total income amounted to 32%. Also, it can be noticed that companies with higher income, which are listed in the top half of Table 7, generally have a lower share of labor costs in total income than companies listed in the bottom half of the table. This is undoubtedly a result of a higher level of organization and the use of more advanced equipment, which enable companies to generate more income while incurring equal or lower labor costs. In civil engineering, a common practice is to keep the share of labor costs below 15% to maintain operational sustainability of a company. By simply looking at the listed companies, it can also be concluded that some of the companies with a high share of labor costs eventually bankrupted (Vodogradnja, Werks), while the others are under majority public ownership (Casting, Odvodnja, Karašica-Vučica). All this suggests that such market conduct is not sustainable in the long term and that the share of labor costs in income must be reduced by increasing operational efficiency.

4.2. AVERAGE NET ANNUAL SALARY IS LOWER THAN THE AVERAGE NET SALARY IN CROATIA IN 2017

Based on the data obtained from the Croatian Bureau of Statistics (Official Gazette 21/2017, document no. 506 of 10 March 2017), in the Republic of Croatia in 2016, the average gross salary paid by legal entities amounted to HRK 7,752.00, whereas the average net salary paid by legal entities amounted to HRK 5,685.00.

In section 3.2, it has been stated that the companies from the analyzed sample paid average monthly gross salary in the amount of HRK 6,750.64 and the average monthly net salary in the amount of HRK 5,079.79. Based on this data, **it can be concluded that the average gross salary paid by the companies from the analyzed sample is lower than the national average by 12.92%, whereas the average net salary is lower than the national average by 10.65%**.

This difference is significant and civil engineering is obviously a branch that does not offer high income. Yet, if annual salary expenses incurred by the companies from the analyzed sample were higher by 12.92%, that would decrease their profit by HRK 13.7 million. In that case, their profit margin would be

1.77%, which would make this branch significantly unattractive for entrepreneurs (considering the risks and a substantial amount of funds required for initial investment).

It is clear that below-average salaries for working under hard conditions represent a rather limiting factor for finding and training new workers, as well as for motivating them to choose this profession. In that regard, 2017 was significant because it raised awareness of the fact that more and more qualified workers and professionals move to more developed EU countries, where they have significantly better working conditions. Emigration of workers culminated in 2017 and 2018, which lead to the conclusion of a new branch collective agreement for civil engineering on 20 February 2018. By virtue of this agreement, gross base salary in civil engineering was increased from HRK 3,112.20 to HRK 3,750.00, or by 20.5%.

4.3. THE LOWEST AMOUNT OF REVENUE PER EMPLOYEE IS HRK 100,000.00 OR MORE PER YEAR

To examine this hypothesis, it was necessary to calculate revenue per employee and profit per employee. This is presented in Table 9, in which analyzed companies are sorted by profit per employee (in descending order).

Table 9: Presentation of analyzed companies by profit per employee

NO	COMPANY	INCOME	NUMBER OF EMPLOYEES	PROFIT	REVENUE PER EMPLOYEE	PROFIT PER EMPLOYEE	PROFIT MARGIN PER EMPLOYEE

		580,356,418	1308	24,131,103			

Source: database research: <https://www.bisnode.hr/proizvodi/bisnode-smart-vision/>
30.1.2019.

The table shows that the profitable company with the lowest revenue per employee generated HRK 58,603 of revenue per employee and that only three entities in total have revenue per employee below HRK 100,000.00. **Therefore, the hypothesis was not confirmed.**

Moreover, based on the data from Table 9, it can also be noticed that there are no general rules regarding this matter. This is understandable because a company's profitability is affected by a multitude of factors (and expenses) other than labor costs. Nevertheless, Table 9 shows that all companies with income above HRK 100,000.00 were profitable. This is an excellent result, which shows that 2017 was a successful year for companies classified under division 42 in Osijek-Baranja county. Analysis of each of these companies shows that the average revenue per employee amounts to HRK 326,242.96, whereas the average profit per employee amounts to HRK 10,570.00. This suggests that there is room for increasing profitability per employee.

4.4. COMPANIES FROM THE OBSERVED GROUP WITH MORE THAN 30 EMPLOYEES ARE SURELY PROFITABLE

This hypothesis was based mainly on the assumption that companies with a large number of employees know what they are doing, that such a great amount of workforce has adequate organization and equipment and that it also efficiently uses other resources. By sorting analyzed companies by the number of employees, it can be noticed immediately that **this hypothesis is correct**. Each of the 15 companies with 30 or more employees was profitable. Therefore, it can be concluded that more employees mean a greater chance for a company's profitability. However, this rule is not absolute because it is obvious that all companies classified under division 42 had a successful business year. As mentioned in previous sections, a company's profitability is also affected by other factors, and these were obviously the decisive factors for those two companies.

4.5. COMPANIES FROM THE OBSERVED GROUP GENERATE MORE THAN 20% OF ADDED VALUE PER INCOME ITEM

Added value is calculated as sales income less the cost of goods and services purchased from other parties and depreciation costs. This is one of the indicators which make a particular branch attractive or unattractive to the social community.

To examine this hypothesis, it was necessary to calculate the share of added value per income items. This is presented in Table 10, in which analyzed companies are sorted by income (in descending order).

Table 10: Added value per income items

NO	COMPANY	INCOME	PROFIT	ADDED VALUE	SHARE OF ADDED VALUE IN INCOME (IN %)

30.01.2019.

Table 10 shows that **the hypothesis was confirmed** because the average share of all companies from the analyzed group in added value per income item amounts to 27%. Any activity generating above 20% of added value is welcome in any economy and any public administrative body should encourage the development of such activities in the territory of its competence.

5. CONCLUSION

Civil engineering represents an extremely important branch for any economy because it constructs the tangible assets used for residential, commercial and other purposes. In addition, it is related to other similar industries, from construction materials industry, metal industry, wood industry, chemical industry, non-metallic and glass industry to furniture manufacturing and, to an extent, service industry. It also employs a significant amount of workforce because it is still dependent on human labor, which is why full automation is impossible.

This branch was most severely affected by a far-reaching and lasting economic crisis which impeded technological advancement, reduced civil engineer-

ing capacities and decreased the competitiveness of civil engineering companies in the Republic of Croatia. Civil engineering can be classified as an activity that is largely dependent on economic cycles. Therefore, it is not surprising that the economic growth which started in 2017 was followed by further development of positive trends in civil engineering activities.

Maximum utilization of EU funds allows Croatia to conduct new infrastructure projects and consequently, the companies classified under division 42 of the National Classification of Activities 2007 are able to stay in operation. In that regard, the current status of Osijek-Baranja county is not bad. There are companies in Osijek-Baranja county that can to some extent complete future infrastructure projects, the number of which has been growing. Another positive factor is the fact that these companies can grow by creating new jobs, which should also increase employees' gross earnings and thus motivate the younger generations to choose civil engineering as their profession.

For all these reasons, it is obvious that the future of civil engineering in Croatia is promising, but the construction sector also must adjust to the changing structure of work, address the increasing pressure of foreign competition on the Croatian market and resolve the issues pertaining to the emigration and lack of workers with adequate qualifications and professions. Moreover, technology advances at an unbelievably rapid rate, thus changing production processes faster than ever. This paper also indicated the downsides that companies classified under division 42 are less efficient and that their work productivity is below the required average. All of the above represents factors that must be worked on in the future for the purpose of achieving technological advancement, competitiveness and eventually profitability and long-term operational sustainability in the area of civil engineering.

Abstract

Project management (PM) in government administrations (GA) in all countries reflects the increasing demands for better effectiveness, efficiency, and quality of services. In GA the PM is directed towards the establishment of managerial principles and public governance, growing their efficiency and quality, making effort to achieve and maintain the sustainability of their functioning.

Based on national strategic documents GA is establishing project within programs and portfolios to develop, increase and upgrade capabilities.

Ministries of defense facing new challenges to respond to new threats introduce project management principles. The aim is to reach strategic goals expressed in strategic documents to build the new tools to deter and defend national interests and interests of international organizations that nation is part of.

For that purpose Ministry of defense of Republic of Croatia (MoD) introduced the Program Management Office (PMO) as part of MoD organization and hierarchical decision-making levels for better supervision, command, control, and decision making in PM. With the new organization establishment, MoD achieved the better success of introducing new capabilities as declared and targeted in national defense planning documents.

Keywords: *project management, government administration, PM office, Ministry of Defence*

JEL Classification: H00, H11

1. INTRODUCTION

Here we discuss project management (PM) in government administrations (GA) wherein all countries reflects the increasing demands for better effectiveness, efficiency and quality of services. In GA the PM is directed towards establishment of managerial principles and public governance, growing their efficiency and quality, making effort to achieve and maintain the sustainability of their functioning.

GA is spending public money collected from taxpayers in government budget which has to be spent wisely for executing government objectives to improve the quality of government service for the benefit of citizens.

There is a range of different PM methodologies used around the globe. The most used PM methodologies are Project Management Body of Knowledge (PMBOK), Projects in a Controlled Environment (PRINCE2) and Agile. All three are used depending of organisation preferences and projects to be undertaken. As GA in this work is using PMBOK or PRINCE2 these two are to be listed.

Project management standard PMBOK defines as “the application of knowledge, skills, tools, and techniques to project activities to meet the project requirements. Project management is accomplished through the appropriate application and integration of the 42 logically grouped project management processes comprising the 5 Processes Groups”. And “The specific project characteristics and circumstances can influence the constraints on which the project management team needs to focus”. (PMI, 2013, p. 5-6).

The PMBOOK Guide “contains the standards for managing most projects most of the time across many types of industries”. (PMI, 2013, p.6, p.18).

PRINCE2 is a process-based method for effective project management. This methodology is extensively used by the UK Government and widely recognised and used in the private sector, both in the UK and internationally. The PRINCE2 method is in the public domain, and offers non-proprietary best practice guidance on project management. The methodology focus is on business justification, defined organisation structure for the project management team, product-based planning approach, emphasis on dividing the project into manageable and controllable stages and flexibility that can be applied at a level appropriate to the project. (PRINCE2, 2019)

2. PROJECT MANAGEMENT IN GOVERNMENT ADMINISTRATION (GA)

As defined in A Guide to the Project Management Body of Knowledge (PMI, 2013) “PM is the application of knowledge, skills, tools, and techniques to project activities to meet the project requirements”.

Project management is important for functioning of GA and for the purpose to assist to reach established strategic and operational goals declared in planning documents. The focal point for integration of strategic management in any organisation is PM. Different countries developed their own specific approach to PM with the respect to A Guide to the Project Management Body of Knowledge (PMBOK) “as general principle and framework to provide guidelines for managing individual projects and to define project management related concepts. It also describes the project management life cycle and its related processes, as well as the project life cycle”. (PMI, 2013, p. 1)

PM in GA is established and led somewhat different than in business sector still respecting PM general framework but applying some specifics. Such specifics exist in different organisations depending of their organisation structures, hierarchy, leadership and personnel. Public administration is also specific since it relies on established legal framework which is very stiff. For that purpose PM must obey hierarchy and legal procedures as in PM in GA financial resources support comes from state budget and report of budget spending is public for taxpayers to know where money goes.

2.1. PROJECT MANAGEMENT IN GA IN SLOVENIA

Government of the Republic of Slovenia 1997 adopted the general project management methodology in state administration (MVPDU) which represented the framework for project planning and implementation in Slovene PA. The MVPDU methodology was developed on the bases of the PRINCE2 methodology. (Žurga, 2018, p.150) This methodology is still valid and unchanged.

Although the methodology is in force since 1997 according to Žurga (2018) not all ministries use the PM methodology. Knowledge and understanding is not at the same level in all ministries. Project offices are rare in organisation structures in ministries lacking the defined rules in PM.

In document issued by the Government of the Republic of Slovenia „Public administration 2020, Public administration development strategy 2015–2020“ declared to “undertake measures to attain the strategic objectives when introducing project management” (Kern Pipan et al. 2015, p.56). Measures are clearly stated as follows:

- ✦ preparation of the project management methodology in public administration;
- ✦ systematic training of employees in public administration on the project-oriented manner of work
- ✦ establishment of a tool for IT-supported planning and implementation, monitoring and reporting on major strategic projects;
- ✦ establishment of the leading body or an organisational unit to coordinate and supervise the implementation of projects. (Kern Pipan et al. 2015, p.56).

This approach should contribute to better understanding and implementation of PM in GA.

2.2. PROJECT MANAGEMENT IN GA USA

Project management is at the core of almost every government business implementation related to initiatives for improvement. “Scrutiny for government project management extends far beyond a government organization’s internal customers to its citizens, its political appointees, and even to the United States Congress”. (Pyne & Rigby, 2002). In addition, in their work Pyne and Rigby (2002) observe several trends in the business of government that is contributing to the public sector movement toward a project orientation.

Pyne and Rigby (2002) elaborate trends in business of government as follows: There is “a significant portion of the government’s work that is being outsourced to commercial entities.” Therefore, government workers must transition from functional management responsibilities to project management. Project management is important to ensure that work under a contract is on time, within budget, and to the government’s specifications.

Government organizations are using project management to enhance efficiency and demonstrate their own viability. Good government project management means that work cannot necessarily be done better by a commercial entity.

Competition exists for work between government organizations. For example, a government organization is no longer obligated to use its own Facilities Management group; they could go, and have gone, to another Facilities Management organization with their requirements. Project management provides a framework for better and consistent customer service.

The size of the federal civilian workforce has declined by 19% since 1985. In addition to shrinking, the workforce is aging and considering retirement. Middle managers need project management skills to handle increased workloads and increasingly complex programs.

Government organizations are being called upon to provide 24-hour, secure, access for citizens. This has resulted in a dramatic increase in highly visible, complex information technology projects.

Effective project management is the key to maximizing any organization's business opportunities and in meeting its challenges. It will enable the government workforce to meet time, cost, and performance constraints, while focusing on its customers' satisfaction". (Pyne & Rigby, 2002).

2.3. PROJECT MANAGEMENT IN GA UK

PM in UK is regulated 2017 by Guidance Project and programme management as "essential resources for project delivery professionals leading, managing or involved in projects or programmes in government." (Gov.UK, 2017)

In UK since 2010 as a result of UK government reorganisation the Minister for the Cabinet Office announced that the Best Management Practice functions have moved into Cabinet Office. Government apply the Prince2 methodology as essentials for managing any project.

The Infrastructure and Projects Authority (IPA) supports the successful delivery of infrastructure and major government projects by working with government departments and industry. Its support includes offering expertise in all aspects of project delivery.

The Government Functional Project Delivery Standard sets out expectations for the direction and management of all government portfolios, programmes, and projects.

The Treasury Green Book provides guidance for public sector bodies on how to appraise proposals before committing funds to a policy, programme or project. (Gov.UK, 2017)

2.4. PROJECT MANAGEMENT IN GA IN THE REPUBLIC OF CROATIA

Project management is present in whole world for decades but in Croatia is not validated inadequate way. According to the words of prof. Radujković in the past few years significant advancement is evident, but potentials of profession of project management are not used to the measure to produce expected benefits to organizations and community. A certain advancement in business world in Croatia are evident but still not enough and benefit in increasing success of projects are immeasurable. (Paparella, 2017)

In GA project management, according to available information is arranged primarily in the area of project management for EU funded projects what, by prof. Radujković, represents lesser part of projects where project management profession is involved. Larger amount of projects are executed as internal projects of organisations and in business commercial projects. (Paparella, 2017)

3. PROJECT MANAGEMENT AND EDUCATION

As the solid base towards stronger implementation of project management into the practice in Croatia are education modules in Croatian faculties, university colleges and education centres. Here are just few randomly selected as examples:

3.1. UNIVERSITY OF APPLIED SCIENCES BALTAZAR ZAPREŠIĆ.

At the moment there is several hundreds of thousand persons certified in IPMA Four Level Certification system. Certification of Project Management students is executed in cooperation with Croatian Association of Project Management (CAPM) since 2009. CAPM represents International Project Management Association (IPMA) gathers national members of over 70 countries of the world. Until today IPMA certificates in Croatia acquire over 270 students of Project Management of University of Applied Science Baltazar, Zaprešić. (Veleučilište Baltazar, 2018)

3.2. ALGEBRA UNIVERSITY COLLEGE, PROJECT MANAGEMENT SEMINARS

Algebra is providing attendees with basic and advanced knowledge of project management through interactive exercises in web environment applying curriculum with simulation of project process in virtual project teams of participants. Algebra is also cooperating with CAPM in process of preparation for certification. (Algebra; 2018)

3.3. MIRAKUL EDUCATION CENTER ZAGREB.

In cooperation with leading Croatian experts and Mirakul lecturers organize business seminars and workshops in key areas of business. Students gain knowledge and skills needed for certification for Project Management Professional (PMP) certificate. As well as IPMA certificate PMP is recognized as universal standard of excellence in Project Management. (EduCentar; 2018)

4. PROJECT MANAGEMENT IMPLEMENTATION IN GA

Project management in GA is not sufficiently recognized as a tool for the successful process of initiating, leading and completion of projects. Efforts in the implementation of project management were undertaken in ministries of Croatian Government where project management knowledge and skills are applied by educating and certifying personnel in project management and establishing program management offices, and introducing rules and regulations.

For the purpose of this study three ministries with practice and documentation in project management will be represented by the Ministry of Regional Development and EU Funds, Ministry of Construction and Physical Planning and Ministry of Defence. The Ministry of Defence will be elaborated in more details as a case study.

4.1. PROJECT MANAGEMENT IN MINISTRY OF REGIONAL DEVELOPMENT AND EU FUNDS (MRD & EU FUNDS)

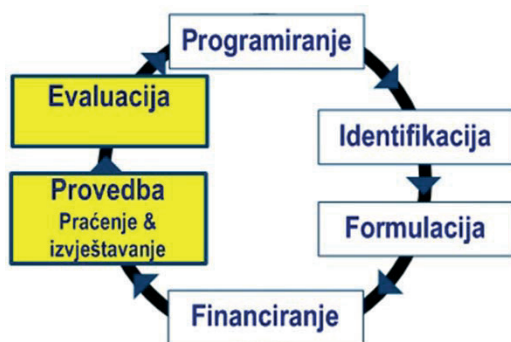

MRD & EU Funds was established by the Law on Establishment and Scope of Ministries and Other Central Bodies of State Administration (Official Ga-

zette 93/16, 104/16) to equally develop all parts of Croatia, to improve work and life conditions with emphasis to less developed regions. (Ministarstvo regionalnog razvoja i fondova EU, 2018)

In the area of project management MRD & EU Funds is oriented to prepare priorities of multiyear and annual strategic and operational documents for use of EU funds and other international sources of financing for regional development. (Ministarstvo regionalnog razvoja i fondova EU, 2018)

MRD & EU Funds in its webpage declare responsibility for monitoring of entire program and project execution as well as for monitoring and execution of decisions and recommendations. In the process of project execution monitoring and evaluation are part of project life cycle. With these tools MRD & EU Funds evaluates and assess effectiveness in projects and programmes execution financed in the framework of EU assistance program. (Ministarstvo regionalnog razvoja i fondova EU, 2019)

Figure 1. Project cycle in MRD & EU Funds

Source: (Ministarstvo regionalnog razvoja i fondova EU, 2019)

For this purpose and to better withdraw of EU funds allocated for Republic of Croatia in various areas MRD & EU Funds in 2014 initiated project of Academy of regional development and EU funds. The goal is to inform and educate student population on EU funds and present to students the importance of EU funds as one of most important source of financing different development projects and provide skills and tools for preparation of project proposals. Until today Academy educated over 600 young people and prepares them for use of EU funds. (Europski strukturni i investicijski fondovi, 2018)

The project of Academy is developed in four modules which assist students to understand projects and to gain skills in full spectrum of project lifecycle from idea to the completion of project documentation for EU financing. (Europski strukturni i investicijski fondovi, 2018)

4.2. PROJECT MANAGEMENT IN THE MINISTRY OF CONSTRUCTION AND PHYSICAL PLANNING (MCP)

MCP was established by the Law on Establishment and Scope of Ministries and Other Central Bodies of State Administration (Official Gazette 93/16, 104/16). In its scope the ministry performs administrative and other tasks related to construction, physical planning and housing, and participates in the development and implementation of programmes from European Union funds and other forms of international assistance in these fields. (Ministarstvo graditeljstva i prostornog uređenja, 2018)

Ministry has specific responsibility in the area of construction where construction was regulated by Laws: Building Act (Official Gazette 153/13, 20/17), Construction Products Act (Official Gazette 76/13, 30/14, 130/17), Act on the Chamber of Architects and Chambers of Engineers in Construction and Physical Planning

(Official Gazette 78/15, 114/18), Act on Physical Planning and Building Tasks and Activities (Official Gazette 78/15, 118/18), Act on Proceeding with Illegally Built Buildings (Official Gazette 86/12, 143/13, 65/17, 14/19) and Administrative Fees Act (Official Gazette 115/16) and list of statutes, decisions and internal regulation including statutes and decisions of EU. (Ministarstvo graditeljstva i prostornog uređenja, 2019)

In the area of construction MCP strictly regulated roles and responsibilities of persons who perform activities in construction project management who must be registered for specific activities. The intention is to avoid conflicts of interests of stakeholders in construction program management. It is strictly emphasized that registered organization for construction must have project manager.

MCP in 2009 introduced into force Regulation on necessary knowledge in the area of project management. Since then the Regulation is amended and the newest document is dated from 2015.

According to the Ordinance on required expertise in the field of project management (Official Gazette 85/15) person authorized as project manager for specific project is by regulation of MCPPP obliged to have necessary knowledge and skills in project management and, as minimum, to be certified through system of certification of International Project Management Association (IPMA) and/or Project Management Institute (PMI). (Ministarstvo graditeljstva i prostornog uređenja, 2019)

Apart from that program manager has to have education in architecture, construction, electrotechnics or civil engineering. There is also regulation for the level of education and minimum of ECTS points. (Ministarstvo graditeljstva i prostornog uređenja, 2019)

4.3. PROJECT MANAGEMENT IN THE MINISTRY OF DEFENCE – THE CASE STUDY

Ministry of Defence (MoD) was established by the Law on Establishment and Scope of Ministries and Other Central Bodies of State Administration (Official Gazette 93/16, 104/16).

From the very beginning, when the Ministry of Defence and Croatian Armed Forces (MoD and CAF) were established, various project management processes were conducted. Projects were conducted in functional organizations by decisions of the minister of defense.

During five-year post-war transition period until 2000 MoD was advised and supported in transformation from war to peacetime structure by one US consulting company who laid down foundation for future development of Defence Management System in MoD. System was basically built on implementation of three interrelated systems, Defence Planning System, Defence Management System and Decision Making in Procurement System. All of them integrated by Planning Programming Budgeting and Execution System (PPBES) in more long term planning and executing manner with introducing for the very first time managing the processes and project-oriented organization. Originally PPBES is an “annual Department of Defence (DOD) process for allocating resources. It serves as the framework for DOD civilian and military leaders to decide which programs and force structure requirements to fund based on strategic objectives”. (Peters, 2018)

Croatia's membership in Partnership for Peace (PfP) in 2000 (NATO, 2005) and later Membership Action Plan (MAP) in 2002 (NATO, 2019) as a NATO aspirant recognized needs for development of a new capabilities defined in strategic documents as Partnership Goals and Force Goals. This brought MoD to the position to form the working groups or task forces with the clear directions to initiate, lead and conclude the process of procurement, adjustment and implementation of a new defence system into the CAF. It was the working groups to lead the process by their best knowledge and skills. There were no standards of project management.

It does not mean that projects were not led professionally and that they were not brought to its successful conclusion. Simply they were not led by standards of project management and there was no central administrative evidence and coordination of projects as part of the program and entire MoD project portfolio.

Projects were initiated, conducted and brought to its successful conclusion by the imagination and significant efforts of the appointed heads of the working body together with the appointed members, personnel from different parts and functional organizations of MoD and CAF.

Through the time and recommendations of personnel who were familiar with standards of project management, MoD introduced to project management principles. Project management principles were formalized and set inadequate framework by officially regulated project management process.

First document to regulate PM in MoD was internal document Regulation for Project Team Activities which was approved and introduced by the minister of defence in 2001. This document defined the position and role of project team in process of acquisition of armament and military equipment for CAF. The intention of this Regulation is to fit the PM in internal procedures, rules and regulations as well as legal framework for procurement of armament and military equipment. It was first but important step in better PM in MoD.

For the purpose of project standardisation and better overview, control and decision making on projects, MoD in 2014 approved and introduced Methodology of management of development projects of MoD and CAF (Ministarstvo obrane; 2014a). The methodology was developed on the basis of the IPMA (International Program Management Association) standards. This document based on project management standards with recognition of national legal framework introduced basic order in project management process from initia-

tion to its conclusion. Since the MoD is governmental organisation all regulations and procedures must comply with national laws and regulations.

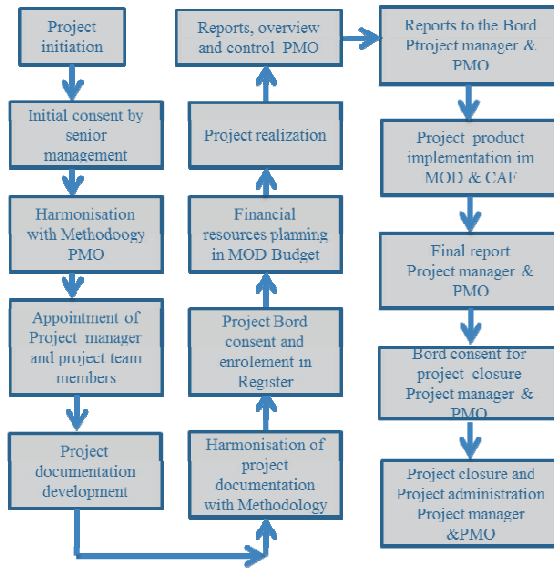

Methodology introduced standard steps in project management, project categories according to IPMA, type of project according the complexity of projects, stakeholders, and senior supervision and decision body The Board for supervision, control, and decision making in project management (Board). The Board was established 2014 (revision Act 2017) by the Decision of minister of defence and the board consists of key civil and military personnel of MoD and CAF where state secretary/deputy minister was appointed as the head. (Ministarstvo obrane; 2014b)

As additional tool for project supervision MoD formed the Project Register as evidence of projects which were already in process and new accepted projects by the Board. Board, to clarify its role in project management, introduced the Rules of procedure of the Board. (Ministarstvo obrane, 2017b).

The next very important step in process of project management institutionalization is the Project Management Office (PMO) in MoD Statute which was formed as independent body in organisation structure directly subordinated to minister of defence. Its position, role and line of work was set and described in Art 170 of the Statute of internal organization of the MoD (Official Gazette 2/17) Statute entitled PMO for project coordination, time framework, extent, expenses, quality and human resources. PMO is also the organisation which provides the Board with all relevant documentation and information as support for decision making. Its role was recognized in revised document of the Board "Odluka o osnivanju Odbora za nadzor kontrolu i odlučivanje u upravljanju projektima" (Ministarstvo obrane, 2017a)

To improve project management process PMO prepared a draft of revised Methodology which incorporates improvements in project management process with more details and clarifications specific for GA is prepared for brush up and confirmation by senior management during 2019. The revised methodology is much more aligned with PMBOK guide then previous one. (Ministarstvo obrane, 2018)

Figure 2. Project steps flow

Source: (Ministarstvo obrane, 2018)

Important part of Methodology is incorporated in annexes which contains steps on project development process and standard forms for initiation, planning, reporting and risk management. Depending of project category and type Methodology proscribes the key documents to be developed for specific project. Such documents are Tactical Technical Study, Feasibility study, Risk analysis, Status report, Final report, Analysis of project success, Lessons learned etc. Apart of listed, as every project is new, original and different may have additional specific documentation which were relevant for specific project (Figure 2.).

The entire project management process is in compliance with specifics of a structure, work organization, hierarchy and other internal regulations in the field of organization management. Projects regulated by Methodology are initiated by stakeholder i.a service of CAF or functional areas of MoD.

PMO in 2018 initiated education, workshops and certification for heads of project teams of active projects. The next phase is to continue education in project management primarily for project team members in active projects. In continuation, the aim is to continue with regular annual cycle to share the knowledge, skills, and competencies of project management and to develop a wide base of civilian and military personnel of MoD and CAF later to be included in new projects as leaders or team members/experts.

PMO developed and implemented information support by the development of specific software that fits into the needs to keep evidence of documentation and to keep track of each phase of each project from the Project Register. Information model consists overall overview of all projects from the Project Register, individual project information on project phases, finances (planned budget, phase expenditures items, remaining financial obligations etc.), project team minutes registry, list of project team members with skills review and work results.

5. CONCLUSION

As PMI definition say Project management is temporary endeavor undertaken to create a unique product, service or result. And a project is unique in that it is not a routine operation, but a specific set of operations designed to accomplish a singular goal.

Project management is important because it is systematic and regulates standard steps from beginning to the end respecting specifics of each project as one-time operation. With introducing at least basic regulation of project management in certain organization it is much easier for every stakeholder to understand his role. It is even better when proper understanding of project management is introduced in organization and when large number of personnel in certain organization understands at least the basic rules of project management. For that reason, independent of prescribed regulation, it is much more important to have as much as possible number of personnel of any organization educated in project management. For those involved in project management process it will be easier to initiate, lead and bring projects to successful conclusion and implementation.

GA in Croatia is not using PM systematically in all government bodies. It is more related to senior individuals recognizing the benefits of PM to save efforts, time and money and introduce PM in their organization which then becomes the standard.

Still, there is much more to do ahead in embedding and establishing a certain level of understanding of the necessity of project management for better use of financial, material and human resources and to increase the level of success.

Articles such as this and with the assistance of experts an member of academic society can motivate GA to introduce PM as standard procedure to improve organization and to implement new technologies in GA procedures.

Abstract

The aim of this paper is to determine the connections between social media activity and different success categories in sports organizations. This primarily refers to the number of spectators following sports organizations. Sports organizations which are the subject of this research are futsal clubs in eastern Croatia that play in the highest ranks of competitions managed by the Croatian Football Federation. Futsal, also known as five-a-side football, is a sport with a long tradition and a high percentage of players and supporters. It is important to mention that, even though the analyzed sample deals with clubs competing in the first and second rank of competitions, those sports organizations are nonprofit and amateur in terms of their structure, since players who play for

the clubs only get a certain fee, rather than a salary, which means that futsal is not their primary job. From that point of view, the analyzed sports organizations can be placed in the context of all sports nonprofit organizations. The aim of the research is to determine whether and in what manner can varying intensity of activities on social networks such as Facebook and Instagram affect the attendance or business results of a sports organization. Nowadays, in the time of intensive use of social networks, it is considered obligatory to be present on social networks. Taking the targeted audience of the analyzed sports organizations into account, a conclusion shall be made on the impact of different scopes of social network activities by individual sports organizations on the overall results of a nonprofit sports organization. The obtained results will be highly indicative considering that most sports organizations in the Republic of Croatia are nonprofit regardless of their competition rank, and their players have amateur status.

Keywords: *social networks, sports nonprofit organizations, futsal competition, attendance*

JEL Classification: L39, M37

1. INTRODUCTION

Recreational sports definitely play a major role in the health and social segments of all individuals, but of society in general as well. In the health context, they constitute an imperative life component which should ultimately result in physical activity and health care. In the social context, recreational sports cover another indispensable life component that reflects in the human need to socialize and spend time together. Recreational sports, which are categorized into leisure time, voluntary and free choice of each individual, have the potential to fulfill these tasks. For this reason, it is necessary to pay special attention to the organization of recreational sports and to the management of organizations that organize activities in the field of recreational sports. Futsal, also well known as five-a-side football, is one of the sports activities that stand out in the domain of amateur and recreational sports. Futsal as a team sport greatly encourages team spirit as well as homogeneity and, due to low organizational costs and its link to the classic “big” football, it became widespread in the world; therefore, it has a long tradition in the area of eastern Croatia as well.

Taking into account that futsal sports organization are non-profitable for the most part and that they are placed in the category of citizens associations, it is extremely important to be competent for management of such organizations, since their primary aim is not financial gain, but continuous development of futsal. Regardless of the fact that the primary aim of non-profit organizations is not making a profit, it is extremely important that such organizations manage their finances responsibly, in order to function normally. Just as digital transformation affected all segments of society, so it did the segment of sports and, in terms of management, the segment of managing small and non-profit sports organizations. The fact is that recreational sports belong to the domain of leisure time greatly affects a sports organization's business approach since the quantity and conception of leisure time have largely changed. Nowadays, people work longer hours and have less leisure time at their disposal. In addition, futsal organizations have competitors from many different social areas, from those in sports that also seek their own market and customers, to non-sports ones that fill the leisure time of an individual with programs of their own. In this contest for each individual, the sports organizations need to use all the competitive advantages they have over other activities in order to realize their goals.

The important thing is to mention the fact that all sports organizations need to adapt to social and consumer needs and demands that are constantly taking place in the surroundings they act in. Despite the fact that the primary purpose of non-profit organizations is not making a profit but reinvesting the funds raised in the development of sports through the evolution of their non-profit sports organization, they are increasingly turning to the approach of professionalizing certain activities in their business operations. This paper will focus on presenting the importance of this adaptation through the digital transformation of business operations in futsal organizations with an emphasis on the eastern part of Croatia. The aim of the implemented research is to establish the way in which application of digital tools affects the development of futsal organizations and, following this, their comparison with regards to the rate of digital tool application in everyday business operations. Taking into account the age structure of the market, this definitely is an important tool for achieving goals, i.e., efficiently using digital tools and media in everyday activities, retaining existing members and acquiring as well as attracting new ones. Digital tools such as websites can greatly contribute to transparency, they enable the creation of a central place for informing the public and members, but through certain mod-

els of acknowledging sponsors and donors as well as different models of online commerce they can provide an additional source of revenue through this digital channel. Social networks, as a sort of added features of websites, allow for much faster and more direct communication with members, providing short-term information, but also, most importantly, they enable two-way communication between futsal organizations and the user.

2. THEORETICAL PART OF THE PAPER

2.1 FUTSAL AND ITS SIGNIFICANCE

Futsal is an extremely popular team sport all over the world. Its popularity is based on several important elements. In the organizational sense, its organization does not require extensive infrastructural needs, which is why futsal can be played in courts of different sizes as well on different terrains. To make things as simple as possible, an arbitrary size court, two markings for the goal and a ball will suffice. All other elements only increase the quality of the organization and the game. Another very important fact lies in the similarity of futsal to football, which is why it is often referred to as five-a-side football in the Republic of Croatia. Since playing “big” football requires more players and a larger grass-covered football pitch, which is not required for playing futsal; futsal became extremely popular with younger age groups that cannot notice any significant differences between “big” football and futsal. Despite the fact that the majority of the futsal-playing population is comprised of men, women partake in futsal as well. Life expectancy of futsal players is far longer than in most athletes and this is precisely why many football players continue doing sports on a recreational level by playing futsal after they finish their professional football career.

According to Crofutsal.com (2018), in the context of futsal as an organized sport, it is not considered to be a version of indoor football that is played according to strict FIFA rules. For a long time, futsal existed under different names: street football, five-a-side football, indoor football, etc. According to one version, the creation of futsal can be attributed to Juan Carlos Geriani who, at the YMCA youth competition in Montevideo in 1930, presented football with 5 players on each team. Another version goes in favor of the claim that futsal came into being at the beaches of Brazil. In the 1960s Netherlands, Helder

Indoor Soccer Organization (HZVO) was founded, which was the beginning of institutionalization of futsal. In Madrid, *fútbol de salón* and all other names of the game were officially and internationally changed to FUTSAL in 1985. In the world, there are approximately 30 million people involved in futsal in at least 100 countries worldwide. In Italy, for example, approximately 4 million people play futsal, along with a million that play football.

Futsal has a long tradition in all parts of the Republic of Croatia, especially the one on a recreational level. Organization of a great number of competitions, both outdoors and indoors, has been attracting a large number of competitors, but supporters as well, which says a lot about the great popularity of this sport. During the summer, in places in the Republic of Croatia with futsal courts, summer tournaments with many prizes are held, and besides the recreational and representative futsal players from Croatia, many players from abroad participate in them as well. All these arguments go in favor of the claim from the beginning of this paragraph, i.e., that futsal truly is a popular sport, both in Croatia and the world.

2.2. FUTSAL STRUCTURE IN THE REPUBLIC OF CROATIA

In the Republic of Croatia, the sports umbrella organization is the Central State Office for Sport. Its primary task is to make a long-term strategy for the development of sports in the Republic of Croatia and, through legal instruments and authorized legal persons, control implementation of the strategy at all levels (Central State Office for Sport: 2018). The legal framework for operation and all activities are linked to the sports activity described in the Sports Act. The Act regulates the sports system and sports activities, professional jobs in sports, sports competitions, sports financing, supervision and other matters significant for sports (Official Gazette:2006). The Act was passed in 2006, however, due to its flaws and poor rate of application it became a subject of discussion, and a new Sports Act is being drafted that should cover and correct those elements that were missing in the initial Act, i.e., the initial formulation was not suitable to for the actual condition.

According to the basic division, sport in the Republic of Croatia is divided into (Bartoluci;2003:151):

- Physical education of children and youth

- ♦ Competitive sports
- ♦ Sports recreation for citizens
- ♦ Kinesiotherapy and adaptive sports

Since competitive sports is divided into amateur and professional, it can be said that futsal in the Republic of Croatia is primarily placed in the category of competitive sports, the amateur type to be precise. In the institutional sense, the most highly positioned sports association in the Republic of Croatia is the Croatian Olympic Committee. Its mission is to permanently contribute to the promotion of sport as universal civilization heritage; spreading of Olympic principles, as well as ethical and moral standards in sports; creating the top sports achievements of the Croatian athletes; promotion of the Republic of Croatia as a democratic state; fair relationships among the participants in sports (Croatian Olympic Committee:2016). Hierarchically, national sports federations and local sports organization are below the Croatian Olympic Committee. All sports in the Republic of Croatia are assembled around national sports federations for a certain sport, and national sports federations coordinate the highest structures of competitions through their county organizations and local sports associations.

Football competitions in the Republic of Croatia, including futsal competitions, are coordinated by the Croatian Football Federation. The authority that organizes competitions within the Croatian Football Federation is the Futsal Commission (Croatian Football Federation: 2018). The competition system for the senior category is organized in one 1st HMNL (Croatian First League of Futsal) and three regionally divided 2nd HMNL (Croatian Second Leagues of Futsal). Besides the league competitions, a cup competition is organized and held in each region in the beginning, then the best teams continue to the competition on a national level. All competitions below these two levels and the cup are competitions that are not under the direct supervision of the Croatian Football Federation, i.e., they are considered to be recreational systems of competitions. An example of this is county leagues of futsal, as the third level of competition. These are not official HNS competitions, however, county football centers support them and give them a status of competitions. In younger age categories, tournament or league competitions are organized in individual regions for certain age categories.

When discussing the east region that includes Osijek-Baranja, Vukovar-Srijem, Brod-Posavina, Požega-Slavonia and Virovitica-Podravina Counties, and their futsal structure, then it is important to emphasize that, in the season of 2017/2018, of the 12 teams in the 1st HMNL, the eastern part of the country had 2 representatives: MNK Osijek Kelme from Osijek and MNK Brod 035 from Slavonski Brod. From the aforementioned, it may be concluded that the majority of teams is from the other two regions, the south one and the north one. In the 2nd HMNL East, 9 clubs competed in the season of 2017/2018, 3 of which were from Osijek-Baranja County, 3 from Vukovar-Srijem County and 3 from Brod-Posavina County. In a season of 2018/2019 in the 2nd HMNL East, there are 10 clubs competing, 2 of which are from Osijek-Baranja County, 4 from Vukovar-Srijem County, 2 from Brod-Posavina County and by 1 team from Požega-Slavonia County and Virovitica-Podravina County.

Table 1: Number of teams in the official HNS competitions in seasons of 2017/2018 and 2018/2019

Season 2017/2018					
	OBC - 031	VSC - 032	BPC - 035	PSC - 034	VPC - 033
1st HMNL	1	0	1	0	0
2nd HMNL	3	3	3	0	0
Season 2018/2019					
	OBC - 031	VSC - 032	BPC - 035	PSC - 034	VPC - 033
1st HMNL	1	0	1	0	0
2nd HMNL	2	4	2	1	1

Source: Author's research

Ultimately, it can be additionally emphasized that all futsal clubs in the Republic of Croatia greatly rely on volunteering at all levels since, regardless of the non-profit level, they act at the amateur level, the specificity of which will be further discussed in the following paragraph. The only exception, i.e., a club that has professional players is MNK Split (Crofutsal.com: 2018)

2.3. NON-PROFIT ORGANIZATIONS IN SPORTS

Sports organizations, according to the basic division, may be categorized into three different types according to the sector they act in. These are (Tomić, 2007:57):

- Public (state) sector

- ♦ Volunteer (non-profit) sector
- ♦ Commercial (professional) sector

It is very important to note that these three sectors greatly depend on each other in everyday functioning, as seen in *Figure 1: Institutional sectors in sports and their interdependence* and certain sports organizations overlap in different institutional sectors. This way we have organizations competing in professional ranks, but in the organizational sense, they function as non-profit citizens associations.

Figure 1: Institutional sectors in sports and their interdependence

Source: Tomić, M (2007), *Sportski menadžment*, Belgrade: DATA STATUS

Non-profit sports organizations make the greatest part of sports organization and these include all those sports organizations the primary task of which is not making financial gain, as is the case with sports organizations acting in the commercial sector. To realize their goals which primarily regard the development and expansion of non-profit sports organization in the sports sense, they have unavoidable expenditures, therefore they need to collect revenue through memberships, sponsorships, donations, public sources of revenue or sales of certain services to balance the revenue and expenditure sides of the budget.

Non-profit sports organizations that are the subject of this research may, by many criteria, mostly be characterized as simple sports organizations of the “kitchen table”, unlike clearly structured sports organizations that are characterized as organizations of the “executive office”. “Kitchen table” organizations, as defined by Beech and Chadwich (2010;203), are organizations where most decision-making in the organization and administration typically occurs around the kitchen table or something similar. The same authors state that these orga-

nizations, among others, are typically characterized by the following: an absence of a central office location and paid staff, heavy reliance placed on volunteers who hold a number of different roles within the organization, the structure has few hierarchical levels, the sports organization is governed by a few formal rules, little specialization of volunteer roles or tasks, and decision-making is centralized with a few people.

In order to sustain themselves in today's competitive market, non-profit sports organizations need to define their strategies and include answers to questions on their relationships with current and future members, the manner of defining the management structure and control mechanisms with an aim of defining responsibility. What is also necessary is to define the short-term and long-term strategic direction of a non-profit sports organization through long-term and short-term goals and, through this, define all processes and long-term policy of the sports organization that will clearly present values on which the sports organization should be based on and towards which it should strive.

When considering a broader context of sports, regardless of the type of sports organization and regardless of the fact that this paper deals with futsal organizations, it is important to mention the fact brought up by Bartoluci and Škorić (2009:47) which says that the area of sports in the developed European countries generates much more funds in the market, than it is invested in by the state. For all the aforementioned reasons and the fact that the volunteering level and the level of transparency for all its members and the public is very high in non-profit sports organizations, use of digital technology and a full digital transformation of business operations may significantly contribute to the realization of set goals.

2.4. ROLE OF THE INTERNET AND THE IMPORTANCE OF DIGITAL TRANSFORMATION IN SPORTS

Digitalization in everyday life is present on each step so it is very difficult to find a segment of society that is not at least partly digitalized or not in the process of digital transformation. The digital transformation may be described through two strategies. The first strategy is an optimization that includes digitalization of the existing business operations and the second strategy would be innovation, i.e., the introduction of innovations at the business model level and creation of new products and services based on digital technology (100posto.

hr:2017). Digital business models “include all business activities that occur electronically and with the help of digital technologies which, through extensive electronic integration with the surroundings, generate new value and utilize benefits of running business operations in the digital economy”. (Spremić; 2017:38)

According to several authors, sports as an institution include four main components (Xian, Hedman, Tan, Tan, Lim, Clemmensen, Henningsson, Mukkamala, Vatrappu, van Hilleberg; 2017):

- The organizational component
- The technological component
- The symbolic component
- The educational component

The aforementioned authors believe each of these components went through a digital transformation of their own as a result of necessary adaptation to today's digital way of life and functioning of the society as a whole. Because of this, sports digitalization contains the aforementioned components as well, and the paper will further present the fact that some of the elements interlink with each other, i.e., influence several components. Further on, the effects of digital transformation on each component will be discussed.

Digitalization of the organizational component reflects in the use of digital technologies in administration which eliminates the need to carry out processes by hand and hence reduces the chance of making mistakes. Digital technologies enable splitting of live broadcasting rights for TV rights, but also to rights that regard the use of digital technologies which generate new revenue for clubs, but also new value for sponsors, supporters as well as for owners and members of sports organizations. Use of digital data analysis generates new value in terms of revenue as well, and both social networks and websites allow new members from all over the world new ways of communication and inclusion in the work of sports organizations. The occurrence of fully digitalized sports (eSports) opens a completely new market and way of experiencing sports.

Digitalization of the technological component may have had the greatest impact on sports and athletes. Promotion of sports in the technological sense can be noticed in the commercialization of physical components and effects of athletes through their conversion to digital products such as computer games

as well. Additionally, monitoring of players and their form by analyzing data received through wearable technology can be used to reduce weaknesses in individual players, but also to record their strengths compared to others with an aim of utilizing them better and improving the athlete's form. In certain sports, digital technology was implemented in the rules of the game themselves and is used as a tool in resolving certain controversial situations during a contest to determine the final outcome or the winner.

Digitalization of the symbolic component of sports relates primarily to the fact that digitalization allowed the events occurring in a sports organization or on a sports competition to be transmitted all over the world. For example, supporters of a club or club members can now keep up with events in their club, news from practice, presentation of new players or games of their club and it can all be viewed live, at the time when the event is taking place. This way, sports organizations increase their base of supporters, but also enable supporters and club members to become closer to their club or to connect to it even more through such interaction. This way, the gaps between keeping up with a club physically and doing so online are closed. Social networks and online channels for transmitting video content play an important role here.

Digitalization of the educational component regards promotion of information on the health components of athletes and their form through detailed training analysis, preparation, the contest itself, but also post-competition analysis. The most important role in this component is that of wearable technology and the "Internet of things" (*IoT*). This way, traditional ways of training are changed, but so are the required competencies the employees in sports need to have. With the help of digital technologies and specially created computer applications, different digital simulations, training analyses and adaptation to the needs of all athletes are implemented. With social networks and different digital platforms for the exchange of video and other material, knowledge and new developments are transferred from coach to coach, but also from player to player. There are no geographical or linguistic barriers for sharing this knowledge and it became available for everyone; in this context, conditions and competencies necessary for the realization of sports achievements are equal for all.

In the managerial sense, digitalization in sports is extremely important in the areas of marketing and client management. Client relationship management greatly changed with the use of digital technologies. The term "*Customer*

Relationship Management” (CRM) and systems that enable client management in the business world play an important role when discussing the business operations of a company. CRM can be defined as a way of managing relationships with clients, i.e., approach to company management through interaction with current and prospective customers. The CRM approach attempts to analyze customer data and their history of relationships with the company to improve business relationships with clients/customers while placing an emphasis on retention and ultimately achieving sales increase (BizIT.hr;2016). Lately, CRM has been increasingly used in sports organizations as well. Up until 20 or so years ago, in terms of marketing, sports organization were focused on ticket sales, advertising space in the stadium and sales of props at the shops. All activities were limited to the area of the stadium and around it. When doing so, no attention was paid to the ones who purchased those products. There were no records of clients at all, which are the supporters in this case. By starting to pay attention to the relationships with the supporters, the focus of the clubs started to shift from products and services they sell to the persons they sell them to.

From the perspective of viewing sports that were not viewed by a large number of viewers due to the physical specificity of such sports, digitalization led to an extremely significant increase in viewers, i.e., clients. For example, water sports such as sailing could not be adequately viewed since viewers would either remain on land or they would need to board a vessel to view the races, which is of course quite inconvenient. Digitalization allowed for these sports to be viewed all over the world, however, transparency and regularity of the competition itself significantly improved as well. Each vessel can now be tracked with the Internet and a GPS device. A similar thing happened with long-distance running competitions. A specially developed computer application can track each competitor from the beginning to the end with maximum precision through wearable technologies worn by all the competitors. This way of tracking the position of the participants can be provided for all the viewers as well. Regarding sports such as, e.g., extreme skiing at mountain peaks, it is extremely difficult, even impossible for viewers to physically view the sports event live. Digital technologies are the things that allowed people to view such sports from the comfort of their homes.

At the end of this paragraph, it can be concluded that digitalization in sports brought up great changes in the management of sports organizations and, in some cases, even in sports themselves. This change primarily regards the new

ways of collecting, processing and later on analyzing data on athletes and sports activities themselves. The concept of client relationships completely changes, in the case of a relationship with the supporters in sports, so the supporter is put in the first place, which was until now exclusive to the product and service. The manner of promotion completely changes with the use of new Internet tools. With the development of management in sports, the time period of sales activities in sports increased from the time of duration of the sports activity to the entire day of the sports event (in expert literature, this is known under the term match day). Certain sales activities, with the digital transformation of sales operations, are later on continuously expanded to the whole year due to the change in the relationship with supporters and the manner of mutual communication between players, supporters, sponsors, owners, and the public. The way we consume sports today changed dramatically in the last few years. Visiting a sports event no longer means just viewing a sports event, all of it is starting to be perceived as a social experience and an adventure associated with these events (Eventbrite.co.uk;2016).

When talking about specific digital tools, then sports organizations have a whole array of options they can use to improve their work. Besides improving the work, proper use of digital technology leads to greater transparency of business operations, better data protection, improvement of communication with members in all directions as well as networking with the goal of exchanging experiences or gaining information on activities in real time. Most often, these digital tools are web pages of a sports organization, communication on social networks, online stores, forms for online application, specialized applications for electronic data processing, etc.

3. RESEARCH PART OF THE PAPER

3.1. METHODOLOGY

In terms of methodology, several scientific methods were used for the purposes of the research part of this. Geographically, the subject of the research was the area of eastern Croatia and the sample included five of the most eastern counties: Osijek-Baranja County, Vukovar-Srijem County, Brod-Posavina County, Požega-Slavonia County, and Virovitica-Posravina County. To accu-

rately determine samples in the secondary research, accurate sample parameters were gained through the publicly available information on the condition of futsal competitions in Croatia and especially in eastern Croatia. Several different methods were used for the needs of primary research. Initially, a research was carried out by surveying responsible persons in futsal organizations included in the sample and after this, official, non-publicly available data on the number of viewers were gained from an official of the Croatian Football Federation. In the secondary research of publicly available data, a detailed analysis of activities on the Facebook social network for all futsal organizations included in the sample was carried out. All 9 futsal clubs of the 2nd HMNL East and two clubs from the area of eastern Croatia that compete in the 1st HMNL were included in the sample. The considered competition season is the season of 2017/2018 since this is the most recent completed competition season. Results obtained in the primary and secondary research were analyzed and synthesized to form relevant conclusions in accordance with the goals set in the aforementioned research.

3.2. RESEARCH RESULTS

Analysis of research results can be started by reviewing levels of activity on Facebook. This analysis shall establish the number of people that follow Facebook pages of the analyzed futsal clubs and the level of activity of the Facebook page administrator. These data can be significant in the later parts of the research.

Table 2: Relationship between the number of followers and posts on Facebook pages of futsal clubs

Team	Number of followers on FB	Number of posts in the season
MNK AURELIA	5092	581
MNK Osijek Kelme	3178	108
MNK BROD	2601	412
MNK BROD 035	2462	343
MNK VINKOVCI	2276	261
MNK OSIJEK 031	1599	13

If the data from the table were to be presented in a graphic form, it becomes even easier to notice that the relationship between the number of followers usually goes in line with the number of posts on individual Facebook pages in the last season. The exceptions to this are clubs from Osijek, MNK Osijek Kelme and MNK Osijek 031. These clubs had significantly fewer posts than their competitors, MNK Osijek Kelme had only 108 posts in the whole competition season and MNK Osijek 031 had only 13 posts in 365 days. Despite the fact that MNK Osijek Kelme has a large number of followers, this potential is obviously not adequately used.

Chart 1: Representation of the relationship between the number of followers and posts on Facebook pages of futsal clubs

Source: Author’s research

The research also conducted an analysis of the potential viewer base and realistic data on the average number of visitors in a home game. Men from age 15 to 64 (source: Croatian Bureau of Statistics; 2011) were considered as the basis of calculation of potential viewers, i.e., high-school students and persons of working age that live in a place where a futsal organization has its seat. The female sex was not considered since the percentage of female viewers in the total number of viewers is very small, and this number does not have a significant influence on the result of the research.

Table 3: Representation of potential and actual viewers during the home games

Team	Potential viewers	Average number of viewers	Share
MNK OSIJEK KELME	35440	127	0.36%
MNK OSIJEK 031	35440	50	0.14%
MNK BROD	19274	261	1.35%
MNK BROD 035	19274	231	1.20%
MNK AURELIA	11579	234	2.02%
MNK VINKOVCI	11579	92	0.79%
MNK BATA BOROVO	8735	200	2.29%
MNK NAŠICE	5714	100	1.75%
MNK NG UNITAS	4525	35	0.77%
MNK MALA MLJEKARA	4042	30	0.74%
MNK MOBY DICK	799	30	3.75%

Source: Author's research

When considering data in *Table 3: Representation of potential and actual viewers during the home games*, it can be noticed that the number of visitors, when compared to the potential, is less than 1% in half of the sample. It is also very important to note the fact that in 3 places, there are 2 clubs that are competitors to each other in terms of attracting the potential base of viewers. The aforementioned places are Osijek (MNK Osijek Kelme and MNK Osijek 031), Vinkovci (MNK Vinkovci and MNK Aurelia) and Slavonski Brod (MNK Brod and MNK Brod 035). For the purpose of providing a clear representation and due to the existence of two clubs in the same city, the total number of potential viewers per club was divided in half for the aforementioned cities, the results may be seen in *Chart 2: Graphical representation of the share in the number of viewers in the total number of potential viewers*. In this representation, it can be seen that futsal clubs with the smallest number of posts on social networks are once again in the back, while MNK Aurelia, which had the largest number of posts, has the greatest share, but it also has the most followers on its Facebook page.

Chart 2: Graphical representation of the share in the number of viewers in the total number of potential viewers

Source: Author's research

In the theoretical part of the paper, the importance of responsible and efficient financial management was mentioned, regardless of whether non-profit organizations are in question or not. It is precisely in a non-profit organization that own sources of revenue are extremely important. This is why an analysis of part of sold tickets on the revenue side of the budget was carried out in order to try and find a connection with activities on Facebook.

Table 4: Representation of the size of the budget and share of revenue in the budget generated by ticket sales

Team	Budget	Revenue generated by ticket sales	Share in budget
MNK OSIJEK KELME	380,000.00 HRK	27,940.00 HRK	7.35%
MNK AURELIA	97,000.00 HRK	16,400.00 HRK	16.91%
MNK BROD 035	70,000.00 HRK	50,820.00 HRK	72.60%
MNK OSIJEK 031	70,000.00 HRK	0.00 HRK	0.00%
MNK BROD	60,000.00 HRK	14,000.00 HRK	23.33%
MNK NG UNITAS	50,000.00 HRK	0.00 HRK	0.00%
MNK NAŠICE	45,000.00 HRK	7,000.00 HRK	15.56%
MNK BATA BOROVO	45,000.00 HRK	3,000.00 HRK	6.67%
MNK MOBY DICK	40,000.00 HRK	0.00 HRK	0.00%
MNK MALA MLJEKARA	40,000.00 HRK	0.00 HRK	0.00%
MNK VINKOVCI	30,000.00 HRK	6,300.00 HRK	21.00%

Source: Author's research

Graphical representation of the share in revenue generated by ticket sales in the budget of a sports organization shows indicative data. The teams that had the greatest number of posts on Facebook have the largest share of revenue generated by ticket sales in their budget. Foremost, these are the clubs MNK Brod 035 and MNK Brod as well as MNK Vinkovci and MNK Aurelia. On the other hand, clubs that quit the competition after the season 2017/2018 are in the back, i.e., clubs MNK Mobi Dick, MNK NG Unitas and MNK Osijek 031. Along with MNK Mala mljekara, these are the 4 clubs that generated no revenue from season, member or regular tickets.

Chart 3: Graphical representation of the revenue share in the budget generated by ticket sales

Source: Author’s research

By referring to *Table 5: Representation of the relationship between the ranking at the end of the season 2017/2018 and activity on Facebook* it can be noticed that, as in previous cases, futsal clubs that are more active on Facebook have a higher ranking, i.e., the ones that had a lower level of application have a lower ranking. There are 3 futsal clubs that quit the competition in season 2018/2019 which are marked with an asterisk in the table and after an inspection into their basic Facebook activities, it can be noticed that they were extremely low in intensity.

Table 5: Representation of the relationship between the ranking at the end of the season 2017/2018 and activity on Facebook

Team	Ranking	Number of followers on FB	Number of posts in the season	Level of competition
MNK VINKOVCI	1	2276	261	2nd HMNL
MNK BROD	2	2601	412	2nd HMNL
MNK AURELIA	3	5092	581	2nd HMNL
MNK NG UNITAS*	4	0	0	2nd HMNL
MNK BATA BOROVO	5	865	139	2nd HMNL
MNK NAŠICE	6	1228	78	2nd HMNL
MNK MOBY DICK*	7	639	30	2nd HMNL

MNK MALA MLJEKARA	9	620	14	2nd HMNL
MNK BROD 035	8	2462	343	1st HMNL
MNK OSIJEK KELME	9	3178	108	1st HMNL
*Quit the competition in season 2018/2019				

Source: Author's research

All research presented in the paper points to a correlation between activities on Facebook and sports, business and financial results of non-profit sports organizations.

4. CONCLUSION

Non-profit sports organizations in the area of eastern Croatia, but in the world in general as well, are definitely going through a very important phase of transformation in which they are starting to apply different digital tools in their business operations more and more. One of such digital tools is social networks or, in this case, Facebook. The fact going in favor of this is that it is becoming more difficult to find funds, i.e., change in the perception of non-profit sports organizations management which believed that it was sufficient to fund themselves solely through public sources of revenue and that it was not necessary to seek additional funds through other commercial sources of revenue. Many sports organizations are adhering to a wrong principle which dictates that they do not need to generate additional funds if they are non-profit and are forgetting the fact that the essence of a non-profit organization is not generating as

many funds as possible but using the raised funds for additional investments in the development of sports they deal with and not for profit.

Facebook is one of the more efficient ways of communication and one might say of advertising as well when considering its effect and financial resources deployed. Research in this paper showed that futsal clubs which actively use Facebook as a tool in their operations have better results in other areas. Starting with the sports ranking at the end of the season where it can be noticed that clubs which were the least active on Facebook did not compete in the upcoming season. Furthermore, the same link can be noticed with the share of people attending events when compared with the number of potential viewers, i.e. revenue generated by ticket sales and their share in the total budget.

From all the aforementioned it can be concluded that for sports organizations and perhaps most for recreational, non-profit and amateur competitions, activity on social networks can have positive effects on everyday operations, both in sports and business.

Abstract

Influential or persuasive aspects of communication necessarily relate to political communication that has its purpose primarily in this convincing dimension. The aim and purpose of politics as a discipline and communication is to convince the target audience of the quality of the political programs or policies that a particular party, group or individual brings to the political arena.

With the development of communication channels, we can also monitor the development and adaptation of political communication to all kinds of media politics and politicians use to communicate with their public. Today it is hard to determine which medium is suitable for the public so we can hardly speak about the segmenting of the media as the target channel through which we communicate targeted messages. The 'target audience' is almost at the palm of our hand, which makes political communication much easier.

What we can distinguish between communication aspects are messages that are shorter or longer, which are accompanied by attractive and receptive visuals and so-called hashtags that identify the target audience to which it is addressed. Although such communication is adapted to online media or social media, traditional media track events on these platforms and consequently adapt communication to so-called offline media.

Persuasiveness and influential aspects are reflected in the number of clicks, likes, and shares of a certain status, according to which traditional media determine who and what is interesting to follow. The influential aspects of political communication will be further explored through the analysis of content and case study of local elections in 2017. The aim is to show that political communication and persuasive aspects are not universal, but adapt to the participants of political communication and the target public.

Keywords: *political communication, persuasion, public, media, social networks*

JEL Classification: D72, D83

1. INTRODUCTION

The process of persuading someone into something is as old as humanity; it is born with us and dies with us. The media are very skillful in convincing, but instead of declining over the many years of their existence, they are even getting better in convincing the public. Although the media offered us these new values that we were not aware before, they offered us a new way of life, new possibilities, but also a lot of information which might help us in determining what is true and what is not. As far as media persuasion is concerned, we almost never ask 'what if' - on the contrary, the truth we get from the media is accepted as the only real truth.

The fundamental aspect of persuasion discussed in the paper is the persuasion power of politicians who influence the perception of the world around us as equally as the media. Aristotle claimed that we are 'homo politicus', so we probably instinctively fall under the influence of politicians' persuasion magic, even though political communication and their messages are deeply questioned. They are skilled in what they do, know how to gain public attention, and for their persuasion purposes, they also use the same media we consume. The me-

dia carefully select messages transmitted to the public, so some politicians are more convincing than others. But when it comes to politics, we ask 'what if'...

Traditional media, social networks, and today's information dissemination speed have changed the way information intended for the influential aspects communicate their message to us instead of just transmitting the naked information. Journalists used to check their sources, their integrity was important, but now the speed is crucial. The quality of information is put aside. Quality of the information or the message is measured by the influence it may have on the reader - the recipient of the information and in which direction that information can move further.

2. COMMUNICATION ON NEW MEDIA

The media have always had a tremendous impact on people who consume them, and equally affect the world of human cognition. The value of information or media content affects the number of consumers who consume media industry content (Bestvina Bukvić et.al., 2016). Producing and distributing media content is getting faster every day, and messages that are created and sent via media are aimed at affecting people. It is therefore important to know and understand each media platform that we use with the intent of communicating with our community.

New media are now a part of popular culture, and if we look at popular culture through semiotics, a new and different view of the contemporary world is required. As the new media developed, they adapted and fitted into everyday practice until the generations of users became addicted to them. Below all these media are the cultural constructs of speech and language, common values, ideas, beliefs and practices (Gaines, 2010: 12, according to Danesi, 2010)

2.1. NEW MEDIA AS A NEW COMMUNICATION PLATFORM

The success of a computer as a universal information - processor device lies in the very fact that the universal language is present in this medium, within which the various types of information can be encoded and that language can mechanize it. It is precisely the computer that is characterized by a well-known Leibniz dream of a universal language that would be the lingua characteristics which would allow a 'perfect' description of knowledge that represents the 'real

signs' of concepts and things, and the calculus ratiocinator, enabling the conceptualization mechanism. If such language was in use, Leibniz claimed 'mistakes in understanding would be avoided, and infinite philosophical discussions would cease because all philosophers would say 'we are adding up' (Codognet, 2014).

The development of technology has influenced the creation of new media that have created a universal language. New media, digital media, the virtual world, satellites, and all other innovations like SMS, the Internet, blogs, and social networks have changed not only the way we communicate but also the things we value and which are becoming the most important to us in everyday life. In this way, mass media, by image and sound, entered our private lives from distant places, which influenced the sense of privacy, and our personal experiences with new technologies differ greatly because of the speed of acceptance of such an accelerated way of communicating.

The new media and new platforms the technology development brought out have influenced the speed and quality of everyday communication. Messages and sentences are becoming shorter. Sometimes the picture alone is enough to transfer the message in real time and as such to be accepted by the recipient. Virtual communities and online social networks are mostly groups of people using the Internet's default communication infrastructure (media environment) to communicate and participate in daily interactions with virtual friends (O'Neill, 2008: 24).

We are invited to participate in the online community to share content and data with similar 'strangers'. We have the ability to inhabit this digital world and play the inventive roles from the comfort of our own home, being always available, at any time and anywhere. We are a technology generation 'infected' by the blend of different media devices. Social networks, due to the rapid exchange of information and countless many members of the online community are becoming the fastest growing phenomenon (O'Neill, 2008: 24). The globalization and the spread of communication reached the highest homologation of social models of production, giving primacy to the semiotics. One type of market now dominates the whole planet, one type of production and system consumption that leads to homologation not only in human behavior but in imaginative life (Petrill, 2005: 549).

2.1.1. Visual symbols of contemporary communication

Emoticons, due to the way they developed, became a real social phenomenon, an indispensable part of modern communication, and in line with the advancement of technology, there are also their 'advanced' versions. Scripturally, it is difficult to convey emotions, intentions or tones, so Internet users have come up with emoticons (a blend of 'emotions' and 'icons'), or keyboard character sets that represent facial expressions.

In order to simulate voice communication, virtual communication users turn to a group of non-voice characters called emoticons, as well as acronyms and abbreviations. Emoticons simulate speech - they actually simulate facial expressions and physical communication that accompanies speech - which would make speech communication (Randall, 2002). This symbol gives us a clearer understanding of the mood of the interlocutor in any form of virtual communication, and there are three forms of emoticons used in virtual communication (Amaghlobeli, 2012):

1. Typographic emoticon - :-) or: - (- consists of punctuation marks or some other typographic symbols that can be found on the keyboard;

2. A graphic emoticon ☺ or ☹ - often animated, is a sketch of some of the computer extensions (JPG, GIF), and some of them automatically form the typographical emoticon in the graphic;

3. Verbal emoticon (Happy Smiley) is a graphic or typographical emoticon that is becoming more productive, in parallel with a non-verbal smile.

If we look at the emoticons in the context of the six basic emotions that psychologist Paul Ekman came to during his researches, these emoticons really look like a human face. Below are examples of emoticons and their meanings for four facial expressions for which there are written rules in the form of typographic emoticons.

- :-) or :) smile, happiness or joke (eyes and smiling mouth)
- :-(or :(frowning face or sadness (eyes, nose, and frowned mouth)
- X-(anger (squinty eyes, nose, and frowned mouth)
- :-O surprise (eyes and mouth open)

In computer terms, they are a series of characters, such as a colon, a parenthesis or a dash, or a thumbnail, and both versions should represent the face of the subject and convey the mood and emotions of the person who typed it. In other words, emoticons are considered to be the form of a paralanguage that was born in emails, online ads and chat rooms, which popularized a long ago created smiley.

Emoticons are often used on online or virtual platforms as an addition to the written text. The most common is a smiley :-)) with the meaning 'I'm laughing to a joke'; winking ;-)) with the meaning 'I'm winking and grinning to a joke'; :-(sad smiley with the meaning 'I'm sad'; :-P with the meanings of 'poking my tongue out of my mouth'; :D or :-D a big smile with the meaning of 'I'm thrilled'; and :-O 'I'm open-mouthed, in surprise'. In the written message, the addition of an emoticon in the middle of the text or at the very end of it gives the person receiving the message a clear tone and a sense to the written message (Danesi, 2004: 73).

The fact that virtual platforms cannot express emotions today is absurd. Just as any text, such as a novel or poetry, expresses emotions, the addition of emoticons as facial expression is important for transmitting the message in online communication. No matter which online platform you choose, the fact is that different types of characters, different colors, and emoticons can be used to express our own emotions. Some emoticons are in the form of an image and do not consist of some symbols typed on the keyboard. Today, the amount of emoticons is countless and every sender of the message can complete the tone of what he wants to say (Berger, 2010).

3. DIGITAL MEDIA AND ONLINE COMMUNICATION

The appearance and development of social networks have made two-way communication between politicians and voters, as well as with their opponents, quicker and easier. Twitter, taking the primacy over the radio, has become the fastest medium millions of posts go through every day. The importance and speed of Twitter have been recognized by numerous companies, non-governmental sector, private users, political parties and politicians individually, and having an active profile means being available for direct communication 24 hours a day (Đaić et al., 2017: 125). The new generations born or growing up in

the digital and online world are called the 'Internet generation' or 'digital natives'. The 'new era' generations are driven to the information provided 'immediately' and 'right here'. They are who we call the 'Internet generation'.

Digital media are lighter, cheaper and require less space when storing data, they are harder to eradicate but also easier to delete or accurately copy. The analog medium requires a certain type of device when it is reproduced or created. On the other hand, digital media use a universal machine, a computer that does this all at once and is used for all digital forms.

Social networks, their potential, and constraints, in political terms, are a different communication platform that substantially changes the current ways of communication processes (Đaić et al., 2017: 128). Web 2.0 or new media facilitate direct communication, especially since the introduction of the mobile wireless standard, and the new standard - to be online the whole day. Easy access to information means that the users themselves put their materials on the Internet and thereby increase and create databases. In keeping with these simple but sometimes inadequate rules, the media are trying to come to their auditoriums every day. By placing information, they consciously or unconsciously impact public opinion, therefore, there is still a need to pay close attention and constant review and control.

4. POLITICAL COMMUNICATION AND INFLUENCING SOCIAL NETWORKS

Politicians today use various blends of communication channels to achieve the purpose of political communication, which is persuasion – convincing people into something and influencing public attitudes. In the process of persuasion, public relations are increasingly involved between politicians and the media. In modern societies, the media are the bearers of political communication that goes beyond direct face-to-face communication. Their role in making politics visible is indisputable, providing information to the public by opening a discussion place.

We can talk about political communication in the sense of what is interesting for everyone involved in communication analysis - verbal and non-verbal speech, or the study of the messages that have been made and whether they are in accordance with what our body is saying. Are there any hidden messages?

Dynamics of communication manages the power of the media to select messages and shape their presentation and to use the strategic use of political and social power to influence topics of discussion as well as to start and frame public themes (Habermas, 2013: 149).

Particularly interesting are the politicians whose public appearances are constantly being analyzed, as well as influential aspects of political communication. Social networks have, too, become the relevant source of information in journalism circles, or at least a source of good topic ideas. Twitter has thus become one of the most relevant sources of information because research has shown that Twitter, more frequently than the planetary popular Facebook network, is used to expedite seriously and verified information. Although new techniques and technologies are unavoidable communication channels, the power of television is not decreasing. This most powerful mass media allows us to conduct communication analysis of public performances of famous people.

The appearance of the Internet as a tool of political communication raises numerous researches and discussions of its potential in the electoral campaign, especially considering that online users are exactly the voter's candidates want to attract. The low levels of political communication we are witnessing on a daily basis, as well as continuous manipulation, and the infamous and often badly communicated messages, resulting in distrust of citizens towards political parties and politicians. On the other hand, there is an 'army' of young people who show abstinence, and which are an important pillar of the development of a democratic society. By being interactive, the Internet is different from all other media. On the Internet, man is not only a passive observer, as in most other advertising techniques, but he is also an active tracer, a 'surfer' for information, a participant in social networks. On the Internet, an individual can post information, open pages, participate in discussions, not only exist as a consumer of information - but he is also the creator of information (Haramija, 2014: 448).

4.1. INFLUENTIAL ASPECTS OF POLITICAL COMMUNICATION

The online community is getting louder, and today it raises the question of the role of the media in reporting on politics and how far the impact of political communication to the work of the media goes. Persuasive communication is most often defined as a form of communication that tries to influence others, i.e. their beliefs, attitudes, and/or behavior, using cognitive and effective arguments

and appeals. This influence is attempted to be achieved through symbolic structures and using selected methods and techniques considered to be the most optimal for achieving predetermined goals of communication (Hrnjić, 2008: 11). The main goal and purpose of both the media and politics are to convince its public in the messages being transmitted. Techniques of persuasion are equally well-used by Hollywood producers whose miraculous techniques and special effects convince us into the genuineness of what we see. Similar techniques are used by television when transmitting news. The most sophisticated persuasive techniques are used by political public relations. The public is more likely to accept them because they are different from advertising itself, and messages that the public through the media gains from public relations are easier to fall into the fertile ground. Public relations use various persuasion techniques to convince us that their product is the best. They do it either by 'selling' positive images of corporations and different public figures every day or assuring us that certain politicians share our attitudes about a better future and how they are the people we should give our voice to.

In order for the public relations to convey their message, they need the media, and the media are more present than ever. The persuasive messages will be seen on the Internet, on leaflets, billboards, and on traditional mass media as well. The language of persuasion is easy to learn, and long ago Aristotle had taught people of it through speaking and writing. If we learn to read the media, we will recognize when someone tries to convince us in something but the question is whether persuasion is here to convince us or just to help us decide whether we are right?

5. RESEARCH

For the purposes of this paper, after a thorough theoretical presentation, the visual communication aspects created by the Internet and the social media will be analyzed. In the research part of the paper, promotional material from the 2017 local election campaign, which was communicated as a channel through the web pages and social media, will be analyzed. The aim is to show that well-designed visual tools can influence attracting the attention of the target audience. The colors of the visuals will also be analyzed, as well as the messages of the ads, and the timing of their release.

Furthermore, social media communication, primarily the Facebook channel, will be analyzed in the research part, which in the campaign of a candidate for the county prefect of Osijek - Baranja County proved to be the most appropriate communication channel for message transmission and presentation of policy to target public. Given the specificity of the local environment and the media ownership structure, the paper will look at the minimal media coverage on traditional media channels, of one of the candidates for the county prefect of Osijek - Baranja County. In the so-called media blockade, the analyzed candidate succeeded in finding a communication channel and presented himself to the citizens of Osijek - Baranja County, which will be equally represented through the research part of the paper. For the research part of the paper, open source, high-quality sources published on the Internet and social media will be used.

5.1. ANALYSIS OF POLITICAL COMMUNICATION OF CAMPAIGN ACTORS FOR LOCAL SOCIAL MEDIA CHOICES

In February 2017, during the campaign, on Ivan Anušić's official Facebook page a profile photo was changed. In the primary focus were Ivan Anušić and a few young people who were happy and smiling, talking to him and holding his hand. The photo got 366 'likes' and was shared four times (Picture 1)

During the same month, an interview accompanied with a short text entitled 'My County Prefect Ivan Anušić' was shared from the web page 'kamenjar.com', the primary focus is on a concrete topic, i.e. the campaign program to be realized. The photography of Ivan Anušić was also shared, with the description which cited his determination, loyalty, and commitment to the citizens. The most common hashtags used in the post were: #mojzupan (#mycountyprefect), #ivananusic and #hdz (Picture 2).

By the end of February, two releases were successfully received by the followers. Six photos from the first post, where the focus was on casually dressed Ivan Anušić who was on a meadow in Antunovac with his dog Rex, were shared. The additional description under the picture referred to Ivan Anušić as a family man and a person who successfully balances the business and family responsibilities. The post was liked 299 times. In the second post, the album '70th anniversary – Osijek Football Club' was shared. The event took place at the Croatian National Theatre in Osijek. The album contained 22 photos, including Ivan

Anušić, theatre audience and, of course, the footballers of Osijek Football Club. In these photos, Ivan Anušić was dressed formally, wearing a suit, and around the neck, he had a special detail for that occasion, an FC Osijek scarf. In that post, hashtags like #pokrenimograd (#restartthecity) and #nkosijek were used. With this announcement, Ivan Anušić explained that the city's football institution was a symbol of the city of Osijek and congratulated the club's 70th birthday (Picture 3 and Picture 4).

Blue colors and the HDZ logo prevailed. There were links to his official social sites (Facebook, Twitter, Instagram). In April, the young population was particularly visible in the photos, and young followers were invited to volunteer. The common hashtags on this announcement were #volonTiraj ("volunteer") #ivananusic #mojzupan (#mycountyprefect) #obz (an acronym for Osijek-Baranja County), while the photo itself presented a young team standing by Ivan Anušić's side. On the official Facebook page, the album '21 Archbishopric meeting of workers in political life' was also added, the location of the meeting is in the city of Đakovo. In one photo, Ivan Anušić shakes hands with Msgr Đuro Hranić, while on the other 20, the atmosphere of the Catholic Theological Faculty in Đakovo is presented. In the same month, another interview was shared, this time published in the daily newspaper 'Glas Slavonije', which is being released in Osijek, the words of Ivan Anušić being outlined in the interview. On the occasion of Easter, Ivan Anušić has been tagged on the pictures of the Facebook page of the humanitarian association 'Rijeka Ljubavi', where he was seen giving away 700 Easter packages for children from socially vulnerable families. Ivan Anušić was also tagged in the photo of the creative home for children 'Dokkica Association' from Osijek, which performs various educational activities for the youngest citizens in Osijek. In the photo, Ivan Anušić holds a hand-made colorful box in his hand and the paper with the phrase 'Laughter is a cure' (Picture 5 and Picture 6).

In the middle of the month, an album containing six photos was published, photographs featuring HDZ candidates for municipal mayors, mayors and county prefects of Osijek-Baranja County. The dominant colors on the photograph are the colors of the Croatian flag and extremely blue color. The album is liked 212 times and shared 10 times. Followers on Facebook particularly liked the post in which 49 photos were added, in the album 'Easter in our kindergartens'. In the photos, Ivan Anušić is hanging out with the youngest population in kindergartens in Ivanovac and Antunovac. The municipality donated packages

full of Osijek candy factory products (Picture 7 and Picture 8). Four new photos were added to the album 'Presentation of Elected Program for Development of the Osijek-Baranja County' 2017 - 2021, the Croatian Democratic Union. The post presented a more detailed program that is to be realized, the problems to be solved and the motto 'together to the win for a new beginning!'. In the photograph, Ivan Anušić is in the front, by the microphone, holding a speech, while in the background the blue color and HDZ logo prevail. Also, Ivan Anušić's business cards were photographed in one of the posts (Picture 9).

In one of Facebook statuses, links were provided in which the electoral program and 343 projects that were planned to be realized were presented to the followers. The published post talked about Ivan Anušić's possibility of becoming a county prefect of Osijek – Baranja County, which would then lead eastern Slavonia to a brighter future. In this status, the hashtags #343SpremnaProjekta (#33ProjectsReadyToGo) and #DoPobjede (#UntilTheWin) were used. Also, in one of the posts, Ivan Anušić thanked all those who supported his candidacy with their signature, accompanied by a photo of two young girls dressed in HDZ shirts. The post got 403 likes and was shared 15 times (Picture 10).

Three photos were also taken on the International Day of Nurses in KBC Osijek (Clinical Hospital Centre Osijek), and a link was shared from Ivan Anušić's official website (Picture 11). On Mother's Day, a photo of Ivan Anušić and his mother Kata was shared (Picture 12). Ivan Anušić also visited the Retirement Home. The post contained a single photo where Ivan Anušić is with an old lady and hashtags #BoljaBuducnost (#BetterFuture) #MojZupan (#MyCountyPrefect) #ZaNoviPocetak (#ForTheNewBeginning) #IvanAnušić (Picture 13).

The campaign included famous people who participated in it, so the popular singer Tony Cetinski could be seen on the pictures, as well as the former handball coach and state team player Slavko Goluža. Due to their overall popularity and a big number of Facebook followers, the visibility of the campaign was greatly impacted (Picture 14 and Picture 15). In the end, Ivan Anušić, in one of the Facebook statuses, thanked everyone who voted and participated in creating new ideas for the future and invited all the followers to come to the elections. Here was used a hashtag #ZaNoviPocetak (#ForTheNewBeginning) as well (Picture 16).

5.2. THE ANALYSIS OF POLITICAL COMMUNICATION OF THE PARTICIPANTS IN THE LOCAL ELECTIONS CAMPAIGN VIA PROMOTIONAL MATERIALS

The posters and the visuals are characterized with simplicity and clarity, the font is standard and readable, and the blue color, the sign color of the Croatian Democratic Union, prevails. Blue is often associated with depth and stability. It symbolizes trust, loyalty, wisdom, self-confidence, faith, and truth. The main motto 'For the new beginning' was used most of the time, as well as visuals featuring important days such as 'Women's Day'. Visuals were used as a 'thank you' note for voting, as well.

The visual that is directed at the 'VolonTiraj' project is particularly creative since it referred to a young population, prevailing in blue and white, but 'TI' (YOU) in the word 'volontiraj' (volunteer – wordplay) is highlighted in red. The shirts made for the campaign had a phrase 'Za novi početak' (For the new beginning) and a hashtag #mojzupan (#mycountyprefect) and social network logos (Facebook, Twitter, Instagram), and on the back 'Ivan Anušić' and the official website link was printed. The same is communicated on the other promotional materials - lighters, pens, etc.

In promotional posters, the team of Ivan Anušić went for a simple and minimalist style. The posters contain blue background with white letters, the face of the candidate on the poster, in order to make it easier for the public to connect, and the message 'For the new beginning' and 'For county prefect' – two messages that have marked his campaign for the local elections. As previously stated, the team of Ivan Anušić has made good use of social networks, so the promotional materials, along with the traditional media, were submitted via the portal and as social media ads. The added value of the posters is QR code, or augmented reality, which is linked to the slogan 'Jedna Hrvatska' (One Croatia). Throughout this communication tool, all candidates of the Croatian Democratic Union were connected on the national level (Picture 17). As the campaign developed, the team of the Croatian Democratic Union decided to show the deputies of the prefect to the public. This banner also radiates with simplicity and all the elements listed above, and it contains a message to circle number 1 for the county prefect of Osijek - Baranja County. This communication channel may be the most explicit (Picture 18). It was followed by a leaflet containing a summary of the political program of Ivan Anušić, summarized to the most essential points. The leaflet was distributed to home addresses, equally

distributed through the web site ivananusic.hr and through social media. This is the only promotional material that does not contain the above-mentioned communication messages but still exudes minimalism with a dominant blue color (Picture 19). The ‘VolonTiraj’ part of the campaign is probably the most interesting and dynamic. Ivan Anušić evidently addressed the younger population, which was largely neglected, but he invited them to join and contribute to ‘the new beginning’.

The echo of this part of the campaign was positive, and the promotional materials themselves differ from the previous ones in many details. The human faces and playful colors are dominant, the slogan itself is of different color and its tones are more vibrant than the usual blue colors recognizable for the Croatian Democratic Union. Posters from the ‘VolonTiraj’ group do not contain any communication messages from the primary promotional material. Same as the previous ones, these materials were distributed through the web page of ivananusic.hr and the social media (Picture 20).

6. DISCUSSION

In the previous chapter, we discussed the influential aspects of political communication, in which we also discussed the local elections in 2017, wherein the research part we analyzed the campaign for the county prefect candidate of Croatian Democratic Union, Ivan Anušić. This candidate was selected because of the diversity of campaign access. Although at the very beginning of the campaign Anušić was not a favorite, and polls showed that local elections were to be won by Vladimir Šišljagić, by intensifying the campaign itself, as well as political rhetoric, circumstances changed in favor of Ivan Anušić, who ultimately won the local elections. The traditional media were turned to the current county prefect at that moment, and he got more media attention. Other candidates had to use alternative communication tools, i.e. social media, through which they sought to reach the target audience. Today it is difficult to say with certainty whether this is an alternative communication channel, although it is certainly not a mainstream media. This option was best used by Ivan Anušić, as he used Facebook social network maximally to disperse his own messages to the different target audience. Visuals were designed to show simplicity, but contained remarkable messages #mojzupan (#mycountyprefect) and #zanovipocetak (#forthenewbeginning) which confirmed our first hypothesis H1: Due

to the adequate implementation of convincing factors in public communication, local elections candidate influenced the public's attitude. Likewise, in addition to the established and entrenched political communication with already pre-prepared phrases, the language Ivan Anušić used on social media stood out from the other candidates' language. He was acceptable to the traditional voter body, but Anušić made a move in political communication and spoke directly to the young people he communicated within a more informal way. The best example of this is the campaign 'VolonT'Iraj'.

7. CONCLUSION

Today it is hard to determine which medium is suitable for by the public so we can hardly speak about the segmenting of the media as the target channel through which we communicate targeted messages. Persuasiveness or influential aspects also manifest through the number of clicks, likes, and shares of certain posts, according to which traditional media determine who and what is interesting to follow. Even though we are 'homo politicus', our society is deeply politicized and we instinctively fall under the influence of convincing politicians, regardless of the fact that their political communication and their messages are deeply questioned. They are skilled at what they do, they know how to gain public attention, and for their persuasive purposes, they are increasingly using social media which we originally used to communicate with, perhaps, a long-lost friend. Today, politicians and parties are friends on social networks, and communication with them has never been simpler and more immediate. While traditional media still choose politicians and messages to be transmitted to the public, and because of these messages some politicians are more convincing than others, the situation on social networks is significantly different because there is not a time limit or timing in this type of communication, nor a gatekeeper. Today we are all online, so this way of communication has become customary. Numerous people interact via SMS, blogs, or make friends on social networks - which requires a new way of evaluating forms of communication. Communication is often ambiguous today, precisely because of the different media and communication platforms we are surrounded with. The media have always had a tremendous impact on people who consume them, and equally affect the world of human cognition. Producing and distributing media content is getting faster and faster every day, and messages that are created and sent

via media are aimed at affecting people. It is therefore important to know and understand each media platform that we use with the intent of communicating with our community.

New media, digital media, the virtual world, satellites, and all other innovations like SMS, the Internet, blogs, and social networks have changed not only the way we communicate but also the things we value and which are becoming the most important to us in everyday life. In this way, mass media, by image and sound, entered our private lives from distant places, which influenced the sense of privacy, and our personal experiences with new technologies differ greatly because of the speed of acceptance of such an accelerated way of communicating. For high-quality, persuasive political communication, it is important to listen to public opinion, which can be much simpler through social media than through channels traditional media provide. In this way, it is easier to correct the bad communication steps and, due to the shortness of the campaign itself, adjust the message to the polling body that is being targeted. Social networks have become the relevant source of information in journalistic circles or at least a source of good ideas for their topics. Twitter has thus become one of the most relevant sources of information, as research has shown that Twitter is being used more often than the planetary popular Facebook network, to make the serious and verified information spread faster. Persuasion is the primary purpose of politics and politicians, and the appearance of the Internet as a tool of political communication raises numerous researches and discussions of its potential in the electoral campaign. More so, the practice shows that online users are precisely the voters that candidates want to attract. It is important how we present something, so politicians need to be able to know the interests of the audience.

Drage Baranjke i Baranjci,

HDZ
Hrvatska demokracija

predstavljam Vam osnovne smjernice svog programa za ravnomjeran razvoj cijele Osječko-baranjske županije u razdoblju od 2017. do 2021. godine. Baranja zbog svoje prirodne i kulturne posebnosti obiluje potencijalima koji nažalost do sada nisu bili dovoljno iskorišteni. Stvorit ćemo preduvjete za kvalitetniji život na području Baranje kako bismo spriječili iseljavanje mladih te projektima razvijali gospodarske, poljoprivredne, turističke i brojne druge potencijale.

Programi i projekti

- Osnažit ćemo gospodarske potencijale kroz projekte namijenjene poduzetnicima
- Razvijat ćemo poduzetničke zone i inkubatore
- Građevinske dozvole izdavat ćemo u roku od 15 dana
- Osigurat ćemo besplatnu prehranu svim učenicima osnovnih škola
- Prehrana za osnovnoškolsku djecu nabavljat će se od slavonskih i baranjskih proizvođača
- Povećat ćemo broj timova Hitne medicinske pomoći
- Pokrit ćemo područje Baranje HotSpot točkama
- Iskoristit ćemo sve turističke resurse s područja Baranje i osnažiti turističku ponudu
- Revitalizirat ćemo kulturnu i prirodnu baštinu
- Pojačat ćemo prometnu povezanost i obnoviti ceste u našoj nadležnosti
- Uredit ćemo prirodne vodotokove i revitalizirati zapuštene vodne površine

U partnerskom odnosu s Vama, kao i s Vladom RH, aktivno ćemo raditi na razvoju Osječko-baranjske županije kroz Projekt Slavonija Baranja i Zapadni Srijem. Predanim radom, vođeni znanjem, iskustvom i vizijom stvorit ćemo preduvjete za kvalitetniji život Slavonaca i Baranjaca i tako spriječiti iseljavanje mladih iz naše županije.

BEHAVIORAL ECONOMICS AND MAKING OF BUSINESS DECISIONS

Andreja ŠVIGIR, Ph. D.

Altius savjetovanje d.o.o.

E-mail: Andreja.svigir@altius.hr

Abstract

The development of behavioral economics and its growing implementation had a considerable impact on the process of making business decisions. Modern management and decision-making have not been connected exclusively with mathematical models anymore for a long time. An increasing number of researches that refer to observing the business decision-making process clearly indicates that it is not influenced only and exclusively by rational considerations, but also by psychological processes, the emotional, as well as the spiritual state of the decision-maker. Man is both, a rational, and an emotional being, therefore, his decisions will not be the consequence of rational choices alone, but they will also often be directed on satisfying the need originating from the psychological world of the decision-maker. Human beings are often not aware of the external and internal factors influencing their choices, they are rationally and emotionally limited. The rational limitation is reflected in the fact that it is not possible to have absolutely all the information that led us to the best possible decision, while the emotional limitation is reflected in the fact that man often does not recognize his internal state and emotions and runs away from them even more often. It is exactly the internal and external factors that affect our thoughts, actions, and feelings and make the process of making business decisions difficult and complex.

Keywords: behavioral economics, decision-making, rationality

JEL Classification: D23, M29

1. QUALITY OF INFORMATION AND BUSINESS DECISION-MAKING AS A PREREQUISITE FOR BUSINESS MANAGEMENT

The century in which we live and work has been marked by numerous changes emanating from incessant innovations. They are principally related to the unremitting development of technology within which information technology is rapidly developing. It is precisely the latter that brought about major changes in both decision-making and management. The world today is a global village where information is exchanged at a speed that is almost impossible to perceive and interpret. Its quantity develops into an impediment to quality decision-making, because it is becoming increasingly difficult to distinguish between information relevant to the decision-making process and information which does not have any effect on this process whatsoever. Information is at the heart of every business decision-making. In order for a piece of information to be considered useful in the decision-making process, it should be timely and accurate. Similarly, it should have other features that ensure its quality, such as actuality, precision, and comparability. A piece of information containing the qualitative features lies in the core of business decision-making.

Decision-making is the foundation of business management; there is no management without making decisions. Furthermore, without good-quality and timely information, there is no business decision-making and subsequently – no business management. Hence, we can conclude that information is the most important resource on which business decision-making and management are based. (Švigir, 2018, 21).

Today, management has become demanding for at least two reasons. The first relates to the market volatility that constantly compels every decision-maker to try to leave their own framework of deliberation and action, while the other relates to the psychological and social aspect of the generations to come, which has been and still is significantly influenced by the development of information technology.

Business management is closely related to business decision-making and is predominantly associated with the highest levels of management. Decisions that are made at the highest management levels, apart from quality information, include the prior experience of the decision-makers which makes the decision-making process complex and unpredictable.

Different definitions of decision-making, in relation to management, can be arranged into two basic groups: one refers to authors who equate the terms of governance and decision-making, while the other refers to authors who are in minority and who believe that it is erroneous to equate the terms of governance and decision-making. And even though decision-making can be observed as a broader category since it involves making non-managerial decisions as well, all decisions are still deduced from managerial decisions (Sikavica et al, 2014, 4)

Business decision-making is a prerequisite for business management, while quality information is the starting point for successful business decision-making. Therefore, it can be concluded that the quality of business management will depend on the quality of information.

2. FACTORS INFLUENCING THE DECISION-MAKING PROCESS

Business decision-making is influenced by numerous factors which can primarily be divided into external and internal. External factors are those upon which most enterprises do not have influence and to which they must adapt. These refer to the external environment consisting of: (Bahtijarević Šiber et al., 2008, 454-457)

- ♦ the economic and social environment that also includes the business environment (economic system, technology, competition, buyers and suppliers, trade unions and other interest groups, infrastructure, natural resources, etc.)
- ♦ the political environment (political system, political stability, political risk, etc.)
- ♦ the legislative environment (laws, trade incentives/restrictions, etc.)
- ♦ the social and cultural environment (values, customs, demographic factors, etc.).

All the factors mentioned above influence the process of making decisions, and in particular, decisions aimed at enterprises' long-term development and investment cycle, i.e. decisions that are strategy-oriented and made at highest management levels. The external environment is most often highly volatile, insecure and risky, which additionally complicates the decision-making process. Although, when making business decisions, managers often rely on quantitative

information, believing that their sheer volume will make their decision-making more reliable, still, most of the important decisions of a company are made as result of intuition and assessment. Research conducted in 2018 on a sample of 308 large companies doing business in the Republic of Croatia showed that managers, when making business decisions, mostly use reports containing quantitative financial information and that they use them primarily when setting up both short-term and long-term goals. (Švigir, 2018, 282-285). This research shows that, in the decision-making process, managers primarily rely on rationality, ignoring the psychological aspect of the decision-making process.

Internal factors influencing the decision-making process comprise the business processes and the human resources of an enterprise. Business processes additionally include information technology that significantly supports their creation and monitoring. Human resources are predominantly oriented towards people's competence to make business decisions, as well as their knowledge and skills. Although decision-making is a cognitive process that relies on reason and rationality, it is, however, impossible to ignore the psychological processes that unfold each time business decisions are made. Contemporary research has shown how much attention is paid today to the emotional and experiential dimension triggered by the decision-making process, which significantly influences the outcome of the decisions that are being made.

For a long time, all research ignored the experiential and associative way of information processing and decision-making, by approving only analytical procedures. However, faced with today's business environment of rapid changes and increased uncertainty, decision-makers started looking for new tools, and only relatively recently, theoretically and empirically started developing awareness of the functionality of emotional-experiential images in the decision-making process. Recent research has shown that "intuition" as a concept in decision-making is as equally valuable as the rational-analytical concept. Both are often described as two different, but equally valuable, sides of the same coin. (Bulog, 2014, 7)

Humans are complex beings with intertwined past, present, and future. Therefore, the decisions they make include their experiential dimension that initiates rational arguments, but also an entire spectrum of emotions, thus creating rational intuition as the basis for business decision-making.

Carl Gustav Jung distinguished four basic psychological functions, two rational ones (thinking and feeling) and two irrational ones (sensation and intu-

ition). Intuition and sensation represent a cradle in which thoughts and feelings develop as rational functions. Intuition does not denote something contrary to reason but rather marks something out of reason's context. It is a sophisticated form of judgment by experts who excellently apply years-long experience and specific experience. Intuition does not come easily, requires years of experience in solving problems and is based on a solid and complete understanding of business details. (Khatri & Alvin, 2000, 57-86)

In addition to reason and emotion, business decision-makers often supplement the decision-making process with a spiritual dimension by considering how their decisions affect other people, both inside and outside the company, and ultimately the entire social community.

3. DEVELOPMENT OF BEHAVIORAL ECONOMICS

Economic thought has always been striving towards provability through set hypotheses and their empirical validation or refutation. Its basic premise was rooted in the hypothesis of rational choices and stable preferences.

The theory of rational choice was set in economic mathematics in 1944, in the pioneering work of Neumann and Morgenstern "Theory of Games and Economic Behaviour". It has become an integral part of neoclassical economic theory as one of the variants of the theory of rational expectations regarding economic stability. Its implicit assumption is "homo economicus", the model of an individual who behaves rationally by acting on his/her own selfish interests, and the central interest is to maximize profits. (Katunarić, 1995, 35-52)

Economics differs from other sciences on the belief that human behavior can be explained by the assumption that subjects have stable and well-defined preferences, ultimately proven by rational choices consistent with market choices. (Kahneman et al., 1991, 193-206)

However, a human being is not just a rational being. Correspondingly, his/her preferences are not always stable and well-defined. Emotions often play a more dominant role in the process of making business decisions than rationality to which classical and neoclassical economic theory point. Likewise, apart from ratio and emotion, the decision-makers' social status also significantly influences their choices i.e. preferences.

Economics is based on the axiomatic definition of individual preferences. It is assumed that each individual is able to form stable preferences. Economics, therefore, does not deal with psychological preference-forming processes or with social factors influencing those processes. For economists, preferences are default variable and therefore they define rationality by using the logical-mathematical condition of transitivity: if we like to consume commodity A more than commodity B, commodity B more than commodity C, then we like to consume commodity A more than commodity C. (Šonje, 1995, 129)

The assumption of “homo economicus” entirely abstracts other dimensions of humankind except the one pertaining to rationality and stability. Although it is considered that economics as a science has always been solely and exclusively based on logical-mathematical models, this claim is not entirely correct. This is proven by numerous economists who have throughout history questioned the relationships within social politics and consequently the economic community pointing to the fact that decision-makers in decision-making do not neglect the ethical, moral and even the spiritual aspect of humans.

The emergence of economic science is associated with Adam Smith and his renowned work “The Wealth of Nations”. He taught natural theology, ethics, law and political economy in Glasgow. His lesser-known work published in 1759, “The Theory of Moral Sentiments”, promoted him into an acknowledged philosopher and moral theorist of that era. In that work, Smith speaks of humans as beings able to make moral judgments based on other bearings, and not just on selfishness. This seeming paradox is solved, as Smith argued, by the ability to feel compassion. It is exactly this ability to feel compassion that is the basis of altruism and morality. (Babić, 2002, 538-539)

Rationality models are directed towards observation of the wealth available to decision-makers, and the choice of the best option made by rational “homo economicus”. It was precisely the abstraction of other dimensions of humans that led to the development of behavioral economics which showed that individuals are not as rational as classical and neoclassical economists would like to portray them. Therefore, the focus of behavioral economics is the observation of irrational deviations from rationality as a prerequisite for making a choice that would best meet the needs of the decision-maker.

Behavioral economics is a discipline which examines behavioral irrationalities as “deviations” from or bias against a model of rational behavior i.e. it is a

psychological discipline that synthesizes empirical findings primarily from psychology and economics. It is a discipline that enhances the exploratory power of economy, combining it with more realistic psychological settings, by using social, cognitive and emotional factors in understanding the economic decisions of individuals and institutions. (Polšek & Bovan, 2014, 7)

Though it was deemed that behavioral economics had introduced an entirely new view of economic science, it is important to emphasize that classical and neoclassical economic thought has always shown interest in the psychological aspect of decision-makers and were aware of their influence on the decision-making process.

Most ideas promoted by behavioral economics are not new; on the contrary, they are actually rooted in neoclassical economic thought. Namely, at the time when economics became a scientific discipline, psychology as a scientific field was still unknown. Many economists were also psychologists of their time. An example of this is Adam Smith. Namely, he was the most influential economist of the 18th century. Adam Smith presented an idea which is well-known today, the one of the loss aversion" effect and said that "we suffer more when we fall *from a* better *to a* worse situation than we *ever* enjoy *when we rise from a* worse *to a* better situation". It wasn't only Adam Smith who pointed out the psychological aspects with which economic science abounds. Jeremy Bentham, a British philosopher and the founder of utilitarianism, whose utilitarian concept set the foundations of the neoclassical economy, wrote about the psychological underpinnings of utility. Some of his insights into the determinants of usefulness have only just begun to gain importance. Furthermore, Francis Edgeworth's "Theory of Mathematical Psychics" takes into consideration "box" diagrams that show possible outcomes of negotiation between two persons and includes a simple model of social utilitarianism in which the utility of one person is conditioned by the reduction of the usefulness of another person. (Camerer & Loewenstein, 2002, 3-4)

Behavioral economics is not an entirely new discipline and it can be established that its ideas are deeply rooted in classical and neoclassical economic thought. Although classical and neoclassical economic theories were primarily focused on rationality, they did not completely ignore the totality of an individual and the manner in which s/he brings it into the business decision-making process. Behavioral economics went further in its observations of people's be-

havior, particularly in the process of making business decisions, proving that people do not behave steadily and consistently while making their choices. And with that, it opened room for further explorations that helped comprehension of people's behavior and their choices in the process of making business decisions.

4. BEHAVIORAL ECONOMICS AND BUSINESS DECISIONS

Business decision-making is considered linked to psychology. All decision-makers bring in their entire personality in the decision-making process, and that, apart from intellectual capacity, includes their psychological maturity as well as their spiritual legacy. It is difficult to fully understand business decision-making without understanding psychology, especially one approach to psychology called behaviorism.

Behaviorism observes human behavior and the rules underpinning behavior that were instigated by stimuli from the environment as well as the experience we gain from the earliest age. Yet, behaviorists disregard two important determinants which significantly influence human behavior. Those are psychological processes and free will. Behaviorists are not that much interested in psychological processes occurring in humans but are rather more focused on behaviors that can be observed and measured through scientific methods. Equally, they assume that free will is illusory, which implies the determination of human behavior.

Neglecting psychological processes and their influence on people's behavior, as exercised by the behavioral approach, faces criticism from both psychologists and economists. Such criticism is fully justified because the complexity of the decision-making process implies the existence of many relationships that we develop with ourselves and others since before we were born. It is therefore worth asking to what extent behavioral economics diverges from the neoclassical economy. If behavioral economics abstracts individual free will as well as the psychological processes that occur in the person with the idea that human behavior is determined, then, in proving its ideas it uses the concept of "ceteris paribus" just as neoclassical economic thought does. (Švigir, 2018, 51)

John B. Watson is considered to be the founder of behaviorism. He was an American psychologist who believed that psychology, in order to be considered science, needs to collect data which can be publicly disclosed and presented, just

as in any other science. He believed that behavior was public and consciousness private, and that science was to deal only with public facts. Watson and other followers of behaviorism argued that an individual's general behavior is the result of conditioning and that the environment shapes behavior by supporting specific habits. Thus, for example, giving chocolate to children (awards) to stop crying affirms the habit of crying. (Smith et al., 2007, 7).

The development of psychology as a science has led to the development of numerous psychotherapeutic directions which corroborated the fact that humans are complex beings that cannot be accessed unilaterally. Each psychotherapeutic school gave its unique contribution to finding the causes of human activity, but it was often equally unilateral in approaching the human, placing an emphasis on one segment of observation, and consequently losing sight of the totality of the individual both in being and acting. The behavioral approach was also not immune to such mistakes. If human behavior emerges only as a result of conditioning and the influence of the environment that affirms certain behaviors, then it is more than obvious that emotions are completely rejected as the possible cause of certain behavior and action. Rejection of emotions as a cause of one's behavior means completely rejecting an important part of an individual, which is often the decisive motive for their actions.

The behavioral psychotherapeutic approach also influenced the development of behavioral economics which was a response to neoclassical economists' claim that individuals are motivated in their decisions by rational choices and stable preferences. Although classical and neoclassical economists were aware of the psychological as well as the ethical and moral dimensions of individuals, still in their claims and evidence they were more aligned with the logical-mathematical proof of economic models. In addition to considering the rational segment, behavioral economics also took into consideration the irrational segment of human beings, the one that came about as a result of conditioning or suppression of the environment. Therefore, this irrationality to which behaviorism points out can reflect in the part of irrationality which came about as a result of someone else's irrationality, especially the one that has conditioned us throughout life by the supporting our behavior. This irrationality came from family, friends and the environment, that is, all those we have met or will encounter throughout life.

With the emergence of behaviorism, a new term "homo reciprocans" was introduced in economics, supplementing action and the understanding of the

action of “homo economicus.” In that sense, behaviorism that was accepted and observed in the context of behavioral economics has contributed significantly to the “understanding” of people’s behavior.

Even though individuals bring their whole personality in the decision-making process, their rationality as well as their emotional nature, there are still limitations to that involvement. These emanate from human imperfection. Therefore, we cannot speak of perfect rationality and perfect emotional state that might lead to a perfect decision, but we rather talk about limited rationality and changeability of emotions i.e. imperfect conditions in which we make business decisions. Limited rationality strives for the best possible and not for the perfect decision. It is a decision that is good enough and which results in decision-makers’ sense of satisfaction.

Nobel laureate Herbert Simon developed the theory of limited rationality in order to explain the fact that people irrationally seek satisfaction, and not maximization of utility, as it had been usually assumed by economics. Psychological traits, such as overinflated confidence, partiality, projections, and the effects of limited attention, have now become part of the standard theory. (Poles & Bevan, 2014, 41-45)

The emotional world of decision-makers is subjectively marked. Emotions are characterized by fickleness, so decision makers are frequently influenced by one set of emotions when business is going in the desired direction, while emotions are completely different when unpredictable or unwanted situations occur in the business. This fact invokes an emotional maturity of the decision makers reflected in their awareness of the emotional state in which they are; the acceptance of their emotions, their understanding of the causes of the emergence of those emotions and the delay of the moment of decision-making. All of this is related to the mature personality that needs to be a quality of decision makers.

Within the aspects of decision-making, the influence of perception and personality on decision-making is significant and important, although decision-makers do not have to be aware of this influence. Different individuals see the world in a different way. The way information obtained through sensory pathways is interpreted represents the perceptual process. Psychological research has identified a wide range of factors that affect the decision-making process of individuals by limiting rationality when processing information. Some of the most important factors are attention, memory, heuristics, predisposition and

the person's perception. On the other hand, personality is the basic and one of the most powerful psychological forces that affect the decision maker. (Bulog & Dadić, 2014, 103-108)

It is important to note that behavioral economics, apart from psychological, neglects the spiritual dimension of individuals, if the free will is illusory and that human behavior is determined. The latter assumption is inaccurate because otherwise, it would explain the behavior of people in moments when they perform great works. A person is a spiritual being who makes decisions that can at first glance seem entirely opposed to "common sense," and are often opposite to the emotional state that would result in making entirely opposite choices. Likewise, behavioral economics negates the free will of human beings as the ability to choose not according to utility but according to conscience.

Despite these criticisms, behavioral economics has made a breakthrough in understanding the process of making business decisions, proving that decisions in general and business decisions accordingly are not and cannot be motivated solely by rational elections alone.

5. THE ROLE OF LIMITED RATIONALITY IN THE PROCESS OF MAKING BUSINESS DECISIONS

Rational decision-making is the most common way of making business decisions, particularly at lower managerial levels. Those are operational, repetitive decisions based on operational information. Such information is a product of high-quality information systems. Although rational decisions primarily based on financial information are largely carried out at lower management levels, however, in the decision-making process higher-level management also often relies on financial information.

Most business decisions are based on rationality and on numbers or financial information. Equally, management at all levels believes that decisions made in such way are far better when compared to intuitive decisions. (Švigir, 2018, 302) Rational decisions are most often related to reason and logic, and since reason and logic are generally based on exact values, it is consequently believed that decisions made in a rational manner will be of better quality and their outcomes will be more successful.

Homo economicus possesses knowledge about the relevant aspects of its environment which, even if not entirely complete, are impressively pure and complete. There is a stable and well-ordered set of predispositions and options for absolute comparison of the available behavioral variants. From the point of view of decision-making theory, an “economic man” is always able to find and/or choose the version of decision (or behavior) that maximizes his/her personal preferences and his/her own interest, has full knowledge of the means that can maximize usefulness in the decision-making process. (Sikavica et al., 2014, 87)

This is the concept of complete (objective) rationality, which has the following shortcoming: the idea that a person is capacitated to choose one among the many variants presented to him/her that will result in maximum utility ignores the possibility that somewhere else there is another version that is actually the best and that would be in fact ideal for the decision-maker. Complete rationality turns humans into supernatural beings, attributing them with an ability to choose the ideal solution in the decision-making process. In reality, however, something completely different unfolds: the most satisfactory outcomes are selected, most often using heuristics, which enable reaching optimal solutions with the rational use of available resources, which not only include money but also the time needed to make a quality business decision. It’s a limited (confined) rationality. The idea of “limited rationality” and “satisfactory choice” was first considered by Herbert A. Simon, one of the fiercest critics of the concept of rationality.

“Standard economic models that discuss human behavior contain at least three unrealistic concepts that need to be modified:

- ♦ unlimited rationality,
- ♦ unlimited will (motivation),
- ♦ unlimited selfishness.

Herbert Simon criticized these concepts by comparing them to a free lunch. If human knowledge were unlimited and if we would have unlimited use of time, it would hardly be expected to make optimal choices. The concept of rationality would make us use “shortcuts” in order to make decisions. (Mullainathan & Thaler, 2000, 5-13)

All three concepts simultaneously idealize and humiliate human beings. First of all, unlimited rationality turns human beings into robots which decide solely and exclusively guided by rationality. Furthermore, human beings do not

have a perfect motivation. The latter is always confined to one's own vision of the life they want to live, and that does not have to be motivated by rationality and pursuit of wealth. Ultimately, unlimited selfishness deprives people of altruism and empathy toward other human beings. Consequently, in the context of business decision-making and management, acceptance of the behavioral concept, as well as the concept of limited rationality, is more acceptable and meaningful. (Švigir, 2018, 69)

The concept of limited rationality is a more realistic concept of complete rationality. It completely rejects the idea of a perfect decision and accepts the optimal decision as the one to strive for. The optimal decision is one made in imperfect external and internal circumstances. It is equally influenced by rationality, emotions, and the decision maker's value system. Since human beings in the process of making decisions bring in their entire personality, which is influenced by everything mentioned above and since humans are imperfect creatures, the process of their decision-making, as well as the decisions they make, will be also imperfect and influenced by constant changes.

Human behavior, even rational human behavior, is not constant and unchangeable. Likewise, it is not perfectly adapted to its surroundings. (Simon, 1979, 510)

Human thinking needs to be compared with scissors: one blade represents the environment and other people's cognitive abilities. According to this paradigm, it makes no sense to study human rationality in abstract tasks and to expect that they would reflect the efficiency of thinking. (Simon, 1990, 7)

Cognitive bias in decision-making or limited rationality as discussed by Herbert A. Simon take into account all the limitations of human beings, and principally their rational constraint which manifests in their cognitive inability to absorb all existing information that could affect the quality of business decisions. Aside from being rationally limited, a person is equally emotionally limited, which manifests in the volatility of emotions and their impact on the quality of business decisions.

Given that in the business decision-making process management still relies more on quantitative information and rational decision-making, it can be concluded that this fact leads to the possibility of neglecting the impact of their own rational constraints on the decision-making process. (Švigir, 2018, 306)

Ignoring the impacts of rational limitations on decision-makers in the process of making business decisions creates a feeling of unrealistic supremacy often taking a wrong course and producing unwanted consequences. It is therefore important to constantly warn management at all levels of the traps that occur during the process of making business decisions, not because there is a possibility for those traps to be fully anticipated and subsequently rejected, but rather to raise awareness about them and eventually transform them into an acceptable business risk

6. CONCLUSION

Making business decisions is a demanding process both from a cognitive and psychological point of view. The volatility of today's business, as well as the volume of information we have at our disposal, has made decision-making processes more difficult. Rational decision-making instituted on the very fundamentals of the classical and neoclassical economy, which presupposes perfect rationality of the decision-makers, has been replaced by more realistic models offered by behavioral economics. However, it also shows certain limitations that reflect in the abstraction of psychological processes during decision-making as well as the abstraction of the free will of the person deciding. The human individual is a complex being acting by exercising free will and at the same time a being who decides under the influence of psychological processes that are an integral part of the decision-making process. Behavioral economics has made a significant contribution to the observation of decision-making process and has paved the way for further research that will certainly go in the direction of eliminating the aforementioned shortcomings identified by both psychologists and economists. The more realistic models which introduced the term of limited rationality in the observation of the decision-making process as well the limitations related to psychological processes point to the fact that decisions are made by imperfect people in imperfect circumstances. These limitations prove that decision-making is not and will never be a perfect process in which there is no place for errors, but rather a process that embodying many imperfections and unpredictability.

Abstract

Social risks such as age, inability, disability, poor health, insufficient health care and other costs that can cripple the normal lives of citizens are the dangers that care should be taken to the entire society at the level of the state system.

Stability of the society is based on the satisfaction and security of each member and takes care of the dangers of social character across the various levels of satisfying the needs in terms of meeting the living conditions. Various security and protection processes are trying to achieve the normal living conditions for every citizen.

Economic security and the standard of citizens are largely dependent on compulsory social security, with a tendency to expand voluntariness and private equity, to protect the various dangers covered by a pension, health insurance, and unemployment insurance systems. Theoretically, analytically and empirically

in this paper, we prove the importance of the pension system for the economic stability of each member of the society.

Keywords: management, social risks, economic stability, pension insurance

JEL Classification: G32, H55

1. INTRODUCTION

Stable living conditions of citizens are common concerns of the individual and the society as a whole. Stability and security of the individual in every respect should be the imperative goal. Security is an indispensable constituent element of every good society. As a public good, as a non-exclusive and irrational value, security has an important impact on social, economic, and political processes (Loader and Walker, 2007). Stability of the living standard of citizens is largely dependent on the insurance business, especially the pension insurance regardless of whether it is mandatory or voluntary. Pension policy is a part of the socio-economic policy of each country. Many authors point to the link between social welfare development and the development degree of the society in which the following main factors are mentioned (Prasad and Gerecke, 2010):

- Level of economic development,
- Demographic aging and other demographic changes,
- Development of democracy, political institutions, and burden of political inheritance,
- The universality of the globalization process.

The intergenerational solidarity pension system has been operating in all European countries for decades regardless of their political and economic organization and level of development (Vojinović, Žarković, 2016.a). Challenges of survival and development of a socio-economic system are also largely dependent on the results of the insurance business and funds available as own financing sources of the national economy (Vojinović, Žarković, 2016.b). By concluding a pension insurance contract, users are provided with a secure income in a situation in which the acquisition of funds is impossible by their own work. This insurance ensures the social and material security of an individual due to aging or loss of working ability. In addition, this insurance has the significance of a higher labor productivity stimulus as it enhances the material interest of

the insured for greater effectiveness of the work that later provides a greater volume of rights (Jovanović, 2015).

Pension funds represent institutional investors and are, in this respect, similar to insurance companies. It is characteristic for pension funds that the inflow of funds is realized in a continuous dynamic way and the outflows of funds are foreseeable (dynamically observed) which suggests that there should not be a problem of insolvency as the surplus of financial resources can be placed on the capital market (Vunjak, Kovačević, 2016). According to the same authors, pension plans are divided into:

- Funded pension plans,
- Unfunded pension plans.

The pension insurance systems are divided into those established on fixed contributions and those established on determined reimbursement (Davids, 1995). In the practice of pension protection, which is, on the one hand, a way that releases citizens from age risks and represents a method of accumulation of funds as a saving method, it represents, on the other hand, the greatest possible incentive for economic development and becomes increasingly a combination of mandatory and voluntary protection. With this kind of protection, citizens are ensured with pensions when they are retired. Pension and disability insurance belongs to the social security group because of social and economic implications at the level of society. We receive a lot of information on this sphere every day that confirms the significance of this social security (Birovljev, Vojinović, Mirović, 2015). By collecting finances in funds, through contributions of insured persons or from other sources of income, investment, or budget inflows, a mass is made which serves to secure the payment of pensions for current users. In some retirement pension systems reimbursement may be time-bound or lifelong (Hansell, 1999).

Social insurance provides under the principles of compulsory, reciprocal and solidarity, the insured persons with health care and material benefits in case of emergence of certain social risks such as illness, age, disability, death, and unemployment. There are different terminological and conceptual definitions of social insurance in literature. Here are some definitions of the concept of social security:

1. Accordingly, social insurance represents the legal expression of that part of social policy and its directed social relations that are related to the organized social-material, health, and psychological protection of the insured persons and insured persons of certain social risks on the principle of financial contribution, reciprocity, and solidarity (Jovanović, 1998, 411).
2. Social insurance is the area of social policy in which working people are obliged to provide material insurance and medical care in cases of illness, disability, age, death, and unemployment for themselves and members of their families on the principles of solidarity and mutuality (Lakičević, 1987: 34).
3. Social insurance is a form of social security that aims to provide adequate economic and social security for insured persons in the event of insurance risks: illness, pregnancy, birth, accidents at work, temporary or permanent, partial or total loss of working ability, unemployment, inhumane, the loss of the breadwinner and death (Judgment, 1994-273).
4. It could be said that social insurance is a system of material, social and psychological protection of a person (who is insured) and includes protection against illness, injury, disability and age protection (by meeting retirement requirements). Social insurance will also provide protection for family members in certain cases or in terms of prescribed risks (Brajić, 1991.:527).

Social risks, their observation and the creation of stability and security are a result of the implementation of social policy, the social system and its actors (Hagmann, 2015) in different segments of life, whereby the forms of protection change during evolution (Williams, 2008). State pension systems have been facing problems for decades, which is the case in a large number of countries. According to the United Nations estimates, by 2050 the share of the population of Europe aged over sixty-four will grow to 28%, from 16% in 2000 and 8% in 1950. Similar movements can be expected in North America and even in Asia (Swiss Re, 2008). Risks represent dangers that are caused by different events. They are an uncertainty regarding the achievement of an objective with an alternative to the existence of harmful events on our health and property. In an objective sense, it measures the absence of threats to acquired values, in the subjective sense, the absence of fear that such values will be endangered (Wolf-

ers, 1962). Social processes, social policy, and pension insurance systems represent instruments for risk analysis, impairing their harmful effects, thus creating the stability and safety of members of the society (Risley, 2006)

One of the leading risks endangering the stability of living is certainly unemployment that is being accessed systematically and socially. However, most countries now mandate mandatory insurance as the main form of insurance in case of unemployment, and some countries explicitly forbid voluntary insurance such as the Czech Republic, Estonia, Greece, Ireland, Italy, Lithuania, Malta, Poland, Portugal and the United Kingdom (Čulo, Bejaković, 2017, 385). The importance of the social protection system is also seen in relation to the youngest members of society (Laklija, Milić Babić, Lazaneo, 2016). The idea of early childhood social support is focused on eminent state and non-profit organizations aimed to improve the quality of life of children from the earliest age. In the mentioned group of children underdeveloped children, who need additional intensive professional health and social support from the very first days of their lives, are also involved.

2. ANALYSIS, CHALLENGES AND CHANCES

In his work Šučur (2016-16), and according to ESSPROS (ESSPROSS, 2012) sources, states the benefits and services that are covered by social insurance: health/sickness, financial compensation for physical or mental illness excluding disability and health services for maintaining or improving health, inability, ageing, survived restrained members, cash or non-cash benefits related to the death of a family member, family/children, cash or non-cash benefits except health care which is related to pregnancy costs, birth, adoption or upbringing of children and care for other members of the family, unemployment, cash or non-cash benefits related to unemployment, housing, housing allowance, social exclusion, monetary or non-cash benefits related to the reduction of social exclusion that are not covered by other functions.

Rights from retirement and disability insurance are classified into personal rights, ie personal risks, meaning that they cannot be transferred to other persons. Mandatory insurance is provided by contributions paid by insurers and employers and the means for increasing liabilities that arise from the acquisition of rights under special conditions for certain categories of the insured are provided from the budget. (Zakon o penzijskom i invalidskom osiguranju, 2003)

Serbia's pension system is based on two pillars- the mandatory pension insurance and the voluntary private insurance (Matković, 2016) that was introduced in 2006 when the first DPF started with its work and was named Delta Generali (September 2006). For many reasons, the states decided to carry out a reform of the pension system, in particular in terms of parametric changes, which most often implies the increase of age limit, prevention of temporary retirement by applying indices and ways of calculating property, abolishing more favorable positions of individual categories of insured persons and others (Horstmann, 2011, 2012; OECD, 2013). The crisis that occurred later was used as an excuse for introducing unpopular political measures in response to long-standing and recognizable demographic challenges (Casey, 2012).

2.1. CHALLENGES OF STABILITY AND SAFENESS OF THE SOCIAL PROTECTION ACHIEVEMENT

The economic crisis has strongly distorted the pension systems and encouraged numerous reform changes in public and private systems. Extrication from GDP, on average in EU countries, has risen by over 1% only in 2009 and in some countries by more than 14.5%, such as France, Austria, and Italy. In some countries, the financial crisis has shifted into debtors, therefore the shares of the pension system reached 17.5% of GDP which was the case with Greece. (Eurostat base).** Pension funds accumulate very high amounts of cash. The management of these funds is realized through pension funds that aim to provide retirement benefits to their retirees. With regard to financing, we differentiate between two systems (Jašarević, 2010: 198):

- 1) The system of intergenerational solidarity (pay-as-you-go system)
- 2) Capitalization system (ie funded system).

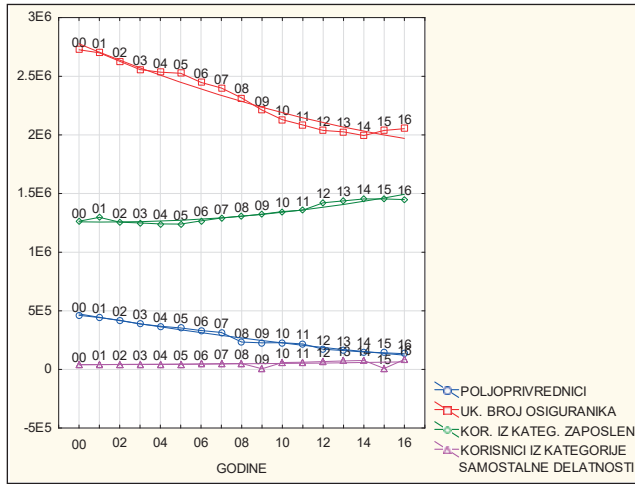

Table 1. Overview of insured persons by categories

YEAR	EMPLOYED	SELF-EMPLOYED	FARMER	TOTAL NUMBER OF THE INSURED
2000	2 098 233	166 144	461 904	2 726 281
2001	2 079 107	178 663	441 705	2 699 475
2002	2 021 485	186 419	419 253	2 627 157
2003	1 972 618	196 061	387 433	2 556 112
2004	1 962 053	204 897	368 207	2 535 157
2005	1 946 671	224 786	353 374	2 524 831
2006	1 883 602	231 534	332 538	2 447 167
2007	1 848 306	236 936	314 925	2 400 167
2008	1 859 285	222 392	233 385	2 315 062
2009	1 778 739	206 002	227 089	2 211 830
2010	1 714 393	186 806	228 242	2 129 441
2011	1 666 505	199 666	217 704	2 083 875
2012	1 661 638	203 976	172 509	2 038 123

Movements of the total number of insured persons in the pension fund as well as the trend of changes in the observed period are shown in the following graph. Employed insured persons are employed persons, civilians serving in the Serbian Army, persons engaged in temporarily and occasionally jobs, foreigners employed on the Serbian territory, domestic nationals employed abroad, domestic citizens employed on the territory of the Republic of Serbia with foreign organizations. Insured self-employed persons are persons who are, in accordance with the law, independently engaged in economic or other activities if they are not insured by employment, priests, and religious officials if they are not insured by employment, members of the agricultural association. Insured farmers are persons who are engaged in agricultural activities and are not beneficiaries of pensions or are not in the process of education. (Zakon o penzijskom i invalidskom osiguranju, Službeni glasnik Republike Srbije)

The financial risk of the pension system is a danger that can undermine social processes of protecting citizens endangering their social status and existence. Proper management of pension insurance by using funds collected from insured persons, its investment and spending are required to be professionally controlled. According to the rates presented, the ratio of insured persons and fund users should at least be 3,5: 1 to ensure the financial stability of the system if we neglect operating costs. Incomes from investment activities are an important part of the revenue side of the fund (Rakonjac-Antić, 2004).

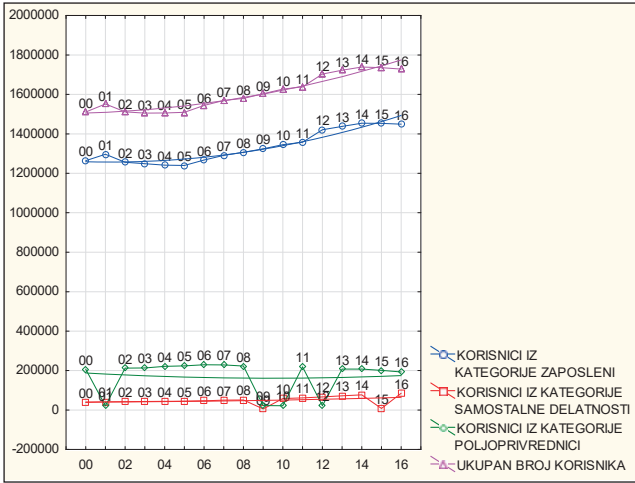

Table 2. Overview of pension user categories- the number of retirees

YEAR	USERS-EMPLOYED	USERS-ACTIVITIES	USERS-FARMERS	TOTAL NUMBER OF USERS
2000	1.264.175	39.337	207.289	1.510.801
2001	1.297.004	41.207	213.480	1.551.691
2002	1.255.814	42.905	212.778	1.511.497
2003	1.248.662	43.472	213.438	1.505.572
2004	1.241.082	43.938	221.047	1.506.067
2005	1.239.573	45.225	224.178	1.508.976
2006	1.267.574	47.181	229.293	1.544.048
2007	1.290.611	49.872	229.072	1.569.555
2008	1.306.394	50.959	222.986	1.580.339
2009	1.324.338	54.450	224.880	1.603.668
2010	1.345.733	58.368	222.480	1.626.581
2011	1.357.846	61.851	218.948	1.638.645

2012	1.420.892	66.718	215.530	1.703.140
2013	1.438.016	72.036	207.783	1.722.649
2014	1.454.332	77.047	207.783	1.739.162
2015	1.453.469	81.550	200.923	1.735.942

2.2. THE POSITION OF PENSION FUNDS ON THE FINANCIAL MARKET

Voluntary pension insurance is an additional form of pension insurance that increases the number of pension benefits for individuals over the volume of mandatory retirement insurance. This insurance is manifested in two ways (Jovanović, 2015):

- 1) Persons, who are not covered by mandatory insurance, are insured to provide for themselves all the rights given by mandatory and disability insurance and
- 2) Persons who are covered by compulsory insurance in order to ensure a greater volume of rights in relation to the scope foreseen by the mandatory insurance.

Graph 4. The market share of some DPF funds in 2016

Source: Authors Personal Processing (adapted by https://www.nbs.rs/internet/latini-ca/62/62_2/statisticki_aneks.pdf - 24.12.2018.)

The Voluntary Pension Fund Management Company is an economic firm that organizes and manages one or more voluntary pension funds (Vojinović, Žarković, 2016.b). According to the Law on Voluntary Pension Funds the management company is established only as a closed joint stock company. The cash share of the companies' share capital provided for management, when it is established, amounts at least 1.000.000 (one million) Euro in dinar equivalent, at the middle exchange rate of the National Bank of Serbia on the day of payment.

3. CONCLUSION

Social security established in the social process of the state pension system is in serious concern and its stability is compromised, despite the positive changes in the last two years. The width of the meaning of this topic is not only to protect older and incompetent but their closest and youngest family members, too. There is a broad understanding of the concept of support for parents. Accordingly, it includes any intervention for parents aimed to reduce the risk and/or promote the instruments of protection for their children's social, physical, and emotional well-being (Moran, Ghate and Merwe, 2004: 21). According to the functioning of this system based on proportionality rather than equality, it is obviously possible to float in the adequacy of financial reserves to cover the liabilities. That is why the ability of the state to subsidize (Birovljev, Vojinović, Mirović, 2015) has been left open.

Reforms of the pension system were, therefore, necessary not only in the direction of parametric changes but also in functional ones. Many countries burdened with this problem introduce more levels of protection for their citizens. In Serbia, it is implemented through three pillars of the pension insurance (Matković, 2009). The possible solution to this problem is to contribute periodically the funds by means provided by the state. In addition to the possibility of increasing the contribution rate, the PAYG system also has the option of reducing the level of retirement benefits that are likely to further aggravate the poor financial situation of the retired. Another objection to this system is

the interruption of the link between individual contributions and individual benefits. Thus, this system provides a great stimulus for temporary retirement.

In the capitalization system, money interflows to an individual or collective accounts managed by a pension fund. Collected funds are invested through the intermediation of a financial stock exchange into securities in order to achieve a certain return. In this system, the pension is directly dependent on the contributions paid and the yield on the invested means of contribution, ie from the capitalization rate. Younger people prefer such a form of funding for pension funds because they are motivated to create savings for retirement days. This system is, in principle, superior to the previous one, because every employee becomes aware of the fact that through paying contributions one saves for retirement days. The employee is also aware of the fact that these means will not serve to cover the pensions of other persons. Such a system has eliminated the shortcomings of the current financing system and it has no impact on the demographic factor.

Another benefit of this system is the strong link between individual contributions and individual benefits. Everyone saves on his/her special account. Incomes on invested funds of contributions at a fully funded system increase the number of retirement benefits and promote the development of the economy of each country.

It is also important to consider the issue of the transition of the pay-as-you-go system to a fully funded system in a large number of countries. The question is: what if the PAYG system suddenly stops functioning and the young generation immediately goes over to a fully funded system? As a result, older people will remain without retirement benefits. It is clear that any transition from a pay-as-you-go system to a fully funded system will cause a number of problems: high transaction costs, social tension, conflicts of interest between current and future retirees. This can be explained more closely by the fact that people are based on the view that it is unfair to allocate funds to current retirees because it can be expected that, after changes take place, no one will do so for them.

It can be concluded that expenditures for social benefits are of non-cyclical nature because in the initial period of the crisis they are higher (observed over the share of GDP). Later on, they reduce through changes in social expenditures, restrictive measures (Bouget, 2003). According to Castles (2001, 2016), social security spending is to a lesser extent exposed to the restrictive policy within the overall cost. All of these reasons have caused a wave of pension system reforms across Europe.

Thus, the best way for countries to manage their retirement costs is to create a three-pillar system (World Bank, 1994). The first pillar in the Republic of Serbia is reviewed due to demographic aging and longer life expectancy that means receiving retirement for a larger number of years. The second pillar, or mandatory private pension insurance, exists in Croatia, Bulgaria, Macedonia, Poland, and Slovakia. In the Czech Republic, Slovenia, Ukraine the second pillar has not been formed yet; therefore the structure of the pension system consists of the first and third pillar. Because of the increase in unemployment and the reduction of tax revenues, the redirection of contributions to private pension insurance funds becomes too much a burden for state systems; therefore, some countries are permanently (Hungary, Bulgaria since 2015) and some temporarily (Estonia) abolishing the second pillar of the pension system or have lowered the rates on contributions (Poland, Romania, Latvia, Lithuania, Slovakia) (OECD, 2013; Horstmann, 2012).

The second pillar did not survive in Serbia for the following reasons: firstly, the introduction of the second pillar is very expensive; secondly, it is not certain that the pensions in this pillar would be higher. Giving up the second pillar can be explained by high administrative costs and very low revenues resulting in mistrust of private funds (OECD, 2013). In short, the introduction of the second pillar implies huge investments and quite uncertain results.

The third pillar is very important because it allows the option of additional savings, therefore, in addition to the social security of pensioners. Within this pillar, additional marketing actions need to be introduced in order to involve more and more employees into this system. This pillar is very important as an introduction of the second pillar and as an alternative process of pension protection that allows the state to relieve its costs and manages to control the social protection system while accumulating and creating funds in an institutional sense.

Abstract

Today, the success of an organization is more than ever a result of effective organizational management, and it is indisputably essential to the business of every organization. Outstanding importance is attributed to management, which is constantly evolving and is a result of many factors of the organization. Management is the process of shaping and maintaining an environment in which individuals achieve specific goals by working together in groups. Undoubtedly, productivity, globalization, competitiveness, and change cannot be realized without a precise, comprehensive understanding of human resources. Man is no longer a limited organizational resource but a significant source of new value. Changes, as well as market success and long-term development, become an essential factor in which business strategy depends. Companies which will achieve top performance in their products and services are those who have discovered how to implement the ideas and abilities of people at all organizational levels. Human resources represent the core strength of an organization, and accordingly, the key

to success lies in the way companies choose and, subsequently, organize people. Through analysis of the defined problem, this paper will show the importance of management and human resources based on the example of one of the most successful companies in the Republic of Croatia – Podravka.

Podravka is the leading food company in the Republic of Croatia with brands that are recognized on the international market, and it records positive financial results year-on-year, which indicate effective organizational management of Podravka. The keys to its success are its creative, dynamic and successful employees. Podravka emphasizes that its core values are creativity, passion, and consumer satisfaction since they add excellence to everything they do and thus promote the underlying values of the company.

Keywords: *management, business strategy, human resources, Podravka*

1. INTRODUCTION

Today, an organization's success is more than ever a result of effective organizational management, and it is indisputably crucial to the business of each organization. For the last few decades, the human resources division has been the fundamental strength of an organization, and accordingly, the key to success lies precisely in the way companies choose and then organize people. An analysis of the defined work problem will show the importance of management and human resources through an example of one of the most successful Croatian companies with long-standing tradition and numerous awards for successful business operations.

This paper aims to present an example of effective organizational management in Podravka. By analyzing the company's business, its process of creating competitive advantages and investing in employees, this paper will show the success of effective organizational management in the observed enterprise.

In the following text of this paper, the theoretical determination and importance of the effective organizational management, essential managerial functions, the role of business managers and human resources will be described as the key to the success of effective organizational management. Podravka is the leading food company with brands which are recognized worldwide and have positive and high financial results every year. The key to its success lies in creative, dynamic and suc-

cessful employees and for this reason, Podravka was chosen as a case study that presents a theoretical review of literature in the real world.

2. MANAGEMENT IN ORGANIZATION

In the business environment, there is an increasing number of rapid changes; the survival of each organization depends on its ability to respond quickly to changes and adapt to the new situations. In other words, the key to the survival and success of modern organizations lies in their management. As stated by Jovanović (2015: 145-146) *“Changes may be happening in their industries, but managers may simply fail to detect these changes because their attention is focused on personal strategies or other related aspects. Most research suggests that changes must often be dramatic or have major consequences for firms before their managers take notice of them. Noticing changes depends on those changes being seen as ‘breakpoints’ (Kiesler, Sproull, 1982). Changes that tend to be noticed are those changes that are significant, sudden, or catastrophic. It seems, unfortunately when managers and their firms face significant and sudden changes in their industries, it is often too late for them to respond effectively. Business is declining as a result and some companies never fully recover.”* Consequently, in the following text, the role of modern managers and the success of the effective organizational management as well as the importance of current managers in daily business and the achievement of market competition will be described.

There is no unique definition of management, so scientists such as Wehrich and Koontz (1998) define management as *“a process of shaping and maintaining an environment in which individuals, working together in groups, efficiently achieve the chosen goals.”* Moreover, Swansburg (1996:1) states that *“To manage is to forecast and plan, to organize, to command, to coordinate and to control. To foresee and plan means examining the future and drawing up the plan of action. To organize means building up the dual structure, material, and human, of the undertaking. To command means binding together, unifying and harmonizing all activity and effort. To control means seeing that everything occurs in conformity with established rule and expressed demand”.* Furthermore, Dasgupta (1969) defines management as *“the creation and control of the technological and human environment of an organization in which human skill and capacities of individuals and groups find full scope for their effective use to accomplish the objectives for which an enterprise has been set up. It is involved in the relationships of the individual, the group, the organization, and the environment.”*

Additionally, Koontz (1961) defines management as “*the art of getting things done through and with people in formally organized groups. It is the art of creating the environment in which people can perform, and individuals could cooperate towards the attaining of group goals. It is the art of removing blocks to such performance, a way of optimizing efficiency in reaching goals*”. Also, Mary Gushing Niles (1956) states that “*Good management, or scientific management, achieves a social objective with the best use of human and material energy and time and with satisfaction for the participants and the public.*” All of the previously mentioned definitions can be reduced to a process that implies maintenance and modeling the environment in which an individual is found, working together in the team, through joint efforts and energies, to achieve specific organizational goals.

Similarly, Datalab (2016) defines management as “*a special discipline, multi-disciplinary, that deals with the research of the problems of managing certain jobs, ventures, and social systems.*” This definition of management implies a complex process involving many sub-processes, as well as a group of individuals who manage systems and methods. While the definitions of management are numerous, each of these can be inferred from the following essential managerial features: procedural approaches to management, but also the skill based on which goals are achieved.

Although there are numerous directions and schools within management theory, there is still no consistent theory that could be used in practice. To that goal, the closest contingency theory is used. This theory emphasizes the importance of the real situation in which the manager is situated, regardless of whether it is in the United States or another country. For this reason, management, besides its scientific dimension, also contains elements of skill and art. More precisely, “*management is science, and successful management is art. This is the main reason why management can never learn and even less copy.*” (Sikavica, Bahtijarević-Šiber, 2004) Just as there is no general model to guarantee the success of an organization, there is no general model for implementing effective management in the organization. The success of each organization is unique, cannot be rewritten and is separate, and when that is not the case, it would be impossible to explain the different business results that the organization achieves.

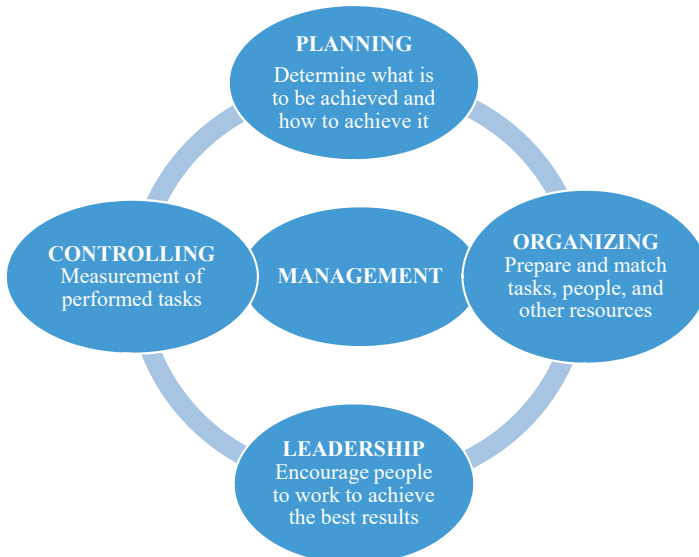

Nowadays, the success of an organization is more than ever a result of effective organizational management. One of the reasons for the bankruptcy and

failure of an organization lies in dysfunctional management. Consequently, it is necessary to develop effective organizational management that adjusts to changes in the business environment and is in the constant process of evolution, resulting from the many factors of the organizational structure. For the success of each organization, it is of utmost importance to have successful management. Efficient management of human resources in the organization contributes to the development of a favorable business environment, thus creating more and more business success.

Although different management theorists mention different (four or five) managerial functions, the concept of managerial functions in the second decade of the 20th century is set by the father of management, Henry Fayol, and the function of a manager today represents the basis for their identification. It is possible to distinguish the following interconnected managerial duties (Figure 1):

- ✦ Planning,
- ✦ Organizing,
- ✦ Leadership and
- ✦ Controlling

Figure 1. Basic managerial functions

Source: Made by authors according to Sikavica and Bahtijarević-Šiber, 2004

Koontz and O'Donell (1968) define planning as a function which “is not an activity that is carried out continuously but only occasionally quarterly, semi-annually, annually, and as such focuses on the future, which implies the use of effort, knowledge and needed resources to achieve the desired and set goals. Planning is a reflection on how to systematically achieve the desired, before carrying out the activities themselves”. In other words, Bateman and Snell (2007) state that planning is a decision-making process as to what to do, what future problems are likely to be and which actions need to be taken to achieve a competitive advantage on the market.

Unlike planning, the function of organizing is a continuous process that takes place on a daily or weekly basis, which implies preparation of all activities within the organization and aligning people, tasks and other resources in accordance with the principles and goals set. The primary task is to determine the role of people working together in the team, i.e. to establish a proper role structure among employees, who need to perform coordinated, efficient and effective routine processes and activities. Lacking in quality of an organization can lead to many consequences, such as a more significant amount of employee stress, an increase in overtime working hours and poor employee efficiency states (Sikavica, 2004).

Leadership, as one of the most critical managerial functions that largely depends on the company's performance, implies activities aimed at interacting between managers and employees. Sikavica (2007) outlines that the main point of the leader is the ability to influence his associates and to motivate them to contribute to the achievement of common goals through their work and activities.

Controlling, as the last management function, allows a manager to see if he or she is working in the desired direction. Controlling, therefore, is defined as “... the process of measuring and assessing the degree of realization of set goals and taking corrective action if the process demonstrates that there are negative deviations” (Pudić, 2016). Without control, managers cannot know how much they have done and to what degree of success. It also serves the purpose of better planning and setting goals for the future.

Today, one of the most critical tasks of a manager is aimed at employees, i.e. modern managers are expected to motivate others, and their charisma and attributes often influence this. “Modern managers must first know how to motivate,

coordinate and link different individualities, whether they are in production or the service” (Bistričić et al., 2011: 32).

This means that managers after they get acquainted with the outside environment, need to focus their knowledge and skills on the internal state of the organization. In other words, they must devote themselves to interpersonal relationships, eliminate all struggles and conflicts so that the organization can develop smoothly in the future.

The key to becoming a successful manager is not to look for the most suitable organizational structure but to focus on managing the company in line with the changes that occur in the environment and the market. “*Human resources are the total knowledge, skills, abilities, creative opportunities, motivation and loyalty that an organization (or society) has.*” (Jambrek, Penić, 2008: 1190) Human resources of the organization create a synergy between the various abilities and intellectual capital of a company that helps in business development and achievement of the organization’s stated goals. The management of human resources is a series of interrelated tasks and activities aimed at employing an adequate number of a qualified workforce that, through their abilities, talents, knowledge, interests, and motivation contributes to achieving success following organizational goals. One of the ways to meet the set goals and ensure that the right people are placed in the right places and can take full advantage of the organization’s success is managing talents. “*Talent Management is a comprehensive and integrated system of a series of interrelated HMR activities to attract, motivate, develop, and maximize the use of the potential of people with extraordinary knowledge and skills that are of strategic importance for the organization in achieving sustainable competitive advantage, further development and performance,*” states Bahtijarević-Šiber (2014:164). The recognition of key talents that have over-the-art skills, knowledge, creativity and developed innovative intelligence and ability to create products, ideas, and solutions in a new way is crucial to the value and success of the organization.

As stated by Glavaš, Uroda and Santo (2018: 811) ” *...there is constant concern about business processes and their improvement, but also, there is the need for these processes to develop in order to achieve the best effectiveness and profit as a unique economic component. Therefore, there is also the need for education and employment of competent employees...*”. Human resources represent the core strength of an organization, and accordingly, the key to success lies precisely in

the way that organizations choose and then organize people. A small number of organizations today recognized the need for radically redesigning the philosophy of the whole organization, which would simply focus on the personal development of an individual. The Hanover, Inamori, and Bill O'Brien believe that managers need to redefine their business, or abandon old dogmas about planning, organizing and controlling, and "... *their responsibility for the lives of a large number of people is considered almost sacred.*" According to O'Brien, the basic task of a manager is to "create better-living conditions." (Džubur, 2003: 47).

"Creative effort" is created by setting a vision and a clear picture of reality, that is, it implies the force that connects the reality and the vision and is caused by the natural tendency to the solution. By stimulating and supporting creativity in humans, the very essence of human knowledge is attained. People who have a high level of expertise and who have a constant desire to learn something new achieve the results that they want in life, and this results in the spirit of the learning organization. Those organizations that discover how to foster people's commitment to organization and readiness to learn at all levels have great opportunities to achieve competitive advantage and market monopoly.

3. CASE STUDY: PODRAVKA - EXAMPLE OF EFFECTIVE ORGANIZATIONAL MANAGEMENT

Podravka is one of the leading companies not only in Croatia but also in most of Central and Eastern Europe. The company mentions "creativity, trust, passion, consumer satisfaction and excellence" as its core values, and its vision is focused on "improving the daily quality of life of their consumers, customers, and employees through innovativeness and internationalization while the mission is geared towards innovative culinary experience and healthy living solutions for all" (Podravka). The goal of Podravka is to improve the quality of life of the society in which it operates and from its foundation invest in various activities that make the quality of society's life better. Podravka "invests in science and education, sustainable development, culture, art, sport, and humanitarian projects" (Podravka). Human resources management as a part of enterprise management and effective organizational management greatly contributes to the mission and vision of Podravka.

Podravka is a food and pharmaceutical company founded by brothers Matija and Marijan Wolf in 1934 in Koprivnica. The Wolf brothers founded a fruit

processing workshop that 13 years later became what is today known as Podravka. After World War II, the company shifted into social ownership and bears the name Podravka since 1947. Podravka was privatized in 1993 and registered as a joint stock company. *“The Podravka Group is a multinational group that operates through subsidiaries and representative offices in 25 countries around five continents (Europe, North America, Asia, Africa, and Australia). Significant business operations of the Podravka Group are in Croatia, Slovenia, Bosnia, and Herzegovina, Russia and Poland”* (Podravka Group, 2018: 15). Podravka’s entry into foreign markets started in 1967 when their product Vegeta was exported to Hungary and Russia for the first time. Podravka started its involvement in the pharmaceutical industry in 1972 when Belupo was founded, and they began to manufacture medicines. Podravka’s business expanded in 2000 with the construction of a manufacturing plant in Poland. In 2006, Podravka bought the brand name, Eva. In 2007, Podravka bought Polish brands Warzywko and Perfekta and the Croatian brand Lero. Podravka continued its acquisitions in 2009 with the brand Belsad, and in 2015 Podravka acquired Žito (Žito, Zlatno polje, Natura, Gorenjak, 1001 Cvet, Šumi bomboni, Maestro). In addition to these purchases and acquisitions, in collaboration with the Ruđer Bošković Institute, the Center for Food Innovation has been established in 2013.

Since it is a huge and successful company, the management structure in Podravka consists of the Management Board, the Supervisory Board, and the General Assembly. Management of Podravka consists of a president and four (4) members appointed by the Supervisory Board. The Chairman and the members of the Management Board shall be appointed for a period determined by the Supervisory Board (up to five years) and may be reappointed. The beginning of the term of the Management Board shall be counted from the day of appointment of the Management Board. Members of the Management Board are responsible for the work of the Company. Management’s mode of operation and division of duties among the members of the Management Board are regulated by the Rules of Procedure of the Management Board (Podravka). The Supervisory Board has nine members, eight of which are elected by the General Assembly by a quarter majority of the votes cast, and one member of the Supervisory Board appoints the Workers’ Council of the Company in a manner and accordance with the provisions of the Labor Law. Members of the Supervisory Board are elected for a period of four years. The beginning of the term of office for each member of the Supervisory Board shall be counted from the day of the

election. To improve corporate governance and business transparency, two sub-committees of the Supervisory Board were established - the Audit Committee and the Remuneration Committee.

The right to participate and to exercise the right to vote at the General Assembly is given to shareholders registered in the computer system of the Central Depository Clearing Company (CDCC) which applies for participation at the General Assembly no later than the seventh day before the General Assembly. Shareholders, stakeholders, and proxies of shareholders vote through ballot papers listing the number of votes belonging to each participant of the General Assembly. According to the Companies Act, the General Assembly decides on the use of profits. The General Assembly shall determine the distribution of the profit to the shareholders following the Company's business results and financial position and other relevant factors. The General Assembly may legitimately decide whether it represents at least 30% of the total number of voting rights. The General Assembly is chaired by the President of the General Assembly, appointed by the Supervisory Board upon the proposal of the Management Board.

During 2017, Podravka's management focused on optimizing costs related to the Food segment while at the same time they were trying to redefine the business model to create the prerequisites for a viable and efficient way of doing business (Podravka Group, 2018: 46). Cost optimization ended successfully thanks to a series of internal activities and measures undertaken by the company's management. To achieve profitability, business decisions were made in 2017 to enable value creation for future Podravka shareholders. The arrangements were related to the reconciliation of assets, and *"the most significant costs related to value adjustments of assets relate to the value adjustment of Warzywko and Perfecta brands in the amount of HRK 17.9m, value adjustments of assets in HUBs in Africa and MENI in the amount of 17.6m HRK and value adjustment of frozen vegetables in Serbia in the amount of 10.7m HRK"* (Podravka Group, 2018: 46).

As stated above, the company's goal is to achieve development and growth through quality management of sales assortment, with emphasis on key brands such as Vegeta, Dolcela, Lino, etc. One of the key benefits of Podravka is strong distribution (about 500 000 stores around the world), a lot of employees (about 6,500) and a variety of food products (more than 800 different items). Based

on Podravka's long-standing business, the financial losses of one product are successfully replaced by the financial gains of another product. From the above-mentioned example, effective organizational management was manifested in 2017 when the corrected income of the *Children's Food* business program achieved a loss of 7.1m HRK while the *Podravka Food* business program in the same period earned a profit of 8.2m HRK.

Podravka's most significant advantage is that production and operations management is located in Croatia, more precisely in Koprivnica. Production and management in its factories for Podravka represent the possibility of a rapid response to the changes in the market. In other words, information going back and forth between the market and the buyers and their feedback is quick, and many changes can be done in a short period of time.

Thanks to effective organizational management, Podravka has a clear strategy and a good organization for achieving its business goals, but the key to its success is its creative, dynamic and successful employees, who are always ready to make their contribution to the company's well-being and invest more time and effort in achieving above-average results.

Podravka offers its incentives and challenges to its employees, providing a wide range of options for professional and personal development and dynamic in everyday work. In their words, employees are allowed what they deem is necessary for *"... individual and teamwork and to reach the potential. In interpersonal relationships, we care about respect, trust, sincere dialogue, and transparency, while in work excellence and aspiration towards achieving above-average results"* (Podravka). Podravka launches its passion into everything it does, and people who live Podravka's values build strength and a better future.

It is important to emphasize that Podravka has continuously invested in their employees and their knowledge throughout the history of the company (Figure 2) and has also presented knowledge in its strategy as the most valuable asset, and employees own this knowledge.

Figure 2. The average number of training hours

Source: Made by authors according to the Sustainable Development Report

By analyzing the picture above, it can be concluded that Podravka has a large number of its human resources annually included in educational programs or workshops. The primary goal of each educational program is to use the acquired knowledge and skills as much as possible in everyday work. Compared to the categories of employees, women averaged the highest hours of training during 2016, while men averaged the most hours of training during 2017. Looking at men and women as a universal category, it is evident that the least number of hours of training averaged during 2015.

4. CONCLUSION

The success of today's organizations is more than ever a result of effective organizational management and is indisputably essential to the business of each organization. In almost every country today there is overwhelming importance for constantly evolving management due to the activity of numerous external and internal organizational factors. If management acknowledges the "human perspective" or the human component of an organization, the organization's success is even more significant since human resources are the most valuable one organization can have. Human resources represent the core strength of an organization, and accordingly, the key to success lies precisely in the way companies choose and then organize people.

Podravka recognized the need for the radical redesign of the philosophy of the whole company, which implies a focus on the personal development of an individual. Accordingly, Podravka continuously invested in its employees through the history of the company and included them in educational programs. Its vision is reflected in the effort to become the leading food company located in the regions of Southeast, Central, and Eastern Europe. By analyzing this company, it can be concluded that good organization and effective organizational management are the keys to success that is reflected in positive financial results. Podravka's business growth, which grows year after year, proves the value of effective organizational management, good strategy, and organization.

PERSONAL DIMENSION OF MANAGEMENT – PERCEPTION OF OPERATIONAL POLICE EXECUTIVES OF THE IMPORTANCE OF MANAGERS’ INDIVIDUAL TRAITS FOR THE SUCCESS OF MANAGEMENT

Ante ORLOVIĆ, Ph. D.

Ministry of the Interior, Police Academy,
Zagreb

E-mail: aorlovic@fkz.hr

Abstract

The police are a security service that protects fundamental constitutional rights and freedoms of citizens. In the police system, the role of management is important, and it has two key dimensions: personal and institutional. Personal dimension of management is demonstrated through the responsibility of police executives (managers) in the police system at all levels - operational, tactical and strategic. Apart from their professional knowledge and skills, the success of police managers also depends on their individual traits - abilities and personality traits. This paper deals with the perception of operational police managers of the importance of managers’ individual traits for the success of management at the operational level. Given the above, empirical research was carried out, using the method of survey, by means of a Questionnaire on Traits and Success of Police Managers. The research included 106 heads of police stations from police administrations with headquarters in the regional centers of the Republic of Croatia (Split, Rijeka, and Osijek) and their surrounding police administrations. Respondents were given a questionnaire with some of the important traits of managers (12 of them), which mostly referred to overall management in the private and public sector. With regard to the above, the respondents expressed their opinion in accordance with their own knowledge and work experience, stating that each of indicated traits has an important

role for the success of police managers in the Croatian police system, primarily in case of managing police stations as fundamental police organizations. Data collected were also considered in the context of the existing system of selection of managers in the Croatian Police, which should be developed. The aim of this research was to identify the importance of certain traits of managers in the police practice (empirical introspection), to valorize some of the managerial traits in the procedures of selection of future managers (preferential selection) and to develop appropriate managerial potentials in persons employed in the police system (educational anticipation).

Keywords: personal dimension of management, managers' individual traits, the success of the police management, the perception of operational police managers

JEL Classification: M10, M12

1. INTRODUCTION

The police are a central service of the Ministry of the Interior which protects citizens' fundamental constitutional rights and freedoms, as well as other values protected by the Constitution of the Republic of Croatia (Police Act, Article 2). The police carry out police tasks and apply police powers in order to prevent and eliminate danger in criminal investigations. A police officer is an official of the Ministry authorized to carry out police tasks by applying police powers (Act on Police Tasks and Police Powers, Article 1 and 2).

Police executives (managers) are very important and they have a special responsibility in the police system at all levels. Positions of executive police officers (Police Act, Article 43) include planning, organizing, managing, and monitoring work processes in the police and routing, coordinating and supervising police officers.

Management in general and police management as well consists of personal (individual) and organizational (technical) dimensions. These dimensions are reciprocal, inseparable, and complementary. Personal dimension of management has a specific value with the organizational dimension of management depending on it and resulting from it.

Apart from the professional knowledge and skills they have, the success of police managers also depends on their individual traits - abilities and personal-

ity traits. With regard to some of the important traits of managers which relate to overall management in the private and public sector in general, a survey was conducted by means of a questionnaire. Traits evaluated by the respondents included verbal communication, leadership, stress tolerance, determination, intelligence, and others.

Respondents were operational police managers – heads of the police station, 106 of them. They expressed their opinion of the high importance of all twelve traits of managers (as offered in the questionnaire) in the context of their contribution to the success of police managers in managing police organizations - primarily in case of police stations.

Data collected by the research were analyzed separately and in the context of the existing system of selection of managers in the Croatian police. It is intended to improve this system in terms of content and form and thus, reflections/ attitudes of respondents who have relevant practical knowledge and accumulated experience of managing organizational units at the operational level of the police system can serve as orientation.

In principle, the existing system of identification and selection of managers in the police that has been simplified and elementary should include (among other things) evaluation of candidates regarding those traits of managers that are proven in practice as useful and which are preferred by the existing police managers with relevant years of service in the police system and significant experience in managing the police organization.

Personal dimension of management (individual skills and personality traits of managers) essentially determines the success of individual organizational units in the police as well as the police system as a whole. Personal dimension of management represents a type of software or a nucleus of the management system, while the organizational or technical dimension of management system can be seen as its platform or hardware

In fact, management deals with people and their relations in the organization. It is the modern management that emphasizes the importance of so-called soft variables, such as people in the organization, their knowledge and abilities and leadership styles, unlike the earlier phases of management development that focused on the so-called hard variables such as strategy, structure, size, technology, planning, controlling, etc. (Sikavica 2011:627-628).

2. RESEARCH METHODS

The research carried out was predominantly empirical and it was based on primary data collected by means of a survey method using a questionnaire. Characteristics of the sample, a method of data collection and used statistical analyses determine the subject of research in quantitative and qualitative terms. This research is of limited scope in terms of analysis and coverage of issues being studied, but it has special value because of professional profiles of respondents who are police officers with functions extremely important for the police system and its functionality.

2.1. SAMPLE

The survey included 106 respondents - heads of police stations (exceptionally, deputy heads or assistant heads participated in the research instead of heads of several police stations that justified their absence - illness, etc.) from police administrations with headquarters or areas belonging to large Croatian cities (regional centers) Split, Rijeka, and Osijek.

When it comes to the questionnaire, the respondents stated several of their demographic characteristics which may be relevant with regard to their opinions/attitudes related to researched problems. Indicated characteristics of respondents are given in Table 1.

Table 1. Demographic data of respondents – heads of police stations

Demographic data (N=106)		N	%
Sex	Male	99	94.3
	Female	6	5.7
Age	25-30 years of age	--	--
	30-35 years of age	2	1.9
	35-40 years of age	17	16.3
	40-45 years of age	31	29.8
	45-50 years of age	29	27.9
	50 + years of age	25	24.0
Category of police administration	1 st category	--	--
	2 nd category	49	46.7
	3 rd category	32	30.5
	4 th category	24	22.9

Type of police station	Regular	19	18.4
	Combined	51	49.5
	Specialized	33	32.0
Category of the police station	1 st category	11	10.8
	2 nd category	36	35.3
	3 rd category	55	53.9
Years of service in the police	5-10 years	--	--
	10-15 years	6	5.8
	15-20 years	9	8.7
	20-25 years	42	40.4
	25 + years	47	45.2
Years of service as a police executive	Up to 1 year	1	1.0
	1-3 years	5	4.8
	3-7 years	14	13.5
	7-10 years	13	12.5
	10-15 years	35	33.7
	15-20 years	22	21.2
	20 + years	14	13.5

Source: author's own data

- *Sex structure* of respondents in this research suggests that women are largely underrepresented when it comes to managerial functions at the operational level in the Croatian police. According to unofficial data, in 2014, out of the total number of police officers in the Ministry of the Interior, 17.29% of them were women, while the rest were men.
- Regarding the *age structure* of respondents, the prevalent age was between 40 and 45 years of age and the average age of sample $M = 45.3$ years of age. The average age of respondents is significantly higher than the average age of the total population of police officers in the Ministry of the Interior, which, according to unofficial data in 2014 was 38.5 years of age.
- Respondents came from *three categories of police administrations* (out of the existing four categories). The largest number of respondents came from the second category police administration (headquarters in Split, Rijeka, Osijek, and Pula), which is also logical given that such police administrations of higher rank include a greater number of police stations than the third and fourth category police administrations.

Regarding categories of police administration in which the respondents are employed, it should be mentioned that the *Police Act* (Article 10) prescribes

that police administrations are established for the purpose of performing police and other tasks in the territory of the Republic of Croatia. The area and headquarters of a particular police administration are determined by the Government of the Republic of Croatia by means of regulation based on indicators such as *the size of an area, population, number of criminal offenses and misdemeanors, characteristics of traffic routes and geographical position and other significant safety indicators*

By means of the Regulation on Areas, Headquarters, Types, and Categories of Police Administrations and Police Stations (Article 3), it is prescribed that twenty police administrations shall be established in the territory of the Republic of Croatia, with determined categories, as follows – *1st category*: Zagreb County Police Administration; *2nd category*: Split-Dalmatia County Police Administration, Primorje-Gorski Kotar County Police Administration, Osijek-Baranja County Police Administration and Istria County Police Administration; *3rd category*: Dubrovnik-Neretva County Police Administration, Karlovac County Police Administration, Sisak-Moslavina County Police Administration, Šibenik-Knin County Police Administration, Vukovar-Srijem County Police Administration and Zadar County Police Administration; *4th category*: Bjelovar-Bilogora County Police Administration, Brod-Posavina County Police Administration, Koprivnica-Križevci County Police Administration, Krapina-Zagorje County Police Administration, Lika-Senj County Police Administration, Međimurje County Police Administration, Požega-Slavonia County Police Administration, Varaždin County Police Administration and Virovitica-Podravina County Police Administration.

Criteria for categorization of police administrations are as follows: *security and criminalistics* (prescribed in the cited Article 10 of the Police Act) and *political and territorial* (“respecting special regulations determining the regional organization of the Republic of Croatia” - the quotation referred to in Article 2 of the above-mentioned Regulation).

Regional organization is regulated by the Local and Regional Self-government Act, Act on Territories of Counties, Towns, and Municipalities in the Republic of Croatia and the City of Zagreb Act.

The result of the provisions of these regulations is the establishment of 20 police administrations in the Republic of Croatia, which according to their number, name and territorial jurisdiction correspond to counties in a way that

each county has “its own” police administration. The exception is Zagreb County Police Administration, whose jurisdiction includes two counties - Zagreb County and the City of Zagreb, which is especially determined in administrative terms as it has the status of the capital of the Republic of Croatia and also the position of the county.

- ✦ Respondents came from *all three categories of police stations* (mostly from the third category) and from *all three types of police stations* (mostly from combined stations). *Regular* stations are those in which regular and criminal police are situated, *combined* stations include traffic police or border police, in addition to the above-mentioned fundamental police forces, and *specialized* stations are those including only specialized police forces - traffic, border, maritime and airport police. (*Organization of the police in more details – please refer to Regulation on the Internal Organization of the Ministry of the Interior*).
- ✦ Respondents’ length of service in the police system is an important demographic characteristic which significantly determines the relevance of respondents’ answers to the subject matter. The basic premise in this respect is that the respondent’s length of service in the police correlates with the degree of relevance of the respondent’s answer. The prevailing period of respondents’ length of service in the police in this research is 25 years and more, with an average length of service $M = 23.8$ years. Indicated years of average length of service in the police are extremely relevant for the credibility of opinions/attitudes expressed by respondents with regard to police management and managers.
- ✦ Particularly important demographic characteristic of respondents in this research should be their length of service in managerial positions in the police, during which they gained managerial work experience (knowledge, skills, and abilities) which resulted in their attitudes/opinions on police management and its characteristics. The prevailing period of respondent’s length of service in managerial positions in the police is 10-15 years, with the average respondents’ length of service in managerial positions $M = 12.8$ years. Indicated years of average length of service in managerial positions in the police are extremely relevant and respondents’ answers are of high importance and credibility in the process of recognizing police management as a subject of this research.

2.2. DATA COLLECTION METHOD

The research was conducted by means of a survey, using a *Questionnaire on Traits and Success of Police Managers*. The questionnaire consisted of an introductory and a main part. The introductory part included the following information - a short description and purpose of survey, an explanation of a respondent's role and what is expected from him/her regarding the manner and the approach to completing the questionnaire, statement of voluntary surveying, guaranteed anonymity of respondents and the use of data obtained exclusively for the purpose of scientific research.

The main part of the questionnaire consisted of three groups of the question with regard to the following: a) respondent's demographic data; b) evaluation of the police system efficiency level and c) evaluation of the level of importance of certain managers' traits (abilities and personality traits) for the success of management.

Technically, the questionnaire was one of the three components of the integral questionnaire on police management issues that were drawn up for the concerned population of respondents. The survey was conducted in the official police premises of the Ministry of the Interior, in Osijek-Baranja County Police Administration, Split-Dalmatia County Police Administration and Primorje-Gorski Kotar County Police Administration in October and November 2018, during the seminar which was a part of professional training of police executives (medium level of management; module 1 - operational police management).

2.3. STATISTICAL ANALYSIS METHODS

Data collected were processed using a statistical computer program for sociological research SPSS 17 (*Statistical Package for the Social Sciences*). The analysis of the obtained data was performed by descriptive statistical procedures, by indicating absolute and relative frequencies, expressing their mean values (arithmetic mean, median, mode) and ranking the variables according to the perceived degree of their importance. Respondents' perception of the importance of particular traits of police managers (abilities and personality traits) for the success of police management was determined by *an importance scale* (from 1 to 7), with figures 1 and 2 indicating low importance of a particular variable, figures 3, 4 and 5 medium importance and figures 6 and 7 indicated high impor-

tance. Respondents' perception of efficiency level of the police system was determined by a rating scale (1 to 7), with a low level of efficiency being marked by 1 and 2, a medium level marked by 3, 4 and 5 and high level by figures 6 and 7.

3. RESULTS AND DISCUSSION

The main part of the questionnaire, as it has been already mentioned, referred to gaining respondents' opinions/attitudes about the level of efficiency of the police system and about particular traits of managers (abilities and personality traits) and their impact on the efficiency of police managers.

Regarding the perceived level of efficiency of the police system (achieved results in the police practice in relation to police duties and tasks prescribed by law); the results showed that this level of efficiency is average (Table 2)

Table 2. Level of the efficiency of the police system – respondents' perception

	Evaluation	f	%	M	M _e	M _o
Level of the efficiency of the police system	1-low	---	---	4.36	4	4
	2-low	2	1.9			
	3-average	18	17.0			
	4-average	38	35.8			
	5-average	36	34.0			
	6-high	12	11.3			
	7-high	---	---			
	Total	106	100.0			

Source: author's own data

The average level of efficiency of the police system (according to respondents' perception) is a challenging fact in terms of the requirements of finding ways to improve the functionality of the system. In this regard, police management is a key factor to be developed on several bases, including a system of identification and selection of managers in the police.

Regarding the traits of managers, the respondents were asked to evaluate, in accordance with their own knowledge and work experience in the police system at a positions of police officers and police executives, what level of importance, in their opinion, has each and every trait in achieving success of police managers in the Croatian police system.

Traits evaluated by the respondents were taken from Burack and Mathys 1980: 212 (according to Bahtijarević-Šiber, 1999: 462). These are the most commonly used factors in determining managerial potentials in US companies. Traits concerned and their short descriptions are shown in Table 3.

Respondents were asked to answer the questions honestly by circling corresponding number (from 1 to 7) reflecting the level of importance they consider corresponding to each of managers' traits mentioned in the questionnaire, in the context of contribution of these traits to the success of police managers in managing organizational units of the police - primarily police stations. The respondents' answers are shown in Table 3.

3.1. MANAGERS' TRAITS AND THE SUCCESS OF MANAGEMENT – THE RESPONDENTS' PERCEPTION

Abilities and personality traits of managers are important *personal instruments* used by managers when performing managerial functions. It is therefore important for organizations to properly identify and valorize indicated "instruments" (individual traits) in the procedures of selection of managers for certain managerial positions.

Respondents expressed their opinions on the most important personality traits of police managers in a way that they were presented a list of twelve characteristic traits of managers (six positives and six negative) from which they should select three traits that, in their opinion, mostly characterize police managers... Along with the "non-objectivity", one of the most frequently selected traits of managers were "superficiality" and "dependence". It is obvious that all three traits that were most frequently selected by the respondents are negative. Along with "honesty" the least selected traits were "objectivity" and "independence". It is obvious that all three traits of managers who were least frequently selected by the respondents are positive. (Orlović, Velić, Harambašić, 2015: 546-547)

A typical list of managerial qualities (Bahtijarević-Šiber, 1999: 461) applied in the selection is the following: energetic, ambitious, intelligent, creative, business-oriented, self-confident, communicative, analytic, decisive, persuasive, sharp. It is a combination of intellectual abilities and personality traits. ... Due to the nature of managerial positions and modern conditions, apart from these characteristics, the ability of cooperation and teamwork, initiative, tolerance to uncertainty and flexibility become (and are) very important characteristics.

With regard to police management, the greatest intensity of work motivation among police officers' results from independence and autonomy in work, as well as teamwork and coordinated actions in more complex cases, while the manner of selection of executives and their unequal attitude towards police officers have a demotivating effect on motivation for work. (Turkalj, Orlović, Milković 2016: 413)

The opinions expressed by the respondents on the importance of some of the managers' traits (indicated in Table 3 in numbers from 1 to 12) for the success of management - were statistically analyzed and presented through several different parameters. The column $f_{(6-7)}$ shows the frequency of respondents who find certain variables to have "high importance" for the success of police management (those who circled figure 6 or 7 in the questionnaire). In the column $\%_{(6-7)}$, the absolute frequency of the respondents from the previous column is presented as a relative frequency or proportionate participation of respondents with such an opinion in the total population of respondents (106 respondents participated in this research). In the next three columns, the table shows the mean values of the expressed opinions of the respondents about the levels of importance of individual variables: the column M shows *the arithmetic mean or average value*, column M_c shows *the median or central value* and the column M_o shows *the mode or the dominant value*. The last column *Rank* includes the positions of individual variables that are ranked in twelve levels (rank 1-12) by the degree of their importance. The ranking criterion of the variables was the level of the arithmetic mean (M) of the expressed opinions of the respondents for each variable.

Table 3. Managers' traits and the success of management – the perception of heads of police stations

	Managers' traits (abilities and personality traits)	f 6-7	% 6-7	M	M_e	M_o	Rank
1	<i>Verbal communication – success in oral expression in individual or group situation</i>	69	65.8	5.61	6	6	7
2	<i>Written communication – the ability to clearly express ideas in writing</i>	57	54.3	5.30	6	6	12
3	<i>Leadership – success in assuring the acceptance of ideas and leading groups and individuals in achieving tasks and goals</i>	67	64.5	5.62	6	6	6
4	<i>Social sensitivity – the ability to perceive and respond to the needs of others; sensitivity in judging personal influence on others</i>	53	50.5	5.41	6	6	11
5	<i>Planning and organizing – the ability to successfully set the appropriate direction for oneself and/or others to achieve a specific goal with appropriate use of human and material resources</i>	74	70.5	5.76	6	6	4
6	<i>Analytical skills – the ability to detect problems, provide relevant information, identify possible causes and suggest an alternative course of actions</i>	62	58.1	5.55	6	6	9
7	<i>Stress tolerance – the ability to act and to achieve results under pressure and obstacles</i>	68	64.8	5.64	6	6	5
8	<i>Creativity – the ability to generate, hear, and / or accept imaginary solutions and innovations</i>	59	56.7	5.47	6	6	10
9	<i>Determination – the ability to make decisions, judgements and to undertake actions</i>	84	80.0	5.97	6	6	1
10	<i>Flexibility (adaptability) – the ability to modify the approach and style of behavior in order to achieve the goal or ability to adapt to the changing needs and situations</i>	67	63.8	5.60	6	6	8
11	<i>Decision making – the ability to make decisions by using logic or judgment</i>	79	75.2	5.90	6	6	2
12	<i>Intelligence – general ability of dealing with problem situations</i>	75	71.5	5.80	6	6	3

Source: author's own data

From the data presented in Table 3, it can be concluded that the vast majority of respondents (50.5% to 80.0% of them) believes that each of the relevant twelve variables is of "high importance" for the success of police managers. In case of nine variables, the arithmetic mean is above 5.0 (in case of the remaining three, it is slightly lower than that), suggesting the dominant perception of operational police managers of the high importance of all relevant variables for the success of police management. This conclusion is supported by the fact that the total arithmetic mean of all twelve variables amounts to 5.64 (minimum = 1, maximum = 7), which is the result approximately 19% lower than the absolute maximum. In addition, the median and the mode are at the level of

importance 6, and the maximum is 7 (minimum is 1). Although differences in the perceived importance of individual variables are not significant (there are no large discrepancies) it is necessary to emphasize for illustrative purposes that the three highest ranked variables were *determination, decision making, and intelligence*, while the last three variables were *creativity, social sensitivity and written communication*.

Data obtained by means of this research are relevant in the context of organization and management in the police system, as well as in the context of the functionality of police practice. Data collected are of particular significance given the professional characteristics of the respondents. Respondents are heads of police stations, i.e. operational police executives in fundamental organizational units in the police system. This type of research model is by its very nature an “*empirical introspection*”. The model is determined by indicated characteristics of respondents and by the focus of the research on identifying individual traits of managers and assessing their importance for the success of management in the police practice.

In addition to the general (organizational) context, *the empirical introspection of managers* is important in an individual context. “To be able to manage others, we must first learn to manage ourselves and to understand our own motivations, perceptions, strength, and limitations. We also need to have a sense for management, a desire to explore and risk and the ability of constant learning from everyday experience. From this point of view, knowing oneself is critical for business success and satisfaction” (Denhardt et al. 2002, according to Marčetić 2007: 147).

3.2. SELECTION OF MANAGERS IN THE CROATIAN POLICE SYSTEM – LEGAL AND IMPLEMENTATION FRAMEWORK

In accordance with *the Police Act (Official Gazette 34/11, 130/12, 89/14, 151/14. 33/15, 121/16; Article 43)* police officers’ positions are classified into three categories – *executive police officers* and *senior and junior police officers*. Positions of executive police officers include planning, organizing, managing, and monitoring work processes in the police and routing, coordinating and supervising police officers.

In accordance with *the Regulation on Classification of Positions of Police Officers* (Official Gazette 129/11, 82/12, 140/13, 32/15, 40/15, 115/15, 11/17, 102/17, 129/17, 5/18, 66/18, 109/18), the classification of the positions of police officers is determined within the categories of positions of executive, senior and junior police officers, as well as standard criteria for each category, sub-category and sub-category level of a position (Article 1). Standard criteria for classifying positions are the following: degree of complexity of tasks, education, personal police profession, level of responsibility and authority for making decisions and a degree of independence in work (Article 2).

Positions within the category of executive police officers are classified into four sub-categories as follows: 1. *Chief Executive*, 2. *Senior Executive*, 3. *Executive*, 4. *Junior Executive* (Article 6). Depending on the sub-category to which a certain managerial position belongs, it is compliant with the “strictness” of standard criteria that must be met by officers claiming or already being appointed to a particular managerial position.

The Police Act regulates the selection of police executives pursuant to Chapter 9 “Appointment and Dismissal of Executive Police Officers” (Article 58-62). Job vacancies of executive police officers (police managers) are announced through *public vacancies* (general police director) or *internal vacancies* (other executives). The Ministry of the Interior announces public and internal vacancies by virtue of previously indicated provisions of *the Police Act* and *Ordinance on the Internal Order of the Ministry of the Interior* (No. 511-01-152-OGR-2458/12 of 28 July 2012 and Amendments to Ordinance of 29 April 2013, 26 October 2013, 2 December 2013, 21 February 2014, 16 June 2014, 5 May 2015, 6 November 2015, 24 March 2016, 2 May 2016, 13 March 2017, 20 September 2017, 2 November 2017, 29 December 2017, 15 January 2018, 9 February 2018, 1 March 2018, 27 April 2018, 29 June 2018, 1 August 2018 and 13 December 2018. This Ordinance generally includes a job description of police officers’ positions, the required level, and type of qualification for each position, the required police officer’s personal traineeship and coefficient of position for the calculation of basic salary.). Techniques, mechanisms, and rules for the implementation of the competition are regulated by *the Regulation on Announcing and Conducting a Public Competition and Civil Service Internal Advertisement* (Official Gazette 78/17).

Candidates applying for internal advertisements or public competition must: (a) *meet formal conditions* (application, CV, certificate on level of education, work

experience, police profession), (b) *take test* (assessment of knowledge, abilities and skills) and (c) *attend an interview* (identification of interests, professional goals, motivation for work, work experience and results of work done so far).

Candidates are selected by a committee, whose president and four members are appointed by the Minister among the executive, senior and junior police officers, as well as trade union representatives at their proposal (Police Act, Article 60). After the procedure has been carried out, the Committee ranks applicants according to the total number of points earned on a test and an interview (Regulation on Announcing and Conducting a Public Competition and Civil Service Internal Advertisement, Article 15).

With regard to the above-mentioned, it is necessary to point out certain lack of transparency in regulations and in practice in relation to the following four key factors in the procedure of selection of candidates for managerial positions in the Croatian police:

(1) *Committee for selection of candidates.* The Police Act or any other legal or subordinate regulations does not include an (elaborated) methodology for appointing members of the committee in question, nor have they arranged their necessary competencies to qualify them for the performance of the relevant duty. The Regulation on Announcing and Conducting a Public Competition and Civil Service Internal Advertisement (Article 8) lists very general criteria on the characteristics of members of the committee: "Members of the committee shall be appointed among officials with necessary education and professional knowledge for assessing knowledge, abilities, and skills of candidates in public competition procedure."

(2) *The content of tests.* The above-mentioned Regulation (Article 11-12) states that "Assessment of candidates' knowledge, abilities, and skills, as well as results in the work so far shall be performed by means of a test and an interview the Committee conducts with candidates. ... In case of an internal advertisement, testing consists of an assessment of knowledge, abilities, and skills important to do the job." This phrase is too general and, in the absence of other regulations/provisions that would regulate the subject matter more precisely, it is not uncommon in practice that assessment of knowledge of candidates competing for completely different/diverse executive positions is conducted by tests with the same questions. Questions are focused on one area exclusively (law / legal regulations) and are often contingent, unimportant and irrelevant in terms of content.

(3) *Conversation-interview*. The above-mentioned Regulation (Article 14) states that “By means of a conversation with candidates, the Committee shall determine the knowledge, abilities and skills, interests, professional goals and motivation of candidates for civil service work, as well as the results achieved in their work so far.” This case also does not include more precise regulations/provisions on how to determine the mentioned qualities of candidates. In addition, members of the committee should have the appropriate professional competences and professional qualifications to be able to successfully carry out the tasks involved, and they often do not have it. The relevance of conversation-interview as a selection method for managers is also problematic due to its shortness that results in subjectivism, generality, and superficiality.

(4) *Ranking*. The above-mentioned regulation (Article 15 and 17) states that „upon conducted interview, the Committee shall rank applicants according to the total number of points earned on a test and an interview... The Committee shall submit to the head of the body a report on the conducted procedure, signed by all members of the Committee. The ranking list of the candidate is enclosed to the report...“. In this case, the lack of transparency is explicitly shown in the absence of an appropriate provision regulating that the first candidate should be appointed to the executive position for which he competed, and if there are justified obstacles for that, the next candidate on the list should follow and then the one after him/her. By omitting this, there is a room for improvisation and manipulation “disguised” by the right of discretionary decision making.

Selection of managers in the police is carried out in the manner and by methods regulated by the positive legal regulations. This is mainly a bureaucratic procedure, which is characterized by discretionary decision making. The actual situation is still better than it was a few years ago because there are a legal framework and prescribed procedures required for the tasks of identification and selection of managers.

3.3. RESEARCH RESULTS – STRENGTHENING THE SYSTEM OF SELECTION OF MANAGERS IN THE POLICE

By comparing the indicated characteristics and parameters of the procedure of identification and selection of managers in the Croatian police and the content and results of the conducted empirical research (survey) – there is a significant discrepancy in the content of managerial traits evaluated in the existing

procedures of selection of managers and traits evaluated by the respondents in the questionnaire (which represent managerial potential in the US companies). For example, three traits in the questionnaire chosen by respondents as the most important (determination, decision making, intelligence) are not at all included in the current procedures of selection of managers in the police.

It is necessary to improve the system of identification and selection of managers in the police both in terms of content and form. With regard to content, the main orientation can be the results obtained as a part of this research, whose aim was to identify those managerial traits which are confirmed as useful and important in the police practice.

Empirical valorization or revalorization of some managerial traits is of fundamental importance for the procedure of selection of future managers. Taking into account opinions of experienced operational managers on the importance of certain managerial traits for the success of management is important in the context of designing and improving the system of selection of managers. Preference of managerial traits confirmed in practice when evaluating candidates for managerial functions can be called a model of “*preferential selection*”.

When it comes to forming, the existing simplified and elementary methods should be enhanced by other standard and specific methods of selection of managers.

One of the methods and techniques of professional selection are psychological tests (Sikavica, Bahtijarević-Šiber, Pološki Vokić, 2008: 689). Considering the content of the tasks, activities and psychological traits that provoke - the tests are usually divided into four major groups: ability tests, personality tests, knowledge and skills tests, interest tests.

Bahtijarević-Šiber (1999: 476) classifies the following as standard methods: professional and work biography, intellectual ability testing, personality, and interest questionnaires, projective techniques, behavioral and situational interviews, assessments of superiors and colleagues. She classifies the following as specific methods: situational judgment tests – selection using simulation and complex processes of evaluation of individual potentials (“Assessment Centres”).

Selection of police executives and the manner and efficiency of their managing of police officers and organizational units are of key importance for the (dis)functional-

ity of the police system. The intensity of negative discrepancy between the required (assumed, expected) and actual levels of knowledge and abilities of police management is proportionate to the certainty and intensity of the emergence of stress among police officers. ... Stressors with the highest perceived intensity are the unjust and dishonest manner of selection and appointment of executives; the lack of professional knowledge and skills and the lack of praise/reward for (extremely) well-done tasks. (Orlović, Labaš, Gudelj, 2015: 113-114)

In addition to improving the system of selection of managers, it is important to develop adequate managerial potentials in employees in the police system. As police managers are generally recruited from internal sources (existing human resources), the selection procedure will be more successful if the quantitative and qualitative levels of contenders competing for certain managerial positions are higher. The focus of educational activities in the police on the system of identifying and developing preferential (confirmed in practice) managerial competencies (knowledge, skills, abilities) in police officers can be called a model of “*educational anticipation*”.

Regarding the education of police officers in the field of management, two subordinate acts are particularly relevant: *Ordinance on Police Education and Regulation on Classification of Positions of Police Officers*.

Ordinance on Police Education (Article 2) stipulates that the Police Education Plan shall be drawn up for each calendar year and shall consist of three parts: (1) Plan of education, specialization, professional training and training conducted by the Ministry for the need of police officers, (2) Plan of conferences, symposia, fairs and professional meetings held outside the Ministry in the Republic of Croatia or abroad, where the Ministry sends its police officers, and (3) Plan of meetings held by individual divisions for their own needs.

Regulation on Classification of Positions of Police Officers (Article 7-10) stipulates that police officers interested in executive positions must meet certain criteria (standard criteria), including “education”. In accordance with the above-mentioned, those interested in positions in the category of *chief executive* and the *senior executive* must have completed a training program for the performance of tasks of executive police officers of *high level*. Those interested in a position in the category of the *executive* must have completed a training program for the performance of tasks executive police officers of *medium level* and

a position in the category of *junior executive* requires completion of the relevant training program of the *lower level*.

The above-mentioned Regulation (*Article 24, Police officers with work experience in management affairs*) stipulates that a police officer who has at least *ten years of work experience in police affairs* on the date of entry into force of this Regulation or who has spent at least *five years in executive positions*, is not required to complete the training program for the performance of tasks of executive police officers in accordance with the provisions of this Regulation.

The quoted provision implies the assumption that accrued work experience in executive or managerial affairs in a given period annuls the need for professional training on management issues. Work experience is certainly to be respected and valued but in some realistic frameworks. In the context of management, the Regulation made ad-hoc differentiation between experienced officers and those who lack experience, which can be considered as reasonable and justified to a certain extent and at the time of the adoption of the Regulation. However, an additional problem is that even several years after the Regulation entered into force (2011), there have been no training programs for managerial positions, although many managerial positions have been filled up with staff regardless of whether they had prescribed years of work experience or not.

4. CONCLUSION

Management has a special role and is of great importance in the police system, as well as in all other systems. Generally, management consists of two key dimensions: personal and institutional. Personal dimension of management is demonstrated through responsibility and contribution of managers to meeting the goals of the organizational units they manage. The success of police managers depends on their professional knowledge and skills, but also on their personality and individual traits (abilities and personality traits).

The objective of this research was to determine the perception of operational police managers (respondents) of the importance of individual traits of managers for the success of management in the police at the operational level. Managers' traits (12 of them), evaluated by the respondents, related to overall management in the private and public sector. The obtained data were considered separately and in the context of the existing system of identification and

selection of managers in the Croatian police with the aim of providing the possibilities for its development and improvement.

Regarding the above, the respondents expressed their opinion *in accordance with their own knowledge and work experience*, stating that each of indicated traits has an important role for the success of police managers in managing organizational units of the police, primarily in case of police stations as fundamental police organizations. Differences in the perceived level of importance of particular traits/variables were not significant, there were no major discrepancies. Owing to providing of information and illustration, we point out that three first-ranked variables are: *determination, decision making, and intelligence*, while the variables ranked as the least important are: *creativity, social sensitivity, and written communication*.

The Police Act regulates the selection of police executives pursuant to Chapter 9 “Appointment and Dismissal of Executive Police Officers”. Candidates applying for internal advertisements or public competition must: (a) *meet formal conditions* (application, CV, certificate on level of education, work experience, police profession), (b) *take test* (assessment of knowledge, abilities and skills) and (c) *attend an interview* (identification of interests, professional goals, motivation for work, work experience and results of work done so far).

By comparing the characteristics of the existing system of identification and selection of managers in the Croatian police and the content and results of the conducted empirical research (survey) – there is a significant discrepancy in the content of managerial traits evaluated in the existing procedure of selection of managers and traits evaluated by the respondents in the questionnaire. In terms of form, the existing system is, in fact, elementary and bureaucratized and needs to be re-examined and developed by implementing a set of standard and specific methods of selection of managers that have been confirmed in the practice of other systems in both private and public sector.

In given context, the meaning of this research is realized by identifying the importance of individual managers’ traits in the police practice (empirical introspection), by valorising the identified managerial traits in the procedure of selection of future managers (preferential selection) and by highlighting and promoting development of appropriate managerial potentials in employees in the police system (educational anticipation).

Personal dimension of management should be systematically and permanently explored, analysed and studied with the aim of developing an appropriate quantum of knowledge and awareness of the subject matter and their proper application in procedures of identification, selection and education of managers in all organizations, especially in large, complex and important organization, such as the police.

Abstract

Active labor market policies help the unemployed to get into employment as quickly as possible and to the job that best suits their qualifications by providing them with the support, they need for a successful return to the labor market. Their main goal is to increase opportunities for employment of job seekers and to improve the matching of jobs by which these policies provide a contribution to employment and GDP growth and at the same time reducing unemployment and dependency on unemployment benefits. In 2015, the Federal Employment Institute implemented a number of active employment measures, including the active measure of self-employment in the Federation of Bosnia and Herzegovina called "Start up 2015". This measure included co-financing of costs of starting a business for 593 unemployed persons from this entity of Bosnia and Herzegovina. The purpose of this paper is to point out the effectiveness of this measure in supporting self-employment and contributing to positive macroeconomic effects. Evaluation of the effectiveness of active measure of self-employment is made on the basis of conducted primary research and analyzed through components related to sustainability of supported businesses, effects on income of beneficiaries

of the measure, the creation of new jobs through additional employment and cost-benefit analysis of the measure. The paper finishes with recommendations for improvements for further implementation of the measure.

Keywords: active labor market policies (ALMPs), self-employment, employment, public employment services (PES), Federation of BiH

JEL Classification: J08, J21

1. INTRODUCTION

According to European Commission (2016), the main goal of active labor market policies (ALMPs) is to increase the employment opportunities for job seekers and to improve matching between jobs (vacancies) and workers (i.e. the unemployed). ALMPs in this way provide a contribution to employment and GDP growth, and at the same time reducing unemployment and dependency on unemployment benefits. Most of the public employment services in the European Union but in other countries also use the similar design of ALMPs that include: counseling and job-search assistance, subsidies to employers, direct employment/job-creation schemes and training.

For EU member states, ALMPs constitute a central part of their European Employment Strategy, which defines employment as one key objective of a joint economic policy, and while such active policies have been in use for many years in most countries, there is a growing awareness of the need to develop scientifically-justified measures of the effectiveness of different ALMPs (Kluve, 2006, pg.4).

Active labor market programmes includes all social expenditure (other than education) which is aimed at the improvement of the beneficiaries' prospect of finding gainful employment or to otherwise increase their earnings capacity, and this category includes spending on public employment services and administration, labor market training, special programmes for youth when in transition from school to work, labor market programmes to provide or promote employment for unemployed and other persons (excluding young and disabled persons) and special programmes for the disabled (OECD, 2008).

In line with positive practices, the Federal Employment Institute implements a range of active employment measures that are implemented through various forms of support in employment, self-employment, preparation for the labor market and vocational education and training in accordance with the needs and requirements of the labor market as well as relevant laws and documents, es-

pecially with the Strategy for strengthening the mediation function in public employment services in Federation of Bosnia and Herzegovina.

Federal Employment Institute implemented a number of active employment measures in 2015, including the active measure of self-employment “Start up 2015” which included co-financing of costs of starting a business for 593 unemployed persons from Federation of Bosnia and Herzegovina. The results of the primary research related to the sustainability of supported businesses, effects on income of beneficiaries of the measure, the creation of new jobs through additional employment and cost-benefit analysis of the measure are used for estimation of effectiveness of the measure. The research and evaluation of the measure were implemented within the Youth Employment Project (YEP).

Evaluation of the active employment measure can be done at all stages - at stages of identification, creation, implementation, and measurement of results. The authors of this paper made an impact assessment of the measure since the evaluation was done in the stage of results measurement in order to determine the net impact of the measure. The results of the net impact of the measure for beneficiaries have been assessed in comparison with the appropriate group (control group), what enabled measurement and comparison of the achieved effects with what would happen if the measure was not implemented. For this purpose, the authors applied econometric analysis, which compares the differences in the data pairs of the beneficiaries of the measure and the selected control group members i.e. authors applied the matching method by similarity.

One of the objectives of the research are is to determine how many beneficiaries of the measure kept their businesses open six or twelve months after the end of the measure. The additional objectives of the analysis are to review the financial effect of the measure Start up 2015 through the prism of improvement of the financial situation of the beneficiaries, as well as the cost-benefit analysis of the measure from the Federal Employment Institute point of view. Ultimately, the final objective of the research but also the evaluation is to provide a contribution to improving the procedures and processes of implementing active self-employment measure by giving recommendations that are consisting part of the paper.

2. ACTIVE LABOR MARKET POLICIES

Public Employment Services exists to provide social security to unemployed persons during the unemployment period, but their primary purpose

is to link supply and demand, i.e. unemployed persons and employers, which is achieved through modern tools and active labor market measures (Markuš and Umihanić, 2014. pg.3). According to International Labor Office (2003, pg.3), active labor market policies are policies that provide income replacement and labor market integration measures to those looking for jobs, usually the unemployed, but also the underemployed and even the employed who are looking for better jobs. ALMPs typically include labor market training, job creation in the form of public and community work programmes, programmes to promote enterprise creation, and hiring subsidies. ALMPs are usually targeted at specific groups facing particular labor market integration difficulties: younger and older people, women and those particularly hard to place such as the disabled. (ILO: GB.288/ESP/2, 2003).

The success of ALMPs depends not only on expenditure levels but most importantly on the design of the measures and the way they are implemented. Counselling and job-search assistance are mostly useful for short-term unemployed and include advice combined with a range of potential interventions. Subsidies to employers are relatively costly and are typically targeted at the most disadvantaged groups for whom other measures have proved ineffective. Direct employment/job-creation schemes are typically targeted at medium and long term unemployed to avoid perverse employment effects on the short term unemployed, through participants who might otherwise have found “real” jobs, being held off the labor market during the period of participation. Training is usually found to have the strongest positive long-term effects, but it is expensive (EC, 2016, pg. 6).

Based on positive practices, the Federal Employment Institute as an authorized institution for implementation of the active employment measures in the Federation of BiH implements different sets of ALMPs including the ones intended for employers as well as for unemployed individuals. The first group of measures is implemented for the purpose of satisfying demand of employers for workers of a certain profile and occupation, while other groups of measures are implemented with the aim to improve the labor supply of the Federation of BiH. When defining the measures, Federal Employment Institute takes into account the needs and requirements of the labor market as well as of compliance with the relevant strategic documents in the area of labor and employment. Special attention is paid to the diversity and needs of cantons in the Federation of BiH, and the available funds for the implementation of the ALMPs.

Some of the active employment measures implemented by the Federal Employment Institute include: Program of co-financing of the employment and gaining the first employment experience, Program of employment program and self-employment of Roma people, Program of co-financing of start-ups, professional orientation (professional information, training program for active job search etc.), program of preparation for job (training, vocational training and specialization), public works programs and joint programs with other institutions.

3. ACTIVE SELF-EMPLOYMENT MEASURE START UP 2015.

Active employment measures in 2015, the Federal Employment Institute defined and implemented in line with the Law on mediation in employment and social insurance of unemployed persons in Federation of Bosnia and Herzegovina („Official Gazette of Federation of Bosnia and Herzegovina“, no. 41/01, 22/05 and 9/08), Strategy for strengthening the mediation function in Public Employment Services in the Federation of Bosnia and Herzegovina and 2015 Annual working plan of the Federal Employment Institute. Support was provided to target groups of unemployed people identified by the aforementioned strategic document as more hardly to employ, especially young people and women. The realization of active employment policy measures was aimed at recruiting the persons from the unemployment register in the Federation of Bosnia and Herzegovina with special social and gender sensitivity in order to strengthen their competitiveness in the labor market, to prevent long-term unemployment and to create the conditions for acquiring the first job experience. Part of the ALPMs in 2015, was Program of co-financing of self-employment named Start up 2015. Planned funds for this measure were 2.640.000 BAM, and Federal Employment Institute implemented this program in cooperation 10 cantonal public employment services.

The aim of the program was to encourage at least 600 people from the unemployment register in the Federation of BiH for self-employment as well as employment of other unemployed persons, with support to the development of social entrepreneurship.

As a target group/beneficiary of the funds were defined persons from the unemployment register in the Federation of BiH before submitting the application for the program, regardless of the level of education and age, which would upon approval of the funds, register and maintain the small business for at least 15 months.

Measure was defined in a way that Federal Employment Institute would transfer the incentive funds to the beneficiaries after registration of small business (craft or limited liability company) in the number of obligatory contributions determined depending on the field of business activity, for the duration of 15 months, after the beneficiary provide proof that he/she paid these contributions. In the case of employment of an additional person, Federal Employment Institute would transfer incentive funds in monthly payments in the number of mandatory contributions of employees' salaries. Also, for the purpose of business start-up costs (registration fees, materials, equipment etc.), Institute transferred incentive funds in the amount of 200,00 BAM. For the purpose of implementation of the measure and collecting applications, the Federal Employment Institute published a Public call through the media and the website www.fzzz.ba, which remained open until the expenditure of funds, i.e. until the signing of contracts in the value of available funds determined by cantons. Review of allocation of funds by cantons and the level of implementation of funds are presented in Table 1.

Table 1. Program Start Up 2015 - Allocation of funds by cantons and level of allocation

Canton	Participants of the control group (No of unemployed persons at the time when the call was opened)	TOTAL (Planned)	TOTAL (Allocated)	Level of allocation of funds (%)
Una Sana Canton	45.251	297.517,13	301.501,00	101%
Posavina Canton	5.378	105.478,52	112.156,00	106%
Tuzla Canton	98.215	544.642,64	560.842,00	102%
Zenica Doboij Canton	70.017	411.153,59	382.561,00	93%
Bosnian Podrinje Canton	3.797	96.329,56	43.368,00	45%
Central Bosnia Canton	42.917	276.142,86	223.011,00	81%
Herzegovina Neretva Canton	33.135	238.520,01	177.040,00	74%
West Herzegovina Canton	9.157	130.899,62	60.569,00	46%
Canton Sarajevo	70.579	415.643,27	237.464,00	57%
Canton 10	8.159	123.672,79	103.384,00	83%
TOTAL	386.605	2.640.000,00	2.201.896,00	83%

Source: Federal Employment Institute, author's creation

The total amount of allocated funds were 2.201.869,00 BAM, which is ca. 83% of the planned amount. The total planned number of beneficiaries was 600, while the actual number of beneficiaries was 593. The average cost per beneficiary was 3.746 BAM.

4. EVALUATION OF ACTIVE MEASURE OF SELF-EMPLOYMENT START UP 2015

4.1. METHODOLOGICAL FRAMEWORK

According to Corbanese & Rosas (2009) in net impact estimation, the outcomes of program participants are judged in relation to an appropriate comparison (control) group. These authors explain that measurement of net impact includes the impact on employment and earnings and that is needed in order to estimate whether the programs were adequately designed, targeted, sequenced and administered.

Econometric analysis was conducted for the purpose of net impact estimation of participation in the program. This analysis compares the differences in the data pairs of the beneficiaries of the measure and the selected control group members, more specifically, the pairing method by relatedness was applied. The general demographic characteristics of the beneficiaries were known. In order to satisfy the objectives of the analysis, a similar member of the control group was identified satisfying at least five basic criteria (PES, qualification, sex, age and period of job search/period spent at unemployment register of the Federal Employment Institute). Econometric analysis indicated the effects of participation in the program for each participant, by direct comparison of differences in data pairs of beneficiaries and carefully selected member of the control group. Thus, for each participant in the program/beneficiary of the measure, at least five potential individuals for pairing within the control group were identified. After pairing the members of these two groups, the difference between them was measured.

A qualitative part of the research, which was conducted for further accepting/rejecting defined hypotheses, was realized using the questionnaire and in the form of interviews with beneficiaries of the self-employment measure and members of the control group, with attempt to include less important, unformed

or disguised attitudes about the measure and the services provided by the PES, all based on the research objectives. The survey was conducted on a sample of beneficiaries, but also on randomly selected members of the control group, i.e. unemployed persons who were on the unemployment register of the Institute in the period when the active self-employment measure was implemented. The questionnaire of the International Labor Organization (ILO) was used as the basis for the creation of questionnaire, and additional questions from the Labor Force Survey were included, which was additionally adapted and modified in accordance with the requirements of ALMP Start up 2015. The survey questionnaire contained questions about income before 2015 and after 2015 as well as questions about subjective evaluation of the program.

In the assessment of the net impact of the measure Start up 2015 several research questions were defined:

- ✦ How many beneficiaries of the measure have retained their business after the end of the measure?
- ✦ What are the effects of the measure on the household members of the beneficiaries?
- ✦ Does the measure contribute to additional employment of other persons on the unemployment register?
- ✦ Do the benefits outstrip the costs of the measure and is the investment in the active measure justified?

Based on the methodological framework and research objectives following hypothesis were defined:

- ✦ H1: An active self-employment measure encourages employment with a significant percentage of beneficiaries who have retained small business for 6 or 12 months after the end of the measure.
- ✦ H2: Active measure of self-employment affects the income of the beneficiary's family.
- ✦ H3: Active measure of self-employment has a positive impact on additional employment.
- ✦ H4: Benefits of the ALMP overcome its costs, and investment in the implementation of the measure is justified.

H1: The starting point for the individual analysis were the data from the database of public employment services in which beneficiaries of the measure,

as well as unemployed persons, were registered and by which the trends and relevant individual changes could be identified over time or reference period. A large number of data (more than 146 variables) are stored in the public employment service databases, which measure different interactions between job seekers and service providers (bureaus). All persons in the database are marked with ID¹ numbers, so the cases (episodes) of persons who are registered or removed from the register can be tracked. In this particular case, beneficiaries of the measure have been removed from the register at the beginning of the use of the funds, and in case of eventual closure of business, were registered again. Therefore, for the purpose of accepting or rejecting H1, it was necessary to conduct an analysis of the duration of integration of the beneficiaries of the measure on the labor market.

As a first step, out of two tables “asset effects” and “passive effects” a new table was made containing the total actual episodes of unemployed persons. A real episode of unemployed persons is the time period that passes from the time of the beginning of the use of the measure until the eventual return to the register. Returning to the register is an undesirable outcome of the measure, and the share of those beneficiaries in the total number of beneficiaries was used to determine the effectiveness of the measure. To prove this hypothesis a comparative analysis of the data was used, in a way that statistical indicators were compared as the average effect of the measure for two different periods. As referent periods, indicators of beneficiaries which maintained the status of employed person 6 and 12 months after the end of the measure were used. To prove this hypothesis, the results of the analysis of the net impact were calculated using the propensity score matching - PSM.

H2: In proving this hypothesis, the results of the online questionnaire, filled out by beneficiaries of the Start up 2015 measure, were used. According to clearly defined criteria, it was necessary to assess the improvement of the overall socio-economic situation of the individuals during and after the use of a specific measure. The questionnaire was used to evaluate the subjective perception of the beneficiary about changes in lifestyle standards or quality of life, as well as to evaluate the current business situation in the case of those beneficiaries whose businesses were still active and in which beneficiaries are still employed,

¹ In order to protect personal data, a unique “key code” was generated for each person, which is monitored through all episodes and has a function of individual registration number.

providing an insight into the improvement of the socio-economic situation of each individual beneficiary. The qualitative part of the survey was implemented using a questionnaire for beneficiaries of the measure and by using the method of dubious interviews with the employees of the PESs.

H3: The indicator of the success of measure's outcome relates to whether the beneficiaries employed additional staff during the use of the measure and to what extent. So, the questionnaire contained questions related to this issue, and used statistical tool for this hypothesis was a statistical comparative analysis of the results.

H4: For the purpose of the analysis of benefits of the measure and determination in which extent the costs and investment in implementation of the measure were justified, authors used partial cost-benefit analysis, which presents determination and comparison of the cost of the measure for one individual and expense of the unemployed person which is on the unemployment register, as well as ratio of the costs of the self-employed person. Calculation included average annual costs of fees for the unemployed person and the average cost for health insurance which is different depending on a canton, so the average value of 8,00 BAM was taken into calculation.

In its original form, the database of the Federal Employment Institute contains information about people who were unemployed for a certain period of time. For the purpose of defining the database of the control group, only those individuals who were unemployed at the beginning of the certain month were selected. Conditions for the beneficiaries were defined in a way to allow monitoring of the duration of use of the measure. Creation of the input bases in this way enabled pairing with a double from the control group, which at the same month was on the unemployment register. The pairing procedure for each month referred to:

- the case of a group of beneficiaries of the measure - persons who started to use the measure in a certain month
- the case in the control group; persons who did not use the measure (with control related to participation in other measures) and at the same time which were unemployed on the first day of the given month.

In order to control variations in the labor market at the year level, exact matching at month and year levels were applied. This, besides the closest approximate values of the sum of the propensity of participation, implies the ap-

plication of the conditions under which the person in the control group must be unemployed in the same month as the person who participated in the measure to which this match-pair belongs.

Through the econometric longitudinal model, labor market outcomes were tracked for both groups. To measure the net impact of the measure, the authors applied the method that allows post hoc evaluation of the net impact of the measure based on propensity score matching – PSM method. Within the model, the probability of employment or unemployment (depending on the type of dependent variable) is simulated according to the formula:

$$e(X_i) = \Pr (z_i = 1/X_i)$$

for $z_i = 1$, for beneficiaries and $z_i = 0$ for the control group; X_i – covariance observation vector and^{te} observations.

Since the PSM is the probability model, it is defined through binary variables 0 to 1. The general logic of the model was to identify a set of variables of persons who participated in the Start up 2015 measure which affect the possibility of inclusion in this measure.

Pairing of data was based on the assumption that, at a time when the co-financed and funded persons entered in some of the ALMPs, it is possible to identify a set of their similars which, according to the selected characteristics available in the used database, could use the analyzed Start up 2015 measure but they have not done so.

4.2. RESULTS OF THE ANALYSIS

The analysis included 593 beneficiaries of the self-employment measure. In relation to gender, 41% of the beneficiaries were women, while the rest of 59% of beneficiaries were men. Only 2% has left the program. The measure included 33% of persons between 24 and 35 years old and 15% of 19 to 24 years old.

The extent of the analysis for all reference years is defined by 12 months after the nominal duration of the measure (15 months). In addition to showing the average effect of the measure on total data, paired data provided a comparison and interpretation of the average effects of the measure at the year of its implementation.

H1: *An active self-employment measure encourages employment with a significant percentage of beneficiaries who have retained small business for 6 or 12 months after the end of the measure the measure can be accepted since 52% beneficiaries retained their working status 12 months after the end of the measure. More precisely, out of 593 beneficiaries, 411 of them were still employed after 6 months and 310 of them after 12 months.*

For the purpose of the analysis, two logistic regression models were used. These two models have the same set of independent variables and various dependent variables. In each model, the dependent variable referred to the outcome of the measure - the status of a person in the labor market. Employment status is a variable used as a dependent variable. For the purposes of econometric analysis, logistic regression was used. People who were employed were assigned a binary value of 1 and a non-working person was assigned a binary value 0. In the second model, as the main independent variable, the value 1 was used for the persons who used the measure and belonged to the beneficiaries group and 0 for persons who did not use the measure and belonged to the control group.

In the estimations of the model, the indicator of belonging to the beneficiaries or control group was used as the main independent variable. Namely, the statistical significance of this variable was used to estimate the statistical significance of the effect of the measure. Other independent variables were used as control variables and were included in the model, with the aim of further testing the significance of the measure effect test.

The set of independent variables were the predictors of the outcome of the intervention previously used in the matching process, and the measure underestimation indicator (coded as 1 = beneficiaries group, 0 = control group). Systematically, on the basis of simulations implemented using the econometric model of logistic regression, β coefficients of the model from sample distribution were obtained, defined by the standard error of the logistic regression model. For each of the models, two types of simulations were performed, one for the beneficiaries group and in which the binary value of 1 was assigned for the affiliation indicator. The second simulation was performed for the control group, for which the binary value assigned was 0. For each model, other independent variables were set at the average values of the analyzed data set. The next step in the econometric analysis was to estimate the difference between the expected probabilities of employment/unemployment between the beneficiaries and control group.

In Table 2, the distribution of “scoring” was compared to similarity before pairing and after pairing between the control group and the beneficiaries group. The “total data” column shows the arithmetic mean of the scores according to the likeness of the beneficiaries of the measure and the control group which in this column implies all observations in the database that have not entered the ALMPs in the given model.

The other parameters in this column are: the standard deviation of the scores according to the preference within the control group (SD control), the difference between the arithmetic mean treated and the control group (average of the differences), and the standardized difference between the arithmetic mean of the two groups (st. average of the differences). The standardized difference of the arithmetic means was obtained as the difference between the treated and control group divided by the standard deviation of the control group and represented a sort of reduction of pair-matching bias according to the formula:

$$\text{The standardized difference of the arithmetic means TOTAL DATA} = \frac{\bar{x}_T - \bar{x}_C}{s_C}$$

\bar{x}_T = average of the aimed variable (score depending on the preference or predictor of the logistic regression model) in the beneficiaries group,

\bar{x}_C = average of the aimed variable (score depending on the preference or predictor of the logistic regression model) in the control group

s_C = standard deviation of the aimed variable (score depending on the preference or predictor of the logistic regression model) of the control group

The same set of data is also presented in the next column (paired data), with the difference that the data only concerns paired bases. The last column (reduction) offers an amount of data bias reduction after implementing the pairing algorithm. The second subset of the “reduction” column represents the reduction percentage of the standardized difference of arithmetic means after the application of the pairing procedure.

Table 2. Support to self-employment – Rating of pair-matching quality – distribution of bias scores

	Total data					Paired data					Reduction	
	Average - beneficiary	Average - control group	SD of the control group	Average - difference	SD difference	Average - beneficiary	Average - control group	SD of the control group	Average - difference	SD difference	Average - difference	SD difference of averages
2015	0,005	0,000	0,000	0,001	1,6487	0,001	0,001	0,001	0,000	0,0145	97,8746	97,1457

Source: Federal Employment Institute, Federal Tax Office, Authors' creation

As can be seen from the previous table, the pairing quality is high regarding the distribution of bias scores. Thus it can be concluded that the members of the control group within the base of all the unemployed persons at the moment of the initiation of the measure, by their characteristics, corresponding to the members of the beneficiaries group.

In each model, the standardized difference of the arithmetic means before pairing was consistently higher than after pairing. Sample distributions of these differences and 95% confidence intervals were made through simulation. Reliability intervals that do not include value 0 are statistically significant, regardless of the positive or negative sign. In case that the range of intervals at a certain moment got the value of 0, the effect of the measure was not statistically significant.

Confidence intervals were calculated for each model at the level of each of the analyzed object for 12 months after leaving the intervention. The table below shows the obtained intervals.

Table 3. Beneficiaries of the measure and members of the control group at the employment register

	Beneficiaries of the measure	Pair-matched members of the control group
Startup 2015	593	972
State on the employment register of the TAX office after six months	69%	31%
State on the employment register of the TAX office after twelve months	52%	27%

Source: Federal Employment Institute, Federal Tax Office, Authors' creation

On the basis of the final results, it can be concluded that the level of the measure's implementation is 98%, that is, withdrawal from the measure of the beneficiaries is very small, only 2%.

Distribution of the confidence intervals for the employment outcome in the sixth month after the end of the measure, reviewed in relation to total data, indicates that the impact of self-employment measure on employment rates is statistically significant at the 95% interval. The average effect in the sixth month after the end of the measure is 0.379 and the lowest limit of the interval is 0.359.

In the self-employment aspect, the average impact of the measure on employment is high and it is on the level of 52% 12 months after the end of the measure, while for the members of the control group the employment rate has remained at the approximately equal level of 27%.

H2: *Active measure of self-employment affects the income of the beneficiary's family* is accepted, although the survey showed that this impact is not significant, but that there was the certain impact on the financial situation of the beneficiaries of the measure. More in-depth analysis of the impact would include additional data from the tax office and the amount of the money invested in the business by the beneficiary. Cca. 57% of beneficiaries stated that before 2015, they had a very bad financial situation, while 50% rated the financial situation as moderate. At the same time, 25,12% of beneficiaries of the measure stated that their financial situation before 2015 was relatively good and only 35,11% said they had a good financial situation. Although the number of beneficiaries whose financial situation improved after 2015 was more than 10 %.

H3: *Active measure of self-employment has a positive impact on additional employment* is accepted since, in addition to 593 employed through the implementation of the measure, 130 other persons were employed. Besides 593 employed persons, additional 130 persons were employed by the beneficiaries of the measure, out of which 50% of those who had additional employment, employed one person, while 2% of them employed more than one person. The interesting indicator is that out of 130 additionally employed, 78% of them were employed after the end of the measure.

H4: *Benefits of the ALMP overcome its costs, and investment in the implementation of the measure is justified* is accepted since the funds for 2,6 beneficiaries should be spent in order for one beneficiary to be employed.

For the purpose of accepting/rejecting this hypothesis, the cost-benefit analysis was used. Table 4. show the cost rates per employed beneficiary of the measure Start up 2015.

Table 4. The cost rates per employed beneficiary of the measure Start up 2015

Total spent funds for implementation of the measure	2.221.584,72
Number of beneficiaries	593
Average cost per beneficiary	3.746
The net impact of PSM 12 months after the end of the measure	0,38
Absolute net (Number of beneficiaries * PSM net impact)	225
The unit cost of the measure by achieved impact, ie by employed (total spent funds, divided by absolute net)	9.873
The cost rates per employed beneficiary (how many unit costs per beneficiary should be spent to employ one beneficiary 12 months after the end of the measure)	2,6

Source: Federal Employment Institute, Federal Tax Office, Authors' creation

Table 4 shows that total funds for the measure were in the amount 2.221.584,72 BAM and that average costs per one beneficiary was 3.746 BAM. In order to compare the cost of the measure per one individual, beneficiary of the measure and cost of the unemployed person which stays on the unemployment register, and the ratio of the costs of the self-employed person, authors calculated how much the unit cost per beneficiary should be spent for one beneficiary to be employed 2 months after the end of the measure. It can be concluded that it was necessary to spend the amount of the cost of 2,6 self-employed people so that one person can be employed. To this calculation, we add the fact that the average cost of receiving certain remunerations as the unemployed person at the unemployment register is 4,632 BAM, so the Public Employment Services should have higher interest for the proactive inclusion of the unemployed persons in the use of active employment measures especially self-employment measure.

It should be emphasized that within the survey authors also conducted a certain estimation of satisfaction with the measure by the beneficiaries. The results show that 54,22% of beneficiaries stated that they were satisfied with the implementation of the measure, while 50% of them were satisfied with the reporting process. At the other hand, 82,17% of participants of the control group stated that they were not offered to use the measure. On the basis of this, it can

be concluded that Federal Employment Institute had partial success inadequate communication of the measure, which implies greater involvement of counselors in the process.

5. RECOMMENDATION FOR IMPROVEMENT OF EFFICIENCY AND EFFECTIVENESS OF THE MEASURE

Based on the results presented above, authors provide a set of recommendations which implementation would contribute to the higher effectiveness and efficiency of the start-up measure as active employment measure of the Federal Employment Institute, thereby contributing to the creation of new jobs and new employment in the Federation of Bosnia and Herzegovina.

Recommendation 1: Introduce continuous control of databases of PES and state at the employment register of tax offices.

Establishment of the regular monitoring system of the employment data within the databases of PES and tax offices would contribute to more effective monitoring and evaluation of ALMPs, while huge time-wasting on a collection of information by cantonal employment offices would be avoided. Besides this, monitoring of these data would contribute to more effective planning of new ALMPs with the final objective of providing a contribution to new employment.

Recommendation 2: Improve procedures of application, implementation, and reporting of ALMPs.

Although over half of beneficiaries of the measure stated that they were satisfied with the application procedures, implementation, and reporting related TO the implementation of the measure, 22% of respondents stated that they were not satisfied with the mentioned aspects. As it is a significant share, it is necessary to further consider the reasons for the expressed views and to improve these procedures. Special attention should be paid to the promotion of the public call and distribution of the information. Procedures of the monitoring and reporting should take in consideration the needs and requirements of the people who do not have the advanced IT skills.

Recommendation 3: *Self-employment measure should have pre and post activities in order to contribute to greater employment and survival of supported businesses in the market.*

Since only 130 additional persons were employed by the beneficiaries of the measure, as well as that the certain percentage of beneficiaries left the measure, this implies the need for continuous improvement of the measure including pre and post activities. The entrepreneurial process starts with the decision of the entrepreneur to become an entrepreneur, including the business idea generation process (Baringer & Ireland, 2008). The process continues with the validation of the business idea (through feasibility analysis and creation of a business plan) then starting a business and further development of the business. Looking from this aspect, self-employment measure covers only the step of business start-up process which implies the need for ensuring support in business idea validation process and support in development of established business, which can be done through entrepreneurial education before the financial support and mentoring services during the business start-up process but as well after registration of the business, in order to provide contribution to better entrepreneurial and managerial competencies of business owners/beneficiaries of the measure, but as well as to higher employment and sustainability of the established businesses. This would also contribute to less drop out rate of the measure.

Recommendation 4: *Parallel monitoring and evaluation of ALMPs*

Parallel monitoring of the multiple ALMPs provides opportunities to contemplate and compare effects of every individual measure, but also to measure the average cost per beneficiary, which can provide additional information about the costs of the measure and whether it was more efficient in relation to other implemented ALMPs.

6. CONCLUSION

Active labor market policies have become one of the main approaches and instruments for providing support to unemployed persons to find a job at the same time improving the matching of jobs. These policies have a significant role in providing a contribution to employment and economic development of the country. There are several forms of ALMPs focused on different groups and different outcomes. Most of the active employment measures differentiate in target

groups (youth, vulnerable groups etc.) or field (public works, self-employment etc). Based on positive practices, the Federal Employment Institute in 2015 among other active employment measures implemented active self-employment measure called Start up 2015 with the aim to support unemployed persons to ensure employment through starting their own business.

Analysis showed that this measure provided a contribution to employment since 52% beneficiaries retained their working status 12 months after the end of the measure and that additionally 130 persons were employed as a result of the implementation of the measure. Measure positively affected the income of the beneficiaries, and its benefits overcome its costs ie. investment in the implementation of the measure is justified since the funds for 2,6 beneficiaries should be spent in order for one beneficiary to be employed. These results showed that the measure was effective, but for better higher effectiveness and efficiency of the start-up measure as active employment measure of the Federal Employment Institute it is necessary to introduce continuous control of databases of PES and state at employment register of tax offices, improve procedures of application, implementation and reporting of ALMPs, introduce pre and post activities in order to contribute to greater employment and survival of supported businesses in the market and to ensure parallel monitoring and evaluation of ALMPs.

ALMPs in Federation of Bosnia and Herzegovina experience increasing interest by unemployed persons as well as employers and provide positive effects on employment. With the implementation of suggested recommendations and another improvement of the measure, their positive macroeconomic effects will be higher in the forthcoming periods.

Abstract

The notarial service deals with preparing and issuing public documents, verifying private documents, storing documents and various valuable items and other affairs. By doing these duties, public notaries take care of the legal security of the affairs and collect and store certain archival material in their archives. Archival material often has an important historical, political and scientific significance and is important for the preservation of legal and cultural heritage, but it can be a precious source of other information. In order to keep the legal security at a high level and to preserve legal and cultural heritage more efficiently, it is necessary to have a good organization and management in each notary public office and the notary public service in general. The organizational structure of the notary public service, as well as the division and manner of work, will be presented in this paper. Today, owing to modern technology, the management can be even more effective, and the notary public service becomes an important database holder that can manage it for the purpose of general social and notarial service benefits. Through the knowledge management related to the notary profession and the knowledge related to modern technology, the

notary public service has the potential to make an even greater contribution to the preservation of legal security and cultural heritage.

Keywords: *notary public service, management, knowledge, experience*

JEL Classification: M10, M19

1. INTRODUCTION

The Notary Service consists of the official drafting and issuing of public documents on legal affairs, statements and facts on which the rights are established, the official certification of private documents, in receiving documents for safekeeping, money and valuables for their submission to other persons or public bodies, and, when demanded by courts or other public bodies, other procedures defined by law (the Public Notaries Act, Official Gazette 78/1993, 29/1994, 162/1998, 16/2007 and 75/2009, Article 2). Through the compilation of public documents and their preservation, the notary public service contributed enormously to the preservation of legal and cultural heritage in their archives. (Gagro, 2018, 117).

The Notary Service has been gradually developed and improved through its twenty-five years of experience and it is today in position to contribute to society through acquired knowledge and experience today by providing first and foremost legal certainty and offering new solutions that will speed up individual procedures and increase their efficiency (enforcement procedures, land registry procedures, procedures relating to companies, legacy proceedings ...).

2. MANAGING A PUBLIC NOTARY OFFICE

2.1. MANAGEMENT IN GENERAL

Each public notary office has a formal organizational structure based on the Public Notary Regulation and the Public Notary Act, which specifies the schedule of works, hierarchy, management, and the conduct rules that are primarily determined by the Notary Code of Ethics. (Gagro, 2018, 88). The Act stipulates that public notaries are independent and independent holders of public notary services, who have the capacity of public trust. They perform their service as a sole occupation over time for which they are placed. (Public Notaries Act, Official Gazette 78/93, 29/94, 162/98, 16/07 and 75/09, Article 2). The

Act stipulates that public notaries are the autonomous and independent holder of public notary services, as persons worthy of public trust. They perform their services as a sole occupation over the period for which they have been appointed for office work. A public notary is the leading person in the notarial office and vested with the highest authorities arising from his appointment. However, in spite of the high degree of centralization, there is also a high degree of decentralization that can be determined by a public notary directly by employing a public notary assessor. A public notary assessor may perform all activities that are legally authorized to be performed by a public notary (unless his or her activities are limited at the request of a public notary). (Gagro, 2018, 89).

A public notary shall be appointed by a decision of a minister responsible for justice affairs on the basis of an announcement for positions. The Croatian Notaries Chamber is responsible for appointing a notary public on the basis of the Ministry of Justice. (the Public Notaries Act, Official Gazette 78/1993, 29/1994, 162/1998, 16/2007 and order 75/2009, Article 14, paragraphs 1 and 2). Only after appointment, the public notary shall become the hierarchically highest person who makes decisions in the notarial office (manager) and shall be responsible for the work of the office (Gagro, 2018, 89). Following the vertical hierarchy order, in addition to the Public Notaries Act public notary, the public notary office may have employed notary assessors, advisers, and apprentices at law, and it can be said that they are informal holders of the horizontal organizational (office) units. (Gagro, 2018, 89). The scope of work of public assessors, advisers and apprentices are determined by the Public Notaries Act (the Public Notaries Act, Official Gazette 78/1993, 29/1994, 162/1998, 16/2007 and 75/2009, Article 126).

A public notary runs the office respecting strictly the formal organization based on Notary Public Regulation, the Law on Public Notaries Act and the Code of Public Notary Ethics. Along with a strictly formal organization, there is also a social and social informal organization of the office manager that is based on the creation of quality interpersonal relationships among employees and which indirectly affect the quality of the formal organizational structure of the notary public office. (Gagro, 2018, 88).

Public notaries are obliged, based on the service needs and according to their assessment, to employ assessors, advisers and apprentices at law from the ranks of capable and valuable lawyers to develop and improve the notary public ser-

vice. A public notary must ensure satisfactory working conditions at the office taking care of the professional staffing of employees. The notary public is obliged to enable and encourage assessors, advisers, and apprentices at law to acquire a comprehensive and thorough knowledge of the public notary practice and knowledge. In particular, a public notary must endeavor to make assessors, advisers, and apprentices as future notaries, to adopt and preserve the principles of public notaries' ethics in equal measure as they acquire professional practice and knowledge. A notary public is obliged carefully and in accordance with the law and the rulebook to allocate tasks to the assessors, advisers, and apprentices as well as to employees; supervise their work, take care of their status especially in the performance of their tasks and relations with clients. It is forbidden to conclude any contract on the participation in profit or on the partnership between public notaries and assessors, advisers and apprentices as well as any other persons. A public notary is obliged to make efforts to solve any disputes between the public notary and assessors, advisers and apprentices in a peaceful and dignified manner, either personally or through the bodies of the Chamber. In the case of an assessor, adviser, and apprentice of another public notary, the notary public will first contact the other notary directly for a peaceful solution of the dispute. (The Code of Public Notary Ethics, Official Gazette 55/2011, points 49 - 53) .

It has previously been mentioned that a public notary assessor may perform all tasks that are legally authorized to be performed by a public notary, from which it can be seen that a public notary is equated with a public notary with full authority, and thus a public notary has the option to physically disengage from certain segments of office activities (legacy proceedings, companies, enforcement cases ...). However, such comfort should not lead to the complete relaxation of public notaries as the service provider in terms of the discontinuation of training, the loss of control over the work of the office and ultimately the question of his or her authority. The wealth of experience and knowledge gained during the years of work is the basis of the public notary services and the source of knowledge for assessors (future notaries). It is important to point out that, in order to avoid relaxation of public notaries to cease their training and, above all, to regulate the rules of conduct in the service by the Code of Public Notary Ethics which lays down the basic principle of the public notary ethics, i.e. the public notary performs his or her service conscientiously, fairly and impartially in accordance with the Constitution and the laws of the Republic of

Croatia. In carrying out his or her profession, the public notary has to acquire and strengthen the trust of clients and at the same time of the judicial and other bodies in front of which they perform, with his or her knowledge and behavior. A public notary is obliged to conscientiously fulfill the duties deriving from the notary public service and to preserve the reputation of the public notary service in performing the service and in private life. By his or her own behavior he or she shall serve as an example of humanity, respect for human rights and human dignity. In doing the public notary service, a public notary acts impartially and without prejudice or adherence to race, color, religion, nationality, age, marital status, sexual orientation, social and property status, political commitment, and any other diversity. A public notary is obliged to preserve his or independence in order to protect impartiality. A public notary is obliged to protect the interests of the clients by means that are in accordance with the laws and dignity of the public notary profession, guided by impartiality, good practices, conscience and the rules of public morality. In their documents and speech in official activities and generally in public, private or public performances, a public notary should take into account professionalism and general culture. A public notary may not accept jobs that are not compatible with his or her vocation and which could adversely affect his or her independence and good reputation as well as the honor and reputation of a public notary. Performance of tasks that, pursuant to regulations, may only be performed by public notaries, assessors, advisers, and apprentices may not be transferred onto persons who are not authorized to do so. A public notary may not refuse taking over of the task entrusted to him or her by the competent authority, except for the reasons set forth in the Public Notary Act. A public notary may not agree on an item or part of an item as a prize to which his or her official acts refer to.

A public notary is neither in a position to emphasize his or her prior service or duty to obtain clients nor in any way keeping a client in the belief that he or she is, therefore, able to provide the requested legal aid or service more effectively for that purpose. A public notary has to refresh, expand and improve his or her legal and general education uniformly so that he or she does not ignore any legal field within the jurisdiction of a public notary. A public notary takes care of acting out of the service and in the public place as it fits the public notary service and not diminishing the personal reputation and trust of citizens in the public notary. (Code of Public Notary Ethics, Official Gazette 55/2011, point 1.- 16.)

2.2. KNOWLEDGE MANAGEMENT

Through the process of gaining knowledge in the public notary service, and such knowledge does not have to be directly related to the profession, new ideas and solutions are created that enhance the service itself and contribute to the common good. Every notary public should be a *worker of knowledge* because it only ensures the future of the service. (Gagro, 2018, 39).

As an individual, every notary public through lifelong learning and experience becomes an increasingly knowledgeable worker transferring it to his or her employees (assessors, advisers, and apprentices at law and other employees) and users of public notary services can recognize the public notary as a resource of knowledge used for legal security of all jobs, they conclude either private or for economic purposes. (Gagro, 2018, 41).

Table 1. Job position before opening own public notary office

Source: (Gagro, 2018, 128).

Workers of knowledge of the Croatian Chamber of Notaries are 334 public notaries who, in order to work as public notaries, had to undergo long and formal training (to complete law school, pass judicial and public notary exam). According to a survey carried out among public notaries, the data presented in Table 1 show that 25% of subjects gained practical knowledge and experience in another public notary office, 28.6% of subjects worked in courts, as attorneys or in law firms 17.9% and in other public or civil services 16.1%.

Obtained data show that the public notary holders together have enormous knowledge and legal experience that can be directed towards the advancement of the service and transfer it to the new generations, where the Croatian public notary academy plays an important role.

Public notaries in the Republic of Croatia are connected to the central information system of the Croatian Notaries Chamber through the new central web application e-Notar. Such a system enables the public service to create its own databases (registers) and linking with external databases. The e-Notar application is a new application, officially introduced on 1 January 2018 and the result of the knowledge and experience of public notaries. The application has the ability to be customized.

In order to communicate quickly and get quick answers to some of the issues that arise during everyday business activities, the public notary assessors have, through Viber's application, created the informal group "JB - help each other". This group currently consists of 240 participants sharing knowledge and experience in giving each other answers to the questions asked and present various findings. (Gagro, 2018, 37).

The importance of the wide range of knowledge from various fields can be seen from a survey conducted on a sample of 36 notaries in the Republic of Croatia where the knowledge and skills needed for public notary job are examined and all the activities performed by public notaries and need to know to perform.

Table 2. Knowledge groups and skills needed to perform a public notary job

NAME OF KNOWLEDGE AND SKILLS GROUPS	Number of listed knowledge and skills	Number of employers who listed a knowledge or skill	MANNER OF GAINING KNOWLEDGE AND SKILLS			NEED FOR KNOWLEDGE AND SKILLS IN 5 YEARS		
			Educ.	Both	Work exper.	Educ.	Both	Work exper.

TOTAL	183	36	17%	4%	78%	1%	50%	49%

Source: (Dekra zapošljavanje d.o.o., Analiza o standardu zanimanja, Javni bilježnici, Izvještaj o istraživanju, 7)

Subjects listed a total of 183 required knowledge and skills that they considered necessary for performing various key jobs at the workplace of a public notary. Answers received are categorized into 10 content categories. One category also contained those statements that referred to a greater number of knowledge and skills. Table 2 shows the values that point to the percentage of subjects who consider that the categories of different pieces of knowledge and skills are acquired through the education and work experience and their assessments of whether the need for certain knowledge and skills will be smaller, greater or equal in five years. Subjects most often included knowledge and skills that are categorized into a group of legal knowledge. The group contains 96 items of knowledge and skills by 34 subjects.

Most subjects believe that this group of knowledge and skills is gained through work experience. They also emphasize the importance of communi-

cations skills for everyday work. They also believe that communications skills are generally gained through work experience. Responsibility and integrity are considered necessary for the work of public notaries. They believe that the need for responsibility and integrity in work will be even more pronounced in the future. The knowledge and skills group that can be classified under the name of computer skills is listed 11 times by 8 subjects participating in this survey. Most subjects believe that this group of knowledge and skills is primarily acquired during practice (work). Almost all subjects agree that the need for these skills and skills will be greater in five years. Seven categories of organizational capability contain 10 items, 3 subjects give some of the answers that can be classified in this category. Most of the respondents believe that this group of knowledge and skills is gained solely through work experience. A similar percentage of subjects believe that the need for this group of knowledge and skills will remain the same and be greater in the future.

Other categories that contain a smaller number of listed items are also shown in Table 2. If we focus on total percentages, we can notice that subjects estimate that all groups of knowledge and skills are primarily gained through work experience. Given the assessment of future importance, 50% of subjects believe that knowledge and skills will be needed to the same extent, while 49% of them estimate that the need for knowledge and skills will be greater in the future. (Dekra Employment d.o.o., Occupational Standards Analysis, Notaries Public, Research Report, 8).

Table 3. Knowledge groups and skills performed a public notary job

NAME OF KNOWLEDGE AND SKILLS GROUPS	Number of listed knowledge and skills	Number of listed key task	Number of employers who listed key task	IT IS EXPECTED TO ADOPT KNOWLEDGE AND SKILLS THROUGH			NEED FOR KNOWLEDGE AND SKILLS IN 5 YEARS		
				Educ.	Both	Work exper.	Educ.	Both	Work exper.
General statements on public notary job	37	13	15	8%	0%	89%	0%	27%	70%
Communication with clients and state bodies	36	14	13	11%	0%	89%	0%	53%	47%
Drafting legal documents	32	19	15	27%	0%	73%	0%	52%	48%

TOTAL	183	84	36	17%	4%	78%	1%	50%	49%

Source: (Dekra zapošljavanje d.o.o., Analiza o standardu zanimanja, Javni bilježnici, Izvještaj o istraživanju, 9)

Subjects listed 84 items of key business tasks, which were later categorized into 10 content categories presented in Table 3. For work as a public notary, subjects listed 13 items that can be categorized into a group called general statements on notarial work. A total of 15 subjects listed a key task that can be attributed to this group because of its contents. The statements categorized in this group mostly referred, according to the subjects, to solving legal problems and to all the activities defined by the Public Notary Act.

They believe that employees at this job place should gain the knowledge and skills required to perform jobs covered by this group by work experience. A part of subjects also lists key tasks that can be categorized as a group titled as communication with clients and government bodies that contains 14 key business

tasks. The group of key tasks of drafting business documents includes 19 items by 15 subjects. A group of key tasks conducting legacy proceedings includes 6 items by 8 subjects. Other key job categories are listed in Table 3. Subjects generally state that knowledge and skills for all key business groups are mostly acquired through work experience.

They believe that only the knowledge and skills required to carry out key business activities from the legal analysis group are those that are primarily gained during education. Almost the same percentage of subjects believe that the need for the knowledge and skills required to perform these key business groups will remain the same and be greater in the future. (Dekra Employment d.o.o., Occupational Standards Analysis, Notaries Public, Research Report, 10).

3. MANAGEMENT OF THE CROATIAN NOTARY PUBLIC CHAMBER

3.1. MANAGEMENT IN GENERAL

Pursuant to Article 173 of the Public Notary Act, the Croatian Public Notary Chamber was founded when at least fifty public notaries were appointed and started working at proposal by the Minister of Justice, and the founding assembly convened and chaired by the President of the Supreme Court of the Republic of Croatia as proposed by the Minister of Justice.

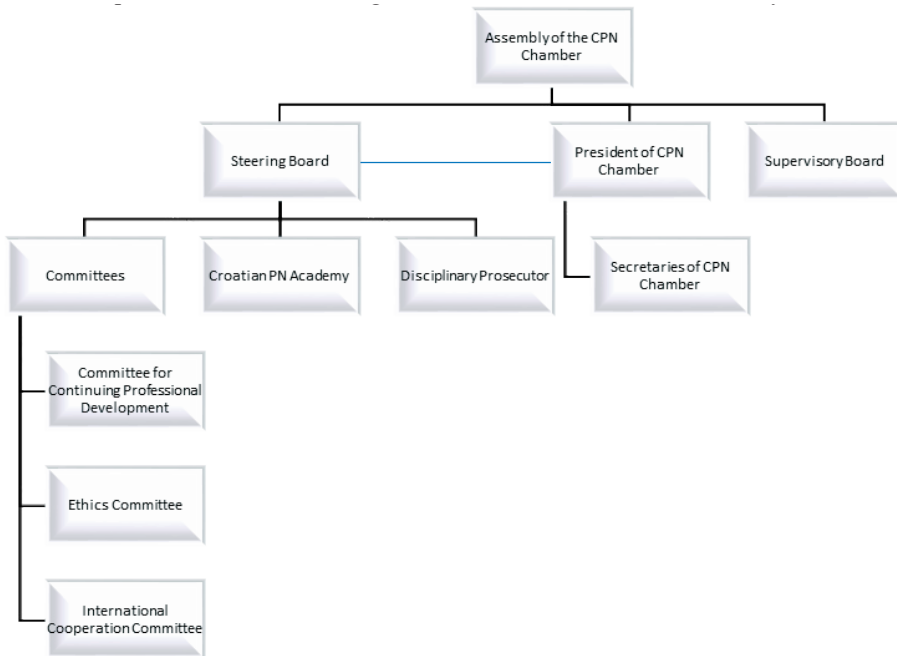

It can be said that Article 3 of the Statute of the Croatian Notary Chamber refers to the Management Chamber. The Chamber shall in particular:

- 1) Preserve the reputation, honor, and rights of public notaries;
- 2) Supervise the work and conduct of public notaries, officers in charge and public notary deputies, assessors, advisers, and apprentices in accordance with law;
- 3) Care for permanent professional developing of public notaries, assessors, advisers and apprentices and in this regard establishes and promotes various forms of professional and scientific cooperation with the ministry of justice (hereinafter: the ministry), courts, Croatian bar association, administrative bodies, faculties, lawyers' associations, etc.;
- 4) Establish the rules of public notary ethics and care for its development;

- 5) Monitor and study relationships and occurrences, including the situation in the judiciary and the administration that are of interest for the organization, position and work and the improvement of the public notary service;
- 6) Promote material, historical and other interests of the public notary service;
- 7) Care of the position and rights of retired public notaries and assessors and other persons employed in the public notary offices;
- 8) Establish and develop cooperation with other public notary chambers and international organizations of public notaries and lawyers;
- 9) Perform other tasks stipulated by law, by-law, by this statute or by other general acts of the chamber. (Statute of the Croatian Notary Chamber, Official Gazette 64/2014, 69/2014 and 33/2015, Article 3).

The bodies of the Chamber are the Assembly, the Steering Board, the President, the Supervisory Board, the Croatian Public Notary Academy, the Ethics Committee, the International Cooperation Board and the Disciplinary Board. The Statute stipulates that the Chamber may also establish other bodies and determine their competence to perform preparatory activities under the jurisdiction of the permanent bodies of the Chamber. The Steering Board may appoint occasional committees. (Statute of the Croatian Notary Chamber of Commerce, Official Gazette 64/2014, 69/2014 and 33/2015, Article 4.).

Figure 1. Schematic presentation of the management structure of the Croatian Notary Chamber

Source: <http://www.hjk.hr/O-Komori/Ustroj-Komore>

Figure 1 shows the structure of the management of the Croatian Notary Chamber. The Assembly of the Chamber is made up of all notaries registered in the Chamber's Registry, ten public notary assessors and five advisors. The Assembly is the highest body of the Chamber because it elects directly the management of the Chamber for a period of three years, i.e. the Chamber Assembly, members of the Management Board and the members of the Supervisory Board. It may be said that the Assembly Chamber also represents the management of the Chamber as it decides on the election of the above-mentioned bodies. (Public Notary Act, Official Gazette 78/1993, 29/1994, 162/1998, 16/2007 and 75/2009, Article 141, paragraph 1).

The Steering Board appoints the Expert Council of the Croatian Public Notary Academy, which is responsible for the management of knowledge of the Croatian Public Notary Chamber.

Supervision over the work and behavior of public notaries, performers and public notary deputies, and assessors, and apprentices shall be conducted by the Steering Board and the President of the Chamber. (the Public Notary Act, Official Gazette 78/1993, 29/1994, 162/1998, 16/2007 and 75/2009 Article 141. paragraph 1.).

The Supervisory Board consists of three members, who elect the President among themselves. The Supervisory Board is obliged to review the Chamber's cash operations and the final financial statement at least twice a year. It submits a report to the Chamber Assembly on his or her work each year and proposes to give a discharge to the old Steering Board when electing a new one. (Statute of the Croatian Notary Chamber, Official Gazette 64/2014, 69/2014 and 33/2015, Article 20, paragraphs 1 and 2)

The Ethics Committee consists of at least five members, who elect the President among themselves. Ethics Committee:

- As the first-instance body it decides on violations of the Code of Public Notary Ethics;
- Establishes the draft of the Code of Public Notary Ethics, organizes and conducts a discussion on this draft and submits a draft of the Code to the Steering Board for a referral to the Assembly for adoption;
- Monitors the state of implementation of the rules of the public notary ethics and establish proposals for measures for improving public notary ethics;
- Organizes various forms of educational and scientific work (counseling, seminars, forums, round tables etc.) on the public notary ethics independently or in cooperation with the Steering Board and the Croatian Public Notary Academy and other relevant institutions,
- Performs other tasks related to the promotion of the public notary ethics in accordance with the conclusions and recommendations of the Assembly and the Steering Board. (Statute of the Croatian Public Notary Chamber, Official Gazette 64/2014, 69/2014 and 33/2015, Article 21, paragraph 1 and 2.)

3.1. KNOWLEDGE MANAGEMENT

Intellectual capital is the largest capital owned by the Croatian Public Notary Chamber and is contained in the knowledge of all members (notaries) and

innovations. Investing in knowledge and creating solutions (innovation) paves the way for the future of the service and leaves no room for any competition. (Gagro, 2018, 19).

The creation, transfer, and application of knowledge in business and production processes and knowledge management are one of the most important tasks of modern organizations. The continuous increase in knowledge and maximum use of knowledge of all employees becomes an imperative not only of development but the survival of organizations. Therefore, successful knowledge management becomes the greatest challenge of organizational managers and human resources management (Bahtijarević – Šiber, 2014, 219).

For the purpose of transferring the knowledge and for the training of its members, the Croatian Notaries Chamber on 17 May 2008 issued a Decision on the Establishment of the Croatian Notaries Academy (HJA). (Gagro, 2018, 36).

Pursuant to the Code on the Work of the Croatian Public Notary Academy, its main features involve: professional training of chamber members, elaboration of scientific concepts for professional and educational conferences and seminars intended for further professional development, participation in drafting expert opinions and guidance on legal proposals, organization of seminars for judicial and public notary exams, the implementation of professional training of other employees in the public notary offices, cooperation with universities, polytechnics, as well as cooperation with other professional organizations in the country and abroad, organization and development of various forms of professional and scientific training, publishing and information technology education. (Ruždjak, 2016., Zbirka proposal o javnom bilježništvu, Pravilnik o radu Hrvatske javnobilježničke akademije, članak 2. stavak 3.).

From the data in Table 2 based on the survey conducted, it is apparent that the public notaries have supported the initiative to develop and run the e-public notary practice. With the help of the five-degree Likert scale, subjects could express their own degree of agreement with each of these statements, including the initiative to develop and maintain e-public notary practice with a score of 4.036. It is also evident that (4.164) largely support encouragement of the establishment of national registers and their interlocking. (Gagro, 2018, 134).

Linking national registries through the central notary public e-mail application (e-Notar) would allow access to information from one place.

Table 4. Supporting the initiative for the development and management of e-public notary practices and the establishment of national registers and their linking

	I fully disagree	I disagree	Neither agree nor disagree	I agree	I fully agree	Arithmetic mean
Initiate development and maintain the register of e-public notary practices	7.3	5.5	5.5	40.0	41.8	4.036
Encourage the establishment of national registers and their links	7.3	1.8	10.9	27.3	52.7	4.164

Source: The authors, according to the data from Table 9, which outline the claims on activities within the jurisdiction of the Croatian Notary Chamber (Gagro, 2018, 134)

The Croatian Public Notary Academy is working on a project to develop an electronic collection of public notary practice that would be accessible through the closed page of the Croatian Public Notary Chamber and new e-Notar application. Such an electronic collection will greatly contribute to equality of acting and further acceleration of the notarial business.

The Academic Council and the President of the Academy are the bodies of the academy and are appointed by the Chamber Board. The Professional Council shall establish the Committee for Continuing Professional Development, which shall have at least five members appointed by the Steering Board at the proposal of the Expert Council.

The Board for Continuing Professional Training deals with topics related to the public notary profession and legal issues, participates in drafting expert opinions and guidelines regarding legal proposals, for the Steering Board for certain issues important for the way of handling and harmonizing the practice of public notaries, preparing draft circulars and, at the request of the Expert Council or the Steering Board, performs other tasks within the competence of the Academy (Ruždjak, 2016. Zbirka propisa o javnom bilježništvu, Pravilnik o radu Hrvatske javnobilježničke akademije, Article 7, paragraph 3.).

4. THE MINISTRY OF JUSTICE AND CROATIAN PUBLIC NOTARY CHAMBER

4.1. THE RELATIONSHIP BETWEEN THE MINISTRY OF JUSTICE AND CROATIAN PUBLIC NOTARY CHAMBER

With regard to decision making related to the public notary service, it should be noted that certain key decisions are also made by the Minister of Justice. The public notary shall be appointed by a Minister responsible for Justice Affairs on the basis of an announcement for positions. (Public Notary Act, Official Gazette 78/1993, 29/1994, 162/1998, 16/2007 and 75/2009, Article 14, paragraph 1). It has already been mentioned that the Croatian Public Notary Chamber was founded when at least fifty public notaries were appointed and started working at proposal by the Minister of Justice and the founding assembly convened and chaired by the President of the Supreme Court of the Republic of Croatia (Public Notary Act, Official Gazette 78/1993, 29/1994, 162/1998, 16/2007 and 75/2009, article 173.). The places of public notaries in the Republic of Croatia shall be determined by the Ministry on the basis of the opinion of the Chamber, the Courts of the Republic of Croatia and the competent county authority, taking into account that at least one notary public in the area of each court as determined by law. (Public Notary Act, Official Gazette 78/1993, 29/1994, 162/1998, 16/2007 and 75/2009, Article 16, paragraph 1).

The Ministry of Justice also decides on the termination of the notary public's office and issues a decision on dismissal of public notaries and temporary removal from office. Reasons for termination of service are set out in Article 19, for dismissal under Article 21, and temporary removal from service under Article 21 of the Public Notary Act. (Official Gazette 78/1993, 29/1994, 162/1998, 16/2007 and 75/2009).

Legal and subordinate legislation define the powers of the Ministry of Justice in terms of control of the work of the public notary service, so it can be said that the Minister of Justice is included in the management of the public notary service since he or she appoints and dismisses notaries and supervises the work of the notary public service.

The Ministry of Justice *ex officio* or in case of any complaints from interested persons may determine the inspection of the performance of the Chamber,

individual notaries public, officers in charge, public notary assessors and apprentices and take the necessary measures to eliminate and sanction the irregularities determined. (Public Notary Act, Official Gazette 78/1993, 29/1994, 162/1998, 16/2007 and 75/2009, Article 140, paragraph 1).

The Minister may dismiss the Steering Board and dismiss the Chamber President if he or she finds serious irregularities in the work of these bodies, or if, even after a reminder, these bodies do not fulfill its legal obligations. In its resolution, the Minister will set a deadline for the election of the new Steering Board and the President of the Chamber and will appoint a trustee among the public notaries in the Republic of Croatia, who will perform the affairs of these bodies until their performance is taken over by the newly elected bodies. (Public Notary Act, Official Gazette 78/1993, 29/1994, 162/1998, 16/2007 and 75/2009, Article 140, paragraph 5).

The Chamber is obliged to submit to the Ministry every year a report on its work and its views on the state of the public notary service, in relation to the situation in the judiciary and the administration and on the measures that should be taken to improve this situation. (Public Notary Act, Official Gazette 78/1993, 29/1994, 162/1998, 16/2007 and 75/2009, Article 138).

The aforementioned shows that legal powers of the Ministry of Justice (minister) relate to planning, organizing, managing human resources, management, and control within the public notary service and therefore it could be said that the minister of justice is also a manager in the notary public service.

Management is a process of forming and maintaining an environment in which individuals, working together in groups, efficiently realize the chosen goals. (Wehrich & Koontz (1998), 4). The previous definition of the management of Wehrich and Koontz, when applied to the public notary service, suggests that the management of the public notary service is a synergy reflected in the work of every public notary, the President of the Croatian Notary Chamber and the Minister of Justice. Each public notary manages the work of his or her office and also has the opportunity to participate directly in the Assembly of the Croatian Notary Chamber in making important decisions and choosing the management (President of the Croatian Notary Chamber).

4.2. THE RELATIONSHIP BETWEEN THE MANAGEMENT CONTRACT AND THE LEGAL AND SUBORDINATE REGULATIONS ON PUBLIC NOTARY SERVICE

In private sector, the organization of work, powers and duties and the method of management are mainly regulated by a commercial contract on business co-operation or a management contract or the manager of a company is defined by a contract of employment concluded with the employer. There is no official form of such contracts, such contracts can be seen as a kind of business status under which specific rights, obligations, and responsibilities in relation to a project or company management are delegated to one or more persons. The contract is a common 'task' for entrepreneurial risk holders (investors, owners) and managers as occupational risk holders. It can be said that such a contract is a sort of synthesis of the power of management and guidance or a document that builds a partnership between those who have a certain business vision and the willingness to invest money and a manager who accepts a professional challenge to realize that business vision. In principle, the contract on the employment of a manager is actually a contract of partnership between those who are owners of a business idea and those who believe they are capable of turning that idea into a good business result. For this reason, a management contract is defined by the act of free entrepreneurial will of both parties, a document that provides a professional synthesis of the power of money, the power of knowledge and power of partnership. At the same time, the management contract should specify the rules of the game between the involved protagonists and predict the overall scenario for each possible outcome of business cooperation, including the possibility of termination of the contract.

There are no management contracts or other similar contracts in the public notary service that would correspond to these descriptions, i.e. the Public Notary Act, Statute, and Rulebook are applied instead of these contracts. The mentioned contracts determine and govern the manager and his or her obligations, powers and rights in the private sector, while in the public notary service a public notary is determined as a manager by law and thus his or her powers, obligations and rights are regulated by law and other regulations.

5. CONCLUSION

The structure and manner of management in the public notary service are described herein. Obviously, the management of the public notary service is largely determined by the Public Notary Act, the Statute of the Croatian Notary Chamber, the Code of Public Notary Ethics and Rulebooks. A public notary is not the only manager in this sector, there is an elaborated hierarchy of management, all for the purpose of effectively and properly performing the notary business. Thus, the public notary independently manages the office and his or her employees, but he or she has the Notary Chamber over him or her that monitors and improves his or her work. The chief manager of this organization is the Minister of Justice.

As with any other organization, knowledge and monitoring trends is very important for public notaries as well. Thus, the development of information communication technology and data management in the public notary service can greatly affect the effectiveness of the notary public service in a positive way and make the public notary service recognizable in terms of its contribution to increasing the efficiency of other state services and improving legal and economic security.

Abstract

The authors have reviewed the car sales market of the Republic of Croatia and have placed an emphasis on global changes, such as the accession of the Republic of Croatia to the European Union, access to a common European market and the impact on the developments within the car market. The authors have also examined how the constant changes to the tax regulations for the import of passenger cars to the Republic of Croatia from the EU member states affect the trends within the market of new and used passenger cars in the Republic of Croatia. The change in the structure of the cars is shown in such a way that the ratio of new and used vehicles has reached the ratio 2 to 7 in favor of used vehicles, which results in reduced quality of the vehicles and detrimental impact on road safety.

Keywords: passenger cars, import, common European market, tax regulations

JEL Classification: H20, H29

1. INTRODUCTION

We are increasingly talking about disruptions in certain industries, and the globalization is certainly one of the foundations that would make such a thing happen. We will limit ourselves in this paper to the area that the globalization itself created in the automotive industry in the Republic of Croatia although the changes to the overall industry at the global level are significantly higher. The main focus is on the segment of sales of new and used passenger cars and the impact of tax regulations and global movements on them. Market recovery and free movement of goods since Croatia's accession to the European Union have created the preconditions for easier import of passenger cars from other EU member states. In the segment of trade of new and used vehicles, as well as the changes and harmonization of legislation, there is a significant change of trends in the purchase of used vehicles at the expense of new vehicles, which ultimately affect the need to adopt market participants to continue to operate successfully.

2. THE ANALYSIS OF THE SEGMENT OF SALES OF PASSENGER CARS

We can say that changes occurred in the segment of the sales of passenger cars with Croatia's accession to the European Union because of the harmonization of regulations with the European acquis, and particularly after the abolishment of customs when Croatia joined the common European market, which led to easier import of used vehicles from other EU member states, thus changing the structure of registered vehicles in the Republic of Croatia since July 1, 2013.

In fact, by joining the EU, Croatia becomes a part of a single market and changes the procedure for import of used vehicles, ie, it adjusts to the EU standards. At the time of the import, the vehicle is not registered at the border crossing, but it is necessary to request a calculation of a special tax on motor vehicles. Also, EUR1 document is no longer needed for all vehicles that were registered within the EU territory.

Constant changes in the tax regulations related to the sale of new and used passenger cars lead to various market upheavals. Thus, at the announcement of tax changes on passenger cars, consumers are beginning to calculate which option is preferable – to buy immediately or wait until new tax regulations come into force. As such changes are often made without notice to car importers, it is difficult to make long-term plans for the sale of new and used cars.

Graph 1. Quantitative movement of registered new and used passenger cars

Data source: Center for Vehicles of Croatia, graph by the authors (Center for Vehicles of Croatia, 2019)

Since Croatia joined the EU in the mid-2013, the end customers can in Croatia easily purchase and register all vehicles purchased in an EU member state. This resulted in a fact that there were almost double the number of registered used cars in Croatia in 2013 than in the previous year. The growth trend has continued practically to date, and in the last five years, the import of vehicles has increased almost seven times. At the same time, it is evident that the new car market has only doubled. Consequently, this leads to an aging fleet of vehicles within the territory of the Republic of Croatia and bad road safety situation, where according to the latest statistical indicators Croatia holds the very bottom of the chart among other EU countries.

According to the data shown in Graph 2, it is evident that Croatia's accession to the EU in 2013, the number of newly registered new cars has decreased significantly in relation to the number of newly registered used cars. This infor-

mation also speaks about a tax policy that disassociates the acquisition of new vehicles and has a bad impact on the state of road safety.

Graph 2. The share of registered new and used passenger cars in the Republic of Croatia

Data source: Center for Vehicles of Croatia, graph by the authors (Center for Vehicles of Croatia, 2019)

2.1. CHANGES IN PROCEDURE AND TAX REGULATIONS WHEN IMPORTING PASSENGER CARS IN THE REPUBLIC OF CROATIA

New vehicle type approvals are granted as of September 1, 2017, under the World Harmonised Light Vehicle Test Procedure (WLTP), which is a new and more realistic test method for measuring fuel consumption and CO₂ emissions. As of September 1, 2018, the WLTP replaced the current test procedure, the so-called new European driving cycle (NEDC). Due to more realistic test conditions, fuel consumption and CO₂ emissions measured according to the WLTP process may, in many cases, be greater than the values measured under the NEDC (Volksawagen Croatia, 2019).

Changes occurred in the vehicle homologation procedure in the European Union as of September 1, 2018, which has led to the price increase of almost all new cars on the market in the Republic of Croatia.

At that time, a new vehicle WLTP protocol-based certification was introduced instead of the former NED system that was used. According to the pro-

to col, the fuel consumption measurements are much more objective and approximate to the actual consumption of the vehicle in daily traffic. This has also led to an increase of CO₂ emissions to the atmosphere.

Since the CO₂ emission into the atmosphere is one of the main factors for calculating Special Tax on Motor Vehicles (PPMV), this has led to an increase of the PPMV amount largely as an amount increase.

The procedure for calculating the Special Tax on Motor Vehicles was last changed as of January 1, 2019, when a new PPMV calculation is used.

2.2. DIFFERENCES IN THE PPMV CALCULATIONS FOR THE IMPORT OF USED DIESEL AND GASOLINE ENGINE PASSENGER CARS TO THE REPUBLIC OF CROATIA FROM OTHER EU MEMBER STATES

In order to understand the difference in the special tax on motor vehicles regarding the fuel type, we will show a sample of several German middle-class vehicle manufacturers in both diesel and gasoline versions, with the same engine power and the level of equipment.

Table 1. the difference in the PPMV calculations on an example of 2 vehicles of a higher middle-class from the same manufacturer, with the same engine power and the uniform market price, but different fuel type.

Used car - Diesel	Used car - Gasoline
Vehicle age: 12 months	Vehicle age: 12 months
Audi A4 2.0 TDI / Diesel / 2.0l / 110 kW/150 KS / Man. 6 st. pr. / 4-door 111g Co ₂ New car price: 263.705,06 HRK	Audi A4 1.4 TFSI / Benzin / 1.4l / 110 kW/150 KS / Man. 6 st. pr. / 4-door 131g Co ₂ New car price: 252.048,38 HRK
Eco component 3.455,00 HRK	Eco component 9.620,00 HRK
Value component 6.959,35 HRK	Value component 6.143,36 HRK
Total 10.414,35 HRK	Total 15.763,36 HRK
Used vehicle reduction - 23,96 %	Used vehicle reduction - 23,96 %
Final price 7.919,06 HRK	Final price 11.986,44 HRK

Source: Calculation made by the authors based on the prices from the Customs table (Ministry of Finance, Customs Administration, 2019)

It is apparent from the table that the PPMV for a vehicle that is one year old, from the same producer in the gasoline option is more expensive by 51% than the diesel vehicle. Therefore, the import of used diesel cars costs less at the end since it has fewer CO₂ emissions than a gasoline version. Cars in the diesel version spend on average up to 2 liters of fuel less on 100 km. Therefore, it is much cheaper to import a diesel car.

When importing a used car from EU member state, there are additional costs that must be met in the procedure conducted by the competent customs administration according to the place of residence of the person importing the car to the Republic of Croatia.

The expenses are shown in table 2. As can be seen from the table, the amount depends on a lot of variable components, but we can say that when importing a 1-year old medium class car, with the 110kW engine power, the cost is about 14.000,00 HRK. The amount will be slightly lower for diesel cars than for gasoline cars.

If the car is purchased from a private person that is not in the VAT system and does not include VAT on the bill, it is necessary to pay an additional administrative fee of 5.500,00 HRK for this vehicle.

Table 2. Average cost of importing a used car from the EU

Cost of importing vehicles from the EU to the Republic of Croatia	Amount
1. Transport cost Costs vary depending on the transport type and purchase location.	min. 2.500,00 HRK
2. Issuance of the manufacturer's certificate If the vehicle doesn't already have a valid COC document	400,00 HRK
3. Homologation	695,00 HRK
4. Waste management fee = vehicle mass x 0,60 HRK / kg (average passenger car weighs about 1000kg)	600,00 HRK
5. A special tax on motor vehicles (PPMV), by Customs calculation (Ministry of Finance, Customs Administration, 2019) PPMV = PNV - UMANJ x PNV where: PPMV: Special tax amount PNV: Special tax for a new car according to CO ₂ (eco component) and sales price of a new car (value component) UMANJ: Value reduction rate for a used car Calculated on the basis of an average PPMV calculated from Table 1	9.952,75 HRK
TOTAL	14.147,15 HRK

<p>6. Administrative fee If the car is purchased from a person abroad, who is not in the VAT system (mostly natural persons) This is an option if a car is purchased directly from a natural person without an intermediary Calculated based on a 1-year old car with 110kW engine power from Table 1</p>	<p>5.500,00 HRK</p>
--	---------------------

Source: author's calculation

Given that the above-mentioned inflow of used cars is very high and places the citizens of the Republic of Croatia in an unequal position on the common European market, future citizens of countries such as the Federal Republic of Germany will not pay the above-mentioned allowances, and those same cars without VAT fee can be purchased on the common EU market.

For example, when purchasing a new car in the Federal Republic of Germany, citizens pay a special tax on motor vehicles in accordance with the CO2 emission levels. Since the citizens of the Republic of Croatia pay the tax again on such vehicles when importing from EU member state, they go through double taxation, which places the residents of one EU-member country in an unequal position than residents from another EU-member country.

Since this tax has a discouraging effect on the import of new cars to the Republic of Croatia, which has the latest safety standards, the citizens are mostly opting for older cars with safety components that are obsolete, and in this way, the state has a negative effect on the road traffic safety. Since the Republic of Croatia is at the bottom among EU-member states when it comes to road safety, instead of proposing additional restrictive legal measures, the state could, through PPMV, stimulate the purchase of newer cars by reducing the amount of taxes for cars equipped with the latest security components. In this way, they would multiply the import of newer used cars that have better safety standards and would indirectly increase road safety in the Republic of Croatia.

2.3. IMPACT OF CHANGES IN TAX REGULATIONS ON THE SALE OF NEW PASSENGER CARS ACCORDING TO BRANDS

In the last few years, the tax regulations in the Republic of Croatia related to the import of new and used passenger cars from other EU member states have changed frequently. Such changes have a turbulent effect on the changes in the automotive market.

Table 3 shows that due to the changes in the PPMV calculations, there has been market turbulence on the market for the sale of new cars in the Republic of Croatia related to the car brands. Certain car brands have emerged as a result of a PPMV calculation change, such as Škoda, Suzuki, Hyundai, Ford and Audi, due to the changes in tax policies which resulted in sales decrease in the January and February of 2018, while other brands such as Dacia, Seat, Fiat, and Volvo show an increase due to the same tax changes.

Given the frequent changes in the tax regulations in this sector of passenger cars' sales, it is very difficult for sellers to make long-term plans, as well as for the customers who have difficulties in following constant changes.

Table 3.: changes in market shares for new cars in the Republic of Croatia due to PPMV calculation changes

Vehicle brand pc.		1-2/2018		1-2/2019		difference		
		Share (%)	pc.	Share (%)	+/- pc.	+/- (%)	+	
1.	VW	1069	14,69	1264	18,02	168	15,33	3,33
2.	ŠKODA	1021	13,68	786	11,20	-235	-23,02	-2,48

When determining the PPMV amount for used cars, the customs officers have an objective right to determine the value of a vehicle according to the base amount of the basic model or to include any additional equipment in the calculation that they deem necessary to valorize. Such calculation of the PPMV amount leads the customs officials to a position where a high level of corruption is possible, and such a procedure should be avoided in the future as the calculation should be known before the import of the vehicle. In this way, a person importing a vehicle from an EU member state cannot plan the cost of the vehicle itself.

Source: Promocija Plus Marketing Analysis and Statistics of Croatian Car Market (Plus, 2019)

As shown in Table 4, changes in tax laws affect differently different car brands. Changes in tax regulations are commonplace in January, so in 2019, there has been a change in tax regulations in the form of different PPMV calculations.

3. CONCLUSION

It is evident that Croatia's accession to the European Union has brought about significant changes in the local market. The changes are mostly reflected in the changes in trends where the share of used cars in 2013 was 3 to 2 in favor of new cars, which has changed with the accession to the EU on behalf of used cars with the ration 7 to 5. In any case, since the recession period that has affected the global market to date, the import of passenger cars has increased considerably. The companies certainly cannot plan their long-term strategy by analyzing the local market exclusively. In the segment of vehicle sales, it is noticeable that the adjustment of legal regulations can also have a huge impact on the entire industry.

Permanent changes in the tax regulations affect the constant turbulence on the market, which leads both passenger car buyers and sellers leads to constant market changes, and none can make long-term plans, which also affects the decision to purchase a vehicle. It is especially worth noting that in the calculation of the special tax on motor vehicles the limit of value component is set at 150,000.00HRK and all vehicles that had minor price is not used to calculate the value component of the tax. Setting this limit so low leads customers into the situation to buy worse vehicles so they would not have to pay higher taxes because of the higher value of the purchased vehicle.

The increase in the number of used cars has a negative impact on the state of road safety since due to large PPMV benefits, the customers often decide to purchase older cars where their duties are significantly lower. It would be necessary to align the tax policy with the road traffic safety and CO₂ reduction policies, and accordingly subsidize the purchase of new or newer vehicles with better safety standards and smaller CO₂ emissions, which would, on the other hand, lead to better environmental protection due to newer and safer cars operating in traffic.

In future research on this topic, attention should be paid to the possibility of calculating an adequate limit for the value component of a special motor vehicle tax that would encourage buyers to buy safer cars and that will affect safely on the roads of the Republic of Croatia. It should also be studied further how certain changes to laws or tax regulations have on the economy, before the adoption in the regulations.

Abstract

Tourism in Rabac started to develop in the 1960s, similar to other parts of Istria and since then it has acquired the name 'The Pearl of the Kvarner Bay'. Today the destination Rabac/Labin is a well-known tourist destination. Rabac/Labin, together with Poreč and Novigrad, is one of the chosen destinations for testing of indicators of sustainable tourism in the project MITOMED+. The aim of the paper is to test if the same aspects of tourism satisfaction can be a useful tool for different destinations. The field research was carried out in the period between July and September 2017, in all three destinations. The paper presented the specificity of the tourist destination Rabac/Labin. In total 639 questionnaires from beach users in Rabac were collected. The questionnaire had more questions but, in the paper, tourist satisfaction was presented. Tourists evaluated 10 aspects in the destination as well as their overall satisfaction with the destination. The results have shown that there are some differences in satis-

faction levels but, generally, tourists were satisfied with the destination Rabac. The obtained results can help managers and local stakeholders to achieve a high quality of offer and services in the destination and use tourist satisfaction as a helpful tool in future destination management.

Keywords: *destination management, tourist satisfaction, destination Rabac/Labin, destination aspects, Istria County*

JEL Classification: L83, Z32

1. INTRODUCTION

There is a debate in the world about the importance of measuring tourist satisfaction with destinations in order to get valuable information for maintaining destination competitiveness in the market and to efficiently develop sustainable tourism. The number of tourists in Istria destinations increases every year; consequently, there is a need to improve and extend the quality of the offer in order to meet future tourist demands. Istria is one of the most famous destinations in Croatia and Rabac is the most popular destination on the east coast of the Istrian peninsula. According to the data from e-Visitor, in 2018 there were 216,000 tourist arrivals and 1,246,928 overnight stays in Rabac. Most visitors were from Germany, Austria, the United Kingdom, Italy, Slovenia, and the Czech Republic. Since the tourism industry will inevitably grow in the future it is important to respect and preserve the natural boundaries and limits of the destination and to plan future development according to the principles of sustainable development.

In the framework of the MITOMED+ project, a set of indicators was developed for measuring the performance of the destination related to sustainability. The indicators were developed on the basis of ETIS (European Tourism Indicators System). The overall satisfaction with the destination is one of the leading predictors of long-term success of destination management. The aim of the paper is to test if a different destination could use the same set of questions for the evaluation of tourist satisfaction with different aspects of the destination. By collecting opinions and suggestions directly from tourists, visitors and local residents, destination managers can discover the main disadvantages and advantages of the destination. Local stakeholders in tourism can get useful information from the field and use it as a management tool for future planning.

2. LITERATURE REVIEW

There are an extensive number of researchers who have intensively studied overall tourist satisfaction and satisfaction with various attributes of a destination, such as beaches, scenery, accommodation, cleanliness, climate, nightlife, local cuisine, natural attractions, accessibility, shopping, safety, etc. (Alegre & Garau, 2011; Chi & Qu, 2008; Yoon & Uysal, 2005; Alegre & Cladera, 2006; Alegre & Garau, 2010) or satisfaction with the chosen destination (Della Corte et al., 2014; Truong & Foster, 2006; Kozak & Rimmington, 2000; Pandža Bajs, 2015; Naidoo et al., 2010; Aktaş et al., 2009; Hui, Wan & Ho, 2007). Also, Dolincar et al. (2013) emphasized that there are many measures of satisfaction in tourism: “satisfied with...; pleased with...; delighted about...; quality of the stay was...; positive to return in the future...; enjoyed myself...; feel good about...; the choice to attend was a wise one...; made the correct decision...; exactly what I needed... Wang (2016) summarised studies about visitors’ satisfaction measurement as a tool for tourism destination management as one of the most important indicators of destination performance and future planning of tourism activities. Some researchers have explored how satisfaction is changing over time considering different attributes of the destination and overall satisfaction within different groups of tourists (Soldić Frleta, 2018; Bernini & Cagnone, 2012). Recently Soldić Frleta (2018) has conducted researches with tourists and visitors in the cities of Rijeka and the Opatija Riviera comparing the differences between results over two years. The results have shown that there is a significant statistical difference between the satisfaction of tourists with the elements offered in the two destinations and their overall satisfaction with them in two different years. There are always tourists who have already visited the destination or those who have come for the first time with various desires and expectations. Given the above, it would be worthwhile to evaluate the satisfaction of tourists every year. By examining tourist satisfaction, managers may find out which elements of their offer they could improve in the upcoming season. Alegre & Garau (2010) suggest that it is necessary to consider how the destination’s positive and negative aspects influence tourists in order to get the accurate situation of a destination and to identify negative factors and correct them. Overall satisfaction affects tourists’ inclination to revisit the destination, as well as to recommend it by word of mouth or word of mouse. It is proved that higher overall tourist satisfaction positively affects destination loyalty. If tourists are satisfied, there is a higher possibility that they will visit

destinations again and recommend them to others (Yoon & Uysal, 2005; Chi & Qu, 2008; Hui, Wan & Ho, 2007; Gallarza & Saura, 2006; Oppermann, 1998; Kim & Brown, 2012). Satisfaction and destination image have a significantly positive effect on tourist behavioral intentions (Chen & Tsai, 2007) and the level of overall satisfaction has an effect on future behavior in mature and less mature destinations (Kozak, 2001). Valle et al. (2006) confirmed that tourist satisfaction is an element that certainly contributes to destination loyalty intention. Alegre & Cladera (2009) suggest that the level of satisfaction is the main determinant of tourists' intention to return to the destination.

There are different segments that affect tourist satisfaction in the destination. For coastal destinations whose main products are the sun and sea, the attributes which mostly affect overall tourist satisfaction are scenery, beaches, climate, quality of the accommodation, quality of the environment and urban setting and cleanliness of public areas (Alegre & Cladera, 2006). Several authors have emphasized the importance of the cleanliness of the destination as a factor that has an influence on tourist satisfaction (Della Corte et al., 2014; Alegre & Garau, 2010). In nature-based destinations, the natural landscapes/scenery environment is the main factor affecting the tourist satisfaction (Kim & Brown, 2012). Leisure services as a prediction factor influencing the overall satisfaction were confirmed in the research conducted among tourists in Rimini (Bernini & Cagnone, 2012). Kim & Brown (2012) have determined two main factors influencing behavioral intention; the previous experience and the nature-based experience. Regarding the emotional experience with the destination, Prayag et al. (2015) concluded that the emotion of positive surprise significantly predicts tourist satisfaction. Satisfaction also depends on the various cultures of tourists, so it is possible to study satisfaction with regard to nationality. Kozak (2001) investigated the differences between satisfaction levels of two nationalities that visited the same destinations. Aktaş et al. (2009) concluded that accommodation services have the largest influence on Russian and German tourists' holiday satisfaction when visiting the same destination - Alanya.

Dodds & Holmes (2019) conducted research at rural and urban beaches with beach tourists and have confirmed that satisfaction with facilities and beach characteristics has a positive impact on overall satisfaction. Alegre & Garau (2011) confirmed that beaches are the factor in a destination which has the greatest influence on overall satisfaction. Important factors that influence the sun, sand and sea tourism products are accommodation, easy access to informa-

tion or a simple holiday to arrange, cleanliness and hygiene, security, tranquillity, scenery, and prices in line with budgets. Top factors with the positive impact on overall satisfaction emerged in the penalty-reward analysis and those are accommodation, beaches, and scenery (Alegre & Garau, 2011).

Given the differences and specifics in destinations and customer wishes, it is necessary to identify the factors that most affect overall tourist satisfaction. Moreover, it is necessary to adapt the development strategies and the management of the destination by investing in those factors to compete with future tourist demand. Tourists have a different degree of satisfaction with certain aspects of the destination that further affect overall satisfaction. It is assumed that a lower rating of certain aspects will not affect the overall impression of the destination if most aspects are satisfactory. Furthermore, continuous tourist satisfaction monitoring will enable better destination management. Neal & Gursoy (2008) suggest tracking the satisfaction or dissatisfaction of tourists at all stages of their travel (pre-trip, at the destination and with the return trip services) to get accurate results on overall satisfaction or dissatisfaction with travel and tourism services offered.

3. METHODOLOGY

The aim of the research was to find out the level of tourist satisfaction with various aspects of the destination of Rabac in order to identify and improve the tourist destination offer. The usefulness of the survey is based on valuable information for tourist managers for future management planning in improving the defective aspects.

The research was carried out in three different destinations in Istria County for the requirements of the European project MITOMED+ (Models of Integrated Tourism in the MEDiterranean Plus) whose main goal is to enhance sustainability and responsibility in Maritime and Coastal tourism in the Mediterranean area.

The secondary data in the paper was collected from the Croatian national tourist information system e-Visitor and from the Labin - Rabac Tourist Board.

For the purpose of research, the questionnaire was designed according to ETIS 2016 (European Tourism Indicators System) sample survey for visitors. The survey was conducted among beach users in Rabac/Labin by appropri-

ately trained interviewers in the period between July and September 2017. The beaches where research was conducted were Maslinica, St. Andrea, Lanterna, and Girandella beach. The questionnaire was offered to tourists in six different languages and those were: Croatian, Italian, German, Slovenian, English, and Russian.

The first set of questions concerned information like: how tourists find out about the destination, how many kilometres they travel to reach the destination, what method of transportation they used to travel to the destination and use during their stay in the destination, the main purpose of their visit to the destination and the main reasons why they chose to visit the destination. The respondents had to mark one or several of the questions offered. The second and main part of the questionnaire involved questions about aspects of the destination. The respondents had to give one grade for every aspect from 1 to 5 on the 5-point Likert scale. If they were completely dissatisfied, they marked the grade 1 or grade 5 if they were completely satisfied with that aspect. The respondents rated the following aspects of the destination Rabac: cultural events, nightlife, sports activities, tourist attractions, facilities for children or the elderly, information availability at the destination, accommodation quality, destination cleanliness, local cuisine, reasonable prices and overall satisfaction with the destination. The third set of questions involved in the evaluation of the beach facilities and conditions, but this set was not used in this research. The final part related to the socio-demographic characteristics of the sample. In the paper, data about tourist satisfaction with the destination was analyzed.

The total number of collected questionnaires was 639. The data were analyzed within the SPSS (22) programme and descriptive statistics for the presentation of the results were used. The Principal Component Analysis (PCA) was used and detailed in the results.

4. TOURISM IN RABAC

The village of Rabac is situated on the east coast of the Istrian peninsula, on the Kvarner Bay. Rabac belongs to the municipality of Labin and is located south-east of the town of Labin. The area of Rabac settlement is 564.13 ha. According to the last census of 2011, Rabac had 1,390 inhabitants. Rabac has beautiful surroundings, landscapes, and nature with stunning clear blue sea and clean beaches. For that reason, it proudly carries the name "The Pearl of the

Kvarner Bay". Intense development of tourism and building began in the 1960s. Today, tourism is a dominant economic activity that employs a large number of inhabitants of the village of Rabac. Rabac is a well-known, popular and desirable destination for tourists. Tourist demand for this destination grows year after year followed by investments of local tourism stakeholders. All involved stakeholders in tourism, from local communities, tourist boards, hoteliers and locals to accommodation providers have made a joint effort to make Rabac one of the leading destinations on the eastern coast of Istria. The quality of the offer in Rabac is constantly rising. Among visitors, for years now, the most numerous have been Germans and Austrians followed by English and Italians. Considering the official data of the national information system e-Visitor, the most numerous overnight stays in the destination of Rabac in 2017 were realised by tourists from Germany (368,700), Austria (175,964), United Kingdom (82,000), Italy (73,033), the Czech Republic (72,450) and Slovenia (58,673). Also, the number of tourist arrivals reached the figure of 187,874 tourist arrivals and 1,151,458 overnights. The number of tourist overnights according to the type of facility which was realized in hotels was 784,158, campsites 170,928, household facilities 173,834, other accommodation facilities 13,888, commercial accommodation 1,142,808 and non-commercial accommodation 8,650. The average length of tourist stay at the destination was 6.13 days in the year 2017. Figure 1 shows the number of arrivals and nights spent by tourists in 2017 in Rabac. The highest number of arrivals was recorded in the month of July (43,740) and the highest number of overnight stays per month in August (296,218). From Figure 1, the high seasonality of tourism is clearly visible, as well as that most arrivals and overnight stays were realized in the peak season (July and August).

Figure 1. Tourist arrivals and overnights in 2017 in the destination of Rabac

Source: e-Visitor, 2018

The annual occupancy rate of commercial accommodation in 2017 was 36.8%. The highest rate was recorded in the peak season. In July the occupancy rate was 108.59% and in August, 111.47%. As is mentioned on the official website of the Labin – Rabac Tourist Board, Rabac has the capacity to accommodate 11,000 foreign visitors and beachgoers from Labin and its surroundings in one day.

5. RESULTS

5.1. CHARACTERISTICS OF THE SAMPLE

In the total sample, there were more women (61.16%) than men (38.84%). Although the research involved all respondents' listed age categories, most of the respondents belonged to the age group from 25 to 54 years old (69.12%). In regard to the type of residence, most of the respondents were tourists (85.03%) who stayed in hotels (41.37%) or private accommodation (31.28%) (Table 1).

Table 1. Characteristics of the respondents

Gender (n = 636)	Share (%)	Number
female	61.16	389
male	38.84	247
Age group (n = 638)		
15 - 24	16.46	105
25 - 34	22.41	143
35 - 44	26.18	167
45 - 54	20.53	131
55 - 64	8.93	57
> 65	5.49	35

hostel	0.34	2

Source: Field research, between July and September 2017 in Rabac

The survey was filled in by tourists and visitors from 27 different countries. Most respondents were from Germany (35.85%), followed by the same share of tourists from Croatia (11.64%), Austria (11.64%) and Italy (11.32%). The other shares of respondents regarding the country of origin are shown in Table 2.

Table 2. Country of origin of the respondents (n = 636)

Country	Share (%)	Number
Germany	35.85	228
Austria	11.64	74
Croatia	11.64	74
Italy	11.32	72

Source: Field research, between July and September 2017 in Rabac

On average, the respondents traveled 773.6 km to reach the Rabac destination (SD=522.9, mode=600 and median=660).

According to the TOMAS (summer 2017), the most usual method of transportation of tourists in Croatia is a car, 64% and plane, 14%. Similar results were obtained by the study in Rabac. Istria is already known by tourists as a car destination. Most of the respondents used a personal, friend's or company car (75.82%) to travel to the destination of Rabac. Air travel was in second place with a share of 14.76%, followed by bus or coach 9.26% and the remaining share of transport was small. Concerning the intention of using transport by respondents in the destination, most of them answered that they would use the car, 64.98% of them (personal, friend's or company) or that they would walk, 51.42% which is to be expected, considering that Rabac is a small village and

that everything is within reach. The share of other means of transport in the destination was small.

Considering the way of gathering information about Rabac the answers from the respondents were as follows: the most common answer on how they find out about the destination Rabac was from the Internet (41.32%), they had previously visited the destination (39.43%) or by the recommendation of friends/family (29.18%). Tourist brochures/flyers represented 8.52%, from a tourist information center, 5.21%, from newspapers/magazines, 3.47% and from social networks, 2.84%¹.

5.2. TOURISTS' MAIN REASONS FOR CHOOSING THE DESTINATION OF RABAC AS A HOLIDAY DESTINATION

Respondents could mark several answers as their main reason for choosing to visit the destination of Rabac and the most common answers were because of the beach (74.65%), clean sea (72.3%) and nature (53.83%). The reason indicated as “peace and quiet” was represented by a share of 32.08%, followed by accommodation quality (30.05%), host hospitality (20.97%) and accessibility (18.62%). Other reasons and shares are listed in Table 3.

Table 3. The main reasons why respondents had chosen to visit the destination of Rabac (n = 639)

Reasons for a visit to the destination	Share (%)	Number
Beach	74.65	477
Clean sea	72.30	462
Nature	53.83	344
Peace and quiet	32.08	205
Accommodation quality	30.05	192
Host hospitality	20.97	134
Accessibility	18.62	119
Destination popularity	11.58	74
Cultural richness	10.02	64
Entertainment and recreation	9.86	63
Sport	8.14	52
Something else	8.14	52
Special event	0.94	6

Source: Field research, between July and September 2017 in Rabac

¹ The respondents could choose more than one offered answer.

According to the official results of assessments on sea bathing water quality at the beaches in the year 2017 and 2018, the quality of the sea on the beaches in Rabac was excellent (Source: http://baltazar.izor.hr/plazepub/kakvoća_detalji10).

Almost a hundred percent of the respondents, more precisely 97.17% of them, mentioned holiday, free time and recreation as the main purpose of their visit to the destination of Rabac. Others stated as their purpose for arrival as follows: visiting friends and family (6.93%), shopping (3.46%), business and professional trip (2.05%), health and medical care (1.26%), education and training (0.47%) or something else (1.57%).²

5.3. TOURIST SATISFACTION WITH THE DESTINATION OF RABAC

In general, tourists are very satisfied with the destination of Rabac (Table 4). A large number of tourists are satisfied or completely satisfied with the destination cleanliness (average=4.25, SD=0.86), followed by their overall satisfaction with the destination (average=4.22, SD=0.73), accommodation quality (average=4.09, SD=0.91) and local cuisine (average=4.09, SD=0.84). The worst-placed elements, although they were still satisfied with them, were sport activities (average=3.75, SD=0.85), nightlife (average=3.55, SD=0.87) and cultural events (average=3.51, SD=0.79). Comparing the results with those obtained in Poreč, the difference is in the average score and in the order list of satisfaction with individual aspects, although it is important to note that the results were very similar. In Poreč, overall satisfaction had the best score, followed by destination cleanliness, local cuisine and accommodation quality. Worst-placed were facilities for children or the elderly, nightlife and cultural events (Brščić et al., 2018).

2

The respondents could choose more than one offered answer.

Table 4. Tourist satisfaction with different aspects of the destination of Rabac

Aspects of destination	Relative frequency (%)					Aggregate score (out of 5)	
	totally unsatisfied	unsatisfied	neutral	satisfied	completely satisfied	average	SD
Destination cleanliness	1.62	3.24	7.77	43.37	44.01	4.25	0.86
Overall satisfaction with the destination	0.65	1.96	8.50	52.94	35.95	4.22	0.73
Accommodation quality	1.47	5.07	13.58	42.88	36.99	4.09	0.91
Local cuisine	1.00	3.16	15.45	47.01	33.39	4.09	0.84
Information availability at the destination	0.52	4.36	23.00	44.77	27.35	3.94	0.85
Tourist attractions	0.70	5.09	25.79	49.82	18.60	3.81	0.82
Facilities for children or the elderly	0.57	4.76	31.62	41.52	21.52	3.79	0.85
Reasonable prices	1.97	6.07	24.59	48.03	19.34	3.77	0.90

5.4. PRINCIPAL COMPONENT ANALYSIS (PCA)

In order to test the usefulness of testing tourist satisfaction with the different attributes of the destination and possibilities to summarise the results, the Principal component analysis (PCA) was performed. Principal component analysis (PCA) serves to extract a set of new variables called principal components. The PCA was conducted with 11 different variables to further analyze the tourists' level of satisfaction, but in the final factorial design, 10 variables were used. The variable "Information available at the destination" was excluded since it cannot be explained by the extracted/specified principal components. The same variable was also excluded from the PCA in the research conducted in the destination of Poreč (Brščić et al., 2018).

From Principal component analysis (PCA) two components were extracted (KMO=0.899, Bartlett's Test χ^2 sig. 0.000, satisfactory reliabilities, Cronbach alpha >0.884) with eigenvalues greater than 1 and explaining 61.59% of total variance. The results of the PCA are shown in Table 5.

Table 5. Principal Component Analysis (PCA) results, tourist satisfaction with the destination

Value	Pattern Matrix Component	
	1	2
Destination cleanliness	.929	
Accommodation quality	.832	
Overall satisfaction with the destination	.741	
Local cuisine	.737	
Reasonable prices	.614	
Nightlife		.852
Cultural events		.809
Sports activities		.795
Tourist attractions		.678
Facilities for children or the elderly		.648
Factor statistics		
Eigenvalue	4.944	1.215
Variance %	49.436	12.151
Cumulative variance %	49.436	61.587
Cronbach alpha	0.845	0.834
Mean	4.084	3.664

Extraction Method: Principal Component Analysis.

Rotation Method: Promax with Kaiser Normalisation.a

a. Rotation converged in 3 iterations

The first emerged component includes the following aspects of the destination: destination cleanliness, accommodation quality, overall satisfaction with the destination, local cuisine and reasonable prices. The second component includes the variables: nightlife, cultural events, sports activities, tourist attractions and facilities for children or the elderly. The first component can be described as “destination quality” and the second one as “destination offer”. A similar situation has been confirmed in the research conducted in the destination of Poreč, where the same components have been extracted but with different strengths of correlation among variables (Brščić et al., 2018). Thus, the obtained results demonstrate that the components “destination offer” and “destination quality” can be used legitimately in the following researches.

In the performed research, tourists were asked to evaluate whether the destination sufficiently invests in sustainability initiatives at the destination of Rabac and most of them responded positively (78.52%). It is important that further

initiatives by all stakeholders involved in tourism base tourism development on sustainability so that tourists will recognize and be satisfied with that fact in the future.

6. CONCLUSION

The results of the field research showed that tourists in Rabac mostly find information about the destination of Rabac through the Internet, followed by tourists who had previously visited Rabac and those who came by family or friend's recommendation. By the increasing use of the Internet, tourists can get information more quickly and, instead of recommending by word of mouth, people more often use the word of mouse. Considering a large number of Internet users, this can greatly affect the destination image in terms of positive or negative criticisms of tourist satisfaction with the aspects of the destination and of their further choice of destination to visit. Those who had previously stayed at the destination could better detect the improvements made to aspects of the destination. On the other hand, first-time visitors could give an accurate account of the present situation, without additional expectations. Most of the respondents were repeat visitors or had come on recommendations from family or friends. Satisfied tourists will probably return to this destination and spread good recommendations among other tourists who then become first-time visitors. Kozak and Rimmington (2000) proved that if tourists are satisfied with a destination, they are more likely to revisit it and to recommend it to other people.

Tourists mentioned as their main reasons for visiting Rabac for a holiday free time and recreation and the main attractions were the beaches, clean sea, and nature, which are the main elements of sun, sand and sea destinations. Tourists were satisfied or completely satisfied with the destination cleanliness which also confirms the justified name of Rabac as the "Pearl of the Kvarner Bay". In further management of the destination, emphasis should be placed on the preservation of nature and its most valuable natural resources, i.e. beaches and the sea, and maintaining the cleanliness of the destination at the same level or even better. Overall satisfaction is listed in second place regarding the average grade which is different in comparison to the same study conducted in Poreč, where the overall satisfaction was rated with the highest grade (Brščić et al., 2018) but the rate is still very high (4.22 on average).

In order to reduce the number of variables, the PCA was conducted and two components emerged. The first, “destination quality” included the aspects: destination cleanliness, accommodation quality, overall satisfaction with the destination, local cuisine, and reasonable prices, and the second one, “destination offer” involved the aspects: nightlife, cultural events, sports activities, tourist attractions and facilities for children or the elderly. The conclusion is that destination offer and destination quality can be used as variables that can serve as reduced variables for measuring tourists’ satisfaction with the destination. Similar results were obtained conducting the same research but in a different destination in Istria, in the town of Poreč (Brščić et al., 2018).

In the final conclusion, the measure of tourist satisfaction with attributes in the destination and overall satisfaction is particularly important for the positioning and branding of the destination in the future. Therefore, destination managers should conduct field research on tourists’ satisfaction to obtain an informative tool for successful planning of future development.

LIMITATIONS

It should be noted that in the group of respondents there were probably respondents who had just arrived or had spent only a few days at the destination. Furthermore, there is a tendency for respondents to differently evaluate their satisfaction with the individual aspects of the destination at the beginning and at the end of their holidays.

Another limitation of the study could be that surveys were carried out exclusively on beaches with beach users and there is a possibility that results would be different if the survey had been carried out with tourists in a different location, for example in the village.

The results may also be different between first-time visitors and repeat visitors, so it would be good to track the development of satisfaction of the same visitors, although it is quite complicated to follow the same group of tourists.

FUNDING

The research was carried out within the project Interreg Mediterranean “Models of Integrated Tourism in the MEDiterranean Plus” – MITOMED+ (1MED15-3.1-M23-295).

Abstract

The Croatian health system is a topic that has occupied Croatian media space for a long time, that is often politicized and that is an obvious problem for the country, mostly because of its debts, to which no adequate solution has been found yet. However, there is one solution – increased financial resources aimed at settling debts for the past period and financing future liabilities. How to achieve this depends on the government that defines the allocation of health care resources and the cost of health services, but it also depends on health care institutions doing business rationally. The Croatian health system is most similar to the Bismarck financing model. It is based on the model of compulsory social health insurance which represents the health system financed by the employees and their allocations for health care for the entire nation. Thus, it is easy to conclude that health care resources are largely limited and, in the future, they will be even more limited if the number of employees decreases in the years to come. Under these conditions, the Croatian health care system operates only within the framework it can “cover” financially and transfers liabilities in the future period. This paper will present financial management in health care, especially by using an example of large hospitals in Croatia, i.e. clinical hospitals, and give an overview of the largest financial indicators of these hospitals.

The purpose of the paper is to present a financial management model of the hospitals with the aim of finding solutions to the financial improvement of hospital operations by retaining the same or increase the quality of services and health workers guaranteed by the Health Care Act.

Keywords: health management, hospitals, financial management

JEL Classification: I19, M10

1. INTRODUCTION

Health systems, both in the world and in Croatia, have faced disproportionate revenues and operating expenses for years. Increasing costs over time are part of medical development and advancements in medical technology on the one hand, and population aging on the other (European Commission, 2017). In each country, health care represents a large system that imposes a heavy burden on national finances, creating and accumulating debts. Many experts have tried to respond to this, but given the current trend leading to an increased debt of the health system, it can be concluded that all methods seem to be unsuccessful. The Croatian health care system is categorized into the Bismarck model of financing, i.e., financing mainly from compulsory health insurance contributions based on salaries of employed citizens. Hence it is a social security model that represents a relatively inexpensive model of paying for or financing health care and widespread use of health services at relatively low prices (World Bank, 2004). There is a problem here with the price and the cost of that service. Namely, the price of the service is often lower than the cost of the service in question, which inevitably generates a constant increase in costs. This mode of functioning is best seen in the business operation of hospitals, especially clinical hospital centers that offer comprehensive health care services to the entire population. According to the Health Care Act (Zakon o zdravstvenoj zaštiti, Official Gazette 100/18), health care activities are carried out at primary, secondary and tertiary levels and at the level of clinical departments. Clinical hospital centers are tertiary-level health care institutions, which include specialist and conciliary health care services and health care services provided to patients in hospitals as well as the provision of the most complex forms of health care services. Why do the biggest hospitals generate losses? The answer lies in the way the price of the service is set. For the purposes of research, we will analyze the operation of several clinical hospital centers in the Republic of Croatia in order to explain in

detail the problem of the unsustainability of the system of clinical hospital centers, as well as the need for financial state intervention with the aim of reducing their accrued liabilities. The main aim of this paper is to answer the question of how to improve the economic viability of hospitals without reducing the scope and amount of services.

2. HEALTH CARE FINANCING AND CONSUMPTION

Health care financing in developed countries can be identified through the following three well-known systems: “*systems that are predominantly privately financed, systems that are predominantly financed by the state budget and systems that are predominantly financed by extrabudgetary sources, the so-called social security funds.*” (Mihaljek, 2014, p. 30) The Croatian health care system can be classified as a combination of the Bismarck and the Beveridge financing models, that is, as stated above, a model that is mainly financed by compulsory health insurance contributions based on salaries of employees, which is additionally supported by budgetary resources. In other words, as most health care resources come from compulsory contributions, it can be concluded that the Bismarck financing model prevails in Croatia. This is an extremely socially sensitive way of health care financing, which contributes to health care and the preservation of the health of all groups within the population. Namely, for a relatively low cost of a health care service, a patient in Croatia may receive a wide range of health care services (Vončina, Rubil, 2018). In Croatia, the central authority, i.e., the Croatian Health Insurance Fund (hereinafter referred to as the CHIF), pools the health insurance resources. The CHIF revenue includes contributions for compulsory health insurance, which account for 80% of total revenue and are made up of the contribution rate for compulsory health insurance amounting to 16.5% of gross salary, as well as pension contributions, i.e., 3% for pensions above HRK 5,664; budget revenues realised pursuant to Articles 72 and 82 of the Compulsory Health Insurance Act, which comprise contributions for compulsory health insurance of unemployed persons, revenues from the excise tax on tobacco products, contributions for compulsory health insurance of insured persons who have been deprived of liberty pursuant to a decision of the competent court, additional contributions to pension beneficiaries in accordance with the pension insurance legislation and under the Act on the Rights of Croatian

Homeland War Veterans, and revenues for supplementary health insurance for which the cost of the insurance policy is covered by the state budget. Generally speaking, health care revenues consist of revenue from contributions, revenue from the budget, revenue by special regulations and other revenues.

Health expenditures are tied to three groups of health care expenditures: health care expenditures for compulsory health insurance, health care expenditures for supplementary health insurance and expenditures for workplace health protection and occupational diseases – specific health protection. In 2017, these expenditures accounted for 88% of total CHIF expenditures (the Croatian Health Insurance Fund, 2018). The CHIF allocates the funds obtained to health care institutions pursuant to health care contracts, and ultimately shows positive business results, i.e., an excess of revenue over expenditures. On the other hand, depending on the health service they provide, health care institutions show either positive or negative business results, while clinical hospital centers in the Republic of Croatia almost always show negative business results, with the exception of situations where they receive significant financial assistance from the government with a view to meeting their obligations to suppliers. This is how these institutions run into the largest debts in the health care sector, which brings us back to the beginning of the debate and the fact that the price of the service offered by the hospital is lower than the actual cost of that service. Namely, the prices of services are defined by the CHIF and hospitals do not have any impact on that. More precisely, the prices of services are defined within the DTG (diagnostic and therapeutic group) coefficient relating to hospital medical care of patients suffering from acute illnesses (inpatients) and patient diagnosis, i.e., the cost of treatment is included in diagnosis and treatment within DTP (diagnostic and therapeutic procedures in specialist and conciliary health care) coefficients pertaining to day hospital patients, or the so-called outpatients. The cost of treatment is defined by a procedure or a service provided to a patient (e.g. a check-up) and the DHT (days of hospital treatment - chronic and prolonged treatment) coefficient referring to the price per day that a patient spends in a hospital, and after a certain number of days a patient spends in a hospital, which is defined by the DTG procedure or diagnosis.

3. FINANCING OF CLINICAL HOSPITALS AND CLINICAL HOSPITAL CENTRES

Clinical hospital centers in Croatia are financed on average by more than 90% of total revenue by the CHIF. The basic document on the basis of which provided services are paid to hospitals is a Contract for the Provision of Hospital and Specialist and Consiliary Health Care Services, based upon which all medical procedures at any medical facility within the hospital are contracted and the monthly maximum financial limit of the hospital is defined. On a monthly basis, if a hospital sends an invoice for payment for services rendered within the limit, the defined amount of the limit is transferred directly to their bank account. This amount is also called the hospital budget or hospital health care. What precedes is the contracting procedure, i.e., the period of time within which hospitals offer their proposals referring to types of services and the number of services they offer, and the CHIF decides whether to accept them or not. Upon acceptance, the aforementioned Contract for the Provision of Hospital and Specialist and Consiliary Health Care Services is signed. With the maximum funding limit available for the provision of hospital and specialist and conciliary health care services from compulsory health insurance, hospitals as health care facilities provide funds for particularly expensive medicines, explantation, transplantation, interventional cardiology, interventional neurology, cochlear implants, and transfusion medicine (CHIF, p. 11, 2018). These are the so-called non-limited CHIF funds as hospitals call them. In addition to this, the CHIF is required to allocate funds to hospitals based on the supplementary health insurance of patients who have that insurance, funds for accidents at work and occupational diseases and health care of foreign insured persons in the Republic of Croatia. The additional revenue that hospitals can earn from the CHIF are revenues based on key performance indicators (KPIs) and quality indicators (QIs) in hospitals that provide treatment of patients with acute illnesses. Performance indicators that were valid until December 2018 were determined on the basis of the average length of stay in the hospital and the total number of cases in specialist and conciliary health care per health worker. Quality indicators that were valid until December 2018 were determined on the basis of a general mortality rate, the percentage of day hospital treatments, and the percentage of treatments with reserve antibiotics in relation to the total number of cases. Out of a total of five indicators, hospitals could get 1% per indicator, i.e., a total of 5% of the hospital limit in case all criteria are met (this refers to how many

services hospitals have invoiced in a month, below or above the agreed limit, under the condition that if they have invoiced the number of services above the agreed limit, only a percentage of the contracted limit is acknowledged). Since January 2019, the situation regarding the key performance indicators (KPIs) and quality indicators (QIs) is fundamentally different. Namely, the indicators are evaluated in the following way: based on the complexity of individual cases in the total number of cases (diagnostic and therapeutic groups), the average length of acute hospital treatment per case, the average length of acute hospital treatment due to acute pancreatitis, the percentage of same-day surgery of inguinal/femoral hernia repairs, the total number of cases treated in specialist and conciliary health care per one health worker, the percentage of day hospital treatments, the number of hospital readmissions within 30 days regardless of diagnosis, the percentage of patients treated with restricted antibiotics, a general mortality rate, a mortality rate due to acute myocardial infarction and a mortality rate due to stroke. The maximum possible amount available on the basis of key performance and quality indicators is 3% of the contracted limit. However, the dynamics of payment made by the CHIF to hospitals for hospital and specialist and conciliary health care during a month is an additional issue that defines the financial performance of hospitals, i.e. their dynamics aimed at settling current liabilities (Bogut, Vončina, Yeh, 2012). As shown in the text, the CHIF revenues are divided into several types, so payment is made in several phases. The first is a model based upon which funds allocated for hospital and specialist and conciliary health care are distributed; these funds are paid according to the 90:10 principle, i.e., 90% of the hospital budget, i.e., the hospital limit, is paid immediately at the beginning of the current month, and the remaining 10% on the basis of the provision of health care services. Other funds are then paid for additional health insurance, workplace injuries and the so-called non-limited items. In addition to the CHIF revenue, hospitals also make money from providing services to other health care providers, from direct funding by the budget (central or local), from patient participation payments, and from other revenues that make up a very small, almost insignificant share of total revenue. In any case, the share of the CHIF revenue in most large hospitals accounts for about 80% of total revenue (or even more in some hospitals), which means that hospitals are literally dependent on the CHIF and their contractual obligations with the CHIF.

4. HOW AND HOW MUCH DO HOSPITALS SPEND?

Expenditures of clinical hospitals and clinical hospital centers make up a larger amount compared to realized revenue. Hospitals do not have enough funds to cover expenditures and by applying the balanced budget principle they plan to have fewer expenditures or higher revenue than expected. Due to insufficient revenue to cover current year expenditures, hospitals do not plan to cover the deficit transferred from previous periods (State Audit Office, p. 14, 2018). As shown in the previous chapter, hospitals do not directly affect the definition of their own revenue, so it can be said that they do not affect their own expenditure either.

The largest share of hospital expenditures are expenditures for medicines and medical supplies (i.e., material costs) and expenditures for salaries paid to employees (i.e., labor costs). Clinical hospital centers and clinical hospitals provide wide-ranging health care and can definitely not anticipate in advance or plan their costs for patient treatment or define the number of patients seeking medical care (European Commission, 2018). Precisely for this reason, it is difficult to predict an extraordinary situation and consequently consumption of medicines and medical supplies. On the other hand, expenditures on medicines and medical supplies are not accompanied by a proportional increase in labor or an increase in revenue for services rendered. This means that an increase in the hospital spending limit would cause medicine expenditures to grow up to twice as much as the increased limit. There is mostly an increase in expensive medicines that are paid especially as non-limited CHIF items. However, there is a significant increase in the consumption of “ordinary” medicines and medical supplies.

Furthermore, the pay scale system, i.e., salaries paid to employees, is established pursuant to the basis used for the determination of the salary system for civil and public servants and employees based on the Collective Agreement for Civil Servants and Employees and the Agreement on the Basis for the Determination of Salaries in Public Services and is therefore subject to changes at national level. For example, in December 2017, the CHIF and the hospitals entered into a contract offering hospital and specialist and conciliary health care, which also raised the limit to the hospitals. As early as 2018, a limit increase in most hospitals was canceled by increased expenditures for staff salaries as a re-

sult of a rise in the basis used for the determination of salaries in public services, which grew by 6% in 2018.

The next major expenditures burdening hospitals are current and investment maintenance. Most of the hospitals are located within old and dilapidated buildings requiring frequent and necessary repairs, i.e., urgent and immediate repair works. On the other hand, the advancement of technology requires accommodation in renovated and refurbished buildings, so whenever new equipment is purchased, it is necessary to make changes to existing facilities. Hospitals see the purchase of equipment or capital investments as great but unattainable resources they can barely afford (Cylus, Thomson, Evetovits, 2018). When purchasing modern medical equipment, clinical hospitals and clinical hospital centres almost always depend on additional revenue sources, whether these are budgetary funds or resources provided by the Ministry of Health, or with the approval of the Government of the Republic of Croatia, these might be general budget funds originating from sources from general revenues and receipts. Such funds of the Government of the Republic of Croatia are planted directly in the state budget and as such, they are allocated to hospitals. Another possibility of financing the purchase of capital equipment for the purpose of providing health services of the highest quality in hospitals are the EU grants. Namely, funding is currently possible through the Operational Programme Competitiveness and Cohesion 2014-2020, within which calls for tenders are issued enabling hospitals to have the opportunity to participate in these tenders with the aim of procuring equipment or renovating, upgrading or building additional hospital capacities. The Ministry of Health is also an eligible applicant within the aforementioned programme and its grant scheme, so it can procure equipment needed in hospitals through projects within its area of competence. This is, of course, one of the most valuable ways to reduce expenses and use otherwise insufficient funds for equipment procurement that greatly facilitates hospital financial operation and improves the quality of their services.

Financially speaking, public hospitals are general government budget beneficiaries. From an accounting point of view, revenues and expenditures are not calculated according to the same principles, which results in a discrepancy between revenue calculated on the basis of the contractual relationship and the costs calculated according to the principle of their origin, regardless of their payment (Vrhovec et al., 2014). This is particularly reflected in monitoring hospital operations on a monthly basis and showing monthly outcomes. It is

often the case that after delivery of high-value goods or equipment the invoice is settled and makes expenditure for the current period (a 'period' implies here a month as hospitals are obliged to submit their operating reports to the CHIF on a monthly basis), and revenue related to that equipment, if it is funded by the Ministry of Health, is transferred to the hospital in the following month, or vice versa. In this case, business results are presented unrealistically at the end of the month. The same example can be seen when you make a donation for a specific purpose; expenditure is shown a month or even two months after donation revenue. Hence, for hospitals, the most realistic overview of business operations is given at the end of the year, i.e., when the annual financial statement is adopted.

Special attention should be paid to liabilities, especially arrears. This topic is perhaps most current when it comes to the finances of clinical hospitals and clinical hospital centers. In some hospitals, arrears are growing even over a year. The amount of liabilities depends on the size of the hospital, but it is certainly the amount that the hospitals cannot cover by means of their own resources (McIntyre, Kutzin, 2016). The largest and oldest liabilities relate to obligations to suppliers of medicines and medical supplies. As stated at the beginning of the chapter, in the Audited Financial Statement of Health Care Institutions performed by the State Audit Office it can be seen that due to insufficient revenue to cover the current year's expenditure, hospitals do not plan to cover revenue loss carried from earlier periods. In that case, if hospitals planned to do that, they would not have sufficient revenue to cover the salaries paid to their employees in the current year and further material expenditure necessary for their operation. In the last two years (i.e., 2017 and 2018), the government of the Republic of Croatia intervened several times and by reallocating a surplus from certain positions in the state budget, it let additional funds be paid to hospitals for the purpose of settling hospital liabilities to suppliers of medicines and medical supplies. Thanks to Croatian government interventions, business results of clinical hospitals and clinical hospital centers at the end of the year were more favorable than expected during the year.

The costs of clinical hospitals and clinical hospital centers are large, far greater than the costs of some other public institutions and systems in the Republic of Croatia. Media attention is increasingly focused on hospitals, primarily through the primary medical context of quality and service delivery, while financial discourse, though immensely important and inseparable, is often subordinated to, or hindered by, political relations and the current social and social context.

5. INSUFFICIENT REGULATION OF LABOR LAW STATUS OF HEALTH WORKERS AS THE ADDITIONAL FINANCIAL BURDEN ON HOSPITALS?

An (in) a sufficient number of health workers is a controversy that has been around for a long time between the competent ministry, the Croatian Medical Chamber, the unions involved, the media and the public in Croatia. A brain drain of medical doctors and other medical professionals is a topic permanently discussed in health circles, media and newspapers. Most observers and professionals would agree that currently, we do not have enough health care professionals, primarily medical doctors, nurses and medical technicians (Čipin, Smolić, Vlah Jerić, 2017). Recent lawsuits filed by medical doctors, final judgments and new financial liabilities imposed on hospital budgets have undoubtedly confirmed numerous system deficits, indisputably also those referring to human resources, their (in)adequate workload, as well as their planning in the public health system. Excessive overtime of medical doctors and other medical staff not only represents the financial burden on hospitals, but it undoubtedly confirms that there are not enough employees in the system. Moreover, maintaining the existing quality of services and health care is only possible by imposing an additional burden on the current number of employees. However, on the basis of current trends, undeniable (e)migration of young medical doctors, retirement of nearly 4,000 medical doctors in the next decade, and tough and long-lasting education and training of medical doctors, the normal functioning of the national health system could become seriously questionable in the next decade (Čipin, Smolić, Vlah Jerić, 2017, p. 366).

(E)migration of medical doctors in Croatia, Europe, and the world is not a novelty (Tjadens, Weilandt, Eckert, 2013), but the lack of appropriate national strategies and real long-term strategic human resources management in the health system is definitely a serious national deficit, the consequences of which will be felt. Warnings about the brain drain of the highly educated labor force, especially medical professionals, which was modeled on Poland, after full membership of the Republic of Croatia in the European Union (Kovács, Vinković, 2011, pp. 355-362) have obviously not been taken seriously in political circles. Although the focus of this paper is not on (e)migration of medical doctors, it is impossible to ignore their interconnectedness and interdependence with the

workload of existing health workers and the accumulated total overtime hours in clinical hospital centers, clinical hospitals, and *pro future* hospitals. Overtime hours and their inadequate calculation and payment are the subjects of a few hundred lawsuits before the Croatian courts, which threaten hospital budgets and their long-term financial (in)stability. Although it is possible to give several legal opinions on the calculation of overtime hours and the interpretation of the provisions of the collective agreement in question, it is generally almost impossible to pay out hours worked as overtime less than regular working hours, i.e., not to add related allowances for a salary increase or the labour cost per hour. Quite simply, this would mean that a person is a medical doctor, a specialist, and a subspecialist, who works in special working conditions, only when they work regular full-time hours, while for any hour worked in excess of their full-time workload, they are no longer either specialists or subspecialists, and they do not work under special working conditions. The experiences of similar court epilogues let us draw a conclusion, with a rather high degree of security, that hundreds of lost lawsuits will result in an additional and significant burden on hospital budgets. However, it is even more complicated to see if and when this harmful practice will be stopped?

In addition to recent lawsuits, the issue of insufficiently regulated labour law status, primarily of medical doctors, is also hidden in the fact that there are no precise standards and rules stipulating how many patients medical doctors, specialists or subspecialists are required to examine and treat on a single day, i.e., in their full-time working hours. The absence of such legislation results in the unequal and unbalanced workload of individual medical doctors working in the same department and facility at a hospital, which leads to demotivation in the workplace, reduced productivity, and job dissatisfaction that can fuel the desire to leave the country. No less important, the absence of the representativeness of the Croatian Medical Union, i.e., the lack of necessary legal amendments to the relevant regulations, is still an open question, the answer to which would finally allow the union gathering medical doctors to negotiate working conditions of medical doctors, and not the union/s that *inter alia* gather non-medical staff employed in the health care system. Although this problem seems easy to solve, putting this topic on the agenda has obviously been delayed by the issue of complex political and interest relations, which in turn leads to further disruption of the medical profession with far-reaching and very harmful social consequences.

6. HOW TO IMPROVE FINANCIAL EFFICIENCY

An occasional increase in hospital budget or hospital limits is not enough to improve hospital financial performance and reduce losses. As already stated, an increase in the limit also generates an increase in material expenditures, in particular of medicines and medical supplies, which in turn causes increased hospital workload aimed at reaching the assigned limit. Also, increased workload means increased mechanical wear of medical equipment, which is later reflected in more frequent services and increased maintenance costs. As an umbrella institution for control of invoiced services by hospitals and payment of financial resources to hospitals for the services provided, the CHIF defines both the payment model and the price of the service in question. Namely, payment to hospitals is defined, as mentioned above, based on the DTG (diagnostic and therapeutic groups), DTP (diagnostic and therapeutic procedures) and DBL (days of hospital treatment) coefficients. DTG is something that is unique to the health system, i.e., the definition of DTG itself is complex. The definition and clarification of DTG from the CHIF Handbook for Health Workers read: "Payment by DTS is a payment per episode, the episode being the period from hospital admission to hospital discharge. The duration of the episode may vary. It may last from one to many days, and all costs incurred during this period are included in the price. This means that all health care services are included in the episode and there is only one payment per episode. This approach is usually referred to as per-case payment (the CHIF Handbook). Further in the text in the handbook, it is stated that not all operating costs of tertiary level health care facilities, such as clinical hospital centers and clinical hospitals, are not covered by DTG pricing, such as capital costs, medical staff training costs, costs of teaching and the like (the CHIF Handbook). What is not mentioned and it makes the foundation of all costs, is the depreciation cost. Hence, in its Handbook on DTG, the CHIF itself states that there is a disparity between the actual costs of clinical hospital centers and clinical hospitals. DTG is also designed to cover unplanned medical treatment, extended treatment, etc. However, it covers the costs of extended treatment resulting from the treatment itself, but only those costs are foreseen by the DTG Handbook. The aforementioned costs remain uncovered. The described problem itself imposes a solution for hospitals to achieve financial efficiency and stability, i.e., to include all costs in the price: material costs, salaries, depreciation, and other operating expenses.

It can be concluded that the health system itself is not completely defined in a way that covers all costs this health system generates. However, there is room for hospitals to rationalize their business operations with the aim of reducing costs. An example of such a business operation is to monitor both costs and invoiced services on a daily basis. Such monitoring will certainly not lead to positive business results of hospitals, as it is almost impossible without changing the health care financing model or without the help of the Government of the Republic of Croatia through financial assistance that is occasionally provided to health care institutions. What institutional management can do is, with due care and diligence of a prudent businessman, to manage the system by controlling medicine consumption on a daily basis, stockpiling and tracking invoiced realization of all constituent units within the hospital (constituent units imply here both a medical and a non-medical part of the hospital). In other words, it is necessary to define the spending limits that a certain constituent unit can spend on a monthly basis. There are, of course, unforeseen cases occurring in health care, and because of them, these spending limits can be exceeded, but such cases should be timely reported and controlled by responsible persons. Also, control of invoiced realization implies the monitoring of the realization of services provided in the hospital with the aim of achieving the hospital monthly limit contracted with the CHIF to ensure maximum monthly level revenue. On the other hand, the monitoring of the invoiced realization does not apply only to the monthly limit, but it also includes non-limited items paid to the fullest extent they are made in (with the exception of those invoices returned by the CHIF due to illogical services rendered to patients).

In the contracting phase, for the purpose of signing the Contract for the Provision of Hospital and Specialist and Consiliary Health Care Services and obtaining a higher monthly limit, hospitals contract their maximum or 100% capacity. In order to improve their financial position or increase efficiency and possibly do business with smaller deficiencies, at least one small portion of capacity (e.g. 10%) could be left for hospitals to offer their services at market prices, without waiting lists, or to offer high standard services (Briš-Alić, Harc, Vida, 2018). There would certainly be enough demand for such services because there are patients who find waiting lists unacceptable and have enough financial resources to cover costs incurred for necessary health care personally and directly. In the absence of such solutions, these patients currently seek medical treatment in private clinics. Given that clinical hospital centers and clini-

cal hospitals offer the highest level of health care possible, such patients would probably be delighted to receive their services whenever possible.

At this point, we deliberately omit the option of increasing participation as an additional source of revenue for hospitals as it often refers to vulnerable groups of citizens and patients. Although most vulnerable populations are wholly exempt from participation, it should not be forgotten that participation does not have a long-term effect on increasing the financial stability of the health system. However, more rational treatment and investment in primary health care, both at the infrastructure level and at the level of human resources management and improvement, may have significant financial effects at the secondary and tertiary levels of health care.

7. CONCLUSION

Both decision makers and the scientific and professional public at national, European and global levels are concerned with conscious spending and the need for spending control in hospitals. Mechanisms have been activated that focus on ever greater and more stringent spending control, but unfortunately, the system still does not allow full-scale hospital financial performance, neglecting that hospitals are the largest health system cost generators (European Commission, 2018). Without increased revenue, it is difficult to achieve positive business results.

Funds allocated to hospitals by the CHIF account for around 80% of their total revenue, which is also a limiting factor for additional revenue generation. Through the aforementioned Contract for the Provision of Hospital and Specialist and Consiliary Health Care Services hospitals precisely define health procedures, specific facilities and working hours. Such contracting leaves little room for hospitals to earn more money in the commercial market, all the more so because almost all clinical hospital centers and clinical hospitals are burdened with long waiting lists. On the other hand, in case of exceeding the maximum monthly limit with the invoices issued to the CHIF, the CHIF is not obliged to pay therefor. In other words, hospitals whose employees work too much sometimes risk additional cost increases without having the possibility to compensate for those costs through realized revenue. Limits set to hospitals should be based on objective indicators such as a number and type of surgery, a number, and type of outpatient examinations, and the like, i.e., on comprehensive costs

of all types (Vehovec et al., p. 188, 2014). Namely, the price of a service defined by the CHIF does not include depreciation costs. Thus the question arises as to whether the hospitals that generate losses are really inefficient or the funding system is inefficient, i.e., whether these are predetermined sources of inefficiency on both sides. The problem lies in normative health care planning, i.e., a broad right to health care based on the “all rights for all” model (Vehovec et al., p. 188, 2014). It is indisputable that something must change in the health system. Will it be correcting the DTG or DTP prices, which is, in any case, a smaller revenue generator, in order to increase revenue while maintaining the same level of costs, or will costs be reduced by fixing the prices of medicines and medical supplies? No less important, a more rational approach is needed to increase the indication for medicines listed on the medicine list. The current intention of the Ministry of Health aimed at increasing the number of day hospitals and same-day surgeries or ambulatory surgeries, and consequently reducing the number of inpatients to avoid additional lying costs, can yield results, but only in interdependence with all critically observed and mentioned mechanisms. However, regardless of hospital efforts and plans, if the price of a service does not include all economic parameters, hospitals will undoubtedly continue to generate losses. A comprehensive approach to the problem that will not ignore all of these interdependent factors, followed by the necessary normative interventions of autonomous and heteronomous character, and an adequate approach to human resources responsible for the normal functioning of the health system may bring light at the end of the tunnel.

Abstract

Kosovo as a new state with the purpose of the fulfillment of obligations for the operation of the government and other state institutions has developed a simple and emergency policy for generating the public revenues, where besides the donations the funds were also collected by applying different taxes. During the first post-war years, Kosovo did not have any fiscal policy which will trigger economic sustainability and provision of conditions in order for the country to have a rapid economic development on the way of strengthening of the domestic

economy. An increased diligence for the modernization of Tax Administration of Kosovo (TAK) and implementation of fiscal policies was enabled only after the Declaration of Independence in 2008, where the first tax reforms commenced, and for the first time took place the application of the Strategy for long-term development, modernization and better delivery of services to taxpayers.

Through this paper, we will try to analyze many factors of tax reforms and TAK modernization; a paper that will be based not only on theoretical data but through the comparison of theoretical data with those of the field, we will try to give an overview of the impact of these tax reforms on the increase of Kosovo's budget and the impact of TAK modernization in providing the best services for taxpayers. In order to see how these changes were appreciated and how the respondents evaluate TAK services and what other reform changes are considered as feasible and acceptable, which at the same time would have an impact not only in the increase of budget but also in TAK, through modernization, making the fulfillment of revenue collection plans more effective and efficient, and at the same time affecting the wider extension of the tax basis, but also making the compliance of tax obligations for taxpayers easier.

Keywords: Tax Administration, Tax Reforms, Kosovo

JEL Classification: H20, H71

1. INTRODUCTION

Tax reforms in Kosovo contributed largely to the increase of revenues, and the same time the TAK organization through modernization contributed to better service delivery to taxpayers, whereas application of electronic platforms influenced largely in easing filling returns, payments, an increase in the number of taxpayers filing their taxes.

Therefore, given the fact that there are various opinions on the tax reforms that were applied in Kosovo, especially after 2008, they were associated with a better organization of TAK, increase on a number of inspectors, better services and reduction of informal economy and collections of arrears, an increase of service efficiency for taxpayers. Therefore, we consider that these are some of the issues that shall undergo research, and raise clear objectives over these issues, or otherwise, the necessity for researches in this field.

Today, we are witnessing that the Tax Administration should develop a voluntary filling system, minimizing the risks of tax evasion by establishment of a modern, suitable organization and always in service to taxpayers, to enable easier and efficient compliance of tax obligations, which will also have an impact in the reduction of informal economy in Kosovo, thus enabling opportunity for loyal, equal and reliable activity for all.

The purpose of the study, which we are willing to undertake, respectively the application of tax reforms in Kosovo since its Independence in 2008 until now, is to give a scientific contribution not only to compare the effects of those reforms in the increase of Kosovo's budget, but the provision of services to taxpayers as well. How our respondents evaluate the provision of call center services, education, transparency, and equal treatment, also potential suggestions for other positive impacts which could influence better compliance of tax obligations, reduction of risks, reduction of the informal economy and better taxpayers' coverage base.

Through scientific facts, empirical comparisons of various tax reforms that have been applied in other countries and organizations of Tax Administrations, we will try to give our suggestions on the impacts that the application of reforms and the organization of Tax Administration (TA) could have in the future, the application of which could be implemented in Kosovo as well.

So, although our primary goal, through this study, is to contribute to the interested parties from Kosovo, whether state institutions, businesses or other stakeholders, so that the findings from the empirical researches, which we will carry out, we hope, are applicable in Kosovo and to have a positive impact for the readers of this paper, but naturally, our intention is for this paper to make it helpful for stakeholders abroad, where they could accept the facts from this research or disprove them with other scientific facts.

2. LITERATURE REVIEW

The conclusion from almost all tax experts is that modern tax administrations are concerned with a stronger focus on taxpayers, specialization of personnel, independence from the ministries and politics, fight against corruption among tax administration staff and this should also reduce tax revenue collection costs and help to prevent tax evasion. The efficiency of a tax system is not

determined only by appropriate legal regulation, but also by the efficiency and integrity of the tax administration (Bird, R.M. 1990).

The major administrative reforms were undertaken in different countries in South America like Bolivia, Chile, Columbia, and Uruguay, or in Europe, Spain and Portugal provide encouraging examples. In each case, new management was instituted with a new organizational structure and a more professional staff (Harberger, A. 1989).

These improvements resulted in the successful implementation of the tax reform program and in a dramatic improvement in tax collection. Such successes show that under the right conditions, the efficiency of the tax administration can be increased in a relatively short period of time. These improvements resulted in the successful implementation of the tax reform program and in a dramatic improvement in tax collection. Such successes show that under the right conditions, the efficiency of the tax administration can be increased in a relatively short period of time.

According to Tanzi, V., Pellechio, A. (1995) the main tasks of tax administration involve:

- ✦ information and instruction to taxpayers,
- ✦ registration, organizing and processing tax returns (input of data, processing declarations, and payments),
- ✦ coercive collection (closely connected with registration, accounting and return processing),
- ✦ control and supervision (discovering lacking and insufficient tax returns and controls of books and papers in tax administration offices or business activities and books of taxpayers, while routine check-ups had already been done in the registration, accounting and return processing department),
- ✦ legal services and complaints (taking cases to court, defending tax administration in court, explaining procedures which are or are not in accordance with the law).

A good tax system is an output of good tax policies, legislation, the efficiency and integrity of tax administration (Kaldor, 1980). All this with the justification that practices around the world show that revenue collection is more effective when taxpayers make voluntary compliance and this is achieved when they trust and respect the tax authority, as well as consider it to be highly competent.

3. GENERAL OVERVIEW OF TAX ADMINISTRATION OF KOSOVO AND THE REFORMS AFTER THE YEAR 2008.

TAK mission is to collect taxes and contributions in order to support the economic development and well-being of Kosovo's citizens. Success is measured if the expected government revenues are collected to secure important government services, largely through voluntary taxpayers' compliance with Kosovo tax laws and if employers pay the required contributions for pension savings and other contributions for their employees. (Handbook on taxes in Kosovo 2007)

To implement its mission and vision, TAK has chosen its values, namely: Professionalism, Integrity, Honesty, Efficiency and Effectiveness, Service Excellence and Transparency. These values should be applicable in how Tax Authority treat the taxpayers and the various partners they work with.

Besides the main purpose of revenue collection, TAK develops numerous activities based on the 2015-2020 Strategic Plan, as well as other annual and periodic plans by providing better taxpayer services, increasing professionalism and transparency, better perception on integrity and honesty towards increased voluntary payment of taxes. Certainly, TAK's achievements in addition to internal staff are also related to activities carried out with other local and international institutions that are providing expertise and professionalism to keep TAK in step with its modern system organizations.

In 2016, TAK developed a Functional Organizational Structure, which for the most part complies with best international practices. In recent years, TAK has invested heavily in the establishment of the electronic system, which provides online and cost-effective services to taxpayers. A robust performance management system has been developed with Annual Plans for Addressing Risks and an annual operations planning process.

The online Electronic Data Interchange (EDI) is advanced, secure and suitable for application for tax filing for taxpayers. The EDI system is available for each taxpayer to Declare and pays tax liabilities for all types of taxes, correction of tax declarations, and the possibility of paying unpaid liabilities and access to the history of their declarations. Other electronic services are available through the TAK web site, such as: obtaining tax certificate, reporting for purchases

over 500 Euros, download of tax declaration for taxpayers declaring in manual form, etc.

Currently, Kosovo has ten agreements for the elimination of double taxation, which have an important role in the factors that guarantee, favor and stimulate international economic and trade relations. These bilateral agreements also play a role in the development of tax cooperation, the protection of taxpayers from double taxation, the prevention of tax evasion, the elimination of discrimination and the provision of administrative assistance.

From June 2016, the agreement with Albania is in force for the creation of a Joint Training Centre (JTC), which is aimed at increasing the professional capacity of the financial institutions of both countries. In addition, in September 2012 TAK has signed a cooperation agreement with Albania's General Directorate of Taxation, whose purpose is to exchange experiences and implement procedures simplifying cooperation.

Also, Kosovo has an agreement with the Government of the United States of America, the Foreign Account Tax Compliance Act (FATCA), which is in force since 2015. This agreement is binding for financial institutions to report through the Tax Administration of Kosovo on the financial accounts of American citizens to the US Internal Revenue Service.

In December 2016, a Cooperation Agreement was signed with the Estonian Tax and Customs Board in order to exchange experiences in the field of information technology, tax compliance, and professional capacity building for taxes and customs.

Specifically, TAK receives support through training and seminars on professional development by The Organization for Economic Co-operation and Development (OECD) centers in Ankara, Budapest, and Vienna, as well as by Center of Excellence in Finance (CEF) in Ljubljana, Slovenia.

The following are the most important Departments in TAK through main pillars, achievements and at the same time the identification of needs for further modernization are:

- ✦ Taxpayer Education Department
- ✦ Information Technology
- ✦ Call Centre and
- ✦ Auditing and Enforcement Collection

3.1.1. TAXPAYER EDUCATION DEPARTMENT

Tax Administration of Kosovo, as a responsible authority for administration of tax legislation, all its activities and efforts are focused on the enhancement of voluntary compliance of tax obligation by taxpayers.

The Department of Taxpayer Service and Education (DTES) is one of the most important sectors helping TAK to accomplish its mission on tax compliance.

The role and responsibilities of the DTSE are:

- Taxpayer education and information on their rights and obligations,
- Drafting of explanatory procedures in order for the taxpayers to be easy and simple on the application of Tax Legislation,
- Development of policies, programs, and procedures related to taxpayer services at the central level and regional level, and the coordination with common activities.

To accomplish its role on taxpayer education and information, DTES has undertaken a variety of activities and actions, which have provided a continuous education of business/taxpayers, and on the enhancement of tax voluntary compliance.

From the following table, it can be seen a great number of activities that are in function of taxpayer education providing advice and instructions for the tax voluntary compliance.

Table 1. DTES activities performed during 2017

Description	No. of visits
Refund visits	2
Compliance - Education	2

Compliance - Visits with the police	68
Compliance - Issuance of fiscal numbers	2
Compliance - Contacts in the office	25
Other visits	740

Source: Tax Administration Report for 2017

TAK staff plays a substantial role in the accomplishment of the company's objectives, and in the successful performance evidenced throughout these years. TAK pays special attention to their welfare, health, working conditions and pro-

professional development and advancement. Currently, TAK has 781 employees. From a gender perspective, 535 or 68% of all staff members are male, whereas 246 or 32% are female. Fig 1.

Fig 1. The number and gender structure of the employees

Source: Tax Administration Report for 2017

TAK continuously take care of staff capacity building and through the department of training organizes permanent various courses to lift the professionalism among its staff.

During 2017, technical support for staff training was realized and provided. From TAK, as well as local and international organizations, 58 pieces of training were organized from different fields of tax legislation, where 542 officials attended, 10 seminars and study visits/workshops were held, where 57 officials participated. There were also provided two pieces of training, for external audiences (for other institutions), a number of participants were 58.

As can be seen from Table 2., the revenues are increased year after year and mainly after the changes in fiscal policy, with implementation at the end of 2015. (IMF Country Report No. 18/368)

Table 2. TAK Revenue Collections in euro

3.2 INFORMATION TECHNOLOGY

It is obvious that the information technology used within the Tax Administration is unprecedentedly advanced with European-level programs that help the administration on the one hand but also helps the taxpayer on the other hand. Undoubtedly, TAK is in trend with developments in the electronic information system, it includes information systems that are routine such as the website, intranet, communication through online publications and other forms of exchange within and outside the institution.

EDI (Electronic Data Interchange) - application for the use by the taxpayers - is the abbreviation of the word electronic declaration or E- Filing. EDI is a modern, fast and simple way to declare the tax. This system allows the taxpayers to create an online account with TAK, through which it is possible to complete and submit tax declarations. This electronic platform has been operational since August 2011. Initially, it was available to declare and pay Value Added Tax (VAT) only for businesses in the Large Taxpayer Unit - since the beginning of 2013, all taxpayers were enabled to declare and pay the tax via electronic filing.

This new system of information has created many facilities not only for Tax Administration and tax inspectors but also for businesses.

Before the implementation of a system for electronic filing, all tax returns were filled out manually in three copies and have been submitted at the commercial banks, together with payments. Since the completion of tax returns was

manual, the technical errors were investable, during the completion, commercial banks processing and in the end manual processing or recording into the information system of Tax administration. Through this process, with a range of chain actions are subject most of about 60 thousand taxpayers, as much as they are active in Kosovo.

Through these processes, all taxpayers file and pay tax obligations on a regular timely basis for all tax types. The development of a system for electronic filing came as a demand of time. Therefore, it is correct to say that these systems enabled both the enhancement of collection and have facilitated the work, efforts and time for the taxpayer, making better services for them, which certainly the filing and payments were increased as a result of this advancement of information technology system.

Electronic filing, as much as has easy the TAK work, it has helped more taxpayers to comply with the obligation for filing and payment of taxes. That is proven also with the level of the usage of the system by taxpayers and professionals/accountants, which are the most active community on interactive communication with TAK. It is worth to mention that after the digitalization of all tax returns, the level of usage has achieved the amount of 96% of all taxpayer that actively file and pay tax obligations.

As it can be seen on the Tab. 3, once the electronic filing started in 2012, there were totally 296 521 electronic declarations, which number is increasing year after year to reach the number over 2 million electronic declarations in 2018.

Table 3. Electronic Tax Filing (2012 – 2018)

	2012	2013	2014	2015	2016	2017	2018
Electronic Tax	296 521	701 350	1 065 073	1 374 637	1 710 376	1 886 670	2 027 175

3.3 AUDITING AND ENFORCEMENT COLLECTION

Thanks to a high-level technology system, it is achieved the possibility that audit case selection to be done electronically based on risk. For all tax, types are applied to many variables, which are taken into consideration in case selection of taxpayer for an audit. The case selection for audit based on risk analysis is still a small percentage. Therefore, a number of cases are selected according to regional evaluation where they consider that risk exists or there are requests by other institutions, as it is prosecution, etc., but that sometimes makes the selection to be of narrow interests (requests by competition to make pressure on a business, political party interests, but it could be also corruption elements. Another wonder that is noticed is that audits are lasting too long and a number of audits are very small. From the following table 4, it can be seen that the average of audit per inspectors is only 5.73 per year.

Table 4. Average of audit per inspectors

No	Regions	Additional tax	Structure	Number of audits	Number Inspectors	Average of tax per audit	Average tax per inspector	Average of aud per inspect
1	LTM	22,458,713	42.3%	105	20	213,893	1,122,936	5.25
2	PRISHTINE 1	4,917,278	9.3%	165	28	29,802	175,617	5.89

TOTAL:		53,154,493	100.0%	1,444	252	36,811	210,931	5.73

Source: Audit Department of TAK

As we explained above the case selection for audit is not made only based on risk analysis that could be considered as the best method for audit case selection (it is fair and provides best results).

Before the debt taxpayer cases selected for enforcement collection, TAK applies taxpayer telephone calls from Office of call centers. Call Canter Cases in the system are disaggregated by priority. The priorities are based on the date and the value of the debt. Taxpayers with debt, missing declarations in a priority-based system automatically reach the application of the Call Canter and these cases are automatically tasked to the employees as work cases. Using the details of the assessment officials determine the origin of the debt.

After telephone calls and if they did not succeed then the stuff passed to enforce collection of the department.

Department of Enforcement Collection, which is based on laws and at the moment when the conditions are met for the beginning of enforcement collection it starts the implementation of the law and all necessary steps are undertaken to collect debts. From the different publications by TAK itself, but also by other institutions, notably by IMF publication, it can be noticed that this department needs development and professional building to be able to reduce debts.

Table 5. General debts until 31.12.2017

4. METHODOLOGY, DATA ANALYSES AND FINDINGS

With empirical data from evidences of 50 practical cases from large, medium and small taxpayers in Kosovo, we will analyze impact of tax reforms on budget growth, the increase of the fillers, the wider extent of tax burden on one hand, and improvement of the services of taxpayers through the modernization of TAK electronic filing platform on the other hand, and education service and the call center for tax debts.

It is well known that the application of research methods will be very important since only after problem definition it is necessary to determine which type of research should be done. Causative research, which aims to identify the cause and effect of the relationship between variables and which research includes both investigative and descriptive research can be applied to our research. This research gives us the opportunity to explain how one phenomenon can affect the other one.

For example, changes in tax base had the effect of increasing or decreasing tax filling, the tendency to tax evasion or the reduction of this tendency, business orientation in sectors with lower tax rates such as product orientation by standard 18% in those with a low rate of 8%, etc.

Building on the statistics extracted from TAK for each tax individually, the main focus of this chapter will be on the income tax changes for the last three years, tax declarations, number of declarations, and the impact on revenues from tax rate changes. Also, a detailed analysis will be made in order to highlight what the results of these reforms on the Kosovo budget were. At the same time, a comparison will be made on the impact of modernization of TAK through enhanced staffing, implementation of technological platforms, especially e-filing, and their impact on the better performance of TAK on revenue collection, but also in streamlining efforts of TAK staff on the one hand and of business on the other. An analysis of these findings will be elaborated below.

We will also extract the data from the questionnaire, the responses and the recommendations given by the respondents, to draw conclusions on the fiscal policy and Tax Administration.

From the comparison of results, it can be seen that tax revenues have been increased every year, but it is important that impact on the tax revenue increase was by the implementation of fiscal package started on September 2015.

This year the Government has implemented the changes of fiscal policies as defined by the Government programme. In this context, the Government has put into the function the VAT reduced rate of 8% for a certain number of basic products and it has increased the VAT standard rate to 18%. In addition, in order to stimulate the competition within the domestic market and to reduce fiscal evasion, the changes have been made on the VAT law to reduce the threshold from 50,000 euro to 30,000 euro. (Kosovo Public Finance Management Reform Strategy 2019)

With the aim to provide indirect incentives for the private sector, which is facing difficulties to access finances and the high cost of capital, the fiscal reform includes also an exemption of VAT on importation of production lines and inputs for local producers. Similarly, IT equipment's are exempt from VAT on the border, and the VAT reduced rate it is put into a function for pharmaceutical products. At the same time, these goods are exempt from Customs duties, and this has regulated the competition in the market.

It is true that the change of fiscal policies of 2015, especially the increase in VAT rate from 16% to 18% had increased the tax revenues. But also it should be evaluated the professional buildings and technological advancement in TAK.

4.1 ANSWERS FROM THE QUESTIONER

The selected respondents for the questioner mainly are owners and accountants of the companies from different sectors. These businesses are spread; not only in one town, but some of them have branches in other towns of Kosovo. The selected businesses are traders, producers and service providers of different activities, such as food, textile, construction, etc. We consider that based on their answers the size of some companies exceeds 10 million annual turnovers, but also professionals, mainly accountants and financial officials that were answering to the questioners, which are experts who have very good knowledge on fiscal policies and general tax problems, which they face on daily basis. That makes us believe that their answers are focused on the main problems and the same should be taken seriously.

On the question “Main remarks according to your consideration, mention only those that you consider foremost? The collected answers and more frequent and most important can be listed as Informal economy; corruption; Delay of reimbursement; Bad debt; Fiscal incentives for domestic production; The reimbursement procedure; VAT payment at the border; very rare controls; High-interest rates.

And the answers on what should be improved for a favorable and adequate fiscal policy as well as an effective Administration? Fighting Informal economy; Enforcement of the law; Reduce Bureaucratic procedure; Reduce of tax rates generally; Less procedure for tax refund; Implementation of regulation to collect VAT only within the country (not on import); To reduce Customs barriers; To increase number of Audits; Tax exemption in the first 3 years for start-ups and favoring businesses that invest in increasing employment and domestic production.

The following are the analysis of 4 from 10 questions of the questioner considering as most important and they provide a clear orientation of the respondents’ opinion. So, on the question, do you consider that actual fiscal policy led in Kosovo is a problem for the private sector? 50% of respondents answered that it could be considered as a problem, 38% are considering as a medium problem, and 6% assess it as a small problem.

Also, on the question that the Informal economy in SME sector consequently is of high tax norms? 50% agree, 34% medium, 16% are considering that high rates have a low effect.

Are the taxes and tax norms high in Kosovo? 28% do not consider that rates are high, 58% consider medium-high, and 12 % think that rates are high.

60% of respondents consider that Fiscal policy especially incentives for SME is not adequate and is a problem that is worth to be taken into consideration by policymakers.

Also, 48% consider that a problem is also Limited access in finance and high-interest rate for SME, where 36% consider this as a medium problem, and 8% consider as a small problem.

5. CONCLUSION

Based on the findings from the survey and the result from statistical analysis of the data presented above and also based on the experiences of other countries, we consider that in order to increase the efficiency of the tax administration, the following actions are needed.

Improvements are possible in the areas of organization and performance management, compliance risk management, enforcement of tax filing, debt collection, and tax audit.

The management should carry out an analysis of the TAK organizational structure to identify opportunities for reducing current inefficiencies, including by identifying tasks that can be quickly centralized such as;

- establish a performance management framework at each of the strategic and operational levels,
- high level of management regularly should monitor a set of performance indicators,
- develop a plan with a clear timeline to reduce the level of tax debt. This can be achieved by stronger management of debt collection activities, automation of standard actions like issuance of debt notices, and regular write-off uncollectible debt.

Enforcement of tax filing department should introduce the requirement for all taxpayers who are registered for a tax type, to file a tax return for every tax period during the time of their registration for that tax type, even if there is no tax liability to pay.

The audit program should be reformed and strengthened. Implement an automated audit case selection and allocation system.

- introduce targeted, industry-specific campaigns to mitigate key risk sectors,
- review and strengthen enforcement processes used to identify and target high-risk noncompliant taxpayers,
- redesign regional structures to create distinct capabilities focusing on compliance visits and audits respectively,
- increase the number of audits by better specialization and efficiency of tax auditors, and by redirecting resources that were freed up through reducing the number of low-value compliance visits,

- adopt a formal process to deal with audit requests received from third parties as an input in the TAK risk management and audit case selection system.

Abstract

This paper will present the role that management functions may have in an administrative organization of a state institution, and how it affects the tax policy that needs to be adjusted to modern trends. The aim is to show “business activities” of the Tax Administration in a new European environment, which need to be organized in line with segmentation of its development through organizing, planning, management, and control. Namely, changes have been introduced in the organizational structure and the model of organizational management in order to further improve the performance of basic functions in the internal organizational structure, management, and business activities of organizational entities. Organizational structure and functional orientation of organizational entities have been adjusted to the principles of rationality and elasticity in the process of adjustment to the current state and new challenges.

Keywords: management, strategy, Tax Administration, human resources

JEL Classification: H20, M10

1. INTRODUCTION

Nowadays, management is of great importance for managing different organizations, both private companies, and civil services, profit and non-profit organizations. Management is one of the keys levers of a successful business in

a company (Collins & Devanna, 1999., p. 98). Every company has a unique set of resources and limited opportunities, hence there is not only one best answer regarding the content, process or context of strategic management.

2. MANAGEMENT FUNCTIONS IN THE TAX AUTHORITY

2.1. PLANNING

Planning is the most basic managerial function, it includes the choice of the mission and goals, as well as actions needed for realizing them. Planning directs an organization towards the future (Sikavica et. al. 2008., p.24).

Planning is a process of defining what a certain organization wants to accomplish (goals) and the ways in which it wants to accomplish it (strategies and plans), which starts by determining the current position of the organization (Sikavica et. al. 2008., p.139). It provides answers to the three basic questions: Where are we now? Where do we want to go? How do we intend to accomplish it?, but also answers to more concrete questions such as: what needs to be done, who is going to do it, where is it going to be done, when is it going to be done and how is it going to be done; planning is concerned with goals, what needs to be done and ways how to do something.

Organizational success is the primary objective of planning and it helps to achieve goals. Planning is done in order to direct the organization better, to achieve greater flexibility, better work coordination, minimize risks and uncertainty, to be oriented towards the future and changes, to have better control, develop managers and other participants in planning and achieve better time management at the individual level.

Plans are categorized in different ways and on various grounds; in terms of time frames there are short term, medium term, and long term plans; in terms of the scope of activities there are strategic, tactical and operative plans; in terms of frequency of usage there are permanent and one-time plans; regarding the way of planning there are inside-out, outside-in, top-down, bottom-up and situational plans. Planning is, as a management function, especially connected to the function of control. Statements that direct an organization represent a vision and a mission. A vision is a complete idea of the future image of an organi-

zation and the paths towards its realization, and it answers the question – what do we want to accomplish, i.e. be in the future. A vision is a foundation for developing a mission statement, which means that one first needs to determine a vision, and then the mission of an organization. A mission is a starting point for all organizational existences, by defining the direction in which an organization wants to go, goals emerge, as well as strategies and plans of an organization as a prerequisite of effective planning. Vision and mission exist within a framework of organizational values to which they are connected and represent concepts determining an organization. (Bubble, 2006., p.123). Hence, after the vision is familiar and the mission had been set, the goals of the organization are defined which will direct it by pointing out priorities, facilitate making decisions and represent the foundation for assessing what had been achieved. Basic characteristics of goals are represented by an acronym of the word SMART as specific, measurable, aligned, reachable, time-bound.

Tax Administration has been successfully carrying out its task for 25 years and has accomplished an impressive level of expertise and professionalism. Some of the values and ethical principles it has been following are according to the Ministry of Finance of the Republic of Croatia, Institute of Public Finance, Strategy of Tax Administration 2016-2020: application of regulations – Tax Administration will act in accordance with applicable legislation and expects the same legally bounded behavior from the taxpayers, fair, just and impartial conduct. Tax Administration employees are impartial, selfless, reliable and respect the principles of professional ethics in cooperation with the taxpayers. They perform their tasks free of any improper influence, efficiency – Tax Authority has a strong organisation, supported with quality information system enabling us to be effective in achieving the set goal - collection of budget revenues, professionalism – Employees and management have the necessary expertise, provide quality services to taxpayers and encourage voluntary compliance, readiness to cooperate – Knowledge and experience is shared with colleagues, taxpayers, and other stakeholders. Tax and other regulations within the competence of the Tax Administration are applied to all taxpayers under the principles of equality and transparency. The strategy of the Tax Administration for the period 2016 - 2020 is a foundation for operative planning for the period 2016 - 2020. It is a basic document for measuring and assessing accomplishments during and at the end of the set time period. It encompasses the overview of the mission, vision, and value of the Tax Administration, all the strategic goals that need to be

achieved in the mentioned period, it describes the current state of affairs as well as expected improvements and in the end the way of tracking and assessing the results that had been achieved.

Top-down planning bottom-up planning and negotiation planning are considered as traditional ways of planning, while participatory planning is a modern way of planning. Quality strategic management steers an organization towards the future, anticipates and introduces changes, and acts proactively in the modern operating conditions and is critical to the long-term successfulness of an organization. Analysis of the external (business) and internal environment (strategic abilities of the organization) is an integral aspect of the analysis of the strategic situation of an organization. The best known and most widely used method for the analysis and summarising the key issues from the business environment and strategic abilities of the organization with potential influence on the development of a strategy is SWOT analysis, also called internal and external analysis. It has been developed as a means of analyzing the relation between internal advantages S - strengths, W-weaknesses, O- opportunities, and T- threats. It facilitates the comparison of external opportunities and threats and internal advantages and weaknesses.

2.1.1 Swot Analysis of The Tax Administration

Strengths

- Taxpayers are provided with quality e-services which enable them to comply with their tax liabilities in time and with acceptable costs
- All the IT services are easily available to the taxpayers, they are completely free, well documented and safe to use, including a quality help from Tax Administration Help desk
- Taxpayers can find quality and up to date information on the Tax Administration website and get them via the Call center.
- Efficient data exchange between public administration bodies (G2G) through the OIB system.

Weaknesses

- It is difficult to monitor the IT systems which are located with the external partners,

- Insufficient tracking of key performance indicators
- Lack of IT experts
- They do not have their own Disaster Recovery Centre

Opportunities

- Continuous education of officials (including e-learning) with the aim of strengthening the competencies
- Strengthening of organizational culture and ethical principles
- Implementation of modern IT solutions which enable a higher level of automation of business processes and leave time for the officials to do the tasks regarding analysis and control.
- Using IT technology to simplify the tax procedure and reduce costs for taxpayers
- Further development of the Intranet webpage as a basis for formal and structured information and knowledge exchange among the officials.
- Further improvement of data exchange between the public administration bodies with the aim to reduce administrative costs and improve the services provided to taxpayers
- Improvement of the risk management system

Threats

- Inability to adequately praise expert officials, and especially inability to hire an IT expert due to a great difference in pay between the real sector and public administration
- High dependence on external partners in IT support for core business processes
- Lack of resources for implementation of planned modernization
- Insufficient coverage of systematized workplaces.

2.2. ORGANIZING

Quality of organizing is manifested through the existence or non-existence of dysfunction in an organization. Organizing represents a continuous and uninterrupted process, while the organization is a state resulting from the process

of organizing. The role of a backlink in the process of organizing is extremely important because it enables continuous updating of the organization. The function of organizing is extremely important because it is the basic mechanism through which the managers accomplish their goals. (Jurković, 2012.,p.46). As the highest level and desired goal of every organization, achievement of the self-organization is in the very nature of an organization, as is to choose the best way to organize. In the process of organizational development, a formal organizational structure is established which is developed as the result of the process of organizational development and represents the “backbone”. Next to the formal one, in every organizational structure, there is also the real (objectively existing) organizational structure which develops spontaneously in the process of functioning of a formal organizational structure. The discrepancy between the formal and the real organizational structure is due to the change of each element. Hence, it is more difficult to recognize an informal organizational structure that is linked to people and their activities within an organization.

Key basics of organizing are differentiation as the division of the overall task of the organization into tasks and subtasks, and integration as the allocation of tasks divided in this way to respective organizations. The same bases represent two different processes, which need to be unique (Fox, 2001.,p.67). Factors determining the appearance of each organization constitute the dimension of an organization. Fundamental elements of the process of organization are: division of tasks and specialization, hierarchy, control range, authority and responsibility, delegating, change of command, centralization or decentralization and control (Robbins, 2009.,p.134) All these elements are key in the process of organization because they make up the very functioning of management.

The Croatian tax system is based on principles of equality and fairness, whereby all the citizens are obliged to participate in paying public expenditures in line with their economic abilities. The scope of work of the Tax Administration is in detail determined by the Tax Administration Act (NN-115/2016). The scope of work comprises proposing changes in tax policy, preparing of draft laws and other regulations in order to improve the tax system and more effective tax and contribution collection. The Tax Administration provides expert opinions and explanations in individual cases on application of regulations from the scope of work of the Tax Administration, participates in the work of the European Union institutions for the purpose of implementation of the common tax policy and performs administrative cooperation with the EU member

states and third countries, participates in the preparation and conclusion of international treaties and cooperates with international organizations. Electronic business is an important goal of the Tax Administration since it contributes to a further decrease in indirect costs of taxation. In order to increase the percentage of usage of electronic services, especially the e-taxation system, the Tax Administration promotes the advantages of the said system through publishing the information on the website and targeted media releases. Apart from the further improvement of the existing electronic services, the plan is also to develop a new possibility – increasing the number of electronic forms and establishing two-way communication in the system. Tax Administration has been operating since 1994 as an administrative organization within the Ministry of Finance under the name of the Ministry of Finance – Tax Administration. The Tax Administration is managed by the Director General who is a state official on the position of Assistant to the Minister of Finance. The Director-General manages the work of the Central office with the help from the Deputies and Assistants, who are at the same time Sector managers within the Central office. Territorial organization – The headquarters of the Tax Administration is in Zagreb, and there are 22 Regional Offices classified into 4 categories and 96 Local offices classified into three categories according to the territorial principle (National Tax Journal of Ministry of Finance of the Republic of Croatia, Institute of Public Finance, Strategy of Tax Administration 2016.-2020., p. 7)

2.3. MANAGEMENT

Communication is an immediate connection to the performance of all managerial functions, it is included in all activities, tasks, functions, roles, and behaviors. In order for it to contribute to the success of an organization, it must be efficient and effective, efficient in spending less time and resources and the effective information received is identical or similar to the one that had been sent. The motivational system represents the totality of motivational factors, incentive measures and motivation strategies, which are consciously and systematically incorporated into the work and organizational situation to motivate people through: attracting and maintaining the most quality people, encouraging quality work and achieving high standards of success, encouraging creativity, improvement, changes and business improvement, ensuring identification of the organization and interest in its ongoing development and success. Communication is an immediate connection to the performance of all managerial functions,

it is included in all activities, tasks, functions, roles, and behaviors. In order for it to contribute to the success of an organization, it must be efficient and effective, efficient in spending less time and resources and the effective information received is identical or similar to the one that had been sent. Ultimately, the goal of the communication process is to create an understanding on the part of the recipient.

Management and leadership in the Tax Administration are regulated by the Regulation on the internal organization of the Ministry of Finance (National Tax Journal, Strategy of Tax Administration 2016.-2020., p. 7) as well as by the Tax Administration Act (NN-115/16). The Tax Administration is managed by a Director General who also manages the work of the Central office, assisted by Deputies and Assistant Directors. The General Director of the Tax Administration can have two Deputies. The Deputy Director, who is authorized by the Director-General, in the event of a Director's General inability or absence, performs all the activities of the Tax Administration, as well as other tasks entrusted to him by the Director-General. The work of the Sector in the Central office is managed by Assistant Directors. Assistant Director is responsible to the Deputy Director, Director General and the Minister of Finance for his work and the work of the Sector he is managing. The work of the service in the Central office is managed by the Head of Service who is responsible to the Assistant Director for his work as well as the work of the Service. The work of the Department in the Central office is managed by the Head of Department who is responsible to the Head of Service for his work as well as the work of the Service. The work of the Regional offices is managed by the Head of Regional office, who is responsible to the Deputy Director, Director General and Minister of Finance for his work and the work of the Regional office. The work of the Service in the Regional office is managed by the Head of the Service who is responsible to the Head of the Regional office for his work as well as the work of the Service. The work of the Department in the Regional office is managed by the Head of Department who is responsible to the Head of the Service for his work as well as the work of the Service. The work of the Local office of the Regional office is managed by the Head of the Local office who is responsible to the Assistant Head and the Head of the Regional office for his work as well as the work of the Local office. Head of Local office is assisted by Assistants to the Head of Local office and they are responsible to the Head of Local office, Assistant to the Head of the Regional office and the Head of Regional office for

their work as well as the work of the Local office. Work of the Department in the Local offices of the Regional offices is managed by Heads of Department who are responsible to the Head of Local office for their work as well as the work of the Department.

2.4. CONTROLLING

In the management process, control is the last function that links, i.e. integrates the entire management process by comparing what has been achieved to what had been planned. The purpose of control is represented through four principles in a way that helps the organization adapt to changes in the environment, limits the accumulation of errors, facilitates coping with organizational complexity and minimizes costs. (Rouse, 2005.,p.54, Lamza-Maronić, 2008., p.34)

An effective process of control consists of four core activities by means of setting performance standards, measuring actual performance, comparing actual activities to the performance standards that had been set and assessing deviations and performing corrective actions.

There are various types of controls, but in management, they are divided according to (Sikavica, 2008.,p.134):

- + object as control of performance and standards,
- + focus as forward, parallel and backward control,
- + time horizon as a long-term, mid-term and short-term control,
- + the controlling entity as self-control organization, managers, specialized organizational units and as independent institutions,
- + resources that are being controlled as control of financial, material, human and information resources,
- + business functions that are being controlled as control of research and development, procurement, production, marketing, human resources management, accounting, and finance,
- + the hierarchy of planning as strategic, tactical and operational control,
- + management hierarchy as total control, area control, and site control.

Effective control helps managers decide in which direction they should develop their business, how to steer it, and how to create systems that support it, while ineffective control results in lack of focus, poor steering, and poor overall performance. The basic criterion for determining the efficiency of a control system is how much it facilitates the achievement of organizational goals, and the individual and specific criteria that make a control system capable of achieving organizational goals. The criterion that the control system must satisfy in order to be successful are thus diverse (Bubble, 2011., p.67):

- ♦ the control system must be linked to the desired results,
- ♦ performance standards must be realistic and feasible,
- ♦ control must be comprehensive,
- ♦ control must be objective,
- ♦ control must be effective – accurate,
- ♦ an effective control system provides timely information,
- ♦ it is important that the control system is economical,
- ♦ an effective control system is flexible,
- ♦ if the control system is not understandable to all employees in the sense of implementation, it is unlikely that it will be successful.

Finally, the control system involves the implementation of corrective actions, since the system that does not include the development of corrective action programs is not only incomplete but also unsatisfactory. There are two basic approaches to control, bureaucratic and decentralized, and the basic difference can be seen in the responsibility for control which in the first case lies with the managers, inspectors and specialized organizational units, while in the second approach the responsibility for control lies with all employees.

Strengthening the financial management and control systems is a prerequisite for the successful implementation of all set strategies that aim to achieve the ultimate goal – *modern and efficient Tax Administration*.

Through its activities, the Tax Administration contributes to the realization of state budget revenues, but through its transparent business, it also contributes to preventive actions and the reduction of the risk of corruption. The anti-corruption strategy is a part of the National Anti-Corruption Programme and many activities envisaged in the Programme are being carried out, such as awareness raising regarding the harmfulness of corruption, training of officials, and increased trans-

parency through the use of the Internet. In the forthcoming period, the Tax Administration will with increased attention take measures for tackling corruption.

By the decision of the Government of the Republic of Croatia of 25 June 2008, the Ministry of Finance established the Budgetary Control Section in the State Treasury, the Directorate for State Budget Execution, as an organizational unit in charge of performing anti-corruption activities, in accordance with the Action Plan with the Anti-Corruption Strategy. Tax Administration is responsible within the scope of its responsibility for the implementation of measures from the Action Plan in the Ministry of Finance.

In order to strengthen the accountability and transparency of the work of the Tax Administration and increase the efficiency of detection and prosecution of criminal offences, the European Commission approved the project Strengthening of Tax Administration in the Fight against Corruption from the IPA 2008 programme (National Tax Journal, Strategy of Tax Administration 2011.-2015., p. 28)

In the Tax Administration, internal audit and internal supervision are carried out for the purpose of business auditing, i.e. controlling the legality of work and the proper application of the regulations in order to equalize the conduct of the Tax Administration officials and to prevent, detect and determine the violations of the law and professional rules by the Tax Administration officials (National Tax Journal, Tax Administration Act, 2016., p. 13)

3. STRATEGIC GOALS OF THE TAX ADMINISTRATION AS MANAGEMENT TASK

3.1. PLANNING OF BUSINESS CHANGES

Tax Administration Strategy for the period 2016 - 2020 elaborates the strategic goals that are linked to the strategic plan of the Ministry of Finance for the period 2016 - 2018. The main strategic goals, i.e. the scope of application, are (National Tax Journal, Strategy of Tax Administration 2016.-2020., Zagreb, 2016., p.10):

- Fair and efficient collection of public revenues:

- ✦ Collecting public revenues is the most important goal that needs to be achieved in a way that everyone pays the tax owed, and that officials treat everyone equally and transparently
- Protection of companies and financial interests of the Republic of Croatia and the European Union:
 - ✦ By making sure that tax regulations are consistently applied and by taking measures to detect, prevent and combat tax frauds, the Tax Administration strives to collect budget revenues and reduce the tax gap. It uses modern tools aided by IT tools for timely detection of potential risks. Development and the beginning of the application of the risk management system will result in efficient and timely detection of risky taxpayers
- Tax Administration focus on cooperation and partnership
 - ✦ As a modern organization, it promotes the development of the relationship of trust between the taxpayers and the Tax Administration, based on the partnership with taxpayers and on the publicly published Charter on Cooperation. We raise the level of satisfaction of taxpayers when the officials act in accordance with the Charter and by constantly increasing the quality of services.
- Improving efficiency in using the available resources of the Tax Administration:
 - ✦ The Tax Administration sets the effectiveness in performing its tasks as a strategic goal, the administrative capacity of the Tax Administration is used in a way that will make it possible to achieve the best results. The overall capacity is primarily comprised of employees and their expert knowledge and professionalism, followed by the financial resources that need to be rationally used for financing the necessary improvements, an information system that covers all core business processes, and modern IT equipment. Modern IT and communication equipment will be used for more efficient solving of all tasks.

3.2. HUMAN RESOURCES MANAGEMENT

Human resource management can also be defined through fundamental differences between personal and human resources functions:

Human resources management objectives (Sikavica, 2008.,p.165, Bahtijarević-Šiber, 1999.,p.68):

- ✦ Business objectives – to ensure the right number of employees, the right quality, at the right time, in the right place and in the right way, to take advantage of their potential for achieving organizational goals, increase the organizational competitiveness and performance (to achieve better results with the help of people)
- ✦ Economic goals – the ultimate economic goals are to increase productivity and profitability, reduce total costs, ensure competitiveness, and increase overall organizational performance (to earn more money)
- ✦ Social goals – satisfying the needs, expectations, and interests of employees, improving their socio-economic position and the use and development of individual opportunities, ensuring the ability of permanent employment and raising the quality of working life (better working environment, they cannot be dismissed due to the personal situation)
- ✦ Objectives of flexibility and continuous changes – creating and maintaining the flexible and adaptable potential of all employees, reducing resistance to changes and accepting them as a way of living and acting, and increasing the sensitivity of the human resources of the organization to quantitative, qualitative and structural changes (reducing resistance to changes).

Factors influencing human resource management are external factors – economic system, institutional conditions, labor market, the culture of the society, technology, and internal factors – management, organization size, business strategy, type of activity, technological equipment, the life cycle of an organization, organizational culture.

Strategic goals of human resources management as a task in the Tax Administration, elaborated in the Human Resources Management Strategy for the period 2016 - 2020 (National Tax Journal, Strategy for Human Resource Management 2016.-2020., Zagreb 2016., p.3) refer to: realistically defining the need for new employment, shortening the selection process and skills evaluation, increasing the level of satisfaction and reducing the frequency of sick leave usage, introducing a performance measurement system, digitalization of personal records of Tax Administration officials, strengthening the competence of

the tax officials, learning culture and good cooperation with taxpayers, business processes informatization.

Specific values of human resources management in the Tax Administration include:

- **Transparency:** human resources management process must be based on fully open communication channels and on the continuous availability of all relevant information. The principle of transparency must be applied at all hierarchical levels.
- **Orientation towards goals and the achieved performance:** the system for measuring efficiency and rewards must be based on transferring goals from the highest hierarchical level to the individual level of each official. This approach will help achieve a much higher level of employee dedication to achieving their own goals, and thus the overall objectives of the Tax Administration.
- **Protecting the dignity and integrity of the employees:** in cases when the physical or psychological integrity of the officials is at risk, the Tax Administration applies procedures to maximize the protection of officials.
- **Compliance with legal regulations:** Human Resources Management Strategy has been developed based on the existing legal regulations, i.e. taking into account all the rights and obligations of the Tax Administration as the employer and a Tax Administration official as the employee.
- **Professionalism:** Tax Administration officials and management have the necessary professional knowledge and skills to professionally perform tasks, but these skills need to be further strengthened and developed through continuous and systematic professional training in order to achieve even greater levels of openness, transparency and better cooperation with the taxpayers
- **Protection of the dignity and integrity of the Tax Administration officials:** in cases when their physical and/or psychological integrity is at risk, all the necessary legal and psychological protection must be provided to the Tax Administration officials

4. CONCLUSION

Based on all management functions that have been classified as planning, organizing, managing and controlling, the Tax Administration as an administrative organization within the Ministry of Finance takes account of them. The above mentioned is based on the strategies adopted by the Tax Administration for the period 2016 - 2020 for the purpose of achieving its strategic goals, which primarily refer to the highest possible collection of public revenues by means of a simple tax procedure, the correct application of tax regulations, low costs of tax compliance and good cooperation with taxpayers.

One of the main goals of the Tax Administration is to join the best European tax administrations regarding quality and efficiency in the collection of public revenues for which it is responsible; quality services provided to taxpayers and successful combat against tax evasion. In that sense, it is important to set a series of tasks and to accomplish them in order to abandon the popular opinion that the state administration is a place where non-professional staff work.

From the perspective of officials in the Tax Administration, it can be said that most of the strategic goals that had been set have been achieved, but in order for the Tax Administration to achieve results at the level of European tax administrations, some of the key difficulties such as low wages and associated employee corruption need to be solved. Officials are the most valuable resource of each organization, including the Tax Administration, and a just system of rewards and advancements needs to be established in order for them to be motivated to further invest in their knowledge and expertise. All this should contribute to the change of public perception of the Tax Administration, which should be regarded as a partner by all taxpayers in exercising their rights and obligations on the basis of mutual trust, cooperation, and respect.

Abstract

The elections are a race where the winners become not the best ones, but those who are the most capable of acquiring the support of a bigger part of voters. New candidates on the political scene are in a much harder position when it comes to finding their way to the media and media space, and the fact that they are reserved mostly for existing political actors has a significant impact on the starting positions of the election race.

The financial strength of an individual and a group, i.e. political option, as well as access to the media greatly influence the electoral outcome. The biggest challenges for new candidates, not coming from the established political options,

who compete for political positions, are the collection of financial resources, budget estimates, and access to the media.

It is estimated that for a serious political campaign for a mayor in the city of Osijek, a minimum of 1,000,000 HRK is required, while at the same time the Act on election promotion (Political Activity and Election Campaign Financing Act, Narodne novine 24/2011) states that the maximum investment amount may be 600,000 HRK in case of elections in Osijek. Therefore, the question arises as to whether the costs of pre-election promotion shown are correct and true?

It is explained to what extent the amount of money invested in a political campaign can provide a better result. It is also explained how big are the chances of success for new political candidates who do not have the support of large parties.

Keywords: political campaign, pre-election promotion, pre-election poll, local elections, mayor of Osijek

JEL Classification: D72, K16

1. INTRODUCTION

New candidates on the political scene are in a much harder position when it comes to finding their way to the media and media space due to the fact they are reserved mostly for existing political actors. It is important to distinguish two types of new political actors, i.e. new political candidates fighting for political positions on the local and national political scene. The first type is new political candidates coming from established and well-known political parties, while the other type is new independent candidates, unknown or less known, without a political platform in their background a larger number of citizens is familiar with.

New candidates coming from or in front of established and commonly known political options can gain media coverage much easier, due to the financial strength of these options, their media influence, and connections with journalists. On the other hand, candidates who are independent, or who do not come in front of well-established, well-known political parties, are very difficult to overcome the media blockade because they mostly have to deal with:

- journalists who ignore them
- media space overcrowded with political (known) actors

- + media who ignore them because of potential threats to existing active politicians
- + media who are uninterested due to the insufficient financial strength of the candidate, which prevents them from paying expensive media coverage

Other challenges faced by all political actors, but affecting new political options and new political independent candidates the most are:

- + a proper budget estimate for the implementation of quality and complete electoral campaign
- + Difficulties in fundraising through donations
- + The problem of statutory constraints on donations

HYPOTHESIS 1: Can the prediction be made, based on the publicly announced budgets, about the outcomes of elections for the Mayor and the result of the election for members of the City Council?

HYPOTHESIS 2: Can a new political candidate at the local level on a territory of a single city, who does not have a well-known political party in his background, achieve the electoral threshold?

2. THE LEGAL FRAMEWORK FOR FINANCING LOCAL ELECTIONS

Citizens, but also the media themselves, often point out that political parties, candidates for mayors and prefects, as well as parliamentary candidates often spend much more financial resources than the amounts officially reported by Political Activity and Election Campaign Financing Act.

Political campaigns, i.e. pre-campaigns often begin months, sometimes even a few years before the official and legal start of the campaign. The cost of presenting an individual to the general public requires significant finances. For a clearer positioning in the public eye, it is necessary to combine the continuous or at least regular presence of candidates in the following media:

- + daily newspapers
- + local / national portals
- + local / national television
- + social networks (Facebook, Instagram ...)

Not every media release necessarily has to be paid. Sometimes the media, out of their need to fill in the empty media space, publish interesting news and stories that are not paid regardless of the fact that they also promote a particular person by publishing it. Much effort is needed for this form of presentation because such news should be:

- ♦ actual
- ♦ new
- ♦ interesting to the general public

A large number of such news cannot be independently designed by any of the candidates for a future political campaign if there is not a bigger political party with their administration to support them. Therefore, the biggest challenges of a better presentation to the general public face new and independent candidates who are planning or already officially fighting for certain political positions in the Republic of Croatia.

For example, in Glas Slavonija’s daily newspaper it is necessary to allocate 7,750 HRK with VAT for only one interview, which is more than one average monthly paid off net salary in Croatia in the first half of 2018, amounting to 6,237 HRK (Croatian Bureau of Statistics, 2019.).

2.1. LEGALLY ALLOWED DONATIONS TO POLITICAL PARTIES, LISTS OF VOTERS' GROUPS AND CANDIDATES FOR REPRESENTATIVES IN THE CROATIAN PARLIAMENT AND THE EUROPEAN PARLIAMENT

The laws of the Republic of Croatia allow political actors to collect donations only until the legal end of the election campaign.

An amount of 30.000 HRK is the maximum amount that any natural person can donate during the calendar year. This amount refers to donations to one political option; one independent representative in the unit of local and regional local government whether it was elected from the list of voter groups or from an independent list.

In legal entities, the amount is somewhat higher. Legal persons can donate the amount up to 200.000 HRK in a calendar year, but only if this amount goes to a political party or a candidate for the president of the Republic of Croatia. The maximum amount of donations for candidates for MPs (Members of Parliament) in the Croatian Parliament and in the European Parliament is 100.000 HRK. The third option for donations is the donation of a legal entity to a list of voters and a candidate for local and regional elections (county elections),

which can not exceed the amount of 30.000 HRK in the calendar year (State Electoral Commission of the Republic of Croatia, 2019, Donations and Donation Limits).

2.2. LEGAL CONSTRAINTS ON THE TOTAL COST OF ELECTION PROMOTION IN THE REPUBLIC OF CROATIA

Arranging the legal framework for electoral promotion is a prerequisite for normal, transparent and equitable functioning of political campaigns. Croatia as a relatively young country has plenty of room for progress in checking the transparency of spending financial resources in electoral campaigns. Political analysts, as well as the media themselves, periodically calculate the cost of election campaigns (e.g., for certain mayoral candidates) because it is a smaller and easier-to-see area - one city. The calculation is done in such a way that the number of "jumbo" posters of a candidate, the duration of promotion on those posters, the approximate number of distributed leaflets, the number of media appearances, the number of political gatherings, the approximate number of distributed promotional material (lighters, pens, caps, t-shirts, etc.). Then these figures are multiplied by the realistic prices of these services and products. In the end, the amounts they come to are much higher than the officially presented amounts that are reported to the State Electoral Commission as the actual cost of electoral advertising.

The eligible costs of election promotion are as follows:

- ♦ 8 million HRK in the election of the president of the state
- ♦ 1.5 million HRK per electoral constituency for the Parliament
- ♦ 1.5 million HRK for the election of MP (Member of Parliament) for the European Parliament
- ♦ 1 million HRK for the election of the mayor of Zagreb and councilors
- ♦ 600,000 HRK for the election of the mayor of a big town and a perfect
- ♦ 250.000 HRK for the election of municipal mayors, mayors, and councilors in cities and towns with more than 10.000 inhabitants
- ♦ 100.000 HRK for the election of municipal mayors, mayors, and councilors in towns and cities of 3.001 to 10.000 inhabitants
- ♦ 50.000 HRK in elections for municipal mayor, mayor, and councilor in cities and places of up to 3.000 inhabitants (State Electoral Commission of the Republic of Croatia, 2019, Limitation of the total amount of electoral campaign expenses)

2.3. THE LEGAL OBLIGATION TO REGISTER AND PUBLISH REPORTS ON DONATIONS AND ELECTION PROMOTION COSTS

Political Activity and Election Campaign Financing Act stipulates that, before or after each election, the State Electoral Commission should get the submitted reports on donations to political parties and candidates for certain political positions as well as cost statements. Also, the Act stipulates that reports should also be published on the official websites of political parties or candidates participating in the political contest.

No later than 7 days prior to the regular elections, political parties or candidates are required to submit a Report on received donations for electoral advertising financing as well as an Election campaign expense report to the State Electoral Commission.

No later than 30 days after the political party elections have been held, candidates are required to submit to the State Electoral Commission a financial report on election campaign with data on revenues of election expenditures and sources of funding (State Electoral Commission of the Republic of Croatia, 2019, Publication of reports during electoral campaign).

3. PREPARING THE PROJECT OF A POLITICAL CAMPAIGN ON THE EXAMPLE OF A NEW CANDIDATE, KRISTIJAN ŠIMIČIĆ

On the example of the new and publicly unknown candidate for the mayor of Osijek in the elections held on May 25, 2017, based on the conversations and the collected information, we will try to identify the challenges and issues of appearance and presentation of a new political participant who, on one hand, had the motivation and practical knowledge while, on the other hand, had no easily accessible resources and had no political experience nor experience of managing a political campaign.

Kristijan Šimičić as a candidate for the mayoral elections in Osijek held in May 2017, and also as the holder of the list for the election of city councilors, in 2016, gathered a group of trustworthy people with whom he started the project of political pre-campaign, and later the campaign itself. The team from the early phase of the project was presented with the project time frame:

- Pre-Campaign Organization: June 2016 - April 2017

- ♦ campaign organization: April 2017 - May 25, 2017, and election of the mayor

Prior to joining the political arena, information on the political scene in Osijek, political competitors, and the political atmosphere were gathered and the estimation was that it was a moment for political affirmation and risk-taking. The first co-workers were presented with a vision of the project, projections of the financial frameworks, the profile of people needed in the team and the political market they want to win. The project at that point received its framework and further realization could have started with implementation.

3.1. ORGANIZING PRE-CAMPAIGN: JUNE 2016 - APRIL 2017

During the period of 10 months prior to the official launch of the campaign for the mayor of Osijek, a framework plan for pre-campaigning, campaigns, and all activities for the Mayor and members of the City Council of Osijek held in May 2017, was created.

3.2. GATHERING OF THE CRUCIAL SUPPORT GROUPS FOR MAYORAL ELECTIONS

At the very beginning of the planning, groups we wanted to receive support at the elections from were identified. The target groups were:

- ♦ private entrepreneurs and craftsmen
- ♦ professors, teachers and school principals
- ♦ current high school graduates (18 and 19-year old) residing in Osijek
- ♦ university students residing in Osijek
- ♦ retired people residing in Osijek
- ♦ Croatian Homeland war veterans residing in Osijek
- ♦ workers (working class) residing in Osijek
- ♦ Religious groups in the Osijek area

Each target group had several individuals who publicly supported Kristijan Šimičić as a candidate for the mayor. Kristijan, as a potential candidate for the Mayor, personally met those individuals and presented them with his vision of the development of the city, himself as a person, his accomplishments and the team he had gathered up to then. The vast majority of the people with whom the candidate spoke voiced personal support to the new person's appearance on

the political scene. The smaller number of people he was talking to was reserved because they were unable to perceive a clear plan and program for the elections that were to be done together with all those who expressed support. Namely, the goal of the pre-campaign was to involve as many participants as possible in the program design and strategy for upcoming elections.

3.3. MEDIA PRE-CAMPAIGN

The media campaign was set up to present new candidates to the public through social events in the Osijek area via web portals, magazines, newspapers, social networks, television, and radio.

3.3.1. Social events

The attendance at social events in Osijek, where media and citizens are present, is very important if voters are to be noted. Kristijan as a candidate for the mayor of Osijek visited all available events one year before the election, and in some, he participated as a speaker in order to present himself to the citizens even more.

Manifestations he attended as a guest or as a speaker are:

- + Forming a strategy for the development of medical tourism in Slavonia and Baranja
- + Antique fair in Osijek
- + Humanitarian Action 'Good things will come back to those who do good things'
- + Presentation of the book 'Prodano'
- + Participation at the 5th Regional Conference of Businessmen in Vinkovci
- + Commemorating the 25th anniversary of the famous 'red Fićo' in Osijek
- + The opening of the Osijek Cultural Summer 2016.
- + Cultural Artistic Event 'Slavonijo u jesen si zlatna' (Slavonia, during autumn you are golden) in Tenja
- + Conference 'Business Caffe – Osijek'
- + Panel Discussion 'Eviction from Croatia' in Vukovar
- + Visit Ovčara – the place of the largest organized massacre of the Homeland War

- ✦ Davis Cup finale in Zagreb
- ✦ 'Career booster conference for young people' at the Faculty of Economics in Osijek
- ✦ the Faculty of Economics in Osijek - panel 'Youth and Entrepreneurship'
- ✦ Domestic matches of the Football Club Osijek
- ✦ Commemorating the fall of Vukovar
- ✦ The festive evening of UBH 'Prsten' (Ring)
- ✦ The evening of the Association 'Šokačka grana'
- ✦ Dinner with the Deputy British Ambassador in Croatia, Peter Clements
- ✦ Panel discussion with demographer Stjepan Šterc 'Are we heading towards a classical demographic breakdown?'
- ✦ New Year's Concert at HNK (The Croatian National Theatre) Osijek
- ✦ Setting up of the bust of Blessed Alojzije Stepinac in Osijek
- ✦ Carnival riding in Tenja
- ✦ A Round Table for entrepreneurs of the Entrepreneurs Magazine
- ✦ The manifestation of the Association 'Šokačka grana' 'What did our elders eat'
- ✦ Presentation at AIESEC as alumni
- ✦ Conference of the Croatian Association for Public Relations 'Who is staying in Slavonia'
- ✦ Humanitarian action "Let's make a difference Osijek"

3.3.2. Web portals, magazines, and newspapers

Web portals, magazines, and newspapers are media that give importance to every individual appearing in them, either as positive or negative news.

The candidate acquainted several journalists who agreed to help him with the publication of articles about him, his life, etc. The important thing was to post some positive news about Kristijan and his life every 2-3 weeks. The stories about business success, the importance of family and faith in Kristijan's life, business plans and so on are on portals:

- ✦ Sib.rtl.hr
- ✦ Poduzetnik.com.hr
- ✦ T-portal.hr
- ✦ Priznajem.hr
- ✦ Samopozitivno.hr

- + Liberal.hr
- + Narod.hr
- + Večernji.hr
- + Poslovni.hr

Also, in magazines and newspapers:

- + magazine Poduzetnik
- + newspapers 7-dnevno
- + newspapers Večernji list
- + newspapers Glas Slavonije

Candidate, through the portal, magazine, and newspapers, promoted his future associates who were successful in entrepreneurship, to get the public to know them better during the pre-campaign, so they could later come to a conclusion that the mayor candidate gathers successful young people around him.

3.3.3. Social networks

The appeal of social networks to voters and people in general nowadays is changing the image from earlier years, where social networks from aids in communication with voters (Haramija, 2014, 459) move to a decisive 'trigger' of the media exposure of the candidates.

That application was best emphasized by Donald Trump in the United States Presidential elections (Wells, 2016). He used social networks to present all the relevant details of his life in order to make himself as much acquainted as possible. Also, through Facebook, with targeted sharing of acquaintances' posts on his profile, he wanted to present the promotional announcements of his future political associates in order to better acquaint them with the voters as well.

The goal of using social media in the pre-campaign was to present the candidate as he really is to all the voters in Osijek because the key to the political campaign and the pre-campaign was to get more citizens to get to know the candidate.

3.3.4. Television and radio

Television is an incredibly powerful media service that has been used both in the pre-campaign and in the campaign. The television broadcasted success-

ful business stories about successful projects, investing in other entrepreneurs, guest appearances on local television through commentary on current economic topics, emigration, and so on. Television and radio stations which broadcasted various reports are:

- ✦ NOVA TV
- ✦ RTL
- ✦ Osječka televizija
- ✦ Slavonska televizija
- ✦ HRT Radio Osijek
- ✦ HKR

Examples of Šimičić's advertising campaign during the pre-campaign and the campaign for the mayor of Osijek:

- ✦ portal article 'Only positive no matter what' <http://www.samopozitivno.com/kristijan-simicic-osjecani-poduzetnistvom-mijenjaju-perspektivu-osijeka/> (access date: 23.09.2018.)
- ✦ news in the national television news program: Nova TV - Dnevnik <https://www.youtube.com/watch?v=Bjf0wytOCNU&t=8s> (access date: 23.09.2018.)
- ✦ "Topic of the Day" on local TV: Slavonska televizija

3.4. CAMPAIGN ORGANIZATION - APRIL 2017 TO 25.5.2017. AND THE MAYORAL ELECTION

The pre-campaign was aimed at presenting Kristijan Šimičić to a large number of people through social networking, television, newspapers, portals, magazines, participation in various events, round tables, conferences, etc. It also sought to gather as many quality people as possible in his team, the emphasis being on young and successful entrepreneurs in Osijek. After that, the part of the campaign started where Kristijan's candidacy for the mayor was publicly announced.

For the purpose of the campaign, an electoral headquarters were formed, a collection of the signatures for the candidature for the mayor was organized and the lists for the City Council were compiled. The creation, printing, and distribution of all printed materials, as well as various public events, followed. Cooperation, interviews, guest appearances on portals, magazines, newspapers, televisions, radio stations were also organized, as well as a press conference. Also, there has been a production of content (photo and video) and their release on social networks such as Facebook, YouTube, Instagram, etc.

The campaign ended on the day of the election, and the results are presented in section 4.1.

4. INVESTIGATING THE VOTER'S PREFERENCE AND THE IMPACT OF FINANCIAL RESOURCES INVESTED IN THE CAMPAIGN

Data on voter preferences were collected several months before the election for the mayor of Osijek and the election for members of the Osijek City Council. The issue of the data put forward is that in the preliminary election polls there can never be all the actual candidates due to late and numerous applications.

4.1. ELECTIONS FOR THE CITY COUNCIL OF OSIJEK

The City Council elections were held on May 21, 2017. Most of the candidates for the mayor were at the same time the holders of lists for the election of city councilors. Below we provide analysis of collected data.

Table 1. Elections for members of the Osijek City Council - comparison of the results of the survey and official results and the number of funds collected and spent

Sources: Hrvatska danas, 2019, Poll in Osijek (the City of Osijek - elections, 2019, Final results for the members of the Osijek City Council)

The table shows a comparison of the survey on RTL television conducted by the Promocija plus Agency (Hrvatska danas, 2019, Poll in Osijek) in April 2017, just over a month before the official elections and the actual results for the members of the Osijek City Council (City of Osijek - Elections, 2019, Final Results of Elections for the members of the City Council of Osijek). The table lists the planned and realized number of councilors based on the percentage of surveyed results and actual results. The table also presents the official data on the collected and reported financial resources and official data on the amount of spent funds in the electoral campaign (State Electoral Commission of the Republic of Croatia, 2017, Report on Election Campaign Financing Supervision on Elections for Mayor and Deputy Mayor of Osijek).

The table shows that the political option of Biraj Bolje (established two months before the election of the Mayor of Osijek) led by the mayoral candidate Kristijan Šimičić was not even listed in the Promocija plus Agency's survey. In the elections for the City Council, the List won 7.4% of the votes and three councilors in the Osijek City Council, with the spent amount of 29,730.00 HRK.

Democratic Alliance for National Renewal (DESNO) led by the former mayor of Osijek Anto Đapić got 1% of the voters' support in the poll, while in the elections for the City Council, with the spent amount of 87,814.60 HRK, achieved a score of 6.49% by winning two councilors.

The list of MOST, the Bridge of Independent Lists received 7% of support and won 11.53% with 236.062,17 HRK spent in elections for City Councils. They spent the largest amount of all the other lists in Osijek and achieved a growth compared to the 4.53% poll, which provided them with up to five councilors instead of three councilors which they would win with 7% support.

The next list that invested the most money on the election of the counselor is the Croatian Democratic Union, which spent a total of 154,664.05 on and won 22.78% of the votes in the Osijek City Council elections, although polls only one month before the election showed that they would win 26 %. Despite the investment of a significant amount of money in the campaign, the Croatian Democratic Union lost 3.22% of the votes compared to the results of the pre-election poll.

4.2. ELECTIONS FOR MAYOR OF OSIJEK

Elections for the Mayor of Osijek were held at the same time as elections for members of the Osijek City Council. Below is the analysis of the collected voter preference data based on the pre-election poll, then on the election results and on the funds invested in the election campaign.

Table 2. Elections for the mayor of Osijek - comparison of the results of the survey and official results and sums of collected and spent financial resources

Sources: Hrvatska danas, 2019, Poll in Osijek (the City of Osijek - elections, 2019, Final results for the Mayor of the City of Osijek)

The table shows a comparison of the Mayor's election polls on NOVA TV television channel, conducted by the IPSOS Agency in March 2017, and surveys on RTL television channel, conducted by the Promocija plus Agency (Hrvatska danas, 2019, Poll in Osijek) in April 2017. and the real results achieved in the first round for the Mayor of Osijek (City of Osijek - Elections, 2019, Final Results for the Mayor of the City of Osijek).

In addition, Table 2 shows planned and realized result based on the percentage of surveyed and actual results. Also, the table shows officially published data on collected and reported financial funding as well as official data on the amount of spent funds in electoral advertising (State Electoral Commission of

the Republic of Croatia, 2017, Report on the Election Campaign Financing Supervision on Mayoral Elections and Deputy Mayor of the City of Osijek).

The former mayor of Osijek Anto Đapić was a candidate for the Democratic Alliance of National Renewals - DESNO, whose polls forecasted 5.7% and 6%, and he won 8.79% of the elections, although only 18.09 HRK was spent in the entire campaign, i.e. that amount has been reported to the State Electoral Commission.

Since it is common practice that candidates and parties simultaneously run as list holders for the City Council and also as mayoral candidates the money for election promotion is spent for both lists and promoting themselves. So, an individual promotion is done with every kuna invested in promotion, regardless of whether it is a promotional cost for the mayor or members of the City Council.

Table 2 shows that candidate for mayor Kristijan Šimičić, who had been nominated in front of the newly established political option of Biraj Bolje (Choose Better) was not listed as an option in polls one month prior to the election, and in the elections achieved a score of 7.09% after spending 78,603.75 HRK on pre-election promotion.

Ivan Vrkić held the Mayor's office from 2013 to 2017. He was formally an independent candidate in the 2017 election, although officially supported by the Social Democratic Party, the Croatian People's Party, the Croatian Peasant Party, and Active Independent Retired People's Party. Putting in question the form of 'independent candidate' is also manifested by the fact that Ivan Vrkić was also the holder of a list for elections in the City Council in front of the Social Democratic Party, the Croatian People's Party, the Croatian Peasant Party, and the Active Independent Retired People's Party. Although Ivan Vrkić's polls indicated that he would win 27.90% and 34% of support, he made 37.05% of the support. Interestingly, in the financial statements, it is shown that Ivan Vrkić collected 124,750.00 HRK for the political pre-election promotion while he spent 223,536.03 HRK, so he spent 98,786.03 HRK more than he had collected. It is important to note that Ivan Vrkić entered the second round of elections for the mayor of Osijek and in the second round won over the candidate of Croatian Democratic Union Ivana Šojat.

The survey prediction for HDZ candidate Ivana Šojat showed 18.50% and 14%, while she managed to get 17.17%, thus entering the second round of may-

oral elections. The HDZ list showed that the amount of 259,237.45 HRK was spent for the pre-election promotion of their candidate, while the collected amount was smaller than the spent one, ie 116,935.80 HR. So, HDZ candidate spent 142,301.65 HRK more than what they collected. Ivana Šojat won 33.87% in the second round, while Ivan Vrkić won 62.74% and became Mayor for another four years (City of Osijek - 2019, Final Results for the Mayor of the City of Osijek).

HDSSB candidate Dragan Vulin, whose polls forecasted 12.6% and 10%, won 8.91% with the amount of 102.212,00 HRK spent for pre-election promotion.

4.3. THE EFFICIENCY OF FUNDS USE

It is difficult to estimate how much the candidates for mayors and lists of city councilors actually spent on electoral promotion. Part of the money not shown in the financial statements is mostly spent before the official start of the campaign, while part of the money is not shown at all, and is invested directly by political sponsors. For example, we can list numerous articles on portals that have promotional purposes (interviews, etc.) and are paid for, but this is mostly not mentioned in financial reports. There is a need to keep in mind the volunteer work of many campaign participants, not included in the costs, which is why it is difficult to estimate the actual costs of the campaign.

5. INFLUENCE OF ESTABLISHED POLITICAL OPTIONS ON ELECTION RESULTS

The final results of each election are the best-placed elements present in the electoral race that follow a particular candidate. First of all, a good candidate who can be accepted by the general public is needed for a good result. Better results are achieved by candidates with stronger and more established political options in their background, such as HDZ, SDP, MOST or HNS because they have a significant base of members, a significant voter base and easier access to campaign money since they receive money from the state budget same as all parliamentary parties do. Established parties and their candidates have easier access to the media and automatically appear in surveys, which provides them with free promotion across the general public. All in all, the candidate who suc-

ceeds in arranging as much detail as possible with the good communication of his plan and program has a better chance of better results.

From the tables (Table 1 and Table 2) that we have shown in this paper, it is apparent that MOST, the Bridge of Independent Lists with a large budget invested in the campaign compensated for poor efficiency. On the other hand, previously unknown political option of Biraj Bolje (Choose Better) and a new, publicly unknown candidate for mayor Kristijan Šimičić have managed to achieve excellent results with regard to the circumstances of the election with high efficiency. The HDZ, SDP, and HNS with the candidates in front of them have shown that they could count on a significant base of their existing voters whose votes were directed to candidates who had their political support and who automatically entered the second round of mayoral elections.

6. CONCLUSION

The political strategists think that for a serious political campaign in Osijek, a candidate who wants to become a mayor of Osijek should invest a minimum of 1,000,000 HRK. The maximum amount for the mayor of a large city, which Osijek is, prescribed by law is 600.000 HRK. It is therefore clear that in the case of more serious candidates running for a mayor, the amounts that apply to the State Electoral Commission do not correspond to the actual spent and collected funds. The data presented and the results of the elections show that the amount of presented funds spent in the election promotion does not significantly influence the increase of the candidates' results for the mayor or City Council in relation to the pre-election surveys of IPSOS and Promocija Plus.

Directly delivering an objective and measurable conclusion is not possible because we conclude that the funds raised and spent on election promotion are not realistic and accurate, but are, as expected, considerably higher than what is shown in the financial statements.

Kristijan Šimičić entered the elections for the mayor of Osijek as a new and publicly unknown candidate. He entered a political campaign without political experience. His main goal was to enter the second round of elections for the mayor of Osijek, for which, at the estimates, was necessary to have a minimum of 18% of votes or about 7,000 votes. Pre-election surveys by agencies Promocija Plus and IPSOS did not recognize Kristijan as a possible candidate for

the second round of mayoral elections, so they did not include him in the pre-election polls.

The following initial shortcomings that the candidate met with his team are as follows:

- ♦ A candidate for the mayor was unknown to the majority of the voters in Osijek
- ♦ The number of expert associates in the electoral staff was insufficient
- ♦ Insufficient organization of the staff
- ♦ There was no sufficient voter base that recognized the candidate from the beginning of the campaign
- ♦ Insufficient connectedness of associates and sympathizers in all city districts and local committees
- ♦ The very low output of the last few election cycles - apathy among voters who were difficult to motivate at the time of voting (2017 - local elections in Osijek - 54,000 voters did not go to the polls)
- ♦ the candidate was not invited to present himself and confront the candidates on HRT, NOVA TV, and N1 television, while almost all other candidates from Osijek were invited

In addition, the advantages of other candidates running for the mayor should also be taken into account:

- ♦ All candidates who have crossed the threshold have a great political experience behind them and are well-known to the general public (Vrkić, Vulin, Miroslav Šimić, Đapić, Lovoković...)
- ♦ All candidates who have crossed the threshold since the beginning of the campaign have a stable voter base behind them
- ♦ Almost all major parties have invested multiple amounts of money into their campaigns
- ♦ All candidates who have crossed the electoral threshold have worked in the public administration or in the positions of the mayor, the deputy prefect, etc., which gives them insight into the real state of the City
- ♦ All candidates who crossed the threshold, except for Kristijan, had the opportunity to present their program on national television, i.e. HRT in the show *Otvoreno*, as well as on NOVA TV television in a confrontation show, and most of the candidates received the opportunity to present themselves in person in a confrontation show on N1 television.

The answer is that new candidates for mayors who do not have established and well-known political options in their background can cross the electoral threshold of 5%. Regardless of the media's ignorance, inconsistency in the pre-election surveys conducted by the referent agencies, with a good campaign, high-quality candidates can gain the voter's confidence.

The confirmation of this hypothesis is in the fact that since 2012 there is an increasingly important trend of providing support to new political figures and independent candidates in the Republic of Croatia. All this should ensure new political faces and options in politics. Such activities should ensure that democracy and new political games become wider by gaining new people.

Abstract

Making right decisions - at the time when people are facing immense consequential choices - has been extremely important. How can we be sure not to make fatal mistakes? The aim of this paper is to reveal some important developments in decision making that have been taking place not only in economics but in other social sciences during the past decades, as well as to offer insight in some new discovers that have occurred. There are many questions related to decision making and behaving in the new, uncertain and dangerous environment. One of the most interesting question is – will our action be rational or irrational? Irrational behavior can be understood as a study of the transition process by which people decide for one's own choice. Naturally, this choice can result in defects, economic losses, and sometimes personal flaws such as bad choice of medicines or poor choice of economic policy.

According to traditional assumption of the classic economic theory, the individuals are behaving in rational way and they make rational decisions. Furthermore, irrational behavior is not just isolated to a few 'irrational individuals' but can become the dominant choice for most people in the entire society. Irrational behavior happens when people make choices and decisions that go against the assumption of rational utility-maximizing behavior. Thus, economists and policymakers must consider the potential for irrationality.

Keywords: decision making, rationality, irrationality

JEL Classification: D70, D81

1. INTRODUCTION

Many mainstream economists in the second part of the twentieth century developed sophisticated mathematical treatments that attempted to model human behavior. Most of these were founded on a very simplistic concept of rationality, on the concept of *homo economicus*. The idea here is that we can all be represented by an economic man who is assumed to be completely informed in terms of rational choice theory (Kerjan/ Slovic 2010: 3).

The idea is to set the economic theory presented to a single economic man (*homo economicus*) who rationally behaves on the basis of complete information. This rational behavior follows the goal of maximum utility based on knowledge of economic choice and its consequences.

Slowly, psychologists and other behavioral scientists began testing this presumption of rationality, which, as noted by Herbert Simon, a social scientist that have been among most influential one in the twentieth century, permitted economists to make „strong predictions ... about behavior without the painful necessity of observing people (Simon/Stedry 1969:272). Stimulated by creative conceptual, methodical, and empirical work of Amos Tversky, Daniel Kahneman, Richard Thaler, Herbert Simon, George Akerlof, Vernon Smith, all Nobel laureates in economics, the trickle of studies challenging traditional economic of rationality became a torrent. Their contribution toward understanding the behavioral dynamics of economic decisions further contributed to what has become a revolution in thinking (Kerjan/Slovic 2010:5). Recently, new theories have been emerging, which mostly point to some human behavior that, in new circumstances, consistently deviates from the theory of rational choice and the theoretical basis of *homo economicus*.

The main goal of this article is to provide new knowledge in condensed fashion to help people make better decisions in a world that seems to become more and more uncertain.

2. FOUNDATIONS OF DECISION MAKING

Decision making requires alternatives. If there are no alternatives to choose from, there is no decision making. Choosing among alternatives is not a simple act but a comprehensive process of decision making. There are various models to describe this process.

2.1 THE MODEL OF RATIONAL DECISION –MAKING

In the world of social sciences, economics has won an enviable status in the practical interpretation of the theory of rational behavior that has been set as the core of decision-making.

Let us assume that decision makers are completely informed regarding all possible options for their decisions and all possible outcomes of their decision options. Deficiencies of this approach have become evident and Subjective Expected Utility (SEU) appeared as a response to those deficiencies by considering psychological aspects as well.

It is a traditional assumption that people are motivated by money and opportunities in order to make a profit, allowing it to create formal, often predictable models of human behavior. Sociological and political scientists have tried to build theories around the idea that all actions are based on the „rational“ character as well as the people count the possible costs and benefits before taking these actions. This approach is known as a rational choice theory.

The term rational and the concept of rationality is connected to the decision making of business people who make intuitive or rational decisions, but also many time nonrational decisions as well. Rational decision making has been often leaned to the analytical methods that companies use to come up with a fact-based decision.

Historically oriented theories of rational behavior to the classical economy of Adam Smith and refer to Max Weber’s program of sociology. They are trying to include complex social activities as easy as possible through model approaches (Barković 2009: 51). The rational choice theory has focused heavily on mathematics, converging closely with microeconomic trends.

The development of the theory of rational choice took place in several fields. In the field of policy problematic, models of voting theory and coalition have developed which in mathematical form elaborated on the set problem. In less mathematical terms, they were concerned with social movements, relations within ethnic movements, reproduction of class. These contributions have been discussed by various authors (Downs 1957, Buchanan/ Tullock 1962, Riker 1962, Hechter 1987, Goldthrope 1996, Breen/Rottman 1995). The theory of crime and the theory of marriage were set by Becker (1976, 1981). Buchanan believed that individuals in politics are trying to maximize net income as well

as doing it on the market: they follow the interest they own. For politicians it means they have to respond to the interests of their voters in order to remain in service. Buchanan believes that the legislator trades in voices to gain the benefit of the special groups to which those voices belong, and that loyalty results in state budget strain (Barković / Barković 2009: 52). For Arrow, the best decision-making mechanism other than the market is democracy. His most famous book, "Social Choice and Individual Values," which puts together a collective choice with, has sparked great interest. Arrow was the first of his fellow scientists to convincingly demonstrate that an opinion on the division of national economy from political science into the analysis of social problems was unsustainable. He explores the logical possibilities of aggregating preferences of individual voters into social decision making. The result is now known (or should be) to every student as an Arrow Paradox: Democratic majority decision-making does not always lead to logically misleading (meaning transitive) decisions. Particularly noticeable is the trend of works of those Marxists who in the theory of rational choice saw the foundation of Marx's theory of class and exploitation (Elster 1983, Roemer 1988).

The notion of rationality is differently defined by many authors. Hitt said: "Sometimes a man is compared to a rational animal. He is intelligent; he practiced thinking; he uses logic; and he argues from the scientific point of view. In fact, man is only a rational animal" (Hitt 1979: 654). Baumol speaks of the rational decision-making as the best service to the goals of the decision makers, whatever they were. Such goals may include the company's desire to maximize profit, governments to maximize the welfare of the population or some other government's desire, for example, to maximize the power of their army. The term rational does not mean either confidence or distrust towards the itself (Baumol / Blinder 1997: 51).

One of the most common, perhaps too many times mentioned words in economics, is rationality. Behavior can be rational, irrational or irrational. Rational behavior implies a situation where an individual seeks out a choice that provides him with an optimum level of benefit or utility. A certain kind of simplification of the notion of rationality occurs within managerial decision-making. If a decision is rational, that still does not mean that the decision maker will be rational in other circumstances. Managers may, in turn, be obviously rational in a decision-making situation and seemingly irrational in the other.

Many authors, especially in the field of management, agree that by behaving rationally - after careful analysis of all alternatives - one can make a decision that maximizes business satisfaction or the benefit of the decision maker. The ultimate end of the rational behavior, when it comes to economic theory, is to maximize company profits and to maximize benefits in the case of people in general (Katona 1963: 313).

2.2. BASIC ASSUMPTIONS OF THE RATIONAL DECISION-MAKING MODEL

The fundamental basis in the rational choice model is the optimization that can be defined in different models based upon following assumptions: (1) each individual is governed by a set of logical beliefs in the outcome of his activity; (2) individuals have preferences that sort them by type. In practice, people are expected to maximize benefits and minimize costs, (3) each alternative compares the individual with others based on their cognitive abilities, taking into account time and resources.

The limitation of a rational model is that it does not take into account factors that cannot be quantified, such as personal feelings, ethics, or altruism. The basic assumption of rational decision-making is the concept of maximizing utility that draws the roots from the traditional economic theory of “economic man”.

Most of the models applied in rational decision-making come from economics, statistics and philosophy, while psychologists have only adapted them. That is why these first theories are always discussed from an economic perspective. Early models prevail over relatively simple issues of humanistic content in which the goals set are clear and unambiguous. Such situations are solved by classical optimization methods and traditional system approaches. In practice, this is a complex market problem that is rapidly growing under uncertain circumstances, so the expression of rationality is replaced by the term “conditioned rationality”.

Homo economicus

The concept of an economical man derives originally from the philosophy of hedonism, which claims that individuals are calculating with activities that will maximize their own interests and behave accordingly. Adam Smith relies on

this philosophy when he claims that the search for his own purpose is sufficient to justify the interaction between the buyer and the seller on the market. Adam Smith paints a man of economics (“homo economicus”), who in reality does not exist, as an essential stone-building model; he is capable of seeing his best economic interest and act accordingly. That means rationally and in his own interest. By this, one said almost all important about it.

Homo economicus is one of the most important bases of the economic model. This is a generally accepted term. Despite all this, the cause of great controversy and science has studied it, still studying it, as no other being. We can simply imagine it as a perfectly healthy human being consulted regularly with various specialists. The best thing is when he leaves the economist’s practice. Sociologists, ecologists, and physicians are diagnosed with the most diverse illnesses.

In support of the great dissonance of attitudes about homo economicus, there is a great variety of terms when collecting information about it online. The discussion is completely interesting and tense, but even homo economicus opponents, as economists, have no choice and must be introduced to homo economicus because most of the economic theories are based on that picture. Even the concepts of modern evolution, experimentation and game theory require knowledge of homo economicus. Homo economicus is best described through the form and manner of decision making. Rational in its own interest. The term “rational” can be replaced by reflection, good decision-making, and mastery. Homo economicus always decides to start from its own profit i.e. the value between profits and costs and decides on the possibility of having the highest net benefit.

2.3. CRITIQUES OF THE RATIONAL MODEL

The rational decision model is a very important classical approach in the field of decision theory. It provides the basis for the quantitative disciplines of economics, mathematics, and statistics. Several barriers appear:

- Criticism is targeted at unrealistic assumptions about the full information people have as well as their ability to process them at time of decision making;

- ✦ Bounded Rationality is based on the assumptions that the rationality of the individual is limited in terms of information he possesses, the cognitive limitations of his mind, and the time he has at his disposal when deciding.
- ✦ When there is a lack of ability and resources to reach optimal solutions, decision-makers often try to find a satisfactory solution instead of the optimal one.

3. ALTERNATIVE THEORIES OF DECISION MAKING

New theories have been emerging recently. They are challenging and criticizing the assumptions and predictions of behavior in the theory of rational choice. Some people developed models of limited rationality that they hoped would be more psychologically clear without abandoning the idea that the thinking underlies the decision-making process. Very popular criticism has been the lack of empirical bases. Experimental economics and the experimental theory of games have changed that criticism. It has been concluded that it is not an easy task to find what will replace the standard assumptions of the rational behavior found in traditional economic literature. This is so because the identified deficiency is considered in two ways - as a call for quite different resources and because there is little hope to find an alternative structure of assumptions which would be as simple and useful as the traditional assumptions about maximizing their own interest or the consistency of the election (Sen 1998: 206).

Prospect theory

Daniel Kahneman and Amos Tversky have developed the Prospect Theory, which focused on people selecting alternatives that involve risks but the results are already known as well. When people are making decisions, they are considering the potential value of losses and gains rather than focusing on final result. In order to do evaluation of losses and gains they are using facts which are available to them (heuristics) coming through methods and/ or systems. This theory is descriptive one. It does not predict optimal decisions but it tries to model real life-choices.

Bounded Rationality

Bounded Rationality introduced by Herbert Simon is based on the assumptions that the rationality of the individual is limited in terms of information he possesses, the cognitive limitations of his mind, and the time he has at his disposal when deciding. Consequently, it can be assumed that decision-makers have an intention to act rationally, however to a limited extent only. The assumption of only limited rational behavior represents a serious departure from the long-standing paradigm of the so-called neoclassical theory, which allows human behavior to be best explained and predicted by the assumption of complete rationality. However, until Simon's idea of limited rationality had arrived in the mainstream of economic theory, half a century should pass. In the meantime, economic models of limited rational behavior have gained wide acceptance - more than that, they are almost in vogue (Simon 1957).

3.1. NON-RATIONAL DECISION MAKING

Herbert A. Simon

By awarding the Nobel Prize in 1978 to Herbert A. Simon, the Swedish Royal Academy of Economics awarded recognition to his work, which gave significant, almost decisive impetus in the field of organizational research. The two questions are characterized by Simon's work: "How rational is man?" And "How rational are organizations?" The first question answers Simon in such a way that he replaces "homo economicus" with a more realistic model of a man who decides: a man can penetrate cognitively only in part of his problems, while a large part must be abandoned to habitual behavior; he has to create a sophisticated environment model; he can accept information only selectively; he can in no case achieve an optimal solution, but must leave his problem "inspirational level" (Barković / Barković Bojanić 2014: 63).

Gerd Gigerenzer

German psychologist and investigator of risk Gerd Gigerenzer became known as an expert to the public with the book "Bauchentscheidungen". His work has an important significance for psychologists, economists, philosophers, and animal biologists. He was particularly interested in how people can learn

to live in the circumstances of uncertainty. How does society adapt the change of state from one state to another, which is uncertain? Gigerenzer has been involved in a debate with Daniel Kahneman and Amos Tversky about the heuristics and biases research program that has become one of the most interesting in the circle of psychologists. Although the debate was largely guided to be more of framing than substance, it largely revolves around the question of whether we should characterize “biased” human decisions as error or “irrationality” (Collins 2018).

Ward Edwards

About the same time that Simon was documenting bounded rationality 1960s and 1970s, another psychologist, Ward Edwards, began testing economic theories through controlled laboratory experiments to examine how people process information central to “life’s gambles”. Early research confirmed that people often violate the assumptions of economic rationality and are guided in their choices by noneconomic motivation.

Role of Emotion

Emotions are the primary influencing factor for every definitive action that we make as a human being. The role of emotions in motivating behavior is also an important aspect of understanding our addictions. However, rational model often does not include emotion as a factor. On the other hand, since decisions are often including uncertainty, risk tolerance by individual becomes a factor in the model.

Robust Decision Making

In solving problems with multiple possibilities, robustness plays an important role. Decision makers often find themselves in more uncertain situations choosing more robust than the best solutions. When it is possible to predict the future, selecting the best option is desirable, but when the future is characterized by uncertainty focusing on the best option can carry considerable risk. This approach has built the concept of robust decision-making that takes into account multiple scenarios in the future, focusing on robustness in relation to

optimal, adaptive strategies. For example, the problem of climate change and objective adaptation to it, robust decision making can be a very interesting method that provides support for adaptation decision making. Robust Decision Making tries to find robust options (“good enough”) rather than options that are supposed optimal in terms of economic efficiency. To put it differently, robust decision-making tries to find how to minimize regret, instead of maximizing expected utility (Econadapt, 2016).

Intuition

Intuition is often seen as the last rational way of making decisions. Even today, intuition is dismissed as irrationality. Women have them, men have brains, they say. Who decides to gut feeling is not to be taken seriously. The Nobel Prize for Economics 2017, the US researcher Richard H. Thaler got because of his contributions to the psychological understanding of economic relationships. He had advanced the understanding of our behavior and our ability to make decisions in a time of social upheaval. Thaler considers intuition to be insignificant in decision-making. If you talk to Gigerenzer about it, you immediately sense that there is a war between the American and the German for the power of interpretation. “At a time when our lives are determined by calculations,” says Gigerenzer, it is obvious that those would be awarded their findings underpinned the superiority of the ratio over intuition. Intuition cannot be justified. But man should have abilities, mind and inner voice. “The art lies in recognizing each one: what will help me?” (Zeitmagazin, 2017)

Even the Greek philosophers were concerned with the dualism of reason and intuition. Intuition was considered to be the highest form of knowledge prior to the Enlightenment - though it was not man who had it, but angels and other supernatural creatures. With the Enlightenment grew skepticism: The subconscious mind was now considered a dark place where demons lurked. In the 17th century, the French philosopher René Descartes coined the phrase “I think, therefore I am”, the image of man as a cool decision machine, always to maximize the benefits. A definition that still influences our attitude towards intuition today. Sigmund Freud described intuition as the site of sexual memories and obsessions. Only the economist Herbert Simon recognized our “limited ratio” in 1956, he found that man could not make a single decision rationally (Zeitmagazin, 2017).

IRRATIONALITY: ECLECTIC APPROACHES TO DECISION MAKING

The word eclectic means “selecting what appears to be best in various doctrines, or styles” or, more simply, “composed of elements drawn from various sources” (Webster 1997: 359). Decision making is a meeting ground for new multidisciplinary fields represented by those who pioneered them – including behavioral economics, economic psychology, behavioral finance, decision sciences, and neuroeconomics, to integrate theories and results from economics, psychology, sociology, anthropology, biology, and brain sciences. Applied fields such as management, marketing, finance, public policy, and risk management and insurance are using this new knowledge today in a significant way. It has been obvious that both economists and psychologists are interested in decision making.

It is necessary to introduce the notion of rationality for understanding decision-making. Irrationally simply means a poor adjustment to goals. How difficult it is to see the difficulties arise in understanding decision making immediately when the notion of rationality is introduced. Then it is about concepts rational, nonrational and irrational. Behavior is rational, and the decisions leading up to behavior are rational if it turns out that the behavior prescribed is well adapted to its goals whatever those goals might be. Nonrational reminds us of something else again. It reminds us that the goals themselves have to be postulated somehow in the decision-making process, except insofar as certain goals may themselves be instrumental to other goals (Simon 1993: 393).

About rationality in economics and psychology Simon thinks that he has gone through the various ways in which economists have had very explicit theories about rational behavior while psychologists spoke less about rationality and more often thinking (“good” thinking) (Simon 1993: 395).

4. WHY RATIONAL CONSIDERATIONS LEAD TO IRRATIONAL DECISION?

Anyone who deals with human behavior cannot ignore the concept of rationality. Rationality is differently interpreted by different people. For example, for the common people rational are one who acts rationally, for the economist, who maximizes its utility, for the philosopher, who adheres to his rules of action. All these concepts of rationality have something in common: they only explain how people usually behave, but often people act irrationally. Economists do not op-

pose this fact because their models are based on mathematical considerations and it is in the nature of irrationality to be difficult to calculate. For psychology and philosophy, irrationality is an interesting phenomenon. For example, they ask why irrationality exists and how it arises. One possible answer to this question can already be found in Freud, but it is the philosopher Donald Davidson who generalizes this approach. For him, irrational actions and decisions come about because the mind of a person can be divided into several entities that interact with each other. Irrationally, therefore, is someone who believes that he is acting on one of these mental entities, but in fact has no reason to act. But the division of mind into Davidson also allows for a different kind of irrationality, because one can model the different parts of the mind as players of game theory. These players always decide rationally, but in some cases they actually arrive at irrational game solutions (Schaller 2014). Action and irrationality are explained in the context of game theory and explained by the prisoner's dilemma.

Prisoner's Dilemma

The Prisoner's Dilemma takes its name from a sample story, but can actually be applied to any game situation with a similar order of preference. The initial situation of the Prisoner's Dilemma is the following: The police arrested two people who had committed a robbery. Unfortunately, the officials lack the evidence for the robbery itself, without a confession; they can send the robbers only for car theft for two years in jail. The police, therefore, suggest a robbery to the robbers. If one confesses, but the other does not, the confessed man will be released, the other will have to go to jail for ten years. If both confess, they both go to prison for five years, and if both are silent they are convicted of car theft: two years for each. Both robbers have the same utility function: freedom equals 4 benefit points, two years imprisonment is the next best option and equals 3 benefit points, five years equal 2 points, and the maximum penalty of ten years both rates 0 points (Ross 2012: 23-25). Table 1 illustrates the situation.

Table 1 Prisoner's dilemma

		Player B	
		Confess	Deny
Player A	Confess	2,2	4,0
	Deny	0,4	3,3

Source: Schaller 2014

For Player A, it is clear that it's better to confess. In the best case, he is released (4 points), in the worst case he has to go to jail for five years (2 points). However, if he is silent, the best thing that can happen to him is two years imprisonment (3 points) and he runs the risk of being sent to prison by the other player for 10 years (0 points). Player B thinks the same way. The result: Both confess and go to jail for five years, so they each score 2 (Ross 2012: 25-26). Although both players have reasoned and rationally decided, they have chosen the alternative that offers the second deepest benefit. The solution of the game is the field "confess / confess". The solution of games is called equilibrium, based on physical systems where equilibrium occurs when all causal forces are in balance (Ross 2012: 32). The solution found here is the Nash equilibrium. It refers to a set of strategies in which no player can increase its utility, given all other players stick to their strategy (Ross 2012: 33). It is possible that a game has multiple Nash balances. In these cases, due to purely rational considerations, the result cannot be predicted. However, with the Prisoner's Dilemma, the solution is clear from the point of view of the Nash equilibrium. Despite the unambiguousness and the rational foundation of this solution, it does not seem completely satisfactory, because both players escaped a useful point in this way. The Pareto optimum would be reached, if both players would be silent, thus getting 4 profit points each. A solution is only Pareto-optimal if there is no other solution that better positions at least one player (Mankiw / Taylor 2010: 903). The Pareto Optimal Solution is also referred to as the social or ethical solution because it maximizes the benefits of the community rather than a single one.

The Prisoner's Dilemma shows the limits of rational thinking. Although players make a rational choice, they break their own highest rule of conduct: they do not maximize their utility. The Nash equilibrium is the second worst solution for both players, and although they know that it would be in the interests of both to be silent rather than to confess, they do not deviate from their strategy. In this sense, the solution of the game is irrational. The American scientist Richard Thaler received Nobel Prize in 2017 for his research on behavioral economics. Thaler showed how psychological factors affect supposedly rational decisions in the economy and markets. For example, Thaler was able to prove that people with falling gasoline prices do not plan the money saved - quite rationally - simply for other necessary expenses. Instead, Thaler was able to show that people instead bought more expensive premium gasoline instead. The re-

alization: People do not treat their money completely rationally and purpose-independent, but mentally allocate it to a fixed budget for specific purposes.

There are no purely rational decisions in the economy either. This was also aware of the economists before Richard Thaler. Nevertheless, the premise in economics was different for a long time: Economists assumed that people act rationally - and that assumption is close enough to reality. The pioneer of behavioral economics helped to refute this very premise. "One could say that Thaler and his colleagues are the hangmen of the "Homo Economicus model" In the late 1800s, several economists formalized the ideas of Adam "The Invisible Hand" Smith into the idea of "homo economicus," or the completely rational human that's used as the model in nearly all basic economics education. Given the vast influence economists have over policymakers and politicians, this flawed theory has been the basis for a lot of flawed policymaking.

Bottom of Form

That is why multiple economists and psychologists began developing the field of behavioral economics. Daniel Kahneman, author of "Thinking, Fast and Slow" won the 2002 Nobel Prize in economics for his contributions to behavioral economics and the study of decision-making. Human irrationality is Kahneman's great theme (Kahneman 2013). He contributed to explaining why people do not behave as proposed by economic theory. Economists increasingly adopt the ideas of the behavioral school, whose "de facto" founder Kahneman is, as in reality, people in monetary and economic matters often behave irrationally and that this irrationality is foreseeable. The most significant joint work with Amos Tversky published in 1979 in the prestigious magazine "Econometrics" evolves prospect theories. They describe how people develop a heuristics or a shortcut to the choices they make available to them and identify potential "traps" and anomalies in resonance that reflect more human nature than a true perception of potential risk or gain (Kahneman 2013: 298).

The practical application of Kahneman's scientific results as well as the followers of a bourgeois school finds itself in real life: traders often give their producers a specific and probationary time by exploiting the hypothesis of the theory of the effect of possessing how people value more than they already have; some investors have begun applying behavioral theses in practice on the US stock exchanges, trying to explain to them the sudden changes in stock prices;

macroeconomists are turning to behaviorist theory to explain why, for example, less savings or why they continue to spend at the same level for some time after their income reductions and the like.

Behavioral economics is the use of psychological methods and constructs to introduce limits of computation, will power, and self-interest into economic analysis. Neuroeconomics extends upon behavioral economics by including neural data for the purpose of creating a mathematical approach to the micro foundation of economics that is neutrally measurable (Rangel/Camerer/Montague 2008/545-556).

5. CONCLUSION

The notion of rational decision making epitomizes the confusion and broadly changing interpretations related to the most important activity of managers in any organization. For the rational model to work magic, decision-makers must be able to articulate their basic taste and preferences and make sure they do not violate basic axioms of rational choice.

In the late 1800s, several economists formalized the ideas of Adam “The Invisible Hand” Smith into the idea of “*homo economicus*,” or the completely rational human that is used as the model in nearly all basic economics education. Given the vast influence, economists have over policymakers and politicians, this flawed theory has been the basis for a lot of flawed policymaking.

The presumption of rationality has been tested by psychologists and other behavioral scientists. As noted by Herbert Simon, an important and among the most influential social scientists, stated that it allowed economists to make „strong predictions ... about behavior without the painful necessity of observing people”. Stimulated by creative conceptual, methodical, and empirical work of Amos Tversky, Daniel Kahneman, Richard Thaler, Herbert Simon, George Akerlof, Vernon Smith, all Nobel laureates in economics, the trickle of studies challenging traditional economic of rationality became a torrent.

Their contribution toward understanding the behavioral dynamics of economic decisions further contributed to what has become a revolution in thinking (Kerjan/Slovic 2010:5). Recently, new theories have been emerging, which mostly point to some human behavior that, in new circumstances, consistently

deviates from the theory of rational choice and the theoretical basis of home economics.

In order to better improve the quality of decision making, it is important to understand the effects of various factors such as social, political and cognitive and their impact of making decisions. Further, it is important to retain the beneficial ones such as those who have high interpretative potential and can include distinct views as well as to avoid those who are detrimental such as group thinking. It is necessary to target creation of adequate cultural, structural and procession conditions to achieve this. Some progress has been already made in this direction.

We hope that this knowledge will be shared and used more broadly, we hope to see more behavioral scientists being asked to provide top decision makers with their views, or even to take on high-level positions in the public and private sectors. In doing so, they will assume this dual role of researchers/teachers and influential players in the power circles of business and public policy, as other great minds in economics have done before.

Abstract

Project management process consists of planning, organizing, securing and managing resources to achieve successful completion of defined project goals and objectives. Each project manager deals with the primary challenges: to achieve project goals and objectives in a specific timeframe and with a limited budget. Project management is not traditionally included in the education of academic scientists, but it has been gaining more attention in recent years as universities and scientific institutions are implementing important projects that require certain project management skills and the use of project management tools. With the increasing trend in interdisciplinary collaboration, project managers play the important role in every scientific research. This also requires that the budget for further education of project managers should be implemented as a standard part of every project proposal. That is why is necessary to establish

a strong connection between academic scientists and project managers. Even more, that relationship should be continuously strengthened and maintained during the project life cycle. The intensive scientific activity at the School of Medicine, University of Zagreb is proven by many international and national projects that are included in the list of the most important scientific research projects in Croatia. The aim of this case study is to analyze project management challenges and difficulties in an interdisciplinary and scientifically challenging environment at the University of Zagreb, School of Medicine to assess the effects of project implementation.

Keywords: project management, scientific research, challenges, difficulties, School of Medicine

1. INTRODUCTION

The main goal of scientific research is to produce new knowledge independent of ideological, political, economic or any other consideration. The 21st-century economy is based on knowledge suggesting that academic researches should contribute to economic development, but also find new funding methods to achieve its goals. Croatia is a member of the European Union since 1 July 2013, which further opened the possibility of scientific researches funding from EU funds. In this way, scientific institutions that carry out scientific research accomplish productivity and competitiveness. Scientific research funding from EU funds is a new direction for scientific institutions and it's research management that applies principles, skills, and tools of project management. Typical approaches in classical project management provide a framework centered on project life cycle and rely on specific skills, processes and tools (PMI, 2008) to accomplish the goal of efficient and productive project management system. At universities and scientific institutions, the principles and skills of project management should be implemented to ensure the completion of scientific projects that contribute to the development of science, economy, and society. Earlier empirical investigations (Riol and Thuillier 2015; Perić 2011; Alves Sousa and Hendriks 2008) have examined the relevance of project management skills and tools in managing scientific research projects as well as challenges and difficulties in implementing project management into scientific research. The objective of this study is to examine basic elements of project management approach

through challenges and difficulties in project management implementation in scientific research on the example of the University of Zagreb School of Medicine (UZSM).

2. PROJECT MANAGEMENT

In order to understand project management, primarily it is necessary to illustrate the definition of a project. American Project Management Institute (PMI) defines a project as temporary as it has a defined beginning and end in time, and therefore defined scope and resources. A project is unique as it doesn't contain a routine operation, but a specific set of operations designed to accomplish a singular goal (Project Management Institute, 2019). To understand the definition of a project it is necessary to understand that the project has a series of activities and tasks that have an aim to accomplish specific project objectives in a certain time and with a limited budget. According to Kerzner (2017), project management is the planning, organizing, directing, and controlling of company resources for a relatively short-term objective that has been established to complete specific goals and objectives. Furthermore, project management utilizes the system approach to management by having functional personnel (the vertical hierarchy) assigned to a specific project (the horizontal hierarchy). Reveal (2014) sums that a successful project is the one that meets all expectations of a client or a principal, i.e. the one that met all criteria:

- a) Completed on time,
- b) Goals met,
- c) Quality achieved,
- d) Budget not exceeded.

In the project, management time is one of the most important elements of success and one of the ways to achieve competitive advantage. The project itself demands time for performance. According to Hauc (2007), we can set the time for project performance in two ways:

- a) Progressive, which means we calculate the duration of specific project activities from its beginning to the end and we align calculated project duration with strategic and other requirements;
- b) Retrograde, which means that project completion deadline is set in advance – most often, that deadline is the result of adopting a strategy or

aspiration to achieve competitiveness with the fast project performance – and then some activities are planned within that framework.

Time management is surely an essential skill for project management to achieve project goals and objective. Effective project organizations know which operations make a difference in the business strategy and install methods for keeping these visible to all. At the beginning of the project, senior management needs to tell the project team organization's long- and short- term operational plans and budgets, and how the project fits into or support those. Answers may include targets related to revenue, profit, costs, cash flow, return, brand equity, customer satisfaction and retention, time to market, innovation, efficiency, output and quality. Once the project commences, the fulfillment of the goals and objectives need to be evaluated on the regular basis and reported to the project staff. In some companies, this information is displayed prominently on a "dashboard", keeping critical issues in full sight and ensuring that resources are directed where they are most needed (Longman & Mullis, 2004).

Effective goals urge us to attend to the most critical elements of improvement: solid evidence of learning, short-time, results, common formative assessment (which reveals those short-term results), recognition and celebration of short-term results, and the all-important opportunity for teachers and students to enjoy – to "take joy" – in their work goals should be SMART: specific, measurable, attainable, realistic and time-based (Conzemius and O'Neil, 2006). According to Hauc (2007), some project goals are achieved by performing inter-related logically connected activities or activities that depend on each other in a certain way. If we haven't defined all project goals and objectives, we also won't be able to carry out activities necessary for their implementation.

As each project is unique, there are different approaches to quality management. According to Dunkan (1996), project quality management includes the processes required to ensure that the project will satisfy the needs for which it was undertaken. It includes all activities of the overall management function that determine the quality policy, objectives, and responsibilities, and implements them by means such as quality planning, quality control, quality assurance, and quality improvement, within the quality system. To acquire knowledge and learn about quality costs, a project quality information system should form an integral part of an organization's approach to managing its projects. To do so, it is necessary to collect, measure and analyze quality (Barber et. al,

2000). Project cost management includes the processes required to ensure that the project is completed within the approved budget. An overview of major processes includes:

- a) Resource planning – determining what resources (people, equipment, materials) and what quantities of each should be used to perform project activities.
- b) Cost Estimating – developing an approximation (estimate) of the costs of the resources needed to complete project activities.
- c) Cost Budgeting – allocating the overall cost estimate to individual work items.
- d) Cost Control – controlling changes to the project budget. These processes interact with each other and with the processes in the other knowledge areas as well. Each process may involve effort from one or more individuals or groups of individuals based on the needs of the project. Each process generally occurs at least once in every project phase (Dunkan, 1996).

Every project needs to develop a means to add additional economic value and achieve its competitive advantage. For successful project implementation, before the start or approval of each project, it is necessary to carefully define the project financial plan and other financial sources. The definition of financial resources is a key part of every project. The success of the project is all about whether the planned financial resources are enough or there has been an increase in costs and thus a change in the financial plan (Hauc, 2007). The task of project managers is to determine the course of financial investments and, if needed, to take corrective measures and activities to ensure the successful achievement of project goals.

Each project has a life cycle or framework for managing a project. According to Buble (2010) that life cycle has five phases:

1. Initiation of a project
2. Planning a project
3. Performing a project
4. Supervision and controlling of a project
5. Closing a project

Project initiation is the first phase of the project life cycle. In this phase, we define an opportunity or reason for the project. This is the phase when we establish a project team, define goals and all project details.

According to Andersen (1996) project is a special task that has not been done before. Consequently, it is a very difficult or even impossible to know precisely at the initial planning stage what are all the activities that need to be carried out in order to complete the project, and what their cost and duration parameters are. The importance of the initiation phase of the projects is to stand out relative to other phases in the life cycle of the project.

Performing of the project is the third phase in the project life cycle. In this phase, all activities that have been planned are performed according to the schedule and the time frame of the project. This phase is also important to control the course of activities and to correct all possible deviations on time to finish the project according to its timeline and within the budget.

Project managers play an important role throughout the project life cycle. They eliminate the shortcomings in project life cycle using financial metrics or measuring customer satisfaction to create a more integrated approach to a specific project and project management.

Kerzner (2017) underlines that project manager must control the company's resources within time, cost and performance. Most companies have six resources: money, employees, equipment, facilities, materials and information/technology. The project manager doesn't control any of these resources directly, except perhaps money (i.e., the project budget). According to INTERACT no matter how good the original plan is, there will always be some deviation during implementation. This should be anticipated, and the aim of project management is to track this deviation, make sure it stays within the scope of the project, and redirect activities to get back on track. The further the project goes into implementation, the more important it is to track things systematically to avoid drifting away too much from the original outline and falling outside the scope of the project. Many of modifications will be improvements, and it is a dynamic aspect of project management with the ability to adapt to modifications that are likely to lead to success (Interact, 2019.)

Westland (2006) asserts project closure involves releasing the final deliverables to the customer, handing over project documentation to the business, terminating supplier contracts, releasing project resources and communicating

the closure of the project to all stakeholders. The last remaining step is to undertake a post-implementation review to quantify the level of project success and identify any lessons learned for future projects.

In general, project management is important because it ensures proper project implementation. When implementing the projects, organizations are facing new challenges and difficulties such as time, budget and resources that require project management skills and tools. Using these skills organizations can gain control over project challenges and difficulties and efficiently achieve project goals and deliverables.

3. SPECIFICITY OF PROJECT MANAGEMENT IN SCIENTIFIC RESEARCH PROJECTS

Project management skills and tools are an essential part of a successful project, so scientific research projects are not an exception. According to Sousa and Hendriks (2008), academic research is a timeless and innate type of knowledge-intensive work, and academic work involves knowledge creation in perhaps its purest sense.

In recent years benefit that industry could gain from research and development (R&D) projects developed and implemented by academic and scientific institutions was underlined, while in the same time Croatian scientific research projects are more often funded from EU funds, according to goals set by Europe 2020 strategy. European Commission defines Europe 2020 strategy as EU's agenda for growth and jobs for the current decade. It emphasizes smart, sustainable and inclusive growth to overcome the structural weaknesses in Europe's economy, improve its competitiveness and productivity and underpin a sustainable social market economy (European Commission, 2010).

According to the Europe 2020 strategy, the EU currently has a target of investing 3% of GDP in R&D. The target has succeeded in focusing attention on the need for both the public and private sectors to invest in R&D, but it focuses on input rather than impact. It is also clear that by looking at R&D and innovation together we would get a broader range of expenditure which would be more relevant for business operations and for productivity drivers. The Commission proposes to keep 3% target while developing an indicator which would reflect R&D and innovation intensity (Europe 2020 Strategy, 2010).

Universities and academic researchers in Croatia have obtained a significant part of the funding for most relevant R&D projects in accordance with Europe 2020 strategy but implementing project management skills and tools in academic research projects can mean a significant change in the field of scientific research management. According to Harvey et al. (2002), academic research management is an appealing yet under-researched area because traditionally academic research is standing opposite to management. Ewan and Calvert (2002) say that the necessity of managing limited amounts of public money more closely is leading governments to apply free-market principles to academic research, emphasizing 'audits' and 'accountability'. The result of these government policies is increased interest in different aspects of scientific research projects. According to Cohen et al. (1999) increase in managerial pressures in public research institutes is dealt through renegotiation of the personal and professional interest of researchers.

Skills, tools, and methods of traditional project management are standardized and mostly customized for the industries that develop new products or services. On the other hand, the aim of scientific research is to gain knowledge instead of creating new products or services so traditional project management should deal with scientific research unpredictability and that's why it is not possible to strictly follow traditional project management tools and methods even though scientific research project just like any other project has its timeline, budget, and other resource requirements. The specificity of a scientific research project is that it is not adjusted to the final product or service, but to gain knowledge. In this process, scientific research is planned and conducted using complex scientific methods with the aim to get a dataset that confirms or rejects scientific research hypothesis. According to learned from scientific research projects, during the project life cycle the project may take completely new direction than planned and it would require major re-planning that is rarely acceptable in the industry during the development of new product or service.

Singer (2011) underlines research creates or builds on either new knowledge or through disruptive innovation. Research Project Management seeks to facilitate these endeavors while mitigating unjustifiable risk. Yet, to a traditional project management practitioner, Research Project Management appears to involve either ill-defined or excessively broad scope. Funding can be conditional or its resource unstable. There are variables to consider with each of the multiple steps throughout the project. Novel tasks can be required e.g. some even

requiring a sub-project to invent a testing device or methodology, to manipulate or otherwise accomplish the step. Much of the work is dependent on if/then decision trees cited above. The higher levels of uncertainty that – while customary, accepted and even embraced in the scientific setting - would constitute an unacceptable risk in a most business setting.

Considering specificity of scientific research and the importance of project management in gaining competitive advantage, universities and scientific institutions in recent years offer different project management learning and training courses as managing scientific research project is a special discipline within project management profession.

4. PROJECT MANAGEMENT AT THE UNIVERSITY OF ZAGREB SCHOOL OF MEDICINE (UZSM)

The University of Zagreb School of Medicine (UZSM) is the oldest and the largest school of medicine established in the Republic of Croatia. The decision on its foundation was made by the Croatian Parliament in January 1917. The institutional research profile represents one of the basic strategic features of this academic institution; over time, it has strengthened its position of the most significant and the largest national research institution in the field of Biomedicine. The visibility in the international academic arena has been attained by virtue of scientific contributions published in internationally recognized peer-reviewed journals, as well as by virtue of participation in European research projects. Significant changes in Ph.D. education have been implemented; within this context, the School of Medicine plays a significant role in the international scientific community (Strategy of Scientific Research of the School of Medicine University of Zagreb 2016-2020).

The Research Strategy of the UZSM is in full line with the strategic priorities declared under the national and the EU strategy, so it is to be expected that the Strategy in reference shall directly contribute to the improvement in quality and successfulness of research and increase creativity and innovativeness. High-quality research settings shall, in turn, enable a high-quality education of both researchers and students at each level of education, when it comes to doctoral and postdoctoral studies. Subsequently, a rise in the competitiveness of our researchers shall be witnessed, together with the rise in the attractiveness of Croatian research institutions, and the rise in incoming mobility of foreign

scientists and doctoral and postdoctoral students and shall be an incentive for a higher number of Croatian aboard scientists to return to their Homeland. Finally, Scientific Research Strategy of the UZSM is fully conformant and follows mainstream guidelines laid down by the most relevant Croatian and European strategic documents (Scientific Research Strategy of the School of Medicine University of Zagreb 2016-2020).

The success of UZSM can be demonstrated by several previously awarded and currently active projects which have brought funds and made top scientific research possible. Table 1 listed below is showing projects active at UZSM at the end of 2018:

Table 1. List of UZSM awarded funds and projects in December 2018

FOUNDING PROGRAM	NUMBER OF AWARDED PROJECTS	UZSM BUDGET
Horizon 2020	6	1.896.562,50 €
European Social Fund	3	237.373,34 €
Centers of Research Excellence	2	10.000.000,00 €
Croatian Science Foundation	29	3.696.303,80 €
ADRS Foundation	1	27.027,03 €
University of Zagreb financial support	111	372.972,97 €
European Cooperation in Science and Technology (COST) Action	1	no financing
German Academic Exchange Service (DAAD)	4	no financing

Source: Author's archive

To research project management challenges and difficulties at UZSM, we have put together a questionnaire that contains statements related to challenges and difficulties in managing projects using Likert scale ranging from 1 to 5 with the aim of increasing the success of project implementation in this institution. Measuring challenges and difficulties at UZSM was performed through 20 variables derived from eight project management tasks defined by Hauc (2007:232):

1. The basic concept of project strategy
2. Project charter
3. Project goals and objectives
4. Performance tactics
5. Project plan

6. Risk analysis
7. Project organization
8. Control plan

The survey was conducted among the 12 persons responsible for project management at UZSM. Table 2 shows their attitudes regarding the chosen aspects of project management challenges and difficulties that affect successful project implementation.

Table 2. UZSM project management staff attitudes regarding chosen aspects of project management challenges and difficulties

During project management at UZSM, I face the following challenges and difficulties:	Mean	Std.Dev.
When designing the project implementation plan.	2.92	0.79
When designing a project strategy.	3	0.85
When designing project goals.	2.33	0.98
When determining the purpose objectives in accordance with the project's objective goals.	2.75	1.14
When controlling project content regarding the quality of procurement.	3.25	1.22
When designing ideas and project performance documentation.	2.92	1.08
In the preparation of investment programs, tender documentation elaborates etc.	3.42	0.79
When preparing plans for achieving project goals.	2.92	0.9
In carrying out project activities that achieve project goals.	3.17	1.03
To control the achievement of the goals as foreseen by the project plan.	2.92	1
When appropriate corrective measures should be taken if a deviation from project objectives is determined.	3.33	0.98
In organizing the project implementation.	3.58	1.08
In controlling project performance.	2.92	1.08
When reporting on project implementation progress.	3.25	1.14
In organizing teams for drafting a project plan (lack of professional staff).	3	1.04
When controlling project performance according to the project plan.	3.08	0.79
When including the project plan in annual and operational business plans and annual reporting.	3.17	1.27
When analyzing the impact of risk on the goals, effects, and performance of the project.	3.17	1.27
In the preparation of preventive and curative measures to be included in the project plan.	3.08	1
When acting appropriately if deviations from the project's planned performance are noticed regarding the achievement of deadlines, cost plans, and other project parameters.	3.08	0.9
Average grade	3.06	

Source: Author's calculations

The findings of this research have shown average results in all observed variables (the total average grade of all the observed elements is 3.06). All given statements are graded around 3 according to a Likert scale ranging from 1 to 5. Out of the 20 researched variables, lowest average grading (2.33) achieved the designing of project goals what indicates that the least challenges and difficulties are in this part of project management tasks at UZSM. What follows is determining the purpose objectives in accordance with the project's objective goals (2.75), and then several variables graded 2.92: designing the project implementation plan; designing ideas and project performance documentation; preparing plans for achieving project goals; the control the achievement of the goals as foreseen by the project plan and controlling project performance.

In the further analysis of the results of the research somewhat higher average grade was given to all other variables and elements of challenges and difficulties in project management implementation at UZSM. The highest average grade (3.58) was given to organizing the project implementation what indicates that the greatest challenges and difficulties are in this part of project management tasks at UZSM. Such results confirm that project management challenges and difficulties that can affect successful project management implementation are present at UZSM, but they are not high and can successfully be minimized to a smaller number. The most prominent challenges and difficulties are in the fields of organizing project implementation (3.58) and the preparation of investment programs, tender documentation, elaborate etc. (3.42), while the least prominent challenge is designing project goals (2.33). The standard deviation of all variables in this study shows that data is concentrated around the arithmetic mean. As we look at values far from the arithmetic mean, we will find fewer data with these values. Such findings go in favor of the idea that it is possible to raise the level of project management skills to reduce challenges and difficulties in project implementation especially because researched elements were given average grades.

It is important to say that project management at UZSM includes both national and European sources of funding. An important difference between those two groups of funding is mostly in following different project implementation procedures and rules according to national or EU laws, and guidelines. Those differences are the most often challenges in organizing project implementation what is proven also by the highest rated variable average grade in this research (3.58). Membership of the Republic Croatia in the European Union

gives UZSM a possibility to fund the important scientific project from EU funds. Following the given opportunity UZSM has recognized the importance and necessity of quality project management as well as its challenges and difficulties. Projects are uncertain and unpredictable, so project managers are regularly dealing with challenges and difficulties. When those are significant, project management skills have greater importance. The total average grade (3.06) indicate that some of those problems are successfully solved, but some are out of the project manager's influence and require the involvement of higher instances. With good project strategies and tactics for approaching challenges and difficulties in project management tasks, the project managers at UZSM can deal with a lot of problems that are appearing during the project implementation and create a framework for successful project performance.

5. CONCLUSION

Project management in academic institutions and research centers often faces challenges and difficulties. UZSM is not an exception.

To write an effective project objective, idea or to assure valid project documentation proved to be the simplest part of the project management process, while the most challenging and difficult to handle is project implementation and preparation of investment programs and tender documentation. Project implementation is a key part of each project cycle, while other parts of the cycle only support implementation. In order to successfully implement its scientific projects in conditions of dynamic and unpredictable environment, UZSM needs to coordinate all project management tasks from incoming project strategy, define project goals and objectives as well as tactic and performance to project plan, risk analysis, and control plan. Successfully implemented projects should be the basis of the organization's competitiveness. That's why it is important that project management staff have all the competencies necessary for dealing with challenges and difficulties during the project implementation. Although project staff is successful in solving project management challenges and difficulties, the recommendation to improve the project performance is to assure more education in the field of managing scientific projects funded from national and EU funds, especially in the area of organizing project implementation and reporting process. Also, *intermediate bodies should enable and simplify the method of taking* appropriate corrective measures if a deviation from project objectives is

determined. In that way, UZSM will achieve successful project implementation by applying new project management skills and tools customized to perform scientific projects.

SUPPLY CHAIN STRATEGIES' IMPACT ON PERFORMANCE, COST AND FLEXIBILITY

BURTA Florina - Simona

West University of Timișoara/ FEAA/ Finance Department

E-mail: simona.burta@gmail.com

Abstract

The paper researches the potential use in logistics operations of the synergies between lean and agile strategies in order to increase efficiency in the supply chain and derive benefits by performance enhancement, cost reduction and overall supply chain flexibility. The author aims to provide a thorough and up to date literature review, encompassing the concepts of lean, agile and, most importantly, 'leagile'. The output of our research is a structural framework that reflects the most recent studies in the field and brings together the three supply chain strategies with their subsequent consequences in performance, cost and flexibility. The ease with which a company alternates its strategies is a determinant of the reliability of its supply chain, as well as a measure of flexibility. These two characteristics, namely reliability and flexibility, are prerequisites of a modern supply chain that is capable to turn its advantages into order winner criteria and outrun competitors offering the same product on the market. The differentiator that our research targets is logistics, if similar products in an industry segment become order winners based on the efficiency of their supply chain. While the author considers challenges through concepts that are rather theoretical, we attempt to transfer this knowledge into an operational perspective that would allow a professional in the field of logistics to draw applicable measures. The result of our work is a well-structured study on the impact of supply chain strategies and how their interchange can beneficially steer the operations of a company towards achieving competitive advantage.

Keywords: supply chain, lean, agile, leagile, logistics

JEL Classification: M19, M29

1. INTRODUCTION

In a world where supply chains are worldwide extended affairs, the line between lean and agile strategies is becoming more and more distorted as the complex supply chains are promoting cost, quality, reliability and flexibility objectives that rely on the ability to combine the strengths of the two. The authors consider the perspective in which all the aforementioned objectives can be accomplished through both strategies or their combination and are reluctant to more simplistic views. For example, the assumption that cost is a “market winner” for a lean company and a “market qualifier” for an agile one, as expressed also by Gligor et al. (2015), represents a limited view of the two strategies’ capabilities.

In the taxonomy focused research of Purvis et al (2014), the authors outline the three existing views in specialty literature regarding the concepts of lean and agile. First, there is the view that the two strategies are “mutually exclusive” and only one of them can be implemented throughout the supply chain. Second, the view that the concepts are “mutually supportive” implies that the two concepts can coexist and combinations of the two can be running simultaneously upstream and downstream the supply chain. Third, the view that implies the concept of ‘leagility’ brings forward the idea that leanness can precede agility in the supply chain, thus achieving supply chain objectives on a larger scale. The present study attempts to display the means by which the ability to interchange between lean, agile and ‘leagile’ can yield a competitive advantage.

In addition, another interesting facet of the relationship between lean and agile pointed out in Purvis et al. (2014) extensive research is that the two concepts target the same objectives: cost, quality, service, and flexibility. It is now well-established throughout the literature (Sezhiyan and Nambirajan,2010; Soltan and Mostafa, 2015, Purvis et al., 2014) and our paper also supports the view that the combination of lean and agile can maximize efficiency and flexibility and reduce costs. As the study is a rather theoretical one, attempting to be as close to applicable approaches, it does not include empirical research. Therefore, measures of efficiency, flexibility, and cost will be largely defined.

Naim and Gosling (2011) have thoroughly researched the cornerstone paper on the topic of ‘le agility’, namely “Leagility: integrating the lean and agile manufacturing paradigms in the total supply chain” by Naylor et al. (1999). While this research reestablishes the paper as groundbreaking in the niche, the

authors have a rather limited view as the only the number of citations and indices of download are considered. Future papers, including the present one, are extending the knowledge for the concept of 'leagility' by taking the perspective from this original work to establish variations of decoupling points in 'leagility' and how different levels of lean and agile capabilities determine performance in the supply chain. Decoupling points are the levels in the supply chain where lean and agile strategies can be either changed or combined.

The present paper's objective is to illustrate within the case study section how lean, agile and 'leagile' capabilities can be employed across the supply chain in order to create productive output in the form of increased efficiency, reduced cost, and increased flexibility. We exemplify our standpoints with companies at the forefront of their industries which are leading the way with closely connected commercial and supply chain strategies. As a result, our work welcomes the trend that order winner criteria are increasingly rooted in supply chain capabilities and we support our structural framework with insights on efficiency, cost, flexibility, and reliability.

The structure of our paper starts with a literature review attempting to capture up-to-date views on the theory and application of lean, agile and 'leagile' concepts, followed by a case study that unifies the lessons learned from literature within a framework for deriving performance. The paper finalizes with a well-rounded conclusion of our proposed outline, including directions for future research that would be pursued for extending present knowledge.

2. LITERATURE REVIEW

The purpose of the literature review section of our paper is to gather as many perspectives on lean, agile and 'leagile' strategies, factors, output and measurements as possible. Our research will go from the foundations on which these strategies rely in order to be efficient to how they can be combined effectively to yield jointly the most benefits. This section is the foundation for our case study, where we will be able to express an informed view of a supply chain management strategy in which lean and agile coexist and point out the decoupling point in such 'leagile' strategy.

Purvis et al. (2014) contribute significantly to the literature by developing "a leagile supply network taxonomy" focused around two ideas of flexibility,

namely vendor and sourcing flexibility. The paper deals with both concepts of lean and agile from their origins to the present status in which their combination goes beyond the decoupling point of material flow. Flexibility is emphasized as the most notable competence that distinguishes between lean and agile strategies in the supply chain. The major caveat of the paper is the lack of solid empirical case study materials, as only two companies are analyzed, as well as the lack of attention given to the need for flexibility outside the organization, namely with suppliers.

Soltan and Mostafa (2015) have gathered significant literature to define lean and agile concepts, from their unique characteristics and practices to the point of their convergence. Also, the authors extract from literature the knowledge that a “decoupling point” is a prerequisite for being able to combine lean and agile strategies into a performant ‘leagile’ strategy that they conclude to be the core of a “healthy enterprise”. By employing AHP and ANP methods, the paper aims to place the decoupling point in the concept of ‘leagile’, under the assumption that this separates the focus of the company between order-oriented and planning-oriented. In the framework simulated for maximizing enterprise performance, lean focuses on waste removal and agile focus on market responsiveness, the two being interchangeable as ‘complementary’ focuses. The paper concludes that both strategies are able to lead to enterprise performance, defined through measures of competitiveness, productivity, profitability, and survival.

Myerson (2012) outlines as metrics for a performant supply chain the following: delivery reliability, responsiveness, flexibility, cost and asset management. In literature, these metrics are assigned to either lean, agile and ‘leagile’ supply chains and the author describes the implications for each measurement. First, for delivery reliability Myerson (2012) focuses on waste management, to eliminate errors in the process, but the opposite might also apply as Soltan and Mostafa (2015) show how reliability is a potential output for both lean and agile, with benchmarks differing by considering the decoupling point in ‘leagile’ supply chains. Second, responsiveness is related to a lean organization in Myerson’s work, but we can find in Gligor et al. (2015) and Soltan and Mostafa (2015) studies that market and customer responsiveness can be dependent on downstream supply chain agility that can satisfy upstream requirements. On the other hand, flexibility can measure an agile supply chain but Purvis et al. (2014) recognize the importance of flexibility in ‘leagile’ organizations, as a decoupling point where customer interest surpasses a tight scheduling plan. Last

but not least, cost measurements and efficiency of asset management are not directly attributed to neither lean or agile supply chains specifically, as the author recognizes the importance of several costs in an overall supply chain perspective.

Establishing the appropriate metrics for the organization and its supply chain is an essential process that should recur, considering the constant changes that a competitive company undergoes. While we can use the same metrics in an ongoing lean, agile or 'leagile' strategy, the benchmarks should be adjusted accordingly. Myerson (2012) proposes the SCOR model and the Balanced Scorecard as approaches that can encompass the wide array of objectives that supply chain management has to keep in focus. On one hand, the SCOR model has a closed-loop approach, encompassing the following five processes: plan, source, make, deliver and return. On the other hand, we have a Balanced Scorecard view that includes clearly defined perspectives: financial, customer, internal business processes and learning and growth.

Gligor (2016) realizes an empirical study with data from 1360 questionnaire responses from senior managers in supply chains of companies across several industries that have yearly sales surpassing 10 million US dollars. Results confirm the "negative relationship between environmental uncertainty and Supply Chain Fit" and is able to demonstrate how supply chain agility can "mitigate the negative relationship" in order to derive positive financial performance results. The author's definition of Supply Chain Fit (SCF) is based on Fisher's (1997) framework and implies "how the nature of a firm's products matches the firm's supply chain design". The most important learning from this research is that there are several implications of supply chain agility in the process of diminishing the negative impact of uncertainty on SCF. First, the author draws practitioners' attention to the fact that the degree of uncertainty must be an indicator of how much effort should be directed to gaining agility capabilities. Second, the author explains how the concept of SCF is tailored better to industries not associated with market instability as for the opposite category of enterprises it would imply continuous improvements in the SC characteristics that translate into significant financial investments.

Hartini and Ciptomulyono (2015) have constructed a literature review study on the relationship between lean capabilities and sustainable manufacturing and its impact on firm performance. The authors have identified that in the over 50 researches included for review the overwhelming majority have identi-

fied a strong and positive association of lean and sustainable manufacturing, their relationship contributing to firm performance. By far, the most interesting gap in the literature that the authors have identified is the lack of a clear way of measuring exactly how lean a supply chain is. While researchers and practitioners measure the outputs of lean strategies – from waste reduction to inventory management – there is no consensus on a scale for assessing the degree of lean capability a firm has.

Mittal et al. (2017) discuss the implementation of a “lean-green-agile manufacturing system”, a concept fitting to modern requirements and expectations in industry, which enables integration of customer feedback in the design and production flows and supports resource optimization efforts.

Chan et al. (2017) directed their research on agility through the lens of flexibility, split into strategic flexibility and manufacturing flexibility, attempting to empirically assess their contribution to agility capabilities and further to firm performance. With data from over 100 manufacturers in the fashion industry, the authors demonstrate the direct and significant relationship between strategic flexibility and supply chain agility which further impacts firm performance. Their conceptual framework works perfectly for the fashion industry since it puts together market demands for flexibility, such as short life cycles, highly volatile demand and low sales predictability. The study has a closed loop supply chain approach as the authors follow the logic in the fashion market from consumer demand and associated expectations to manufacturing capabilities and means to deliver the product on the market. Thus, agility is considered as a capability that must be reflected throughout the SC and its members in order to yield a positive impact on firm performance. The results conclude that firm performance, measured by means of operational excellence, revenue growth, customers relationships, and financial performance, is directly impacted by strategic flexibility and supply chain agility.

Shou et al. (2017) study the applicability of several supplier and customer integration scenarios, based on organizational information processing theory, aiming to measure the impact of the two integration actions on the operational performance. Starting from a comprehensive literature review of the field, the authors focus on four operational performance (OP) dimensions: quality, flexibility, delivery, and cost, that can be impacted by external integration. The empirical results, derived from the analysis of 791 firms, confirm that Supply

Chain Integration (SCI) is an “information processing system (...) and its effectiveness relies on proper and rational alignment with requirements”. In the context of choosing the supply chain strategy, the combination of an escalation between lean and agile is facilitated by the information from supplier and customer.

Sezhiyan and Nambirajan (2010) measure empirically the impact of several factors on supplier selection such as quality, delivery, price, technical capabilities, and financial position and assess the effort implied to manage the relationship with the supplier. With data from 358 questionnaires filled by logistics professionals, the paper concludes with the assumption that the dynamics of supplier selection and effort management in the relationship with suppliers' impact business performance. To further develop the idea, the present paper implies that an output from supplier selection and relationship can yield a clearer view of what strategy is feasible to apply.

Gligor et al. (2015) have found a specific niche in the research for lean and agile in the fact that the relationship between agility, cost efficiency, and customer effectiveness is not approached. The research covers the gap with an empirical study, relying on data from over 3000 supply chain managers, to test several hypotheses. The results support a direct link between agility and cost efficiency, which encourages “cost-driven firms” to move towards agile and ‘leagile’ strategies. The bottom line is that agile supply chains can subscribe to cost efficiency expectations while customer efficiency is not sacrificed.

Desmet (2018) has researched extensively the financial measures associated with supply chain strategy, focusing on the service, cost and cash perspectives in his empirical studies. The book's chapter “A shift in thinking: from agile to strategy-driven supply chains” explains the ways in which supply chain will be soon becoming “the centerpiece of strategy discussion”. While it is hard, if not impossible, for a company to outperform its competitors simultaneously in cost, service, and product, the author indicates by various example how the strategy of dominating in one area, differentiating in a second and matching competitors in the other areas has the potential to endorse a company for market leadership. Therefore, differentiation is now gaining momentum and will soon become indispensable for aspiring to be the market leader and it will be achievable only by placing supply chain at the core of strategy, rather than having it follow the commercial strategy.

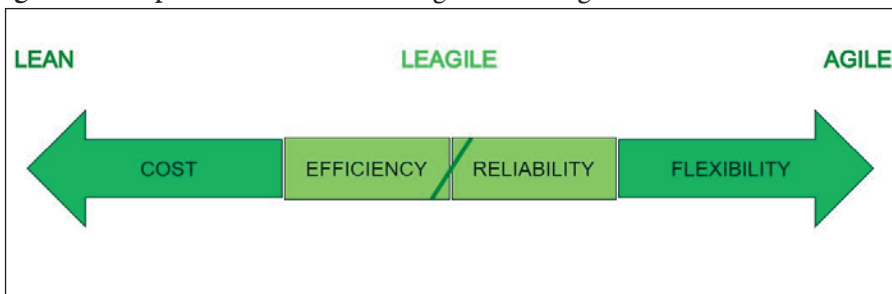

3. CASE STUDY

In this section of our paper, we attempt to construct a structural framework for showing how the choice of lean, agile or 'leagile' strategy is connected to efficiency, cost, flexibility, and reliability. In our framework, we present in a joint manner a collection of knowledge from the most recent literature on supply chain strategies, that we further try to exemplify with corporations that have a global supply chain.

Constructing on Desmet's (2018) assumption that a company's strategy cannot satisfy to a maximum and simultaneously requirements of cost, service, and product, we bring forward the idea that a supply chain cannot, in the same manner, be efficient, cost-effective, flexible and reliable. As a result, we propose that choice of 'leagile' in supply chain management is the equivalent of securing leadership in one, differentiation in another and market qualifying levels in the others, depending on the combination of lean and agile capabilities.

Figure 1 reflects our standing point for the four outputs in relation to the choice of strategy. Efficiency and reliability are represented rather as a middle ground in lean and respectively, agile capabilities since having a market acceptable level come as an order qualifier rather than an order winner criterion. Therefore, we choose to assign efficiency and reliability to a 'leagile' strategy area, where their combination to match market expectations can be achieved successfully. Further, the cost is highly connected to lean and flexibility to agile, which does not imply that they cannot coexist as objectives and results in a company. Our understanding from literature is that while the two outputs are highly associated with one strategy or the other, there is no conclusive empirical study to exclude either of them from achievement between the other strategy.

Figure 1. Outputs Related to Lean, Agile and 'Leagile'

Source: Author's design

Gligor (2016) gives the most eloquent explanation, based on vast empirical research including questionnaires applied to top management in large firms' supply chains, that the level of investment in agility has to be calibrated with the level of flexibility expected of the company by the market. While we cannot exactly transfer this argumentation to the connection between cost reduction and lean, as cost reduction cannot precisely be measured against the market, we can say that a certain level of calibration is required for 'leagility'. More exactly, we argue that for a 'leagile' supply chain, cost reduction should not endanger the flexibility of the company to the extent that it pushes it below the order qualifier criterion.

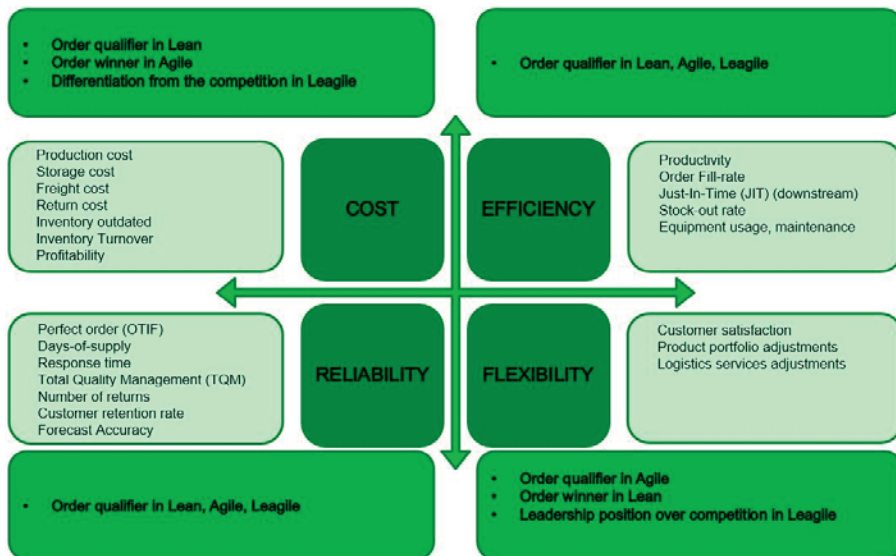

Chan et al. (2017) have concluded that there is a direct and significant impact of supply chain agility and strategic flexibility on firm performance. Throughout their study, the authors underline that agility is a capability that, if truly valuable for a company, is extended both upstream and downstream. As a result, the authors gather the literature views for several types of agility, as follows: "customer agility, operational agility, partnering agility, enterprise agility, organizational agility and supply chain agility". With an outlook on the business strategy as a whole, we argue that while a commercial strategy on its own would distribute resources and flexibility objectives to areas without considering how the resulting supply chain output would match market requirements. Therefore, a joint commercial and supply chain management strategy with lean and agile considered through the various lenses of customers, suppliers, partners, operations and business model, would distribute resources and flexibility objectives to areas that will maximize the potential for achieving order winner criteria and the competitive edge of differentiation.

These two arguments lead us to the point that there are trade-offs between the four outputs, as a supply chain cannot outperform competitors in all of them. However, with such trade-offs being attuned to market expectations, the balance between lean and agile can yield competitive advantages for the firm. A commercial strategy for the supply of a product or service of the company, aligned with its supply chain capabilities, will resonate with customers' expectations and demand. For example, Amazon is a corporation notoriously known for often trading off cost reduction for flexibility, especially upon its rising global popularity. While the company has obviously attempted to maximize cost reduction and efficiency in the downstream supply chain, namely in its internal supply chain, it has not prioritized cost reduction upstream the supply chain.

As a result, their choice of logistic services quality and customer service responsiveness has taken precedence over potential opportunities for cost reduction. In this respect, we can describe this company as a 'leagile' one as it attempted to be the market leader on cost and differentiate itself on flexibility while matching the competitors' efforts in efficiency and reliability.

Considering inputs from the research quoted in the literature review section, the authors have constructed the structural framework summarized in Figure 2. This outline can be employed by both theoreticians and practitioners as an overview of the relationships between the outputs of cost, efficiency, reliability, and flexibility, through several examples of measures, and the strategic outcome compatible.

Figure 2. Structural Framework for Output of Lean, Agile, 'Leagile'

Source: Author's design

In supply chain literature, the cost has been overwhelmingly associated with a lean strategy, although some of the more recent studies have focused on trying to measure the extent to which cost efficiency can be a successful outcome of an agile strategy. Additionally, the literature on the concept of 'leagile' expresses the view that cost and flexibility can coexist and that it is the choice of decoupling point that decides which is the differentiator and which grants leadership in front of the competition.

The study of Chan et al. (2017) gives a persuasive example of how an agile supply chain with high flexibility competences is an order qualifier in the industry of fashion manufacturing. What grants a leadership position in the apparel industry to companies such as the group managed by Inditex is the ability to be flexible in adjusting the portfolio to match the short life cycle and high volatility implied by the market and thus ensure customer satisfaction. A good example can be drawn also by comparing the companies' Apple and Sony responses to changes in how the market for music listening devices has changed. With the launch of the iPod, Apple has taken the leadership position in the industry segment as it was proof of their flexibility to change in order to meet new market expectations. On the other hand, despite persevering in cost, efficiency, and reliability, Sony has managed to shortly survive in the market, followed by the market deeming their Mp3 devices obsolete.

Studies explaining and quantifying reliability and efficiency as results of lean, agile or 'leagile' are not conclusive and lack in empirical research. We have decided to place them in the category of order qualifiers – outputs that the supply chain has to match its competitors – due to the nature of the Key Performance Indicators (KPI) that can be employed. While cost and flexibility can either 'make or break' a company, reliability and efficiency in the supply chain are mostly downstream objectives in supply chain management that are indirectly affecting the end customer. For example, the group of Lidl and Aldi has become successful in European markets due to their differentiation in cost and flexibility in the product range supplied, especially in the product portfolio for own brands. In this context, efficiency and reliability is not a primary focus as their outputs are ordered qualifiers, as long as their values are comparable to competitors in the segment.

To sum up, the case study attempts to employ theoretical and empirical research to explain the synergies between lean, agile and 'leagile' strategies and supply chain outputs related to cost, efficiency, reliability, and flexibility. The author's assumption, based on quoted research, is that a 'leagile' supply chain strategy with cost and flexibility interchanging as differentiator and market leader quality yields the highest competitive advantage in an overall business strategy.

4. CONCLUSION

To conclude, the present paper has employed a thoroughly assessed literature review with research covering several perspectives on lean, agile and 'leagile' strategies, as well as on the cost, efficiency, reliability, and flexibility supply chain outputs. As a result, our case study stands out as a well-informed assessment of the modern strategic requirements from the supply chain perspective.

The added value of our work is the connection realized between research papers subscribing to a wide array of perspectives and qualitative and quantitative results. In the context of continuously increasing the importance of supply chain strategy in the overall business strategy, we believe that only by identifying the need for either lean, agile or 'leagile' and calibrating outputs to have a differentiating and a leading position a company can succeed.

The limitations of our work lie in the absence of an empirical model to assess quantitative data from current literature or to apply our framework to one or multiple supply chain companies' data. Nevertheless, our goal of bringing forward a unified and forward-looking view has been accomplished. Our outlook for future research includes a quantitative case study to assess supply chain output, in the context of the applied strategy, through the measures noted in our structural framework. A starting point for data collection is the list of companies used as examples in this paper.

Abstract

Location is a long-term commitment for a company and choosing the location is an important strategic decision that can have a significant impact on the company's overall performance. Guided by the goal of every entrepreneur for profit-maximizing, different decision-making models have been developed with the ability to use different data to help with the decision-making process and reducing costs. By using a geographic information system (GIS) a company is able to analyze total quantitative information with regard to a particular location. GIS is an IT-based tool that allows gathering, storing and mapping of demographic data. It is an integrated system composed of computer hardware, software, data, and trained staff, all contributing to the creation of geographically informed data. The system's ability to analyze a large amount of various data and their combinations is only one of the reasons for its popularity in location analysis. The purpose of this paper is to point to the fact that for ef-

efficient location management it is necessary to develop a geographic information system considering all factors.

Keywords: location, geographic information system, location analysis.

JEL Classification: M15, R39

1. INTRODUCTION

The location of a business is the environment and a specific place where it is situated. Given that choosing an appropriate location is important for the future of any business, a special location theory has been developed. Its aim is to explain and predict the decisions of a business as to the location of its facilities as well as the spatial arrangement of economic activities as a sum of individual decisions of a business. Location theorists are seeking to include the issue of space in economic theory (Karić, 2009:16).

The aim of the location decision is to achieve an appropriate balance between three related objectives (Slack, 2013:161-162):

- The spatially variable costs of the operation (spatially variable means that something changes with geographical location).
- The service the operation is able to provide to its customers.
- The revenue potential of the operation.

When the selection of the location of a business involves deciding on its external placement, the following categorization of location can be made (Karić, 2009:17):

- Macro location is the interlocal situation, that is, the selection of a location within a larger geographical area (within the national economy)
- Micro-location is the local situation, that is, the selection of a location within a particular area, such as a city or a community.

By using a geographic information system (GIS) a company is able to analyze total quantitative information with regard to a particular location.

The next section of the paper defines the terms location and locating criteria; identifies the benefits and disadvantages of global operations for a company and explains the term geographic information system. In addition, the authors give examples from past research on the possible uses of GIS in analyzing possible

locations and choosing the most appropriate location of a business. The conclusions are presented in section 4 of this paper.

2. LOCATION ANALYSIS

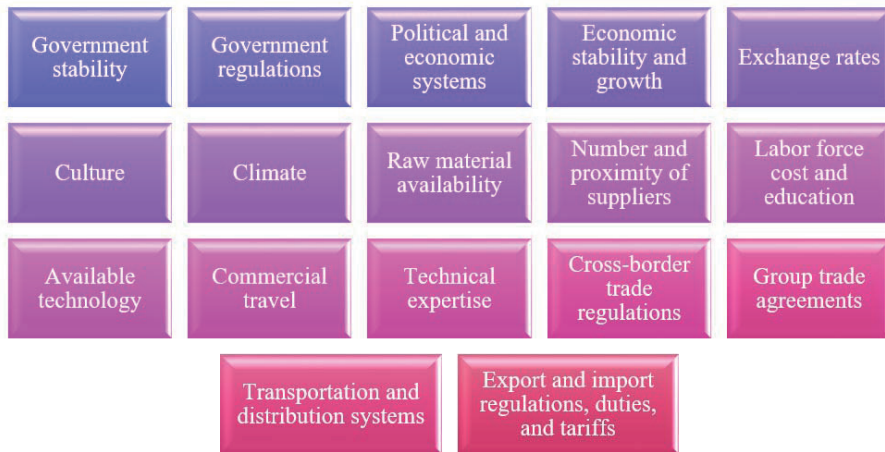

Location is a long-term commitment for a company and choosing the location is an important strategic decision that can have a significant impact on the company's overall performance. Location decisions are closely linked to the organizational strategy. For example, a company that seeks to minimize production costs will select a location where labor and raw material costs are lower or a location in the vicinity of to the target market or raw materials so as to reduce transport costs. If a company seeks to maximize its revenue, it will choose a location with high traffic flow.

Location decisions are strategically important for several reasons. One is that they entail a long-term commitment, making it difficult to correct a sub-optimal choice. Another is that location decisions often have an impact on investment requirements, operating costs and revenues, and operations. A poor choice of location might result in excessive transportation costs, shortage of qualified labor, loss of competitive advantage, inadequate supplies of raw materials, or some similar condition that is detrimental to operations. For services, a poor location could result in a lack of customers and/or high operating costs. For both manufacturing and services, location decisions can have a significant impact on competitive advantage. Another reason for the importance of location decisions is their strategic importance to supply chains. (Stevenson, 2015:338)

Locating criteria are the means for determining the capability of the intended site based on the capabilities of each location according to the type of activity which is considered (Farahbakhsh & Forghani, 2018:3).

Some of the criteria that multinational firms must consider when locating in a foreign country are listed in Figure 1.

Figure 1. Multinational criteria influencing the location

Source: Russel & Taylor III, 2011:299

Some of the criteria that are considered when selecting the part of the country and community for a facility are summarized in Figure 2.

3. LOCATION ANALYSIS USING THE GEOGRAPHIC INFORMATION SYSTEM

IT development has facilitated the emergence of the Geographic Information System as a tool for analyzing possible business locations. GIS is a computerized system for storing, managing, creating, analyzing, integrating, and digitally displaying geographic (i.e., spatial) data. GIS is both a database system as well as a set of operations for working with and analyzing this data (Russel & Taylor, 2011:301).

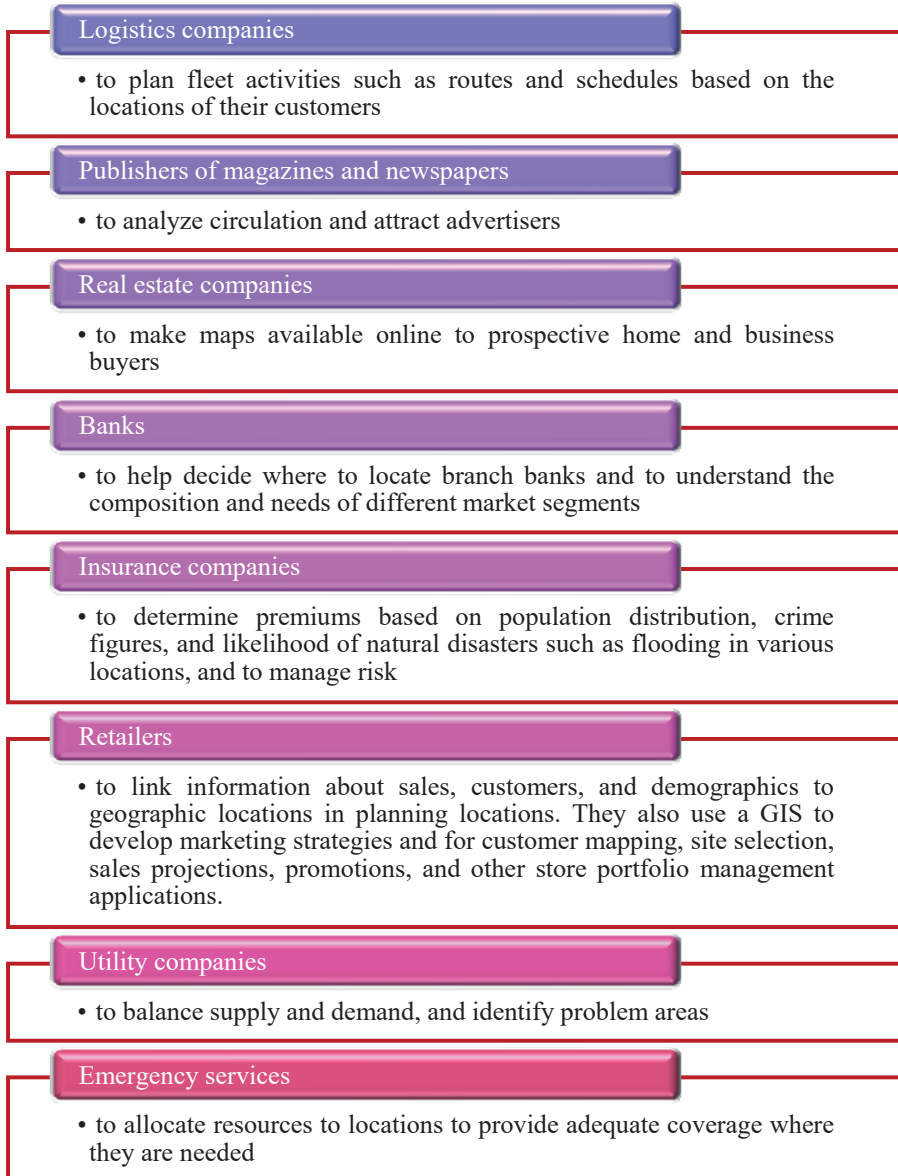

According to Holdstock (2016:147-150), first forms of GIS application can be found in the 1970s, where GIS was used for cartographic principles, map projections, urban and rural geography, physical geography, and human settlement. With further development of GIS software, GIS specialists became more common. For urban planning nowadays GIS can be used for power grid planning, water system development, public transport routes, land allocation for new buildings and planning for emergency services. In modern business, GIS can be used in many different areas, most commonly in route planning, resource allocation, and urban planning. It can also be used for analyzing the market, marketing planning, and cost analysis in project planning.

When selecting a location using GIS, a large amount of quantitative data and information about the potential locations are considered and compared against each other.

The use of GIS in choosing a business location requires making multiple different maps or layers of one map, each representing a piece of data or information characteristic of the location being analyzed. Each layer that might relate to the location selection process is precisely overlaid on the other layers so that their corresponding geographic (spatial, locations) are exactly matched to each other. The bottom layer is a geographic grid that serves as a frame of reference (e.g., latitude and longitude), to which all the other layers are precisely matched. Once these layers of data have been entered into the GIS, information about the layers can be compared and analyzed in combination. Such comparative analyses are frequently in the form of digital computer displays as well as three-dimensional graphs and displays. The GIS may provide just statistical analyses for use in the decision-making process, or it may incorporate one or more quantitative models to provide a recommended decision about a location (Russel & Taylor, 2011:301).

Figure 4 illustrates the possible uses of geographic information systems in business operations (Stevenson, 2015:350).

Figure 4. Possible uses of geographic information systems in business operations

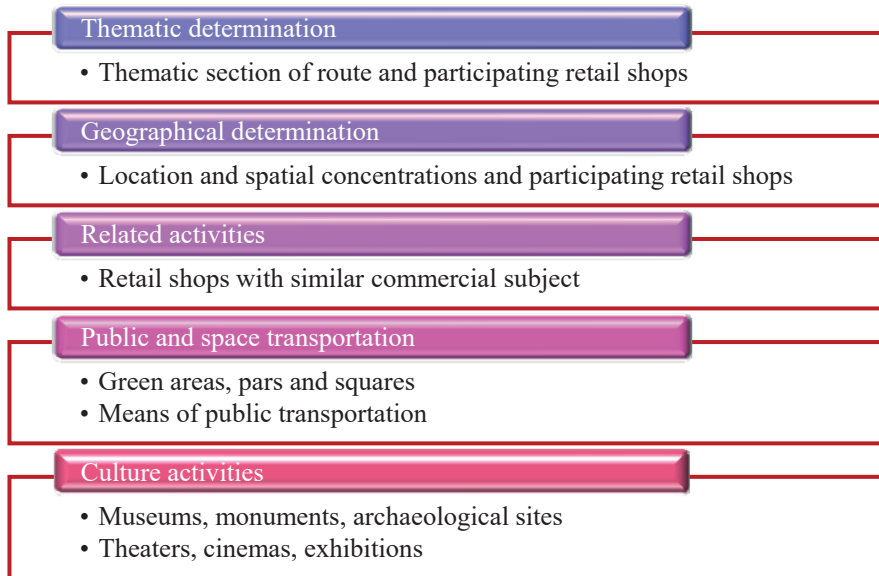

Source: Stevenson, 2015:350

The text that follows contains an overview of past research into the various uses of GIS in analyzing and selecting a business location.

3.1. Business Route Planning Using GIS Technology

Tzima et al. (2017) included spatial analysis method using GIS for the accurate delineation of routes through the combination of quantitative and qualitative criteria, to create a business route to stimulate consumption in small and medium-sized retail stores by integrating shopping with other elements of the city space. Quantitative and qualitative criteria used in the study are summarized in Figure 5.

Figure 5. Quantitative and qualitative criteria

Source: Tzima et al., 2017:277

The factors presented in Figure 5 play an important role in the process of route planning and therefore are selected as criteria for spatial analysis.

More specifically, these criteria correspond to the thematic layers which can be seen in Table 1. For the selection of the final route zone, assigning proper weights to each of the normalized criteria/layers was considered to be indispensable (Table 1).

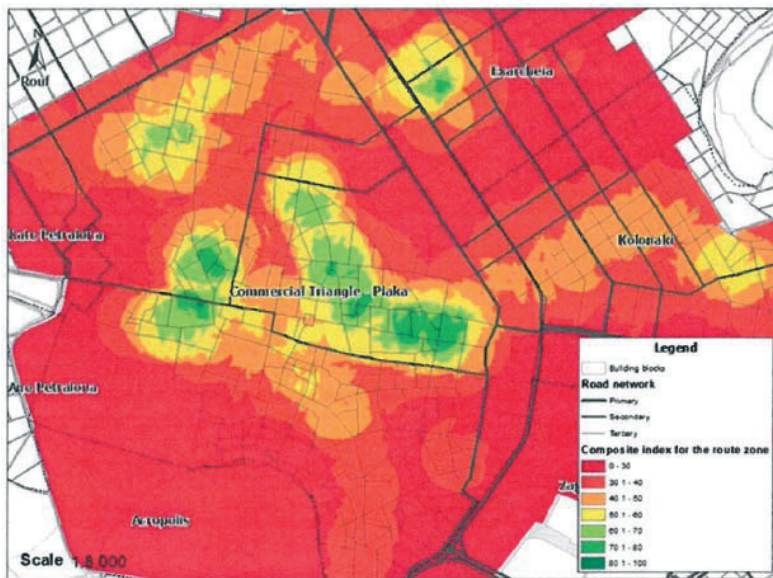

Table 1. Rating of criteria set

Criteria	Weights (%)
The density of retail stores of the main category	50
The density of retail stores of the supplementary category	20
Euclidean distance from green areas and squares	10
Euclidean distance from culture attractions (museums, monuments, archaeological sites), theaters, cinemas, and exhibitions	10
Euclidean distance from stations of public transport	10

Source: Tzima et al., 2017:286

These normalized values of criteria and assigned proper weights were considered for the definition of a final composite index that highlights areas with high suitability for the shopping routes. The resulting layer of the composite index is shown in Figure 6.

Figure 6. The composite index for the determination of the routing zone

Source: Tzima et al., 2017:287

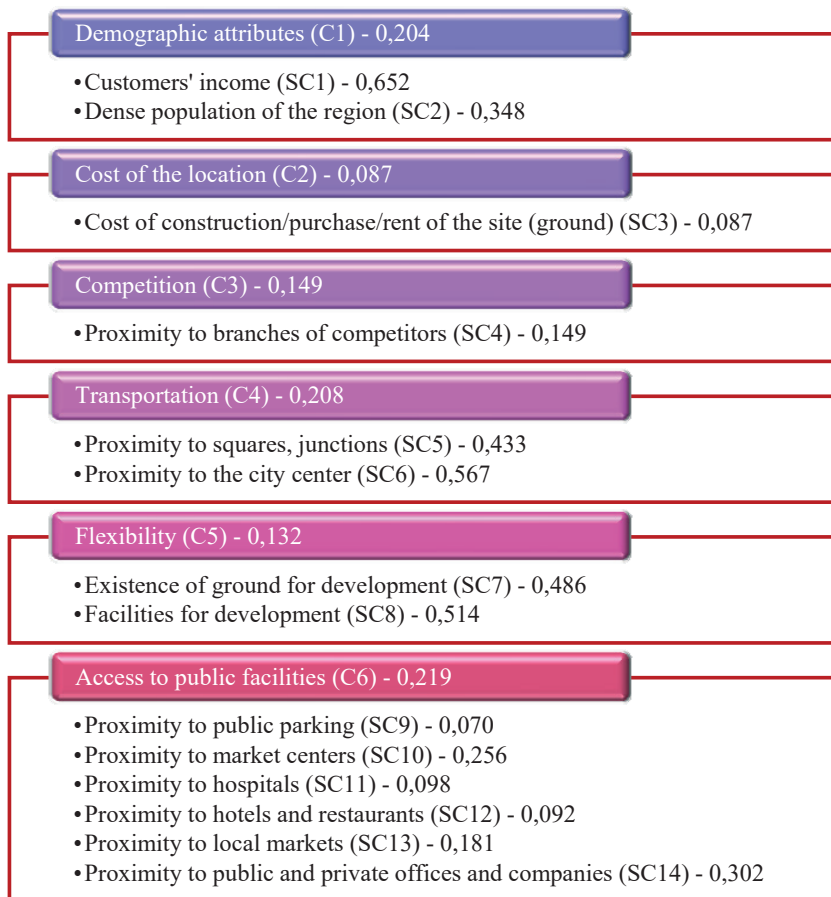

As the value of this index increases (yellow and green colors in Figure 6), the corresponding area becomes more relevant to the route; in other words, the defined criteria are met to a greater extent. On the other hand, the red areas of Figure 6 denote low values of the index and, consequently, they are not suitable for incorporating into the route (Tzima et al., 2017:287-288).

3.2. Selecting an optimal bank branch location

Allahi et al. (2015) provide an integrated model for selecting an optimal bank branch location using available data sources and well-established decision models, specifically Analytic Hierarchy Process (AHP), Geographic Information System (GIS) and Maximal Covering Location Problem (MCLP). That issue is highly important especially for private banks due to vibrant competition, limited budgets and high customer expectations (Allahi et al., 2015:1).

The most commonly used criteria and sub-criteria for branch location are summarized in Figure 7. Criteria and sub-criteria weights were quantified through pair-wise comparison using expert judges, via AHP (Figure 7).

Figure 7. Criteria and sub-criteria for a branch location

Source: Allahi et al., 2015:5

Critical geospatial criteria data for potential sites were determined through ArcGIS software, yielding 10 potential sites. These potential branch locations are illustrated as yellow circle points in Figure 8.

Figure 8. Current locations of bank branches and obtained potential points

Source: Allahi et al., 2015:6

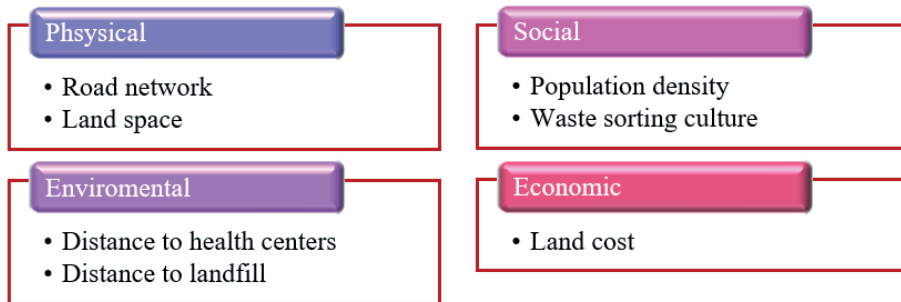

An MCLP model was then developed to maximize demand coverage when there is a limited budget to establish new branches. These results demonstrate the efficiency and applicability of the proposed integrated method.

3.3. Sustainable location and route planning with GIS for waste sorting centers

Farahbakhsh & Forghani (2018) used GIS to present optimal locations for the construction of waste collecting and sorting centers in Kerman, Iran to prevent the loss of existing economic resources in the program context and to avoid the environmental pollution from the burial and dumping waste (Farahbakhsh & Forghani, 2018:12).

Based on the views of five groups of experts from an environmental organization, waste management organization, municipality, economics, and finance organization, and sociology, and their integration with related articles, seven criteria have been selected which can be seen in Figure 9 (Farahbakhsh & Forghani, 2018:4).

Figure 9. Selected seven criteria based on the views of five groups of experts

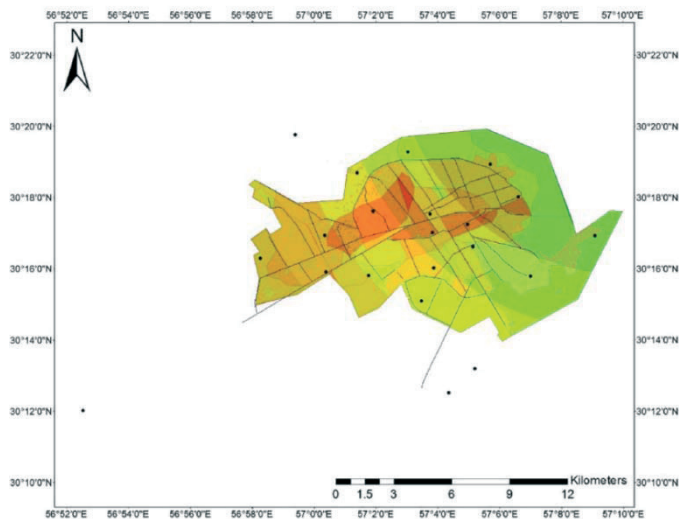

Source: Farahbakhsh & Forghani, 2018:4

The highest degree of importance, with a significant difference, is related to the criterion “waste sorting culture”. After weighing the questionnaire questions by AHP and determining the sample size, using the Cochran’s sample size formula, the layers related to the GIS software were defined according to four urban areas (Farahbakhsh & Forghani, 2018:4).

The final optimal map resulting from casting the maps in accordance with layers based on the weights obtained by the AHP method is shown in Figure 10. Also, 17 optimal points resulting from the final map for establishing sorting centers and four recycling plants in the city are shown in Figure 10.

Figure 10. Final optimal map

Source: Farahbakhsh & Forghani, 2018:9

After determining the optimal points for these locations, it was necessary to serve these locations effectively and efficiently from different aspects, including minimizing costs and distance traveled, reasonable service time, reducing environmental pollution, and full coverage of centers. For this purpose, by using a vehicle routing model, optimal routes for service were identified (Farahbakhsh & Forghani, 2018:13).

Some other examples of GIS usage for location analysis are given in the following part of the paper.

A study by Eunsu et al. (2015) selected the optimal locations for beverage distribution centers, considering transportation cost, travel distance, and frequency of customer visits. Bosch & Rathmann (2018) presented the first study that visualizes spatial dynamics of the expansion of renewable energies considering several technologies and side parameters including social aspects by use of web-based GIS planning tool. They showed how modern GIS planning tools can factor social, ecological and economic parameters into decision making and the ability to quickly change those parameters when considering new data. Droj & Droj (2015) created a GIS model for assessment of the property value using economic and building construction information with the spatial analysis within the city of Oradea, Romania. Using GIS to analyze existing data an assessor can easily approximate and later justify precisely how he estimated the value of a property and which factors are influencing it. Combining the information with economic, financial, and accounting information of some commercial property, the valuation process can be automated. Sanket et al. (2016) presented a model for location and capacity planning of Node B's (Base station for UMTS networks) which are decided with their configuration such as antennae type, power, azimuth, and tilting of the antenna, tower height and locating Node B's in the geographical area. The paper presented a model which would ensure network coverage for all users while planning the network optimally so that network provider should gain an advantage over the competition.

Some business case examples of using GIS for location analysis in Croatia are shown in the following text. Guberina et al. (2018) analyzed the area of activity of each firefighter station, distribution of firefighter interventions and optimal location for deployment of new firefighter stations using GIS software in the city Zagreb. The paper presented the potential for further improvement of the system and a need for creating a universal citywide geoportal that would

help optimize further interventions from emergency services. Tutić et al. (2018) for the first time performed detection of suitable terrain for foot orienteering based on geomorphology and land cover, using multi-criteria land evaluation. The paper used publicly available data and application for land evaluation. The result of the case study gave potentially suitable areas for foot orienteering in Croatia, Slovenia, and neighboring areas. Mladineo et al. (2017) proposed the creation of a Web Multi-Criteria-Analysis-based Decision Support System (DSS) for establishing efficient emergency management using GIS, basing the research on the example of the Adriatic Sea. The basic module for creating the DSS is GIS, which comprises information from different sub-systems and serves the information into the other modules of the DSS. The paper concludes that it is possible to reduce the bad decision rate using visual management in combination with Multi-Criteria Decision-Making (MCDM). Furthermore, it is possible to make the system more understandable for non-expert users. Jurišić et al. (2010) created a map of optimal vineyard using the GIS system as well as relief and satellite images, showing there is more available land for vineyards than it was previously assumed.

4. CONCLUSION

The abundance of various economic, research and social data has led to GIS becoming a very powerful tool in business planning decision making. The GIS enables users to collect, store, integrate, process, analyze and display a large amount of quantitative data and information about potential locations and compare them against each other.

The use of GIS has been rising steadily and many countries now offer open access to their GIS data provided in maps and images. There is a vast amount of detailed information on a range of factors that might be relevant to location analysis. Some of these factors refer to population (density, age, income, ethnicity), and others to infrastructure (transportation resources, utilities, traffic patterns, competitor locations, educational institutions, shopping centers, recreational facilities).

Public availability of data, the existence of simple modern data analysis tools, competent people and the ability to take into account several hundred pieces of different information and their combinations has led to GIS becoming a very popular tool for decision-makers in different areas.

This paper gives an overview of the literature on some possible uses of a geographic information system by businesses and identifies different steps involved in location selection: business route planning, selecting an optimal bank branch location, sustainable location, and route planning for waste sorting centers. The presented works have used publicly available data and applications to create various models that make the location decision-making process easier for contemporary businesses as well as the ability to customize the model to suit future needs.

Examples are given of the use of GIS in Croatia in various areas, e.g., in the valuation of land which is to be used for sporting events, the analysis of land which is to be used for agriculture, and the development of an environmental risk assessment model for the Adriatic Sea.

In spite of the increasing use of GIS as a decision-making tool in different business cases in Croatia, it is evident that the benefits of this technology have not been fully exploited, and that there is room for improvement in the future, which warrants further research.

Abstract

Each manufacturing company strives to make the manufacturing process more effective in order to be competitive in domestic and international markets. One of the basic preconditions for achieving greater efficiency of the manufacturing process is eliminating factors that limit its growth. In order for the manufacturing company to achieve continuity in the manufacturing process, it is necessary to identify and eliminate certain problems that arise in the manufacturing process. Identification of the resulting problems is carried out by constant analysis of the manufacturing process through process flow diagrams, while different problems are resolved in eliminating the same problems. Therefore, the subject of this research identifies the extent to which the underlying problems arise in the realization of the manufacturing process and in what degree of importance they limit the efficiency of the manufacturing process. As the process of identifying and eliminating problems in the manufacturing process aims to improve and accelerate the flow of work items through the manufacturing process, the

underlying problem of this research is to implement ways of eliminating certain problems in the manufacturing process to ensure a higher level of manufacturing process efficiency. It is precisely in science, and thus in everyday practice, that there is a lack of existing research in this area and accordingly there is a need for conducting relevant scientific research. Therefore, for the purpose of this paper, a surveying survey will be conducted in the engineering industry of the Republic of Croatia over 67 large and medium-sized companies whose aim is to identify the problems that may arise and contribute to their elimination through the implementation of business solutions in order to improve the manufacturing process. The first part of the work conceptually analyzes the manufacturing process and its basic elements. The second part of the paper will give an overview of current research and theoretical knowledge of the problems arising in the manufacturing process and their impact on the operations of manufacturing companies. In the third part of the paper, the author will present the results of the research carried out and provide solutions to the problems that arise in order to gain added value necessary to improve the manufacturing process. Concluding considerations will provide a brief overview of the problem of manufacturing process implementation. The paper represents a preliminary phase before carrying out major research that the author will carry out over the coming years in the context of implementing efficient business solutions with the aim of improving the efficiency of the manufacturing process.

Keywords: manufacturing process problems, business solutions, manufacturing process efficiency, machine building

JEL Classification: L69, M29

1. INTRODUCTION

For many years manufacturing companies in the Republic of Croatia are under the scrutiny of economic policy. The reason is that in all countries of the world, including Croatia, manufacturing companies are fundamental drivers of the national economy. However, the driving force of manufacturing companies in the Croatian economy isn't enough because of the insufficient motivating business environment, and due to internal problems, that arise in their business on the other hand. Under these conditions, the effects of manufacturing companies on the Croatian economy aren't sufficient. Besides that, manufacturing companies are increasingly operating in a very complex business environment which requires a high level of flexibility which is the basis for competitive advan-

tage. If manufacturing companies want to be competitive, both in foreign and in domestic markets, it must improve its own manufacturing process in order to accept the demands of end users more easily. There are many ways in which companies can improve their business, such as, for example, the reorganization of human resources, business processes, information flows and documents or work objects, introduction of quality management system, the introduction of various tools and techniques of management, planning or controlling of companies, identification and elimination of the problems, the implementation of new technologies and similar. This paper starts from the fact that the identification and elimination of internal problems are crucial to the continued realization of the manufacturing process, and that the quality approach of solving those problems depends not only on efficiency but also on the effectiveness of the entire company.

Manufacturing is an economic and technical function in which the task is to make manufacturing assortments, dynamics and quantity by using the available manufacturing equipment, labor, technological processes and other manufacturing resources (Mikac, T., Ljubetić, J., 2009, p. 93.). With this concept, the manufacturing can be defined as the economic and social function whose task is to manufacture a certain amount of products with an emphasis on the human factor. Because of achieving the successful realization of the manufacturing process, quality implementation of the planning process of manufacturing is very important, which according to many authors, achieves the following objectives:

- ♦ Quality application of manufacturing program and continuous performance of the manufacturing process (Osmanagic-Bedenik, F., 2002, p. 126.)
- ♦ Materials, machinery, labor and other manufacturing factors connection in order to manage the flow of materials more easily and to use workforce and other resources effectively (Józefowska, J., Ziminiak, A., 2008, p. 109.)
- ♦ At the time manufacturing of quality products at minimum cost in the required quantity (Cigula, M., 2002, p. 195).

According to Everett, Adam and Ebert (1992, p. 5), the manufacturing process is seen as part of an organization which acts with the purpose of manufacturing organizational needs. However, the question arising is what are the differences in the manufacturing process of organizations such as manufactur-

ing companies, financial institutions, and health institutions? The only difference is in the transformation process. In manufacturing companies inputs are used in the transformation process and converted into finished products and include feedback connections between all procedures within the manufacturing system. Once the products and services are manufactured they are turned into the money which requires more inputs which tries to maintain a continuous transformation process.

According to Slack, Chambers and Johnston (2001, p. 3), the manufacturing process can be defined as a set of operations through which inputs are transformed into outputs in order to meet consumer needs. In the manufacturing process, the model input-transformation-output is confirmed. Input in the manufacturing process can be classified according to Slack, Chambers and Johnston (2001, p. 3) as:

- *Transformed resources*, i.e. the resources that are transformed into semi-finished or finished products (materials, information and consumer needs)
- *Transforming resources*, resources based on which transformed resources arise (facilities and human resources).

The purpose of the transformation process in manufacturing is to use transformed resources in order to obtain finished goods. According to Slack, Chambers and Johnston (2001, p. 3), there is:

- *Materials processing* comprises operations of transforming the physical characteristics of materials,
- *Information processing* includes operations that elaborate information used in the manufacturing process,
- *Consumer needs processing* comprises operations which consumer's needs transform into finished goods.

Outputs of the transformation process are products and services that have certain characteristics such as tangibility, storability, transportability, timeliness, customer contacts, and quality.

Besides, the successful realization of the manufacturing process also depends on making quality and timely decisions by managers which are based on manufacturing plans (basic or annual, dynamics annual, dynamic sliding, quarterly, monthly or operational, forward or weekly). In manufacturing plans,

the manufacturing process is elaborated in details in a way to determine who, when and how performs a particular job. Each plan includes a certain period of time to ensure the achievement and respect of the manufacturing objectives mentioned above.

On the other hand, the effectiveness of the manufacturing process shows the results of the successful realization of the manufacturing process which shows in which direction its operations are carried out. According to this definition, the effectiveness of the manufacturing process is the ability of companies to manufacture the greatest possible amount of products. When this definition is applied, then we can talk about the overall effectiveness of the manufacturing process. In fact, in recent time, in addition to the overall effectiveness of the manufacturing process, partial, organizational and operational effectiveness is observed. Partial effectiveness examines the effectiveness of each element used in the manufacturing process. The aim of the partial effectiveness is to determine and control the effectiveness of each element of the manufacturing process. For example, if you evaluate the work of humans, then determining their effectiveness has the aim of reward with respect to the realized effect in the manufacturing process. According to Zheng et al. (2010, p. 767.), organizational effectiveness refers to a degree to which company's set of goals are achieved, while according to Ewyku (2001, p. 257-259.), operational effectiveness refers to a specific experience that enables the company better use of their inputs, for example, to reduce damages in products or to develop products as quickly as possible.

However, manufacturing companies today operate in a very dynamic business environment that puts them in front of numerous challenges and requirements that they must meet in order to be successful on the domestic and international markets. Therefore, manufacturing companies must strive to achieve a higher degree of flexibility in order to overcome all market barriers. Nevertheless, besides factors from the external environment, a company's performance is influenced by factors of the internal environment which are under the control of the companies. One of these factors is the organization of the business within the organization of the manufacturing process is the most important. Although the companies tend to use the quality organization of the manufacturing process, during the course of the manufacturing process, different internal problems can occur that cause certain distortions in its realization.

Therefore, the most important for manufacturing companies is to timely identify problems that commonly occur in the manufacturing process as well as approaches for their permanent and quality elimination. This area has not been significantly explored up to now. The reason is that in most industries, the information about the problems in manufacturing are unavailable because a large number of companies believes that it should be confidential in order to avoid negative company's perceptions in the public and thus loss of existing and potential customers in markets served. Therefore, there is a need to conduct this study in order to identify originated problems in the manufacturing process and to offer ways to resolve them with the aim of improving business, and thus achieving a better competitive position of manufacturing companies in engineering.

As previously stated, manufacturing companies have access to different business solutions that can be used as a goal to eliminate the problems in the manufacturing process, and thus to improve the manufacturing process. Today, customer' demands are more complex and should be executed in the shortest possible time so companies are forced to implement a number of business solutions in order to be flexible and competitive in the domestic and international markets. Therefore, the implementation of a number of business solutions isn't an easy job because it requires the reorganization of own business which includes changes in the current organizational approach, additional training of workers, the adjustment of workers to modern ways of performing tasks assigned, changes in the organization of jobs, reorganization of the communication process, completely different way of thinking, the reorganization of manufacturing activities, etc. However, the goal of quality implementation of business solutions is to eliminate the problems that result in the manufacturing process, whereby continuity in the realization of the same is achieved. Since with the implementation of business solutions, manufacturing companies seek to improve the manufacturing process through the elimination of problems in the manufacturing process, the subject of this research is based on identifying the degree of importance of the fundamental problems that arise during the implementation of the manufacturing process and in what degree of the importance they limit the growth of effectiveness of the manufacturing process. As it is expected, the frequent occurrence of various problems disrupts the continuous execution of the manufacturing process, In that regard, it is necessary to examine the pre-defined research subject and problem and accordingly it is necessary to achieve the following objectives:

- ✦ Identify underlying problems that occur in the manufacturing process,
- ✦ Determine which way the problems in the manufacturing process affect the efficiency of manufacturing companies,
- ✦ Offer solutions to the occurred problems by applying business solutions,
- ✦ Determine which way solving problems in the manufacturing process affects the improvement of the same.

From the research mentioned before, from literature review and analysis in the field of manufacturing it can be concluded that there is still enough room for new research. In this sense, it is considered significant, by research, to identify the degree of importance of the appearance of the fundamental problems that arise during the implementation of the numerous manufacturing processes and to present ways to resolve them through the implementation of numerous business solutions. However, it isn't an issue whether the problems in the manufacturing process are present but it is important to emphasize in which way companies approach to their solution. In this paper, the emphasis is placed on ways to resolve identified problems so in the remainder of this paper the underlying problems that commonly occur in the manufacturing process will be shown.

2. OVERVIEW OF THE PREVIOUS RESEARCH

During the realization of the manufacturing process, companies are often faced with numerous problems which disrupt the continuity of the process. Therefore, the companies needed to identify each generated problem and access to their permanent elimination. In order for the company to perform it successfully, it must analyze the manufacturing process constantly through process flowchart which provides detailed knowledge of the structure and reason for the cause of the problems and its impact on the business. On the other hand, companies should eliminate identified problems by applying different techniques and methods which are supported by numerous technological improvements. For this purpose, in the following paper problems that arise in the realization of the manufacturing process are stated and, in this respect, it is important to highlight that the same are differently present among industries.

Thus, in the manufacturing process, there is a problem of *over manufacturing that can't be placed in the market*. Besides the problem, Sisko-Kulis and Grubisic (2010, p. 165) the same defined as manufacturing wastage under which they

imply also the creation of documents that nobody demands, or which will not be even used for sending instructions for too many people or vice versa. In the company, the occurrence of this problem increases the number of inventories of finished goods which encumber business of the companies and make manufacturing inefficient.

Furthermore, according to Grubisic and Mateljak (2011, p. 46) in the manufacturing, there is also a problem of *high inventories of semi-finished goods in a process* which is typical for companies that have interrupted manufacturing process type. Inventories of semi-finished goods in this type of manufacturing process spend 90-95% of the time waiting to be processed which causes the occurrence of idle time of machinery, bottlenecks, waiting, extension of the manufacturing cycle, high days sales of inventory, low inventory turnover rate and the possibility of failure to meet an agreed delivery deadline. This problem companies often solve by acquiring additional capacity which will manufacture a particular product faster and which will reduce waiting, but, on the other hand, it causes an increase in operating costs which affect the growth of product prices, the decline in competitiveness, reduction of capacity utilization and a fall in operating revenues.

Zülch and Rootinger (2007, p. 273-274.) point out that in the manufacturing process problems may occur, such as various forms of waiting, the slowness or the occurrence of errors while cutting material based on prescribed dimensions as well as a jam of manufacturing equipment. Waiting for that occur during the manufacturing process are primarily related to *workers' waiting for machines or for the material and machines' waiting for workers or for the material*. With this kind of waiting, Chen and others (2009, p. 1465) emphasize *waiting for materials to be processed due to the occupation of workers or machines in the manufacturing line*, which results in the problem of manufacturing line balancing. All types of waiting mentioned above cause the extension of the manufacturing cycle, failure to comply with the delivery time, low productivity, high days sales of inventory and low inventory turnover rate. Furthermore, *slowness in material cutting* causes the extension of manufacturing process cycle time and non-compliance in delivery time, while the occurrence of *defects in material cutting* causes the fallout formation and low efficiency of the manufacturing process. According to the same authors, *delays of manufacturing equipment* caused by the delays in the execution of the manufacturing process, such as incorrect launched work orders, wrong work mode, failure to comply with the order of operations, wrong tools

assigned, an error in the machine calibration, insufficient instruction of the operation executor, wrong types or quality of raw materials, cause low productivity, increased operating costs and decrease in efficiency and effectiveness of the manufacturing company. In addition, also the same authors point out that the introduction of new technologies in the early stages cause low profitability because workers don't have experience of working with the same which results in a greater number of interruptions. When the new manufacturing equipment is implemented quality, profitability grows because the number of interruptions reduces, while at the end of manufacturing equipment life cycle profitability decreases again due to wear of the same.

Furthermore, in his article are Bouchrihi, Ouhimmou and D'Amoursu (2007, p. 319-325.) have identified that in paper production, machines often encountered with problems of *bottlenecks* which is the result of inefficient manufacturing planning, lower levels of resource utilization and high costs of machines and supplies repairation. According to Slack et al (2006, p. 34-48.) reason for the bottleneck's occurrence is a capacity incompatibility with the manufacturing process time, and weak the operation of the manufacturing process and poor permeable power of the work objects through the manufacturing process. Manufacturing bottlenecks is a manufacturing stage, that area of work, machine, facility, device or tool for the work that enables the use of all available resources completely. Process bottlenecks cause certain group delays in the processing of objects due to the queuing delay which causes an increase in manufacturing cycle time (Dennis, P., 2007, p. 35-50.). As stated in the study (Rajagopalan & Yu, 2001, pp. 366-370.) the reason for the machine delay on the object processing delay is in a situation where a machine which is at work center at the same time receives a greater number of different items that need to be processed in batches. This means that the company doesn't have sufficient capacity available. The delay of the machine in object processing results in longer manufacturing cycle which could result in sales loss and in manufacturing order (order consumers) it can cause delays, waiting and non-compliance with the delivery time. Away from bottlenecks, authors in the same article cited (Bouchrihi, Ouhimmou & D'Amours, 2007, p. 325-327.) that in the same industry the problem of *limited manufacturing capacity* often arises since they are adapted to a predetermined demand for products. This is because companies in the paper industry cannot have excess capacity because of high maintenance costs. The problem arises when demand exceeds manufacturing capacity. In that case, the

company cannot fulfill all consumers' requirements and there isn't an increase in sales, income and market share. However, the problem may also arise when the actual demand is less than the size of capacity. In that case, the company will meet all the consumers' requirements, but it will have excess capacity which increases the cost of doing business, and therefore the sale price. The increase in the products selling price causes dissatisfaction among customers which also results in the loss of sales due to falling demand for that product. The problem may also arise when the actual demand is less than the size of capacity. In this case, the company will meet all the requirements of consumers but will have excess capacity which increases the cost of doing business, and therefore the sale price. The increase in the product sale price causes dissatisfaction among customers which also results in the loss of sales due to a decrease in demand for that product.

Next problem in the manufacturing process is linked to the *obsolescence of manufacturing equipment*. Manufacturing equipment should have the characteristics determined by-products which are manufactured and processes that need to be executed. What will be its efficiency depends on the degree of its obsolescence? With newer manufacturing equipment company is able, with current manufacturing, to manufacture new, more sophisticated products. With outdated equipment, it can only manufacture obsolete products. When a company has outdated manufacturing equipment, breakdowns are becoming increasingly common which causes the same delays of the entire manufacturing plant, and thus the manufacturing cycle is extended. In addition, frequent breakdowns or manufacturing equipment failures, cause a lower level of equipment yield in manufacturing and lower level of capacity use due to frequent maintenance of the same (Catay et. al., 2003, p. 1350-1355.).

All problems previously identified that arise during the realization of the manufacturing process, are present differently in industries. Therefore, in the following paper, the results of the study will be presented in order to determine which problems are the most common obstacles for companies in increasing the efficiency of the manufacturing process. Besides, this paper will also provide business solutions with the aim of increasing effectiveness as well as the competitiveness of companies in domestic and international markets.

3. RESEARCH RESULTS

3.1. RESEARCH METHODOLOGY

Identifying problems in the manufacturing process was carried out among manufacturing companies in engineering in the Republic of Croatia. Engineering was chosen because it is a type of manufacturing business in which planning process of manufacturing activities is very complex, as well as a realization of the manufacturing process, so there is a high probability of manufacturing problems than in other industries. The survey was conducted over six manufacturing companies according to the criterion of complexity and quality of the products, the success in domestic and international markets and absolute market share. The survey was conducted among the directors or managers of manufacturing of six manufacturing companies in the period from 01. 02. 2019 to 03. 01. 2019. via questionnaire. Questionnaires were electronically sent and it consisted out of three parts:

- The first part related to the basic information about the company, such as company's legal form, ownership structure, company size according to the number of employees and type of manufacturing process according to the material course,
- The second part examined the frequency of the fundamental problems in the manufacturing process, and
- The third part related to the identification of problems that limit the growth of effectiveness

Data analysis was performed using the statistical package SPSS 17.0. The methods that were used were:

- descriptive statistics for describing variables such as the company's legal form, the ownership structure of the company, company size according to the number of employees and type of manufacturing process according to the material course,
- The mean values for the calculation of the average grade of problems in the manufacturing process for investigated companies.

The data processed were used to identify the main problems in the manufacturing process and for determining their degree of incidence. Besides that, the same data are the basis for making business solutions with a goal to eliminate or to mitigate the manufacturing problems. As stated before, the study included

fifteen fundamental problems that most frequently occur in the manufacturing process, such as: over manufacturing, high inventories of semi-finished in the manufacturing process, idle machine/ machinery / manufacturing plant, manufacturing bottlenecks, workers' waiting on machines, workers' waiting for raw materials and materials, machines' waiting for workers, waiting for materials to be processed due to the worker's occupation, waiting for materials to be processed due to the worker's occupation due to occupation of machines, slowness in materials cutting, the occurrence of errors while cutting materials, manufacturing equipment jam, limited manufacturing capacity and obsolescence of manufacturing equipment.

3.2. THE BASIC CHARACTERISTIC OF THE ANALYZED COMPANIES

The first characteristic analyzed was the legal form according to the criteria of the capital company. According to this criterion, in the Republic of Croatia, there are limited liability companies (Ltd.) and Joint stock companies (JSC.). In this research, both legal forms were analyzed and presented in Table 1.

Table 1 Legal form of the companies

Legal form	Number of companies	(%)
Limited liability company (Ltd.)	3	50
And Joint stock companies (JSC.)	3	50
Total	6	100,00

Source: Authors

From Table 1 it can be seen that research included 3 (50%) limited liability companies (Ltd.) and 3 (50%) joint stock companies (JSC.), i.e. both legal forms have equal presence.

Second analyzed characteristic was the ownership structure of a company that was classified into six types, namely foreign private ownership, domestic private ownership, foreign and domestic private ownership, and private labor ownership, mostly state-owned and mixed ownership (state and private). The results of the research of the selected companies according to this characteristic are shown in Table 2.

Table 2 Ownership structure of the companies

Company's size	Number of companies	(%)
Foreign private ownership	0	0
Domestic private ownership	2	33
Foreign and domestic private ownership	3	50
Private labor ownership	1	17
Mostly state-owned	0	0
Mixed ownership (state and private)	0	0
Total	6	100

Source: Authors

From Table 2 it can be concluded that 2 (33%) companies were domestic private-owned companies, 3 (50%) were foreign and domestic private-owned and 1 (17%) was a private labor-owned company. The rest of the ownership structure wasn't present in this research.

The third characteristic covered by this research was the *size of the company based on the number of employees*. According to this criterion, in the Republic of Croatia, there are three companies: small, medium and large. In this study, medium (50-249 employees) and large companies (250 employees and more) were analyzed and presented in Table 3.

Table 3 The Company's size in engineering

Company's size	Number of companies	(%)
Medium (50-249)	3	50
Large (250 and more)	3	50
Total	6	100,00

Source: Authors

From Table 3, it can be seen that the research covered 3 medium-size companies (50%) and 3 large size companies (50%) i.e. both groups of companies have equal presence

The fourth characteristic according to which companies were analyzed was the *type of manufacturing process*. Three types of manufacturing processes are distinguished based on material flow: continuous, batch and project system and for the researched companies are shown in Table 4,

Table 4 Companies based on the type of manufacturing process

Type of the manufacturing process	Number of companies	(%)
Continuous system	0	0
Batch system	2	33
Project system	4	67
Total	29	100,0

Source: Authors

Table 4 shows that the largest number of companies has a project manufacturing system (4 companies or 67%, while 2 companies or 33% have batch manufacturing system. The continuous manufacturing system isn't present in any researched company.

3.3. THE FREQUENCY OF THE FUNDAMENTAL PROBLEMS IN THE MANUFACTURING PROCESS

After analysis and based on the previous characteristics in the paper following the frequency of the fundamental problems in the manufacturing process will be presented. Fundamental problems are defined with fifteen problems that most frequently appear in the manufacturing process. Using a questionnaire, researched companies had an option to evaluate each problem according to the degree of occurrence in their company by giving graded 1 to 5, where 1= don't appear at all, 2= partially don't appear, 3= nor they don't appear or nor they do appear, 4 = partially appear, 5 = fully appear. All companies successfully answered this part of the questionnaire. The frequency of the fundamental problems will be determined by the average grade between researched companies categorizing them into two degrees: lower and higher frequency degree frequency. Lower frequency degree covers an interval of average grades 1 to 2, 5 while a higher level of frequency covers an interval of average grades 2, 51 to 5. Research results of the average value of the frequency grades of the fundamental problems in the manufacturing process are presented in Table 5.

Table 5 Average value of the frequency grades of the fundamental problems in the manufacturing process

Problems	Average value
Over manufacturing	1,83
High inventories of semi-finished goods in the manufacturing process	1,83
Idle time of machine/ machinery / manufacturing plant	3,17
Bottlenecks	3,67
Workers' waiting on the machines	2,17
Workers' waiting for raw material or for the material	2,33
Machines' waiting for workers	2,00
Machines' waiting for raw materials and materials	2,00
Waiting for materials to be processed due to the worker's occupation	3,00
Waiting for materials to be processed due to the occupation of machines	2,67
Slowness in materials cutting	3,00
The occurrence of errors while cutting materials	2,17
Delays in manufacturing equipment	1,83
Limited manufacturing capacity	3,83
Outdated manufacturing equipment	2,50

Source: Authors

From Table 5 it can be seen that there are 9 fundamental problems with a low frequency of occurrence in the manufacturing process. According to the calculated average values, that category includes over manufacturing (1,83), high inventories of semi-finished goods in manufacturing process (1,83), workers' waiting on the machines (2,17), workers' waiting for raw material or for the material (2,33), machines' waiting for workers (2,00), machines' waiting for raw materials and materials (2,00), the occurrence of errors while cutting materials (2,17), delays of manufacturing equipment (1,83), outdated manufacturing equipment (2,50). When analyzing in details it can be concluded that problems with lowest average grade (1, 83) appear at least such as over manufacturing, high inventories of semi-finished goods in the manufacturing process and delays of manufacturing equipment. The highest average grade (2, 50) at this degree has outdated manufacturing equipment and it is the boundary problem between low and high degree. In order for companies to mitigate or eliminate problems of outdated manufacturing equipment it is necessary to replace the existing with modern and technologically advanced manufacturing equipment which can be achieved by using EU funds ((Module: Construction and equipping production capacity), favorable credit lines by credit institutions (mostly

state-owned) where the cost of financing should be less than 1%, combination of self-financing and credit lines assuming the exempt from payment of various tax burdens (corporate tax, etc.) at the level of own invested funds that can be refunded in one or more years (depending on the company's financial results). By applying business decision with a goal of modernization, the costs of doing the business would be decreased, productivity would be increased, inventory turnover rate would be higher, high days sales of inventory and scraps would be decreased and delivery time would be respected which means better competitive position on the domestic and international markets at the end.

On the other hand, there are 6 problems with a high frequency of occurrence. According to the calculated average values, that category includes: idle time of machine/ machinery / manufacturing plant (3,17), bottlenecks (3,67), waiting for materials to be processed due to the worker's occupation (3,00), waiting for materials to be processed due to the occupation of machines (2,67), slowness in materials cutting (3,00) and limited manufacturing capacity (3,83).

When analyzing in details it can be concluded that problems of waiting for materials to be processed due to the occupation of machines appear with the lowest frequency of appearance in the manufacturing process (2,67) while problems of limited manufacturing capacity have a high frequency of appearance (3,83) which means that it is constantly present. Problems of limited manufacturing capacity appear in the case when the company can't fulfill the overall demand for its products with the existing capacity level because it has a problem with the additional capacity increase. The problem of increasing the existing capacity level can be from a financial and spatial perspective. The financial aspect implies the value of the investment needed for realization of additional capacity taking into account company's financial capabilities, while the spatial aspect implies the possibility of extending the existing spatial infrastructure at an existing or new location. In some cases, the appearance of the problems of limited capacity can be a reason for financial or spatial investment. On the other hand, the increase in the existing manufacturing capacity causes additional costs of doing the business. Therefore, when increasing existing manufacturing capacities, the company should take into account the time period of higher demand compared to existing manufacturing capacity. If the company anticipates that the demand for existing products will be higher than the existing capacity level in the long run, then it is worthwhile investing in the purchase/ expansion of the existing manufacturing capacity, whereby it will be able to meet the increased demand

for its own products, in the long run, thereby enabling additional operating revenues to finance the costs due to the increase in existing manufacturing capacity. If company anticipates the demand for existing products will be higher than the existing capacity level in the short for the company isn't worthwhile investing in the purchase/ expansion of the existing manufacturing capacity because it will fulfill increased demand for its own products in the short run thereby enabling additional operating revenues in the short run which will be insufficient to finance the total costs due to the increase in existing manufacturing capacity. Since the expansion of manufacturing capacity is one of the tangible fixed assets that are long-term depreciated, the company will be able to finance the additional cost of doing business only in the short term (until the demand is higher than existing capacity), while the rest of the period (demand is less than existing capacity levels) the company will need to be financed from its own operations without additional operating revenues. If the company decides on expanding the existing manufacturing capacity in a situation where the demand for existing products in the short term is higher than the existing level of capacity, then there will be an increase in operating costs, increase in the selling price of the final product (if the company doesn't lower margin), decrease in income because buyers will buy the product if it is cheaper at the competition, decrease in market share, decrease in competitiveness and decrease in profit (if achieved previously) or greater loss (if achieved previously). The problem of limited manufacturing capacity when the demand for existing products in the short term will be higher than the existing level of capacity, the company solves by applying the model of subcontracting/ co-operation where the operating costs in the short term are transferred to the subcontractor. In this case, there is no need for purchasing additional capacity, there is no increase in the cost of operations and with subcontractors, it is negotiating a distribution rate of the work done. The rate of distribution of the performed work needs to be in greater value for the sub-contractor as it bears the costs for the work done, and in a lesser value for business owners, because the operating costs of the work done are transferred to the sub-contractor and exercise mostly net profit.

3.4. IDENTIFICATION OF THE PROBLEMS THAT LIMIT THE GROWTH OF EFFECTIVENESS OF THE MANUFACTURING COMPANIES

Manufacturing companies in their business constantly want to achieve a better competitive position in domestic and international markets. Achieving

better competitive position manufacturing companies seek to achieve by better organization of the manufacturing process and all other supporting activities. For that purpose, each company for measuring business success takes certain indicators of efficiency and effectiveness. Since in this paper emphasis is on the manufacturing process efficiency, in the paper following a certain limiting factor of effectiveness will be given observed through four indicators: the productivity, inventory turnover rate, the percentage of scraps and delivery time. Limitation factors imply factors that appear during the manufacturing process realization and prevent manufacturing growth and inventory turnover rate and enable scraps appearance and cause failure to complete the delivery deadline.

When identifying factors that limit productivity growth¹ scale with ranges from 1 to 6 was used where 1 is assigned to the most important factor, and grade 6 least significant factors. After conducting the questionnaire and processing the collected data in Table 6 the average size of the ranks of the factors that limit productivity growth is represented

Table 6 Factors that limit the productivity growth

Factor	Average rank
Outdated equipment	5,00
Insufficient stimulation of workers	3,67
Poor quality of work organization	2,67
Insufficient skills of the workforce	3,00
Unclearly defined manufacturing tasks	4,00
Insufficient interaction between workers in manufacturing and manufacturing manager	4,17

Source: Authors

As presented in Table 6, according to the calculated grades of average rank, the factor that influences mostly the limitations of productivity growth is the poor quality of work organization (2, 67). Poor quality of work organization means an insufficient level of work organization in the manufacturing process which isn't consistent with the complexity level of the manufacturing process. Poor quality of work organization causes waiting for's, delays, bottlenecks,

¹ Productivity is an indicator that measures the output compared to the input. Most often the ratio is calculated of the final products (output) and the investment of factor (input). This indicator can also be calculated using working methods, subsistence-conditional methods and value methods. There are a total productivity and partial productivity. The company strives to achieve the greatest possible productivity indicators.

which impacts the decrease of the number of manufactured products with the existing level of the workforce or work hours which would case the lower productivity. This factor can be mitigated or eliminated by harmonizing the work organization with the complexity of the manufacturing process realization, identifying the required quantities of the corresponding work (degree of work complexity), the period during which the work needs to be performed, what is the degree of organization and level of technical equipped of the manufacturing process, what is the amount of workers necessary for the manufacturing to be realized in phases of the manufacturing process, determination of the available working time fund per worker and other documentation related to organization and systematization of workplaces, manufacturing plan in which its volume is expressed, the required amount of labor consumption and the degree of labor force qualification per unit (the normative of labor consumption), the degree of norms' enforcement (shortfall and transfer of norms), the total fund of working time per worker, for example the number of working hours of workers during the year and the level of utilization of the fund. Furthermore, other factors that limit productivity growth according to lesser importance are insufficient skills of the workforce (3.0), insufficient stimulation of workers (3.67), unclearly defined manufacturing tasks (4.0) and insufficient interaction between workers in manufacturing and manufacturing manager (4.17). In productivity, a factor that at least affects productivity growth limitation is outdated equipment (5.0). Apart from these factors, researched companies have indicated that self-management mentality of partial workers and managers, as an additional factor also affects the productivity growth of researched companies.

After analyzing productivity, in the further analysis which factors / mostly limit/inventory turnover will be examined ² as the second indicator of effectiveness. When identifying factors that limit the growth of inventory turnover scale with ranges from 1 to 4 was used where 1 is assigned to the most important factor, and grade 4 least significant factors. Processing the collected data results were obtained and shown in Table 7.

² Inventory turnover rate or activity ratio, the ratio of income from sales of products (TR) and stock. This indicator shows how many stocks reverse (turned) in a calendar year. The company strives to achieve the highest possible value of this indicator, as this affects the lower level of stock in the company, which releases a larger amount of working capital. The goal of every manufacturing company is to maximize this indicator.

Table 7 Factors that limit the growth of inventory turnover rate

Factor	Average rank
A long period of high-value stocks standing in the warehouse	2,50
Low-quality stocks	3,33
Keeping unnecessary stocks	2,83
Long manufacturing cycle	2,33

Source: Authors

From Table 7 it can be seen that factor that mostly limits the growth of inventory turnover rate is long manufacturing cycle with an average rank of 2, 33. Long manufacturing cycle implies the business situation in which the company needs a longer time to manufacture the final product. If the company has a long manufacturing cycle, it will have higher days sales of inventory and low inventory turnover rate which causes longer delays of stock. In that case, manufacturing companies must maintain the same inventories which causes additional costs (insurance cost, the eventual rental costs, cooling system cost (if it is about stocks with a defined expiration date), i.e. cost of maintaining stocks functional) and inability of lowering prices of the final product, increase revenues, achieving better financial results and a better competitive position. In such situation, manufacturing companies should strive to shorten the manufacturing cycle period in such a way that, first through a flow diagram show the order of execution of manufacturing activities and decide that certain manufacturing activities will completely eliminate (activities that don't create added value and aren't necessary for execution the manufacturing), while the time for the execution of certain manufacturing activities will be shortened (activities that don't create added value, and are necessary for execution of the production and for the activities that create added value). Shortening the manufacturing cycle time companies will achieve in a way that all waiting, delays, idles and bottlenecks in the manufacturing process will be eliminated. In that way manufacturing cycle time will be shortened, days sales of inventory will be reduced, inventory turnover will be increased, maintenance stocks' costs will be reduced and prerequisites for lowering selling price will be created in order to achieve a better competitive position on the markets. Factors that have a slightly lower intensity of limiting the growth of inventory turnover are a long period of high-value stocks standing in the warehouse (2.50) and keeping unnecessary stocks (2.83). Factors that at least affect the growth of the rate of the researched companies are low-quality stocks with the calculated average rank of 3.33. Reduce the cost

of maintaining inventory and create a prerequisite for lowering the sales price of the product in order to achieve a better competitive position in the markets stocked.

Among researched companies' problems that affect the scraps' appearance³ have been identified. During the identification of the factors that influence scraps' appearance scale with ranges from 1 to 8 was used where 1 is assigned to the most important factor, and 8 to the least significant factor. Research results are represented in Table 8.

Table 8 Factors that influence scrap appearance

Factor	Average rank
Bad organization of the work	5,00
Poor/inadequate equipment	7,00
Insufficient workers' experience	4,83
Insufficient level of workers' knowledge	5,00
Overload of workers	6,00
Workers' dissatisfaction	5,17
Poor work methods	5,33
Inadequate materials and raw materials	7,00

Source: Authors

Table 8 shows that insufficient workers' experience (4, 83) is the factor that influences the most scrap appearance. Insufficient workers' experience refers to the engagement of the workforce in manufacturing process whose working experience hadn't reached the necessary level for producing final goods. In that case, insufficient compatibility between work experience and work process cause certain mistakes in work process which cause the existence of certain scrap product levels i.e. the number of produced products which don't correspond to the buyers' specifications or seller and company cannot place them on the market. Then decreased quantity of products is placed on the market which cases lower sales revenue than planned. Besides that, scrap products create losses for the company because they have been produced and therefore expenses and they haven't been placed on the market in order to create revenue from which expenses would be paid.

³ Defect ratios or scrap ratios is an indicator of product process effectiveness because it affects the number of total produced products that meet the defined quality standards.

In order to prevent the scrap appearance caused by insufficient worker experience, it is necessary to apply a model of mentoring or additional training for a particular workplace. A company will apply mentoring when the technology and working methods in the workplace remain unchanged. If a company applies this model, it means that a worker with insufficient experience in the workplace will additionally upgrade his or her experience and knowledge from a mentor i.e. or a person assigned to him by the management or superior who previously worked in that workplace. A company can determine, according to the current level of experience and workers' knowledge, the total number of hours a worker has to take to go through a mentoring model to achieve a sufficient level of knowledge and experience necessary for work at the assigned workplace. On the other hand, additional training of employees will be applied by the company when new technologies and more modern working methods, that haven't existed in the company, have been introduced at the workplace. Then, the company will provide education that can be carried out outside of work or at work by educators specialized in the necessary knowledge in order to gain experience. Educators can be faculties, consultancy companies, centers for professional education, suppliers of new technologies, etc. Educations of gaining experience at work refer to conducting educational activities by educators in a company which is client while education of gaining experience at work implies the carrying out educational activities outside the company i.e. educator or at an agreed place. The time, place, scope, value and specialty area of education are determined by mutual agreement between the clients and educators, which is formalized by signing the contract. Of the other factors that cause scrap appearance according to the calculated average rankings, important is a bad organization of work (5.0), insufficient level of workers' knowledge (5.0), workers' dissatisfaction (5.17), poor work methods (5.33) and overload of workers (6.0). Factors that least affects the occurrence of the scandal in the research companies are inadequate materials and raw materials (7.0) and poor/inadequate equipment (7.0). In addition to these factors, the surveyed companies have indicated that the incompatibility of the top and new equipment with motivating people, as an additional factor, also affects the occurrence of scrap appearance among research companies.

In this research the importance of factors that affect the delivery time failure i.e. which factors and in what degree they affect delivery time failure to the end

user.⁴ During the identification of the factors scale with ranges from 1 to 8 was used where 1 is assigned to the most important factor, and 8 to the least significant factor. Research results are represented in Table 9.

Table 9 Factors that influence delivery time failure

Factor	Average rank
Errors in capacity occupancy records	5,00
Incorrect entry order (launching order)	5,00
Machine failure/ break	4,00
Delay of material processing	3,17
Bottlenecks	4,33
High stock volume in the production process	5,33
Workers' absence	2,83
Mistakes in product specification/ component	4,67

Source: Authors

As shown in Table 9 according to the calculated average rank the factor that influences the most delivery time failure is workers' absence (2,83). Workers' absence refers to the workers' absence from the workplace. Workers' absence can be caused by medical issues i.e. sick leave which is caused by workers' illness. Causes for illness can be because of workers' health condition and by employer's guilt. Employer's guilt can be organizational and technical nature. When it comes to organizational nature it mainly refers to different organizational reasons which had contributed to the negative relationship between work colleagues i.e. superiors and subordinates in the new organization of business. If a company has made such an organizational concept in which there is no professional communication level between superiors and subordinates it will create a negative working climate that causes a decline in employee motivation due to stress and dissatisfaction in the workplace and the occurrence of permanent illness. This will result in more permanent workers' absence from the workplace and the redistribution of workers to job openings due to sickness, which creates certain waiting times that affect the delivery time. Regarding the employer's guilt because of technical reasons, refers to disabling adequate working conditions for the worker such as usage of suitable protective clothing, newer and more modern machinery and tools and organization of the workplace according to the functional needs of workers. If an employer doesn't eliminate previously

⁴ Delivery time or delivery lead time), as an indicator of the efficiency of the production process, implies delivery of the product according to a pre-agreed deadline. The goal of each production company is to maximize this indicator.

stated technical problems at the workplace, it can come to jeopardizing workers' health which will cause long-term absence. All previously mentioned problems at workplace that cause workers' absence company can mitigate or eliminate by constantly investing in the workers' working conditions such as the procurement of new and more modern and safer equipment, new protective clothing, changing business or organization which is adjusted to the workers' needs, faster ways of communication at workplace, involving workers in new work processes, adapting workplaces to the workers' functional needs, achieving a high level of collegiality among workers, creating new incentive measures for innovation at the workplace, applying freedom of decision making in certain stages of the work process, applying good ideas by workers and encouraging way of rewarding workers. By applying these measures companies will decrease sick-leaves and workers' absence and ensure delivery on time. Among other factors which cause delivery time failure important are delay of material processing (3,17), machine failure/ break (4,0), bottlenecks (4,33), mistakes in product specification/ component (4,67), errors in capacity occupancy records (5,0) and incorrect entry order (launching order) (5,0). Factor that influences the least delivery time failure is a high stock volume in the production process (5, 33). Beside these factors, researched companies had also pointed out delays and absence of project documentation, insufficient expertise at high level of management, poor organization of work and poor capacity planning, when the customer isn't ready to take over the product because he or she didn't complete the preparation and documentation, changes in the job specification by the clients and additional work during the project as additional factors that also affect the delivery time failure among researched companies.

4. CONCLUSION

In every country as well as in the Republic of Croatia, manufacturing companies are continuous drivers of the national economy. The reason in that is that manufacturing as an economic and technical economic branch, throughout the whole year in the work process creates a continuous contribution to the national economy. Because of the nature of the work process, each country should give special emphasis to the manufacturing for the purpose of successful development, creating the prerequisites for continuous improvement. The prerequisites that each state should provide for the promotion of manufacturing activity can

be macroeconomic and microeconomic. Macroeconomic prerequisites include stimulation of monetary and fiscal policies, while microeconomic include various stimulation programs that serve for research and development and for the acquisition of cutting-edge technology in the manufacturing process. In such a business environment, manufacturing companies will become even more competitive and will even more easily place their products on domestic and international markets.

In this paper, two phases of research have been made. Besides basic data about researched companies, the first phase referred to the examination of the frequency of fundamental problems emerging in the manufacturing process. The second phase covered identification of the problems which limit the growth of the manufacturing process effectiveness which is measured with four indicators: productivity, inventory turnover, scraps and delivery time. By analyzing the collected data in the first phase of the research, it can be concluded that the lower level of the occurrence of the fundamental problems in the manufacturing process includes: over manufacturing, high inventories of semi-finished goods in a process, workers' waiting for machines or for the material, machines' waiting for workers or for the material, defects in material cutting, delays of manufacturing equipment, outdated manufacturing equipment. On the other hand, the higher level of the occurrence of the fundamental problems in the manufacturing process includes: idle time of machine/ machinery/ manufacturing plant, manufacturing bottlenecks, waiting for materials to be processed due to the worker's occupation, waiting for materials to be processed due to the worker's occupation due to occupation of machines, slowness in materials cutting, the occurrence of errors while cutting materials and limited manufacturing capacity.

In the second phase of the research, the results were that the growth limitation of the manufacturing is affected by the poor quality of work organization, inventory turnover is affected by long manufacturing cycle, scraps appearance is affected by insufficient workers' presence. On the other hand, limitations of productivity growth is least affected by the outdated equipment, limitations of the inventory turnover growth is affected by inadequate stocks, scraps appearance is affected by the poor/inadequate equipment and inadequate materials and raw materials while failing to deliver on time is least affected by high volume of stocks in manufacturing process.

On all fundamental problems identified that arise in the manufacturing process, as well as problems that limit the growth of individual effectiveness indicators and thus the overall effectiveness of the manufacturing process, companies need to work continually on their mitigation or elimination with a goal of achieving a high level of manufacturing process effectiveness, and therefore of achieving a more competitive position in markets.

This research represents the basis for future research that will be made for manufacturing companies in neighboring country Bosnia and Herzegovina. In B&H there is also a lack of this kind of research for manufacturing companies. After conducting an analysis in B&H a comparison between these two countries can be made. It will help to determine the similarities and difference of researched companies in the same industry.

Abstract

The aim of this paper is to show that entrepreneurs in Central, Eastern Europe (CEE), and Croatia are oriented exclusively toward bank financing as the basis for obtaining additional capital. Even though the Croatian market, same as the European market in general, is bank-oriented, a wider market should be aware of the existence of alternative sources of corporate financing, whether it is a variety of funds, and agencies or autonomous issuance of securities and financial derivatives.

The development of entrepreneurship in CEE countries over the past few years was limited due to various macroeconomic events, and the specific problems they entailed.

These limitations and changes have particularly affected the entrepreneurship financing opportunities, as the countries failed to develop an adequate system of financial support for entrepreneurship thus far.

There is a necessity of shifting to other, more sophisticated forms of finance. In this sense, it is necessary to create a stimulating environment for the development of venture capital and private equity funds.

CEE entrepreneurs, modeled on European Union countries, focus solely on bank financing. Bank loans still make a relatively fast and inexpensive way of financing. However, in our opinion, it is not the speed of the approval procedure that is the main reason for applying for bank loans, but rather the ignorance of entrepreneurs about alternative sources of financing that are present in the market, although still relatively unknown.

The third reason for this situation authors found in the fact that foreign venture capital and private equity funds in CEE countries face the same obstacles as other foreign investors, such as complex property and legal relations, corruption, networking, and poor corporate governance.

Keywords: *venture capital, private equity, CEE analytics, alternative ways of finance*

JEL Classification: G24, O16

1. INTRODUCTION

In the non-bank (or market-oriented) financial systems, the capital market is highly developed. In such markets, many financial institutions and financial instruments are present, and a relatively small number of banks are included in the financial sector's assets. Such are the United Kingdom and the United States markets. Europe and Japan, on the other hand, rely on a bank-oriented system of financing: the large influence of banks on companies manifests in lending and shares in the ownership structure (i.e., controlling interest in Japan), and a small share of market capitalization in the gross domestic product.

Even though the Croatian market, same as the European, is bank-oriented, a wider market should be aware of the existence of alternative sources of corporate financing, whether it is a variety of funds, agencies or autonomous issuance of securities and financial derivatives. The Croatian economy has only commenced recognizing risk capital as a source of funding (Ognjenović, 2007).

According to the authors, the basic reasons for this situation are the following: the Croatian capital market stifling the development of financing companies through venture capital funds, the Croatian Government showing no interest in the development of new strategy models for the financing of SMEs,

and the ban on the advertising of investment funds. Namely, the latter hampers the growth of investments through venture capital funds, as entrepreneurs are not familiar with their existence. Because they do not advertise, companies often do not know about their existence. Lack of transparency by entrepreneurs in relation to the business activities of a company makes it impossible for venture capital funds to have a complete insight into the company's business, and therefore to invest. The poorly regulated market, complicated administration problems and the lack of quality legal support all have adverse impacts on the development of venture capital financing.

The emerging markets attract investors with the growing economic opportunities they offer. However, such growing economic opportunities are hardly the only factor that makes a country attractive for PE/VC investments. Other underlying assumptions include an infrastructure that supports the development of PE/VC market and a favorable investment climate, and that implies a meeting of numerous socio-economic and institutional conditions (Šimić, 2015).

The main support in the development of the PE / VC market was the reform of the regulatory and tax environment. It gave rise to the possibility of investing pension funds' assets, as an alternative form of assets, in PE / VC, and the development of the PE / VC industry encouraged tax relief as well. An additional boost to this form of financing is the state subsidies for risk capital.

Together with the entrepreneurs, the state should play an important role in the development of the venture capital industry, through organized education and/or incentive measures to familiarise the entrepreneurs in this form of financing.

Croatia belongs to a group of European countries whose tax and legal system is relatively unfavorable for investing in private equity capital. Compared to 2004, positive changes occurred in the tax and legal environment, but they did not significantly affect Croatia's position in the European countries' rankings. The poor rating of the tax and legal environment partly explains the low level of investment in VC/PE in Croatia, but there are also other causes of insufficient interest in these investments, which may adversely affect the emergence and development of young and innovative companies.

The main hypothesis of this paper is that venture capital and private equity (VC/PE) financing in Croatia and CEE countries is still unknown and underdeveloped. The auxiliary hypothesis is that Croatian financial market is

still underdeveloped and therefore not quite attractive for foreign investors yet. Complex administration, time-consuming procedures, and legal restrictions prevent the development of venture capital funds. When in need of additional capital, entrepreneurs (especially small and medium-sized companies) have no other options but to apply for a loan, either to a bank or to another financial institution, and to undergo a rather complicated procedure. Generally, the smaller the company, the more complicated the procedure.

The paper is organized as follows: Chapter 2 – description of the methodology used in the paper; Chapter 3- review of theories by other authors; Chapter 4 – analysis of the trend in investment activities using annual investment value in the CEE region over the last 15 years, the number of companies invested in per each CEE country, and the amount of investments in comparison with the GDP of each country; Chapter 5 – description of private market developments in Poland and Hungary as a positive example of investment trends; Chapter 6 features the discussion, and Chapter 7 contains the conclusion.

2. METHODOLOGY USED IN THE PAPER

This paper analyses PE/VC financing in CEE countries and Croatia in the period from 2014 until 2017, which is not receiving sufficient coverage in current research. The paper focuses on the undeveloped market, lack of understanding by the entrepreneurs, and legal constraints connected to PE/VC investments in CEE countries, with a special focus on Croatia.

For the purpose of this research, the authors used secondary data sources, processed by applying the relevant scientific and research methods the most important of which are: induction, deduction, compilation, and comparison. The main source was the World Economic Outlook Database for Central and Eastern Europe Private equity investment report. The database is statistics platform, which monitors the development of private equity and venture capital in 25 European countries. The scope and volume of private equity financing in Central and Eastern Europe and in Croatia are illustrated by means of analyses, charts, and comparisons.

The authors collected and systemized the data about PE/VC investments into CEE countries, with a special focus on Croatia in the period from 2014 to 2017. The paper tackles the level of PE/VC investments for the above-men-

tioned countries in an attempt to establish the factors that have an adverse effect on attracting of this type of capital in Croatia, and by comparing Croatia to certain comparable countries.

3. REVIEW OF THEORIES BY OTHER AUTHORS

While the research of financing through PE/VC in CEE countries is very well covered in various research papers, this paper will focus on the overview of the empirical literature specific to the problems like the poorly regulated market, complicated administration problems and the lack of quality legal support. In the paper titled Specificities of financing SME sector in Croatia compared to EU countries, the authors Bujan & Vugrinec (2014) show that the most common form of financing the SME sector are bank loans. According to CEPOR, small and medium-sized enterprises largely focus on traditional sources of financing (bank loans). Poor focus on non-traditional sources of financing (venture capital funds and business angels) can be attributed to the limited supply of such sources at the Croatian financial market. For some forms of financing, small entrepreneurs do not possess enough knowledge or are not familiar with the possibility of such financing at all. According to the results of their research (GEM Croatia, 2002-2011), access to finances is very limited, and a weak interest can be attributed to poor supply of risk capital and business angels themselves (Report on small and medium enterprises in the Croatia - 2012). Small and medium-sized enterprises located in Croatia usually use internal sources of financing (through payments by the owner of the capital) (Škrtić & Mikić, 2011). Bank loans are the most widely used external source of financing (Škrtić & Mikić, 2011), followed by other external forms of financing, such as leasing or factoring.

In the paper titled Attractiveness of Croatia in terms of risk capital investments, the author Šimić (2015) emphasizes low investment attractiveness of Croatia for foreign investors. The author used secondary data collected through the European PE / VC Association (EVCA) and the Global Coverage Index of Country Attractiveness for VC / PE investment (VCPE Country Attractiveness Index). Frequent changes in tax rates, complicated preparation for calculation of tax liabilities, and payment of basic taxes project a negative image of doing business in Croatia. Entrepreneurial culture and business opportunities are the worst ranking variables. Innovation, research and development, and a number of patents contribute to the attractiveness of PE/VC, while the com-

plex start-up procedure is a downside. Entrepreneurs often point out the complicated bureaucracy and ineffective administration, while on the other hand, foreign investors warn about the lack of investment possibilities. The author also emphasizes another major deficiency – the capital market in Croatia is underdeveloped. Namely, the preferred business exit strategy of risk capital investors is IPO, which requires a well-developed capital market.

According to Soloma (2013), when institutional investors decide on the allocation of their assets, they analyze a few economic parameters such as local entrepreneurial activity, size of the market, expected economic growth and legal environment by way of a questionnaire-based survey.

Authors Groh et al. (2008), in their paper, addressed the attractiveness of Central Eastern European countries for VC/PE investors by the construction of a composite index. For the index's composition, they refer to the results of numerous prior research papers that investigated relevant parameters determining entrepreneurial activity and/or the engagements of institutional investors. They aggregated the index via five different methods and received country rankings that vary only slightly, signaling a robust index calculation. They clearly identified six tier groups of attractiveness for all of our sample countries. They compared the index with the actual fundraising activities in the individual countries and revealed a reasonable correlation of both figures. The results highlighted the strengths and weaknesses of the particular economies and provided guidelines for policy improvements and institutional investors' country allocations. The attractiveness of each country depends on expectations of institutional investors from local PE and VC funds, i.e. their ability to make a sufficient number of investments with a satisfactory risk and return, i.e. the attractiveness of an individual region depends on adequate investment opportunities.

The relevant papers (Karsai, 2013) and (Malecka & Luczka, 2016) illustrate how the government can have a positive influence on the development of PE / VC. In the paper titled Venture capital and private equity industry in Hungary (Karsai, 2013), the author made conclusions based on a detailed survey of the entire VC industry between 1989 and 2010. The paper demonstrates a relatively strong correlation between the allocation of capital to VC&PE funds and the capital flow into the Budapest Stock Exchange. He emphasized how the changes in investment activities were closely related to election years. Investments were hampered not so much by the shortage of capital, but by a lack of

demand and attractive business plans. The article illustrates the different roles and approaches of global, regional and country VC&PE funds in Hungary.

Authors Malecka & Luczka (2016) highlighted the importance and the leading role of Poland, as a country that is the first choice for private equity investors in this region. The results presented in the article are based on the source data from annual reports and publications produced and made available by capital market institutions, and from the authors' own research on Polish entrepreneurship. They examined the scope and volume of private equity financing in Central and Eastern Europe and in Poland by means of analyses, charts, and comparisons, highlighting the importance and the leading role of Poland as a country that is the first choice for private equity investors in this region.

4. CENTRAL AND EASTERN EUROPE PRIVATE EQUITY INVESTMENT REPORT

Private equity investment in CEE reached €3.5 billion in 2017, a 113% year-on-year increase and a record high level for the region. This result surpasses the previous peak in 2008 by 40%. The growth in CEE investments underlines the wider trend across Europe where total private equity investments in 2017 increased by 29% year-on-year to €71.7bn, the second highest level on record and only 4% below the peak in 2007.

Figure 1: Annual investment value in the CEE region, 2003-2017

Source: Invest Europe/EDC for investment data. (2018)
IMF – World Economic Outlook Database for GDP data.

The investment activity in the CEE region also manifested particularities concretized in a growth trend until 2009, but annual oscillations can be observed as well, thus in the period from 2000-2015 the maximal levels were registered in 2007 and 2008. Four countries (Serbia, Czech Republic, Poland, and Romania) made investments that represented 80% of total investments made in the CEE area in 2014 (EVCA, 2014). In addition, the main destinations of private equity financing in the CEE region in 2015 were Poland (54% of total value), Serbia (14% of total value), Hungary (10% of total value) and Romania (9% of total value). These four countries made up 85% of total CEE investments by value in 2015 (EVCA, 2015).

The total number of CEE companies receiving funding dropped by 25% in 2017 (down to 257), largely due to another annual decrease in the number of companies receiving venture capital. As in prior years, CEE private equity investments in 2017 were concentrated in a few countries. Poland remained the leading destination, with 71% of the region's total investment value, followed by Romania (14%), Hungary (6%) and Latvia (5%).

Figure 2: Annual investment value in CEE, 2014-2017

Source: Invest Europe/EDC for investment data. (2018)
IMF – World Economic Outlook Database for GDP data.

Hungary saw the largest number of companies receiving private equity investment in 2017 at 104, comprising 40% of the CEE total. Four countries (Poland, Romania, Hungary, and Latvia) combined comprised 96% of the total

CEE investment by value and 70% of the companies receiving private equity investment in 2017. Annual investment results in the region and in individual countries can be influenced by a few, but large investments. The two largest investments in 2017, both funding companies in Poland, accounted for 56% of the total regional amount invested. In comparison, the 12 largest transactions totaled this same proportion of total investments in 2016.

Only three companies were financed by PE investments in Croatia in 2017, in the total amount of EUR 3 m. It was only 0.005% of the country’s GDP. This represented a decreasing trend in comparison with 2014.

In 2007, Serbia attracted some EUR 200 million in investment in risky capital, and in the same year, only EUR 35 million was invested in Croatia. The same trends continued in 2014, 2015 and 2016 (i.e. negative trend for Croatia and positive for Serbia). In 2014, Serbia invested EUR 329 million and Croatia only EUR 42 million, while in 2017 Serbia decreased investments to only EUR 2 million, whilst in Croatia, the investments dropped to a mere EUR 3 million.

Figure 4: Private equity investments as a percentage of GDP, 2017 (by country of destination of investment)

Source: Invest Europe/EDC for investment data. (2018)
IMF – World Economic Outlook Database for GDP data.

CEE private equity investment measured as a percentage of the region's GDP increased significantly from 0.122% in 2016 to 0.239% in 2017. However, investment in CEE continues to lag behind Europe as a whole, where the average was 0.436%. Notable exceptions are two CEE countries. Latvia ranked second on this metric across all of Europe reaching 0.649% (mostly because of one large transaction), while Poland achieved the seventh best country result in Europe with 0.535% (driven by two large transactions).

5. DEVELOPMENT OF PRIVATE EQUITY AND VENTURE CAPITAL INDUSTRY IN HUNGARY AND POLAND

The paper Venture capital and private equity industry in Hungary (Karsai, 2013) illustrates how Hungary became the second most developed venture capital and private equity (VC&PE) market in Central and Eastern Europe. It demonstrates a strong correlation between the allocation of capital to VC&PE funds and the capital flow at the Budapest Stock Exchange.

In the initial period, the capital of investors entering the Hungarian market mainly stemmed from government resources. The presence of these institu-

tions strengthened the confidence of foreign private investors. The supply of resources from the Hungarian government budget increased significantly during 2004–2005, and in 2010, a new wave of government resources reached the VC market when Jeremie funds¹ were set up.

In 2010, Jeremie funds were launched. The government, in addition to its direct VC investments, intended to participate in VC investments indirectly, via hybrid funds, a tried and tested scheme in international markets. In their first year of operation, Jeremie funds reached a similar proportion in the market as private sector investments. Due to the crisis and the increasing uncertainties in the economy, the interest of private sector market players in Hungarian projects dropped. The Hungarian government tried for the first time to divert private-sector VC funds towards innovative enterprises preferred by the state through the Jeremie funds. The main purpose of the new funds was to finance innovative small start-up companies, which had been neglected by both private and public sector VC investors until then. In order to achieve its goals, the government motivated private investors also by financial incentives, i.e., by sharing the expenses and the yields of investments disproportionately (Karsai, 2012a). The state-owned Hungarian Development Bank and a Japanese private-sector investor established a special fund with a total capital of EUR 100 m jointly in 2008.

VC investments utilizing joint public and private resources represent a significant change compared to investments of funds established using public funds and managed exclusively by state-owned organizations.

The level of development in the Hungarian VC&PE sector and the role played by the sector in building a market economy is clearly indicated by the fact that during the two decades under review, 87% of the capital allocated to investments overall were raised from the private sector sources. (Karsai, 2013).

The proportion of domestic institutional investors was extremely small. It was due not only to the time-consuming character of capital accumulation and development of the financial culture but also to the shortcomings of the capital market legislation. Only after the laws changed, it became possible for these institutions to invest in the VC&PE market. From early 2006, the voluntary

¹ JEREMIE (Joint European Resources for Micro to Medium Enterprises) is the European Union's development program for SMEs that offers several means of enterprise development. It was initiated by the European Commission and is financed by the European Investment Bank (EIB) and its venture capital arm, the European Investment Fund (EIF).

and private pension funds in Hungary could invest up to 5% of their assets in funds registered either in Hungary or in a foreign country as VC funds. Earlier, the statutory requirements in Hungary prohibited placing of the savings of domestic institutional investors in VC&PE funds. According to a survey made in summer 2009, the assessment of VC&PE among Hungarian voluntary and mandatory private pension funds was clearly positive (Karsai, 2010b).

By the turn of the millennium, Hungary became the center of the VC&PE industry in CEE, and even though the Polish market assumed this role in the next decade, the Hungarian VC&PE market remained a dominant player in the region. The players and the operation mechanism of the Hungarian market have grown to be comparable to the VC&PE industry in Western Europe. The positive impact of EU accession prevailed in the end, resulting in a rise in the capital raising cycle and improving the availability of the necessary loans for buyout transactions.

The paper Private Equity Market in Poland and in Central and Eastern Europe (Malecka & Luczka, 2016) showed an example of how the political transformation allowed for a re-launch and development of the most important capital market institution – the stock exchange. Today, the Warsaw Stock Exchange is the largest in Central and Eastern Europe, being among top European trading floors in terms of the number of new listings. Stock exchanges are essential for capital flows affecting not only national but also global development of economies of individual countries (see: Plókarz, 2013).

The beginning of the activities of private equity funds, both in Poland and in CEE as a whole, bears a direct connection with the changes in political systems and the related transformations that took place in the economies of these countries after communism had collapsed (Dumitrescu, 2015, pp. 186–197; Maecka, 2016, pp. 34–43; Myshlyayev, 2013, pp. 253–258).

After 1990, CEE countries began operating on a market basis, opening their borders to foreign investors. All related activities were processes, some of which implemented faster and others more slowly, with their effects being sometimes visible immediately and sometimes only after several years.

Poland attracts investors from all over the world for several reasons:

- ✦ well-developed capital market enabling IPO divestment

- ✦ modern and competitive banking sector makes it possible to obtain debt financing effectively and business support institutions ensure more efficient operations
- ✦ EU membership, guaranteeing the smooth functioning of regulations, uniformity of procedures, and ensuring international standards and investor rights protection.

As compared to the entire Central and Eastern European region, the Polish private equity market is very strong. The period of rapid economic growth in Poland and CEE countries is also linked with their accession to the European Union, which not only consolidated their economic and political position but also added credibility noticed in business by private equity funds as well.

6. DISCUSSION

CEE countries lag by the number of funds, the number of investments, and the size of the investments in comparison with other European countries. In addition, among the existing venture capital funds, CEE countries are not recognized as countries with great potential for development of this type of industry. General problems in CEE countries are an underdeveloped market, lack of understanding by the entrepreneurs, and legal constraints.

According to the analysis of data in the period from 2014 to 2017, Croatia showed a negative trend in attracting this type of funding when compared to other CEE countries. The PE investment to gross domestic product ratio in Croatia averages 0.005%, which is significantly less than the average of Central and Eastern Europe, which was 0.239%. Compared to CEE countries, both the number of companies invested in and the volume of investments in Croatia were negligible.

According to the analysis based on the Central and Eastern Europe private equity investment report and based on researches of other authors presented in this paper, the hypothesis that financing through PE/VC funds in CEE countries and Croatia is still rather unfamiliar and underdeveloped was confirmed.

The results obtained herein serve as a solid foundation that can be used in future scientific research, by applying a comparative analysis including the countries highly developed in terms of PE and VC investments, and attractiveness of a country for such investments.

Review of theories of other authors corroborated the auxiliary hypothesis claims that the Croatian financial market is still underdeveloped and therefore not yet attractive for foreign investors. Complicated regulatory requirements and lack of interest of the Croatian government in developing of PE/VC investments makes the Croatian market unappealing for foreign investors. Frequent changes in tax rates, complicated preparation for calculation of tax liabilities, and payment of basic taxes project a negative image of doing business in Croatia. Namely, the preferred business exit strategy of risk capital investors is IPO, which requires a well-developed capital market.

The attractiveness of each country is determined by six key elements: economic activity of the country, capital market development, taxation, investor protection scheme and corporate governance, social environment, entrepreneurial culture and business opportunities (Groh et al. 2008).

Due to a large share of non-performing loans (NPL) in the non-trading books of banks in CEE countries, the European Banking Authority (EBA) issued an NPL strategy in 2018. The strategy focuses on lowering the portion of non-performing loans and mitigating of the credit risk, which implies further restrictions on bank lending. The impact of those new guidelines on the development of VC/PE funding in the CEE countries is yet to be seen and analyzed in some future research.

7. CONCLUSION

Despite rapid financial development, most firms in the region still rely either on internally generated funds and contributions through informal channels (for example, loans from friends and relatives of the owner/entrepreneur), or on external financing such as bank loans.

Entrepreneurial disenchantment clearly manifests in the fact that entrepreneurs neither want to lose control over their business nor want to allow a change in management or accept all the terms of the offered partnership. Most entrepreneurs in CEE countries raise funds to start their business from their own sources. Although there are business angels in Croatia, they finance only 1.6% of initial entrepreneurial investments.

According to a survey conducted in 2008, 60.53% of entrepreneurs based in Zagreb expressed a negative attitude towards venture capital funds as a form

of financing. The main reason for this is the fear of such funds taking over the company and the loss of freedom and independence when making business decisions (Prtenjača, 2008).

Out of all CEE countries, four countries (Poland, Romania, Hungary, and Latvia) combined comprised 96% of the total CEE investment by value. Hungary had the largest number of companies receiving private equity investment in 2017, comprising 40% of the CEE total. All other CEE countries need to take extra measures for improvement of this type of financing.

A major disadvantage is a ban on the advertising of venture capital funds. Since they are not advertised, neither the owners of the existing companies nor any prospective beginners are familiar with venture capital funds, the way they operate, the way they are funded or with anything related to funding operations. People are “conservative”, and still heavily rely on bank financing. Lack of transparency by entrepreneurs in relation to the business activities of a company, poorly regulated market, complicated administration problems and the lack of quality legal support all have adverse impacts on the development of venture capital financing.

In this paper, the authors attempted to investigate positive features of risk capital (which can have positive effects on the development of the economy, GDP growth, and employment), and to point to the significance of the development of such funds. It is necessary to involve the government sector as the main driver of the development of alternative sources of investments, as we saw happening in Poland and Hungary. Encouraging investment through venture capital funds is extremely important for the development of the economy of every country, and therefore for the Croatian economy as well. The funds encourage the economy of a country from several aspects, namely: they generate new jobs, boost the competitiveness of the economy, stimulate liquidity on the capital market, and attract foreign capital.

Bestellpunktpolitik in der stochastischen Lagerhaltung

Prof. Dr. Dr. Wolfgang Gohout, Pforzheim

JEL Classification: C61, D24

Problemstellung

In der Theorie der Lagerhaltungsmodelle geht es um die Bestimmung der optimalen Bestellmenge q eines Lagergutes. Die Optimierung erfolgt im Allgemeinen in Gestalt der Minimierung von Kosten oder der Maximierung eines Gewinns. Ist die Bestellmenge q für ein Lagergut zu groß, dann ist zwar die Lieferfähigkeit für eine Nachfrage nach dem Lagergut hoch, aber es steigt auch der mittlere Lagerbestand und damit die Lagerungskosten. Ist die Bestellmenge zu gering, dann sinken zwar die Lagerungskosten, aber die Lieferfähigkeit sinkt ebenfalls. Damit kann es zu Fehlmengen kommen, also zu Nachfragen, die nicht mehr erfüllt werden können. Dadurch kommen Fehlmengenkosten hinzu, die durch Umsatzausfälle wegen mangelnder Verfügbarkeit des Lagerguts begründet werden können.

Die stochastische Lagerhaltung (vgl. z.B. Gohout 2009) unterstellt eine stochastische Nachfrage, die durch die Zufallsvariable D (demand) im Modell dargestellt wird. Bei einer Bestellpunktpolitik geht man von einer bekannten Lieferfrist von L Tagen aus. Die Bestellung wird bei einem — zu berechnenden — Lagerbestand s ausgelöst, dem sogenannten Bestellpunkt.

Bei der Bestimmung der Bestellmenge q und des Bestellpunkts s handelt es sich daher um ein Optimierungsproblem. Genauer gesagt sollen die Gesamtkosten einer solchen (s, q) -Politik minimiert werden. Da die Nachfrage D eine Zufallsvariable ist, stellen auch die Kosten eine Zufallsvariable dar. Da eine Zufallsvariable aber prinzipiell nicht "optimiert" werden kann, werden stattdessen die "erwarteten" Kosten minimiert.

Modell

Die Fixkosten der Bestellung, also die konstanten Kosten je Bestellvorgang, die unabhängig von der Bestellmenge sind, sollen mit K_B bezeichnet werden. Die Lagerungskosten k_L bezeichnen die Kosten, die je Mengeneinheit und je Tag der tatsächlich eingelagerten Menge entstehen. Sie setzen sich aus verschiedenen Komponenten zusammen, wie etwa den Kosten für Kühlung (oder artgerechte Lagerung), den Kosten der Kapitalbindung oder weiteren ähnlichen Komponenten. Die Fehlmengenkosten, die je Mengeneinheit einer angeforderten, aber nicht lieferbaren Mengeneinheit anfallen, sollen mit k_F bezeichnet werden. Sie sind eher schwer zu ermitteln oder zu schätzen, sind aber für die Optimierung unerlässlich.

Die erwarteten Gesamtkosten sind eine Funktion der beiden Variablen q und s :

$$E(K(q, s)) = K_B \cdot M/q + k_L \cdot E(LB) + k_F \cdot E(FB).$$

Der erste Summand ergibt sich durch die gleichmäßige Verteilung der bestellfixen Kosten K_B auf den gesamten Bestellzyklus T , also die Anzahl der Tage zwischen zwei Bestellungen. Daher wäre der entsprechende Kostenanteil pro Tag K_B/T . Da T aber über die Beziehung $T = q/M$ von der Entscheidungsvariablen q abhängt, muss dies auch in der Zielfunktion zum Ausdruck gebracht werden. Mit M wird die "erwartete" Nachfrage pro Tag bezeichnet: $M = E(D)$. Der zweite Summand enthält die erwarteten Lagerungskosten, indem der Kostenparameter k_L mit dem mittleren oder erwarteten Lagerbestand $E(LB)$ multipliziert wird. Der dritte Summand enthält die erwarteten Fehlmengenkosten, indem der Kostenparameter k_F mit dem mittleren oder erwarteten Fehlbestand $E(FB)$ multipliziert wird.

Zur Darstellung des erwarteten Lagerbestands und des erwarteten Fehlbestands müssen zwei Fälle unterschieden werden. Im ersten Fall ist die zufällige Nachfrage in der Lieferfrist L höchstens so groß wie der Bestellpunkt s . Damit ist in diesem Fall $s \geq M \cdot L$ oder $R := s - M \cdot L \geq 0$, wobei R den erwarteten Restbestand zum Ende des Zyklus bedeutet. Wenn der erwartete Restbestand R beträgt und die Bestellmenge mit q bezeichnet wird, dann ist der (erwartete) Anfangsbestand gleich $q + R$. Der erwartete, und damit zur Geraden geglättete Lagerbestandsverlauf in einem solchen Zyklus kann wie folgt dargestellt werden:

Im zweiten Fall ist die zufällige Nachfrage in der Lieferfrist größer als der Bestellpunkt s . Dadurch ist $R < 0$, und es entsteht eine erwartete Fehlmenge. Der erwartete Lagerbestandsverlauf in einem solchen Zyklus kann folgendermaßen dargestellt werden:

Der mittlere Bestand in einem Zeitraum von 0 bis T für eine allgemeine Bestandsfunktion $f(t)$ lautet:

$$\frac{1}{T} \cdot \int_0^T f(t) dt.$$

Eine einfache Rechnung und Berücksichtigung von $T = q/M$ ergibt daher für den erwarteten Lagerbestand:

$$\begin{aligned} E(LB) &= \frac{1}{T} \cdot \int_0^T \max(q + R - M \cdot t, 0) dt \\ &= \begin{cases} (q + R)^2 / (2q) & R < 0 \\ q/2 + R & R \geq 0 \end{cases} \end{aligned}$$

Analog ergibt sich für den erwarteten Fehlbestand:

$$\begin{aligned} E(FB) &= \frac{1}{T} \cdot \int_0^T -\min(q + R - M \cdot t, 0) dt \\ &= \begin{cases} R^2 / (2q) & R < 0 \\ 0 & R \geq 0 \end{cases} \end{aligned}$$

Für die erwarteten Gesamtkosten ergibt sich für den Fall $R \geq 0$, also $s \geq M \cdot L$:

$$\begin{aligned} E(K(q, s)) &= K_B M / q + k_L \cdot E(LB) + k_F \cdot E(FB) \\ &= K_B M / q + k_L \cdot (q/2 + R) \geq K_B M / q + k_L \cdot q/2. \end{aligned} \quad (1)$$

Für den Fall $R < 0$, also $s < M \cdot L$, ergibt sich nach einigen elementaren Umformungen:

$$\begin{aligned} E(K(q, s)) &= K_B M / q + k_L \cdot E(LB) + k_F \cdot E(FB) \\ &= K_B M / q + k_L \cdot (q + R)^2 / (2q) + k_F \cdot R^2 / (2q) \\ &\geq (k_L - k_L^2 / (k_L + k_F)) \cdot q/2. \end{aligned} \quad (2)$$

Diese Kosten sind offenbar kleiner als diejenigen im Fall $R \geq 0$, so dass wir uns auf den Fall $R < 0$ konzentrieren können. Die letzte Abschätzung in (2) wird für

$$R = -k_L/(k_L + k_F) \cdot q \iff s = M \cdot L - k_L/(k_L + k_F) \cdot q \quad (3)$$

zur Gleichung. Die auf diese Weise von s "bereinigte" Zielfunktion im relevanten Fall $R < 0$ lautet:

$$E(K(q, s)) = K_B M/q + (k_L - k_L^2/(k_L + k_F)) \cdot q/2.$$

Sie wird minimal für

$$q = \sqrt{2K_B M \cdot (k_L + k_F)/(k_L \cdot k_F)}.$$

Dies führt nach (3) zu dem optimalen Bestellpunkt

$$s = M \cdot L - \sqrt{2K_B M \cdot k_L/(k_F \cdot (k_L + k_F))}$$

und zu den minimalen täglichen Gesamtkosten von

$$E(K(q, s)) = \sqrt{2K_B M \cdot k_L \cdot k_F/(k_L + k_F)}.$$

Beispiel

Ein Lagergut soll mittels (s, q) -Politik kostenminimal bestellt werden. Die bestellfixen Kosten betragen $K_B = 240$ €, die Lagerungskosten je Mengeneinheit [ME] und je Tag des tatsächlich gelagerten Gutes betragen $k_L = 2$ €, und die Fehlmengenkosten je ME und je Tag einer Fehlmenge betragen $k_F = 10$ €. Die mittlere Nachfrage nach dem Lagergut beträgt $M = 50$ ME. Die Lieferfrist L beträgt zwei Tage.

Die kostenoptimale Bestellmenge beträgt daher $q = 120$ ME. Der optimale Bestellpunkt, bei dem eine neue Bestellung ausgelöst wird, beträgt $s = 80$ ME. Daraus resultieren die minimalen täglichen Kosten von 200 €. Jede Abweichung von $q = 120$ oder von $s = 80$ würde zu höheren täglichen Kosten führen. Wenn man die Gesamtkosten für $q = 120$ und variable Werte von s betrachtet, erkennt man die Optimalität von $s = 80$:

Wenn man die Gesamtkosten für $s = 80$ und variable Werte von q betrachtet, erkennt man die Optimalität von $q = 120$:

Wenn man von den Optimalwerten $q = 120$ und $s = 80$ simultan abweicht, kann man die Erhöhung der Gesamtkosten in der folgenden Tabelle erkennen:

s	q=117	118	119	120	121	122	123
77	200,69	200,59	200,51	200,45	200,40	200,38	200,37
78	200,38	200,31	200,24	200,20	200,17	200,16	200,17
79	200,18	200,12	200,08	200,05	200,04	200,05	200,07
80	200,08	200,03	200,01	200,00	200,01	200,03	200,07
81	200,08	200,05	200,04	200,05	200,07	200,11	200,17
82	200,18	200,17	200,18	200,20	200,24	200,30	200,37
83	200,38	200,39	200,41	200,45	200,50	200,57	200,66

Servicegrad mit Normalverteilung

Mit welcher Wahrscheinlichkeit kann bei bekannter Bestellmenge q und bei bekanntem Bestellpunkt s die stochastische Nachfrage nach dem Lagergut in der Lieferfrist erfüllt werden? Diese Wahrscheinlichkeit wird als Servicegrad p bezeichnet. Sie hängt nicht von der Bestellmenge, sondern nur vom Bestellpunkt ab. Wenn die Dichte der zufälligen täglichen Nachfrage D mit $f(x)$ bezeichnet wird, dann ergibt sich der Servicegrad wie folgt:

$$p := P(D \cdot L \leq s) = P(D \leq s/L) = \int_{-\infty}^{s/L} f(x) dx.$$

Häufig wird als Verteilung der täglichen Nachfrage eine Normalverteilung angenommen, was durch den Zentralen Grenzwertsatz auch recht gut begründet werden kann (vgl. Gohout 2018 oder Specht et al. 2014, S.153f.). Dann ergibt sich der Servicegrad wie folgt:

$$D \sim N(M, \sigma^2) \Rightarrow p = \Phi\left(\frac{s/L - M}{\sigma}\right)$$

mit der Verteilungsfunktion $\Phi(\cdot)$ der Standardnormalverteilung. In unserem Beispiel ergibt sich für eine Standardabweichung von $\sigma = 15$ der Servicegrad

$$p = \Phi(-2/3) \approx 0,252.$$

Wenn der Geschäftsführung ein geringerer Servicegrad ausreicht, dann gibt es kein weiteres Problem und die normale (s, q) -Politik ist optimal. Wenn aber der Geschäftsführung dieser Servicegrad von etwa 25 Prozent zu gering ist und sie einen Servicegrad von beispielsweise 40 Prozent garantieren möchte, dann muss der dafür erforderliche (höhere) Bestellpunkt s_p entsprechend berechnet werden:

$$p = 0,4 = \Phi\left(\frac{s_p/L - M}{\sigma}\right) \iff s_p = M \cdot L + \sigma \cdot L \cdot \Phi^{-1}(0,4) \approx 92,4.$$

Der Bestellpunkt müsste daher von 80 ME auf 92,4 ME erhöht werden. Formal handelt es sich um eine Minimierung mit Restriktion. Da sich nun der Bestellpunkt geändert hat, muss auch die Bestellmenge zur Minimierung der erwarteten Gesamtkosten angepasst werden:

$$q = \sqrt{2K_B M / k_L + (k_L + k_F) / k_L \cdot (\sigma L \cdot \Phi^{-1}(p))^2} \approx 111,12.$$

Die täglichen Gesamtkosten steigen damit erwartungsgemäß und betragen in unserem Beispiel 207,03 €.

Servicegrad ohne Normalverteilung

Kann die Nachfrage nicht als normalverteilt angenommen werden, so kann ihre Dichte aus Beobachtungswerten empirisch geschätzt werden. Die weiteren Berechnungen des optimalen Bestellpunkts und der optimalen Bestellmenge bei gegebenem Servicegrad verlaufen analog, benutzen jedoch die empirische Dichte.

Beispiel

Die Nachfrage nach dem Lagergut betrage in 15 Perioden:

$$48, 50, 58, 42, 45, 44, 65, 43, 46, 54, 47, 49, 51, 52, 56.$$

Für diese beobachteten Nachfragewerte führen wir nun eine empirische Dichteschätzung oder Kerndichteschätzung durch. Dafür verwenden wir den Epanechnikov-Kern:

$$K(u) := 3/4 \cdot \max\{0, 1 - u^2\}.$$

Dieser Kern hat gegenüber anderen bekannten Kernen den Vorteil, dass er IMSE-optimal ist, das heißt er hat einen minimalen Schätzfehler im Sinne des *Integrated Mean Square Error* (vgl. Rinne (2008), S. 493ff.):

$$\text{IMSE} = \int_{-\infty}^{\infty} E\left(\widehat{f}(x) - f(x)\right)^2 dx,$$

wobei $f(x)$ die wahre, aber unbekannte Dichte bedeutet und $\hat{f}(x)$ die — noch anzugebende — Kerndichteschätzung. Für die Dichteschätzung muss man noch eine so genannte Bandbreite wählen. Die optimale Bandbreite lautet in unserem Beispiel $b \approx 9,2$ (vgl. Rinne (2008), S. 497).

Damit erhält man schließlich die folgende Kerndichteschätzung:

$$\hat{f}(x) = \frac{1}{n \cdot b} \cdot \sum_{i=1}^n K\left(\frac{x - x_i}{b}\right).$$

In unserem Beispiel ist diese empirische Dichte nur in einem Teil des Intervalls $[30, 80]$ positiv. Wir wählen also für x_i die Werte 30,0, 30,1, 30,2, ..., 79,9, 80,0. Je feiner diese Aufteilung des Intervalls gewählt wird, desto genauer wird die Kerndichteschätzung. Die Abbildung zeigt die Kerndichte und die 15 Beobachtungswerte als Kreise.

Der Erwartungswert — sowie weitere Integrale — wird hier mittels Simpson-Formel (Thomas Simpson, 1710–1761), die auch als Keplersche Fassregel (Johannes Kepler, 1571–1630) bekannt ist, approximativ berechnet. Dazu wird das Integrationsintervall $[a, b]$ in n gleichgroße Teilintervalle $[x_0, x_1], [x_1, x_2], \dots, [x_{n-1}, x_n]$ unterteilt. Für n wird eine gerade und nicht zu kleine Zahl gewählt. An den Stellen x_0 bis x_n werden die Werte y_0 bis y_n des Integranden $f(x)$ berechnet, die hier ja durch die Kerndichteschätzung bekannt sind. Dann gilt (vgl. z.B. Gohout (2012), S. 118):

$$\int_a^b f(x) dx \approx \frac{h}{3} \cdot (y_0 + 4y_1 + 2y_2 + 4y_3 + \dots + 4y_{n-1} + y_n).$$

Dabei ist $h = x_{i+1} - x_i$ die Breite der Teilintervalle. Die Simpson-Formel liefert eine gute Approximation des Integrals und umso besser, je größer n ist und je kleiner die Teilintervalle sind. Wenn man mit g den Vektor der "Gewichte" $(1, 4, 2, 4, \dots, 4, 1)$ und mit y den Vektor der Funktionswerte $(y_0, y_1, y_2, y_3, \dots, y_{n-1}, y_n)$ bezeichnet, dann ist die Summe in der Klammer der Simpson-Formel nichts anderes als das Skalarprodukt dieser beiden Vektoren.

Für die erwartete Nachfrage ergibt sich fast genau der Wert $M = 50$ aus unserem ersten Beispiel. Damit stimmen auch die Bestellmenge und der Bestellpunkt mit den Werten der (s, q) -Politik aus dem ersten Beispiel überein. Unterschiede ergeben sich erst bei

Vorgabe eines Servicegrads. Der effektive Servicegrad für die normale (s, q) -Politik mit $s = 80$ ergibt sich durch Anwendung der Simpson-Formel für die empirische Dichte folgendermaßen:

$$p = \int_{-\infty}^{s/L} \widehat{f}(x) dx = 0,0712.$$

Wenn der Servicegrad höher sein soll, dann kann der dafür erforderliche Bestellpunkt s_p einfach bestimmt werden, da es sich bei den Integralwerten über die Kerndichte an den Stellen x_i ja nur um endlich viele Werte handelt. So zeigt sich in unserem Beispiel, dass für $s = 95,2$ der Servicegrad $0,403$ beträgt und damit — in der diskreten Approximation — einen gewünschten Servicegrad von 40 Prozent gerade übersteigt.

Wenn der gewünschte Servicegrad größer ist als der effektive Servicegrad, dann ist der entsprechende Bestellpunkt s_p größer als s . Wegen (1), (2) und (3) ist dann auch die erwartete Gesamtkostenfunktion steigend in s , so dass s für die restringierte Minimierung gerade gleich s_p zu setzen ist. Eine weitere Vergrößerung des Bestellpunkts würde die Kosten unnötig in die Höhe treiben.

Die Zielfunktion ist damit nur noch eine Funktion von q . Die optimale Bestellmenge ergibt sich dann mit $R_p := s_p - M \cdot L$ wie folgt:

$$q = \begin{cases} \sqrt{2K_B M / k_L} & \text{für } R_p \geq 0 \\ \sqrt{2K_B M / k_L + (k_L + k_F) / k_L \cdot R_p^2} & \text{für } R_p < 0 \end{cases}$$

In unserem Beispiel beträgt die optimale Bestellmenge 110,18 ME.

Die minimalen täglichen Kosten berechnen sich folgendermaßen:

$$E(K(q, s_p)) = \begin{cases} K_B M / q + k_L \cdot (q/2 + R_p) & \text{für } R_p \geq 0 \\ K_B M / q + k_L \cdot (q + R_p)^2 / (2q) + k_F \cdot R_p^2 / (2q) & \text{für } R_p < 0 \end{cases}$$

Im Beispiel betragen die täglichen Gesamtkosten 210,75 €.

Fazit

Die (s, q) -Politik ist ein Mehrperiodenmodell der stochastischen Lagerhaltung. Die beiden Parameter werden kostenoptimal — gegebenenfalls mit einem Mindestservicegrad — berechnet und dann in künftigen Perioden angewendet. Wenn die Nachfrage jedoch nicht normalverteilt ist, dann besteht die Möglichkeit, ihre Dichte aus beobachteten Nachfragemerten zu schätzen. Für die Integrale, die bei gegebenem Servicegrad auftreten, wird dann diese empirische Dichte verwendet. Da sie nicht als integrierbare Funktion vorliegt, aber in Form von diskreten Werten, werden die Integrale durch eine Quadraturformel approximativ berechnet. Wir haben hier eine der einfachsten und zugleich genauesten Quadraturformeln verwendet, die Simpson-Formel. Die Berechnungen sind nicht schwierig und können mit einem Tabellenkalkulationsprogramm ausgeführt werden.

Abstract

In order to achieve the maximum possible profit by taking the lowest possible risk, investors build a stock portfolio consisting of a specific number of stocks which, according to the principle of diversification, significantly reduce the risk of loss. To build a portfolio, in developed capital markets investors have used the Markowitz portfolio optimization model for many years that enables us to find an optimal risk-return trade-off by selecting certain stock combinations. Despite the development of the Zagreb Stock Exchange, i.e., the central trading venue in the Republic of Croatia, the Croatian capital market is still underdeveloped. It is characterized by numerous shortcomings such as low liquidity, lack of transparency, high stock price volatility and insufficient traffic. Accordingly, the aim of this paper is to provide an insight into the functioning of the

Croatian capital market and to examine the possibility of building an optimal stock portfolio by using the Markowitz model. The analysis was carried out on a sample of seventeen stocks of companies listed on Zagreb Stock Exchange, which were taken for analysis on the basis of the following criteria: liquidity, affiliation to certain sectors and a positive financial result. The results have shown that underdeveloped capital markets, like the Croatian capital market, have some shortcomings that are, to a greater or lesser extent, problems in the proper application of the Markowitz model.

Keywords: stock portfolio, Croatian capital market, Markowitz portfolio optimization model, risk diversification, efficient frontier

JEL Classification: G11, O16

1. INTRODUCTION

In recent times, entities have started to move away from traditional forms of saving in banks and invest their money in capital market instruments. The capital market is a meeting place for supply and demand of long-term securities - stocks and bonds. Regardless of the type of securities an investor invests in, each investor aims at earning profits in the future. However, they are aware of the fact that such investments carry a certain risk of loss. Given their attitude to risk, investors may be risk-averse, they may be more prone to risk or completely indifferent to risk. Taking a greater risk offers the possibility of achieving higher total returns and vice versa. When investing, investors should take into account the principle of diversification. In other words, they need to invest in a variety of different securities, thus reducing the risk of losing the funds invested.

The fundamental question is how to find a combination of securities that will allow a maximum return to be achieved at an acceptable level of risk. In 1952, Harry Max Markowitz developed a model that allows for finding an optimal risk-return trade-off by selecting a particular combination of securities. By applying the model, investors can build an optimal portfolio that will consist of those securities that promise the highest possible return at the level of risk they are willing to accept. The model is based on several basic assumptions, such as returns that are normally distributed, the existence of rational investors and the existence of a liquid and efficient market. Although there has been a lot of criticism of the applicability of the model, it has been applied in more

developed markets for many years and it is used as a basis for developing new, more complex models.

Due to numerous recent crises in capital markets, it is very important for investors to make a good investment decision in order to protect themselves from potential investment losses. The application of the Markowitz model for the purpose of finding an optimal portfolio is certainly efficient in more favorable market conditions, but its applicability is questionable in underdeveloped markets, such as the Croatian market, that do not meet the basic assumptions of the model.

This paper analyses the application of the Markowitz model to the Croatian capital market. Despite the development of the Zagreb Stock Exchange as the central trading venue in the Republic of Croatia, the Croatian capital market is still underdeveloped. It is characterized by numerous shortcomings such as low liquidity, lack of transparency, high stock price volatility and insufficient traffic. Accordingly, the aim of this paper is to determine whether, despite the aforementioned problems, the model can provide satisfactory results. The aim is also to clarify the theoretical assumptions of the Markowitz model and its applications, provide an insight into the situation on the Croatian capital market and examine the possibility of building an optimal stock portfolio by using the Markowitz model. Four research hypotheses have been set up according to the research subject.

The main hypotheses:

- The Markowitz model is applicable to the Croatian capital market.
- An increased number of stocks in the portfolio reduces the overall risk.

Auxiliary hypotheses:

- All joint stock companies whose shares are part of the CROBEX index achieved a positive financial result in 2017.
- The selected optimal portfolio will be sectorally diversified.

2. LITERATURE REVIEW

When building a portfolio, most investors want to take advantage of the benefits of diversification in order to achieve the expected return with the least risk possible. The key issue here is how to determine and measure the optimal risk-return trade-off. Fabozzi et al. (2002) state that the trade-off between risk and return is explained by modern portfolio theory (MPT). Harry Max Markowitz

is considered the founder of modern portfolio theory. Although the fundamentals of the portfolio model were set up in 1952, seven years later, he developed a theory according to which it is possible to achieve the optimal risk-return trade-off by selecting a certain combination of securities. Xia et al. (2000) state that the basis of the Markowitz model is to achieve the expected return of a portfolio as return on investment and variance of the expected return of a portfolio as investment risk. Accordingly, Wang & Zhu (2002) indicate that every investor has the following two goals: to maximize the expected return and to minimize portfolio risks. Therefore, the Markowitz model is a mathematical model that enables us to find such a combination of securities that will enable investors to achieve the highest possible return at the level of risk they are willing to accept. A portfolio consisting of such securities is called an efficient portfolio. An efficient portfolio is a portfolio that, among all combinations of the same level of risk, promises the highest return, i.e., the one which, of all combinations, gives the same return at the lowest risk (Sharpe; 1963, 278; Mao & Särndal; 1966, 324).

The Markowitz model (1952) is based on several basic assumptions: returns on stocks are normally distributed, investors want to maximise their economic utility, investors are rational and risk-averse, investors are well informed about all relevant facts necessary to make an investment decision, there are neither transaction nor tax costs and securities are perfectly divisible. One of the assumptions of the model is that investors are risk-averse and that they wish to maximise their profit or wealth. Steinbach (2001) explains that the final issue in the portfolio selection context is related to how investors forecast the future, which is presented by the probability of property restitution. If the investors have to choose between two securities that will enable them to achieve the same return, they will choose the one with a lower risk of loss. The investors will be prepared to assume a higher risk only if it will enable them to achieve a much higher return. Hence, when selecting a portfolio, a rational investor will always invest in the portfolio with the best trade-off between risk and return, i.e., in the one that yields a higher expected return for the same level of risk. Although the Markowitz model is one of the most significant innovations in the area of portfolio construction, his basic assumptions have been criticised. Jerončić & Aljinović (2011) criticise the assumption referring to returns on stocks that are normally distributed since they are the result of prices formed by market forces that are not random but are based on economic rules as well as investor's forecasts and expectations. This deviation from normal distribution becomes

evident during the economic crisis or exceptional economic progress. It is also considered that the assumption about risk-averse investors is not fully accurate, that investors cannot be fully informed and have at their disposal all the facts necessary to make a good investment decision. Omisore et al. (2011) point out that the theory does not take into account the personal, ecological, strategic or social dimensions of investment decisions. An obstacle to the model includes the absence of transaction and tax costs and the assumption that securities can be perfectly divisible. Nevertheless, it is undeniable that Markowitz's theory has enabled previous analyses to be supplemented by new statistical methods and that it represents a very important portfolio management tool. The contribution of Markowitz's theory is also reflected in the ability of companies to diversify their risks, i.e., to reduce the risk of an entire portfolio by increasing the number of securities, which is the fundamental principle investors must stand by when building portfolios. However, risk is reduced by intensifying diversification, so it is not desirable to form a portfolio that will consist of a large number of securities. The number of securities that make up a diversified portfolio is the subject of numerous studies (Statman, 1987; Evans & Archer, 1968).

The trade-off between risk and return is analyzed based on a probability distribution. The following two basic probability distribution parameters are applied: the expected return and variance, i.e., standard deviation. Each individual portfolio is determined by its return and risk and a certain number of securities can be used to build a portfolio. A set of portfolios given in Figure 1 is obtained by showing all possible portfolios in the coordinate system.

Figure 1. A set of possible portfolios

Source: Aljinović et al., 2011:135

The shaded area shows possible combinations of multiple investments, and it represents the trade-off between risk and returns referring to these investments. Standard deviations and the expected portfolio returns are shown on the horizontal and the vertical axis, respectively. On the left-hand side, a set of possible portfolios is bounded by a line called a set of minimum variances.

Figure 2. A set of minimum variances

Source: Authors' elaboration

Figure 2 shows a set of portfolios that have the minimum standard deviation for a certain level of return. Given that the minimum standard deviation implies the smallest risk possible, the portfolios on the line represent the dominant portfolios that should be observed as the only ones when finding efficient portfolios. However, not all dominant portfolios are efficient portfolios. If we look at Figure 2 again, we can see a portfolio marked with a dot. This portfolio is located closest to the vertical axis and it divides the line into two parts, with efficient portfolios on the upper part of the line and inefficient portfolios on the lower part of the line, since at the same level of risk they yield lower returns. Thus, a set of efficient portfolios is located at the upper left boundary of a set of potential portfolios, and this boundary is called the efficient frontier.

Figure 3. The efficient frontier

3. METHODOLOGY

Data referring to stocks selected for analysis are downloaded from the official Zagreb Stock Exchange (ZSE) website. The choice of stocks that will form the initial sample is primarily based on the liquidity criterion. According to Jerončić & Aljinović (2011), as a rule, stock liquidity should ensure fair valuation of the stock itself, because in theory a large number of transactions the convergence of the stock price to the equilibrium price of supply and demand, which depend on investor expectations and market conditions.

3.1. SAMPLE DESCRIPTION

The initial sample consists of stocks included in CROBEX, an official index of Zagreb Stock Exchange. Table A1 in the annex shows a list of stocks that were included in the CROBEX index on 19 March 2018 on the basis of a regular audit of the Index Committee and that are, as such, included in the initial sample for the formation of an optimal stock portfolio.

Apart from creating a portfolio with an optimal trade-off between risk and return, it should also be sectorally diversified. The companies whose stocks are included in the initial sample for the formation of an optimal portfolio are grouped into individual sectors depending on their main business activity. For the purpose of classifying companies into sectors based on their main activity, the Zagreb Stock Exchange uses the National Classification of Activities 2007 (OG 58/07 and 72/07). Sectors are determined based on the A*38 intermediate-level aggregation, which consists of 38 categories. Table A2 in the annex shows that the selected stocks are grouped into twelve different sectors, indicating a high likelihood of forming a sectorally diversified optimal portfolio.

Financial statement analysis of joint stock companies was carried out with the aim of eliminating undesirable stocks, which led to a reduction in the sample to be used for the Markowitz model. In order to identify undesirable stocks, we calculated financial indicators clustered into the following five different groups: profitability indicators, activity indicators, liquidity indicators, debt indicators, and investment indicators. Consolidated annual financial statements for 2017 of all joint stock companies from the initial sample were analyzed. The results of the analysis are shown in Table 1.

Table 1. Financial indicators of joint stock companies for 2017

Source: Authors' elaboration based on data from Zagreb Stock Exchange d.d.

Available online at <http://www.zse.hr/default.aspx?id=36774> [Accessed: 27 June 2018]

Based on financial indicators of joint stock companies for 2017 that are listed in Table 1, the following stocks will be removed from the initial sample:

- ♦ DDJH (Đuro Đaković Grupa d.d.) - due to negative financial results, low liquidity and a high debt ratio,
- ♦ IGH (Institut IGH d.d.) - due to negative financial results, low liquidity and a very high debt ratio,
- ♦ JDPL (Jadroplov d.d.) - due to negative financial results, very low liquidity and a high debt ratio,
- ♦ LKRI (Luka Rijeka d.d.) - due to negative financial results, and
- ♦ OPTE (Optima Telekom d.d.) - due to negative financial results, an overvalued stock, low liquidity, and a very high debt ratio.

Following the analysis of financial statements and the elimination of undesirable stocks, there are 17 stocks remaining in the sample that are involved in the further process of forming an optimal portfolio.

4. RESULTS

In order to create an optimal portfolio by using the Markowitz model, the following variables should be calculated: the expected return on the stock $E(r)$, the standard deviation (σ) and the variance-covariance matrix. The expected return on the stock $E(r)$ requires us to calculate historical price change. Stock price changes are calculated on a monthly basis for the period from 1 January 2017 to 31 May 2018. As historical data are downloaded from the Zagreb Stock Exchange official website, which supplies data only on a daily basis, the average monthly prices necessary for the calculation of monthly price changes are calculated as the arithmetic means of all daily prices in a given month. The expected monthly returns on the stocks $E(r)$ represent the average of monthly price changes for each stock.

Table 2. Expected monthly returns, variances and standard deviations of stocks making up a sample for the formation of an optimal portfolio

Source: Excel calculation done by the authors

It can be seen in the table that 6 out of 17 companies have a negative expected return. Particularly interesting is the fact that the companies Uljanik plovdba d.d. and Ericsson Nikola Tesla d.d. with the highest return on equity (80.58% and 28.81%, respectively) have negative expected returns. However, these companies are not as risky as Brodogradilište Viktor Lenac d.d., which has the highest standard deviation of as much as 12.75%, but also the third highest expected return of 2.36%. The least risky business is the Hrvatski Telekom d.d. company with a standard deviation of 1.97%, and a negative expected return. The highest expected return of 3.43% is registered by the Atlantska plovdba d.d. company. According to average standard deviations of companies per sector, the most vulnerable and the least risky sectors are *Construction* and *Telecommunications*, respectively. The next step is to create a variance-covariance matrix.

Table 3 shows the variance-covariance matrix of stocks included in the sample to form an optimal portfolio. The shaded cells indicate return variances of individual stocks shown in Table 2 above. After all necessary variables have been calculated, it is possible to create an efficient frontier and select an optimal portfolio.

4.1. CREATING AN EFFICIENT FRONTIER AND SELECTING AN OPTIMAL PORTFOLIO

The first step in creating an efficient frontier is to form a set of minimum variances. The set of minimum variances is created on the basis of a series of dominant portfolios that are obtained by using the Excel Solver tool, where the expected monthly returns of individual stocks and the variance-covariance matrix should be reduced to annual values.

Figure 4. A set of minimum variances

Source: Excel calculation done by the authors

The line shown in the figure represents a set of portfolios that have a minimum variance or standard deviation for a certain rate of return. Therefore, it is the dominant portfolio with the lowest possible risk. However, not all of the

dominant portfolios are efficient portfolios. If we look again at Figure 4, we can notice a portfolio marked in red. This portfolio is located closest to the vertical axis and it divides the line into two parts. The upper part of the line is known as the efficient frontier and it is a set of efficient portfolios that, with the same level of risk, promise higher returns than the portfolios located on the lower part of the line.

Figure 5. The efficient frontier

Source: Excel calculation done by the authors

Although the efficient frontier represents infinitely many combinations of standard deviation and expected return points, the efficient frontier shown in the figure is created based on eleven efficient portfolios, i.e., eleven combinations of the standard deviation and the expected returns shown in Table 4.

Source: Excel calculation done by the authors

Table 4 shows a share of individual stocks in the portfolios by different combinations of returns and risks. Expected returns and standard deviations move in the same direction, hence portfolios with lower expected returns have less risk, and vice versa – higher expected returns come with more risk. According to the principle of diversification, less risky portfolios consist of a larger number of stocks, and more risky portfolios consist of a smaller number of stocks. For example, the first portfolio with the smallest standard deviation of 6% consists of stocks of five companies (AD Plastik d.d., Atlantska plovidba d.d., Hrvatski Telekom d.d., Kraš d.d. and Podravka d.d.), while the last portfolio with the highest standard deviation of 33.97% consists of stocks of only one company (Atlantska plovidba d.d.).

All portfolios found at an efficient frontier can be called optimal portfolios. Individual investors will select a stock portfolio in accordance with their own views on the risk-return trade-off. Risk-averse investors will choose less risky portfolios from the left-hand segment of the efficient frontier and be ready to

achieve smaller returns. On the other hand, investors prone to risk will invest in a portfolio from the right-hand segment of the efficient frontier, which is characterised by a high level of risk and a higher return. For the purposes of this paper, it is assumed that we deal with a more conservative investor who wants to invest in a moderately risky portfolio with a satisfactory return. Such investors would like to invest their funds in e.g. the portfolio under number 9. The standard deviation of the portfolio is 12.42% and the expected return is 30%. Compared to the maximum standard deviation that can be achieved by combining the observed stocks, the standard deviation of this portfolio is as low as 63.44%, and as such, it is ideal for such type of investor who is not a high-risk taker. On the other hand, the expected return is lower by only 27.11% of the maximum expected return achievable, which makes it more than satisfactory. The stock and sector structure of the investor's optimal portfolio is presented in Table 5.

Table 5. The stock and sector structure of an optimal portfolio

STOCK	SHARE	E(r)	ST. DEV.	SECTOR
ADPL	74.89%	26.99%	45.69%	Manufacture of transport equipment
ATPL	22.14%	41.16%	117.69%	Transportation and storage
INGR	1.04%	34.66%	134.32%	Legal, accounting, management, architecture, engineering, technical testing and analysis activities
MAIS	1.70%	15.29%	61.51%	Accommodation and food service activities
VLEN	0.14%	28.32%	153.95%	Manufacture of transport equipment

Source: Authors' elaboration

The optimal portfolio includes stocks of the following five companies: Ad Plastik d.d., Atlantska plovodba d.d., Ingra d.d., Maistra d.d. and Brodogradilište Viktor Lenac d.d. The largest stock in the portfolio consists of AD Plastik d.d. and Atlantska plovodba d.d. stocks, which is expected since these are stocks with the fourth and the highest annual expected return compared to other seventeen stocks observed. Although individual shares of stocks of other companies are almost insignificantly small, these stocks are among the top seven in terms of the expected annual returns. All observed stocks are among the ten best ones in terms of the return on equity (ROE). When it comes to the portfolio sector structure, it can be noticed that only two stocks belong to the same sector. Given the presence of four different sectors, it can be concluded that the portfolio is sectorally diversified.

5. CONCLUSION

When investing in stocks, each investor is interested in achieving the maximum profit with the minimum risk possible. In order to achieve this, investors should form a stock portfolio that will consist of a larger number of stocks, which will, according to the principle of diversification, significantly reduce the risk of loss. To form a portfolio, investors in developed capital markets have been using the Markowitz portfolio optimisation model for many years to find an optimal risk-return trade-off by selecting certain stock combinations. The aim of this paper was to investigate whether the Markowitz model can also be applied to the Croatian capital market, despite the fact that this market is young and underdeveloped. For the analysis of the application of the Markowitz model, a sample of seventeen stocks was used that had to meet several criteria, i.e., liquidity, which is why only the CROBEX index stocks were taken into consideration, affiliation to different sectors and positive financial results of companies. After calculating all variables needed for model application, an efficient frontier was created successfully, i.e., the curve on which there lie the portfolios with a minimum level of risk for a given level of return. Assuming a conservative investor, an optimal portfolio was selected, which contains five different stocks and which, with an acceptable level of risk, promises a satisfactory return. Nevertheless, underdeveloped capital markets such as the Croatian market have some shortcomings which, to a greater or lesser extent, pose problems for its proper application. Due to a limited number of stocks traded on the market, lack of liquidity and transparency and missing trade history data, it is not possible to accurately calculate the average expected returns. Although because of these reasons the use of the Markowitz model is far more efficient in more developed markets, the use of the expected return as an input parameter is no longer recommended. Today, instead of the original model, much more complex models are used that provide more accurate prediction of return, but this model is still used as a basic model. Despite the aforementioned shortcomings, the first main hypothesis according to which the Markowitz model is applicable to the Croatian capital market is not rejected. The second main hypothesis stating that an increased number of stocks in the portfolio reduces the overall risk is not rejected either. Our research has shown that some joint stock companies, whose stocks are part of the CROBEX index and accordingly make the most liquid stocks listed on Zagreb Stock Exchange, have not achieved positive financial results in 2017; hence the first auxiliary hypothesis is rejected. The optimal

portfolio selected by assuming a conservative investor is sectorally diversified so that the second auxiliary hypothesis is not rejected.

Abstract

The Ilok Cellars (Winery Ilok) are in the eastern part of Croatia, due to the quality of the climate and the specific soil, the area where today's vinery and vineyards are located was recognized as very high quality in the antique period. The first written traces of grape growing in these areas originate in Illyrian times. Today's winery recognizability should be thanked Nikola Iločki master of Ilok area, who in 1450 gave a wine cellar for the purpose of producing and storing wine. Very important for viticulture and winemaking in Ilok area is the arrival of the Italian noble family Odescalchi, who became the owner of vineyards and wineries in 1697, the family constantly increases the planting and cellar capacity until 1945 when their possessions were seized and nationalized. Significant advances in Ilok winemaking business occurred in 1970 with the construction of a new basement in the business of the then owner of PPK Vupik Vukovar. During the war, the vineyards and basements were quite neglected, and the renovation was only at the beginning of 2003 when the privatization process was completed when the vineyards and basements were renovated and

the mansion of Principovac became a unique tourist destination. The purpose of this paper is to investigate and prove justification of investment and financial investments in the pearl of Eastern Slavonia, Ilok Vineyards, through financial and compartmental analysis of the financial reports over the last several years.

Keywords: *financial analysis, comparative analysis, financial statements*

JEL Classification: G00, G30

1. INTRODUCTION

A comparative analysis of the financial statements of a business entity is part of a business analysis aimed at getting acquainted with the company's economic and financial strength, as well as the possible prospects that an enterprise can achieve during its business. Comparative analysis as a research method is very important if we want to get acquainted with the business of the society in the past so that we can get the basis for making decisions in the future. This paper analyzes the operations of a joint stock company that has undergone a transformation from a stock company before 1945, a state-owned enterprise from 1945 until 1990, and back to the joint stock company from 1990 until today.

The work consists of two parts. The first part describes the history of society through various stages and historical events that have created the environment in which society has existed for many years. The second part offers a financial analysis of the company. The aim of this paper is to thoroughly process, investigate and critically evaluate the financial operations of the investigated company, or to determine if the benefits outweigh the disadvantages. The balance sheet and profit and loss account information will be the basis for processing horizontal and vertical analyzes. After the analysis, a conclusion will be drawn that will propose guidelines for sustainable growth and successful business. The methods of analysis and synthesis methods were used in this paper.

2. HISTORY AND TOURIST OFFER OF ILOK CELLARS

Ilok Cellars are in the east of the Croatian city of Ilok. Ilok is old traditional town located on the slopes of Fruška Gora and the banks of the Danube River. Wine growing tradition and vineyards take their origins from the Illyrian and

Roman times. The name Ilok was first mentioned in 1267 as Wjlok, Wylhoc, and Iwnalk. The most important relocation of Ilok as the city and the center of that part of Slavonia is the time when the owner of the town and vineyard was Nikola Iločki, the Croatian Deputy of Croatia, Slavonia, and Mačva. The status of a free royal town was given in the 15th century. In the 16th century, the Turks, who continued their vineyard tradition, expanded to the whole of Slavonia. An important event in the history of Vineyards in Ilok is the arrival of the Italian old noble family Odescalchi, which gains herbs and vineyards. The family builds a new wine cellar under the castle of Nikola Iločka in very contemporary conditions for that time, introduces the cold stabilization of wine and for the first time, the wine is packed into bottles that were new in Europe at that time. At that time a wine sort of Traminac was brought from South Tyrol. Traminac found very fertile soil in the area of Ilok and became a trademark of the IloK Cellars. New owners build their Odescalchi castle below which is a beautiful old wine cellar. In the 18th and 19th centuries, Ilok was an important center of the eastern part of Slavonia for trade and wine production.

During the period of socialism and social ownership, Ilok lost its significance and in time lost the status of the town and became a settlement in the Municipality of Vukovar. At that time, cellars and vineyards from private property went to state ownership and the former holdings of Count Eltz became part of the Federal Agricultural Property of Vukovar to which Iločki vineyards were annexed. The processing of vineyards and wine growing has significantly declined during that period. A small shift occurs when PIK Vukovar was founded in 1968, which was a major food producer. Ilok has experienced the revival and flourishing of vineyards and wine production in 1974 when the vineyards expand and reach about 750 hectares, the cellars were then restored, and modern technology was introduced. 1982 PIK Vukovar changes its name and becomes VUPIK Vukovar with the trademark Vučedol dove. After the democratic changes that have taken place in these parts, VUPIK was organized in 1995 as a shareholding company with majority ownership of the Croatian Privatization Fund. In 1999 Vinogradarstvo Ilok stands out from VUPIK d.d. In 2003, with the completion of the privatization process, they gained a new majority owner.

Afterward, the building and the cellar were reconstructed while the mansion used by former Italian owners has been renovated before it was nationalized in 1945. In 2013, Ilok Cellars have about 350 ha of their own vineyards and 700 ha of vineyards in cooperation with the producers of the Ilok area with the ca-

capacity of processing 4-5 million liters of wine in the cellars. Today's offer of Ilok Cellars turns in not just the production of wine but in tourism promotion and offer of the estate. The renovated country estate of Principovac, which was built in 1864 as the summer residence of the Odescalchi family where they stayed during the harvest. Within the estate, there is a restaurant, with a rich gastro-nomic offer based on local cuisine with original local specialties of Ilok area. In its complex, there is a golf course, a volleyball court, a tennis court, while a special attraction is the panorama view with a panoramic lift from the estate and 8 km of asphalted wine trails through the vineyards which are ideal for cycling,

3. FINANCIAL ANALYSIS OF ILOK CELLARS

Table 1. Analysis of assets of Ilok Cellars

Name of the position	2015	2016	2017	Absolute change 2016-2015	Relative change [%]	Absolute change 2017-2016	Relative change [%]
Non-current Assets	180,230,000	181,320,300	179,250,100	1,090,300	0.60%	-2,070,200	-1.14

Paid costs of future period	0	0	0	0	0	0	0
TOTAL ASSETS	230,752,800	237,798,800	243,977,000	7,046,000	3.05%	6,178,200	2.60

Source: Financial data [available at: <http://poslovna.hr/subjekti.aspx?show=209924&tab=poslovanje>; access March 6, 2019]

Non-current assets were 0.6% higher in 2016 than in 2015, and 1.14% lower in 2017 than in the same period in 2016. Short-term assets were 11.79% higher in 2016 than in 2015, and 14.60% higher in 2017 than in the same period in 2016. Total assets were 3.05% higher in 2016 than in 2015, and 2.60% higher in 2017 than the observed period in 2016.

3.1. ANALYSIS OF PASSIVE

Table 2. Analysis of passive of Ilok Cellars

Name of the position	2015	2016	2017	Absolute change 2016/2015	Relative change [%]	Absolute change 2017/2016	Relative change [%]
Capital and reserves	119,710,300	127,424,000	133,787,800	7,713,700	6,44	6,363,800	4,99
Long-term obligations	66,973,800	44,240,000	58,560,440	-22,733,800	-99,99	14,320,440	32,4
Short-term obligations	66,973,800	44,240,000	58,560,440	-22,733,800	-99,99		
Deferred payment of costs	36,682,400	55,784,600	42,461,300	19,102,200	52,07	-13,323,400	-23,9
TOTAL PASSIVE	15,480,800	30,843,900	14,391,300	15,363,100	99,23	-16,452,600	-53,34

Source: Financial data [available at: <http://poslovna.hr/subjekti.aspx?show=209924&tab=poslovanje>; access March 6, 2019]

Capital and reserves had increased in 2016 by 6.44% in regard to 2015 and increased in 2017 by 4.99% in regard to 2016. Long-term obligations had decreased in 2016 by 99.99% in regard to 2015 and increased in 2017 by 32.4% in regard to 2016. Short-term obligations had also increased in 2016. by 52.07% in regard to 2015 and decreased in 2017 by 23.9% in regard to 2016.

3.2. ANALYSIS OF THE PROFIT AND LOSS ACCOUNT

Table 3. Profit and loss account

Profit and Loss Account	2015	2016	2017	Absolute change 2016/2015	Relative change [%]	Absolute change 2017/20156	Relative change [%]
Revenues	59,628,900	60,949,000	61,165,300	1,320,100	2,21	216,300	0,35
Sales revenues	59,628,900	60,949,900	61,165,300	1,320,100	2,21	216,300	0,35
Expenses	58,947,300	59,434,900	59,378,900	487,600	0,83	-56,000	-0,09
Changes in inventory value	-4,259,100	-2,486,400	-4,226,900	-1,772,700	-41,62	1,740,500	70
Material costs	33,491,800	30,919,100	30,594,100	-2,572,700	-1,05	-325,000	-1,05

Staff costs	16,356,000	17,245,600	18,593,300	889,600	5.44	1,347,700	7.81
Amortization	7,989,900	8,574,300	8,846,900	584,400	7.31	272,600	3.18
Other expenses	5,368,600	5,182,200	5,571,500	-186,400	-3.79	389,300	7.51
Financial revenues	108,900	590,100	759,400	481,200	441.87	169,300	28.69
Financial expenses	3,042,100	3,034,500	4,028,700	-7,600	-0.25	994,200	32.76
TOTAL REVENUES	63,330,400	64,833,800	66,069,300	1,503,400	2.37	1,235,500	1.90
TOTAL EXPENSES	61,989,400	62,469,400	63,407,600	480,000	0.77	938,200	0.92
Profit before tax	1,341,000	2,364,400	2,661,700	1,023,400	76.31	297,300	12.57
Profit tax	102,500	161,800	691,700	59,300	57.85	529,900	327.50
Net profit	1,238,500	2,202,600	2,069,900	784,100	77.84	-132,700	-6.02

Source: Financial data [available at: <http://poslovna.hr/subjekti.aspx?show=209924&tab=poslovanje>; access March 6, 2019]

It is evident that revenues had increased in 2016 by 2.21% in regard to 2015 and had kept on increasing in 2017 by 0.35% in regard to 2016. Expenses had accordingly increased in 2016 by 0.83% in regard to 2015, and in 2017 decreased by 0.09% in regard to 2016.

3.3. CALCULATION OF LIQUIDITY INDICATORS

Table 4. Calculation of liquidity indicators

	Indicator	2015	2016	2017	standard
1.	Current liquidity coefficient Cash Short-term obligations	1.38	1.01	1.52	>2.00
2.	Accelerated liquidity coefficient Cash and short-term receivables Short-term liabilities	0.39	0.36	0.56	>1.00
3.	Current ratio Current assets Sort-term liabilities	0.03	0.03	0.02	1.00
4	Financial stability coefficient Non-current assets Capital and long-term liabilities	0.41	0.61	0.31	1.00
5	Accounts receivable days	74	104	86	
6	Inventory revolutions days	220	217	244	
7	Settlement period	139	168	175	
8	Total labor cost	26.4	27.6	29.3	
9	Dept ratio	0.44	0.42	0.41	0.7
10	Financial stability	1.03	0.95	1.07	1

Current liquidity coefficient shouldn't be lower than 2.00 point. Based on collected data, it can be seen that the coefficient in all observed years is less than 2.00 which indicates that the company has no ability to settle its obligations presently. Accounts receivable days, the time of the payment of receivables expressed in days based on data from the last day of the year. Inventory Revolutions Days; the time of conversion of inventories into claims expressed in days based on data from the last day of the year. Obligation dates, settlement time obligations to suppliers expressed in days based on data from the last day of the year. Dept ratio represents the ratio of all company liabilities and total assets. The debt rate above 0,7 indicates that the company is over-indebted. Financial stability represents the ratio of long-term sources of financing and long-term assets. The minimum value of this indicator is 1, with long-term assets fully covered by long-term sources.

3.4. CASH FLOW QUALITY

Indicator	2015	2016	2017
Net profit	1,238,500	2,202,600	2,069,900
Amortization	7,989,900	8,574,300	8,846,900
Stock	975,200	-134,100	-4,783,200
Short-term receivables	-3,730,300	-5,045,700	2,514,700
Short term fin, Assets	459,700	-280,000	-6,675,000
Short-term liabilities	-7,867,000	3,739,100	3,129,300
Passive delimitations	-977,700	1,963,900	-1,282,700
Operating cash flow	-1,911,600	11,020,100	3,820,000
Long lasting no, property	-3,272,500	-5,493,100	-2,428,200
Long-term assets without am,	-13,173,600	-4,171,600	-4,348,600
Investment Cash Flow	-16,446,000	-9,664,600	-6,776,800
Capital reserve	2,534,700	5,511,100	4,239,900
Long-term liabilities	18,714,300	21,733,700	4,420,400
Short term, obligations	-3,595,500	15,363,100	-16,452,600
Financial cash flow	17,653,500	-859,500	2,261,700
Net cash flow	-704,200	495,900	-695,200
Money at the beginning of the period	1,656,600	952,400	1,448,300
Money at the end of the period	952,400	1,448,300	753,100

The main positions of the cash flow statement are; The cash flow from business activities or operating cash flow (OCF) shows the cash benefits of all transactions that cannot be defined as investment or financial transactions. Cash flow from operating activities excludes the effects of foreign currency exchange rate fluctuations. As a rule, the cash flow from the business activity shows the cash

flow resulting from the activities that generate the company's revenue. Cash flow from investment activities or investment cash flow (ICF) measures the amount of money invested by a business entity in fixed assets, ie measures the amount of money that a business entity disinvested from long-term tangible assets. A negative cash flow statement indicates that a business entity invests in long-term assets (for example, construction of new plants, acquisitions of business units, capital equipment purchases).

A positive investment effect indicates that a business entity liquidates or sells long-term assets. Cash flow from financial activities or financial cash flow (FCF) measures the amount of cash that follows from the capital structure of a business entity. Positive financial cash flow indicates that a business entity is collecting cash from external sources (bank loans, raising equity, issuing bonds, loans). Negative financial cash flow indicates that a business entity returns funds back to external sources of financing. The net cash flow (NCF) is the sum of the operating cash flow (OCF), investment cash flow (ICF) and financial cash flow (FCF). This measures the annual absolute change of money on kuna and foreign currency accounts and cash registers. The negative cash flow indicates an absolute cumulative outflow, a decrease in cash flow while the positive cash flow indicates an absolute cumulative inflow and an increase in cash.

4. PLANS FOR THE FUTURE

According to Croatian national strategy, three operational programs, and rural development programs, contracted projects amounted to HRK 1,6 billion, out of which 700 million HRK are and will be for the rural development programs. The winery in this regard sees the potential for further advancement and expansion of the business. Ilok Cellars produced 4,8 million liters of wine in 2018, which will be placed on the market in the first half of the year 2019. Through national and EU funds, the winery plans to expand capacity in the following years and include new wine varieties in its offer.

Management of Ilok Cellars is actively searching for a business partner abroad. Foreign investors have a significant impact an important role in economic recovery by bringing the much-needed fresh capital, high quality and environmental standards as well as know-how, innovative technologies, job creation, and employee development programs. Wineries in the area of Eastern Croatia should work together on continuing the construction of a stable and

strong market-driven economy, competitive in the world market, to continuously strengthen macroeconomic stability in order to ensure stable and sustainable economic development. In this context, the importance of investment for future development should be recognized as a major contribution to further restructuring and modernization of the economy, strengthening international competitiveness and creating new jobs.

According to the business plan, if the financial and organizational structure is met, Ilok Cellars plan and an investment in the construction of the five-star category hotel on Principovac, with 80 rooms. Such an investment will significantly affect the increase of the tourist offer of the whole region, especially the City of Ilok.

5. CONCLUSION

The financial basis for the financial statements prescribed by the Law on Accounting and General Tax Law are business documents, forms, accounts, and other accounting documents. Bookkeeping documentation that enters and exits daily through individual departments and departments of each trading company. Accounting documentation through financial statements provides information on the results of business activities undertaken to persons, organizations, and institutions outside the trading company, and users within the company. The financial statements are publicly available and are published on the Commercial Register pages and on Fine pages as a media publication.

The analysis of financial statements is part of the business analysis that is being conducted to acquaint the economic and financial strength of the company and possible directions in the further development of the company. The aim of the research in this paper is to study the business of a trading company that has undergone a transformation from a private winery that was nationalized in 1945 in order to return to the private winery after 60 years. The way Ilok Cellars took through centuries under the castle's head tells us that wine growing and wine production is older and more durable than all kingdoms and systems in Eastern Slavonia and Ilok.

Compared to larger wineries with a similar portfolio like Belje and Kutjevo, and several wineries with significantly smaller annual production such as Galić and Krauthaker, it is apparent from financial data that Ilok Cellars are lagging

behind in the stability and trend of business even though they have one of the biggest net profit margins among wine producers. This is justified by investing in brand recognition and historical legacy and continually winning prizes at the world and regional competitions, thus maintaining the placement stability of nearly four million liters of wine annually. Number of enterprises in grape wine production compared to 2014./2011 (+9.73%), Portugal (+56.98%), Germany (+24.07%) and decrease in France (-11.76%). In Croatia, the number of companies increased by 5.18%. The value of grape wine production is growing in France (+ 11.38%), Spain (+ 2.48%), Germany (+4.19%) and Portugal (+20.98%) and falling in Italy 0,29%). In Croatia, the value of production fell by 14.04%. Accordingly, we assume that with a foreign partner, using funds and a significant increase in wine production capacity, Ilok Cellars could parry with foreign producers from Spain, Portugal, and Macedonia.

Through a horizontal analysis of financial statements that allows us to compile data over a longer period of time to detect the tendencies and dynamics of changes in absolute and relative amounts of base positions in the balance sheet over the current period compared to the previous year, it is clear that Ilok Cellars are viable and have a perspective. Vertical analysis comparing financial data in a year shows that assets cover liabilities and that liquidity is long-term acceptable and that with constant investments in new equipment and assets the company has a vision.

Abstract

In this paper, authors represent results of the research conducted at Karlovac University of Applied Sciences related to financial knowledge and financial behavior of student population enrolled in economic and non-economic studies, as well as employed and unemployed students. The questionnaire was based on the OECD methodology for financial literacy measurement and adjusted to national conditions. The goal of the research is to compare the results to similar researches in Croatia and to find out the need of organizing financial literacy workshops for the student population and the interested public in Karlovac.

Keywords: *financial literacy, financial knowledge, financial behavior, the student population*

JEL Classification: A23, I23

1. INTRODUCTION

According to OECD, financial knowledge is “a combination of awareness, knowledge, skill, attitude, and behavior necessary to make sound financial decisions and ultimately achieve individual financial wellbeing.” (OECD INFE; 2011, 3). A financially literate person will have some basic knowledge of key financial concepts. (Atkinson & Messy; 2012, 6).

In each country, financial education is becoming more and more important because of introducing and developing new financial products in banks and other financial institutions. It has become an important factor in making long-term financial decisions that affect the lives of every individual. (Matić, Serdarušić & Vretenar Cobović; 2013, 509). That are reasons that governments around the world are interested in finding effective approaches to improve the level of financial literacy amongst their population and that many are in the process of creating or leading a national strategy for financial education to provide learning opportunities throughout a person’s life (Atkinson & Messy; 2012, 13).

In past years, it has been a growing set of literature regarding financial knowledge issues, as well as a lot of researches conducted with the aim to find out the level of financial knowledge of the population. Lusardi and Mitchell (2014, 6) are defining financial literacy as “peoples’ ability to process economic information and make informed decisions about financial planning, wealth accumulation, debt, and pensions”. They demonstrated that financial literacy is important in economic decisions and showed how costly it is to be financial ignorant (Šreblin-Kirbiš, Vehovec & Galić; 2017, 166). They also compared the level of financial literacy on different social groups and demonstrated the effects of financial literacy on important economic behaviors. Lower levels of financial literacy were related to less frequent saving and retirement planning, more costly mortgages and more often high-cost borrowing. Ali, Rahman, and Bakar (2015) reported that financial planning was an important determinant of financial satisfaction and that financial knowledge and the attitude towards money were significant antecedents of financial planning. Akin, Aysan, Ozcelik and Yildiran (2012) found that people who had more financial knowledge and used it when dealing with financial matters reported fewer financial problems.

Results of the study in Croatia in the year 2015 (Vehovec, Rajh & Škreblin-Kirbiš, 2015) revealed less than satisfying levels of financial literacy among Croatian citizens with the note that lower level of financial literacy was observed

among less educated and unemployed respondents. A similar study in 2017 in Croatia (Šreblin-Kirbiš, Vehovec & Galić; 2017) reveals that women are less financially knowledgeable, invest less and use overdraft more often, making them the more vulnerable gender group in terms of financial literacy. Still, women estimate their own financial management skills better and monitor their expenses more closely than men. The result of the study showed that the most important component of financial literacy was financial behavior. The results of the study in Croatia in 2017 (Bahovec, Barbić & Palić; 2017, 1) indicate that the average financial performance for men is higher than the average value of financial performance for women at the same financial literacy level. Furthermore, a higher level of financial literacy is related to a higher level of financial performance.

According to the financial literacy survey in the Republic of Croatia in 2016, presented by the Croatian National Bank and the Croatian Financial Services Supervisory Agency (HNB, HANFA, 2016), the average score of financial literacy of Croatian citizens was 11.7 points of the total of 21 points. The lowest scoring group was the age group below 19 years of age (9.3) and the highest scoring group was the group with higher and high education (12.8). Poor correlation between financial knowledge and financial behavior shows that Croatian citizens, though relatively aware of the benefits of a financially responsible behavior and how to achieve it, do not always implement such knowledge in everyday life, so it would be desirable to ensure that all education has a positive impact on financial behavior in real life.

Recent research among students in 2016 (Smajla, 2016) showed that although most people in Croatia are involved in banking system (because of the obligation to have bank account to receive wages), involvement in other segments of financial system like non-banking services is lower, especially within student population (78,7% of student population is not involved in financial system other than banking system). The same study pointed out that due to low financial knowledge, a lot of students don't even know which products they are using.

Financial education, therefore, should be implemented in educational institutions, not only for students enrolled in economic but also in non-economic studies. (Smajla; 2016, 629) According to the findings of Šreblin-Kirbiš, Vehovec, and Galić (2017), educational programs should be tailored to accommodate gender differences in financial knowledge. They could incorporate a review and discussion of gender differences in financial literacy and financial

satisfaction. In such a way, the self-awareness of an individual's strengths and weaknesses might be encouraged. Women could learn from men about areas in which they score better on financial literacy such as knowledge, investment and using an overdraft, while men could learn from women about self-management skills and monitoring expenses. Lusardi and Mitchell (2014, 9) state that it is important to raise financial knowledge for everyone early in life (mandating financial education in high school) while providing pre-labor market financial knowledge to the least educated group improves their wellbeing by an amount equivalent to 82 percent of their initial wealth.

Therefore, to increase the financial involvement of the student population, a lot of effort has to be made in educational institutions to make their financial knowledge better. In Croatia, there is a starting point for "further joint learning of all involved about priorities of this type of education as well as for systematic formulation of educational programs for the promotion of financial literacy of the consumers" (Vujčić, B., HNB).

It is expected that students enrolled in economic studies have better financial knowledge and are more involved in the financial system, in comparison to those enrolled in non-economic studies. Unemployed students are expected to have lower financial knowledge in comparison to employed students (and therefore are less involved in the financial system) because they don't have experience in personal finance management while they receive pocket money from their parents.

The objective of this paper is to get information about the level of financial knowledge and characteristics of financial behavior of students at Karlovac University of Applied Sciences enrolled in economic and non-economic studies. The results of the research will be a starting point to organize financial literacy workshops for the student population, as well as for interested public in Karlovac.

2. FINANCIAL KNOWLEDGE OF STUDENT POPULATION AT KARLOVAC UNIVERSITY OF APPLIED SCIENCES – RESEARCH RESULTS

The survey was conducted at student population at Karlovac University of Applied sciences, an institution of higher education, during January 2019, in order to find out the level of financial knowledge and some characteristics of their financial behavior. The research was conducted on a representative sample

of 117 students of bachelor studies, enrolled in economic (bachelor study of Hospitality Management) and non-economic (bachelor study of Food Processing Technology, Mechanical Engineering, and Mechatronics) studies.

The target group included student population, while the survey itself consisted of four parts. The first part of the survey collected some basic information about the sample (gender, age, year of study, name of study, student status and employment information); the second part dealt with the students' information and participation in the financial system; the third part dealt with the attitude and behavior regarding financial issues, and the fourth part dealt with questions related to financial knowledge.

The questionnaire was based on the OECD methodology for financial literacy measurement and adjusted to national conditions and translated to the Croatian language. It covered a mixture of attitudes and knowledge as well as capturing behavior relating to topics such as money management, planning for financial goals and awareness and choice of financial products (OECD INFE; 2011, 4). The questionnaire focuses on those aspects of knowledge and behavior that are associated with the basic concept of financial literacy, related directly to the individual answering the question. The questions have covered some basic financial topics and none of them was complex and none of them required expert knowledge.

Gender, the name of the study and employment status of the student population are shown in Table 1.

Table 1: Gender, the name of the study and employment status of the student population in the sample

Gender, type of study & student status		Frequency	Percent	Cumulative Percent
Gender	Male	50	42,7	42,7
	Female	67	57,3	100,0
	Total	117	100,0	
Name of study	Hospitality Management	44	37,6	37,6
	Food Processing Technology	43	36,7	74,4
	Mechanical Engineering	14	12,0	86,3
	Mechatronics	16	13,7	100,0
	Total	117	100,0	
Employment status	Employed	15	12,8	12,8
	Unemployed	102	87,2	100,0
	Total	117	100,0	

Source: author

There were 57,3% of female student examinees and 42,7% male student examinees who were questioned in the total sample of 117 examined students. Most of the student examinees are students enrolled in the Hospitality Management study (37,6%) and Food Processing Technology study (36,7%). There were 12% of students enrolled in Mechanical Engineering and 13,7% in Mecha- tronic study. Regarding the type of the study, 37,6% of students are enrolled in the economic study, and 62,4% of students enrolled in non-economic studies. Only 12,8% of examinees was employed.

The second part of the survey dealt with the students' information and participation in the financial system. There was a list of 15 financial products: pension fund, supplementary retirement scheme (group III), investment fund, mortgage, credit card, debit card, internet banking, housing savings, stock, fixed- term deposit, life insurance, home insurance, microfinance loan, housing credit and leasing. An examinee had to answer has he/she ever heard of each type of product, if he/she currently holds any of these products and if he/she has cho- sen any of these products in the past two years. The results are given in table 2.

Table 2: The information and the use of financial products

Financial product	Heard of		Currently holds		Recently chosen	
	total	%	total	%	total	%
Pension fund	109	93,2	14	12,0	7	6,0
Supplementary retirement scheme (group III)	60	51,3	6	5,1	4	3,4
Investment fund	95	81,2	8	6,8	3	2,6
Mortgage	114	97,4	5	4,3	3	2,6
Credit card	114	97,4	57	48,7	46	39,3
Debit card	105	89,7	42	36,9	34	29,1
Internet banking	114	97,4	73	62,4	63	53,8
Housing savings	112	95,7	18	15,4	14	12,0
Stock	112	95,7	8	6,8	4	3,4
Fixed term deposit	74	63,2	5	4,3	4	3,4
Life insurance	111	94,9	34	29,1	15	12,8
Home insurance	100	85,5	15	12,8	9	7,7
Microfinance loan	46	39,3	2	1,7	2	1,7
Housing credit	110	94,0	5	4,3	2	1,7
Leasing	97	82,9	5	4,3	3	2,6

Source: author

Almost all of the examinees have heard of the mortgage, credit card, internet banking, housing savings, stocks, life insurance and housing credit (from 94,0%

to 97,4% of students). The less informed they are regarding supplementary retirement scheme (only 51,3% of examinees have heard of this product) and microfinance loan (only 39,3% of examinees have heard of it). Students overall are not using a big set of financial products, especially non-employed students. Within the numbered products, they mostly use credit card (48,7% of examinees), internet banking (62,4% of examinees) and debit card (36,9%). The behavior of examinees didn't change significantly during past two years: recently they have chosen mostly credit card (39,3% of examinees), internet banking (53,8% of examinees) and debit card (29,1%). From presented results it can be seen that some students lack financial knowledge regarding basic financial products – they don't understand the difference between credit card and debit card. A great number of examinees stated that they are using internet banking, but not a debit card (which is compulsory to have if using internet banking), even the employed ones (it is compulsory to have a debit card if receiving a salary). They mostly state that they are using a credit card, instead of a debit card.

The third part of the survey dealt with attitude and behavior regarding financial issues. Eight different attitude and behavior statements were written and examinees should write if they agree or disagree with each statement, using a scale of 1 to 5 (1 means that the examinee completely agrees, and 5 describes that he/she totally disagrees). At each statement, an examinee could also answer with "don't know or don't want to answer". All the statements, together with the average score is given in table 3.

Table 3: Attitude and behaviour statements

Statement	Average score (1-5)	Average score female (1-5)	Average score male (1-5)
1. Before I buy something I carefully consider whether I can afford it	1,92	2,16	1,58
2. I tend to live for today and let tomorrow take care of itself	3,56	3,70	3,37
3. I find it more satisfying to spend money than to save it for the long term	3,41	3,52	3,25
4. I pay my bills on time	1,35	1,35	1,35
5. I am prepared to risk some of my own money when saving or making an investment	2,69	2,74	2,62
6. I keep a close personal watch on my financial affairs	1,98	2,11	1,79
7. I set long term financial goals and strive to achieve them	2,31	2,31	2,31
8. Money is there to be spent	2,45	2,61	2,23

Source: author

Financial attitude and financial behavior are two important elements of financial literacy measure because the way a person behaves and his attitudes towards money and planning for the future will have a significant impact on their financial wellbeing. Within the scale of 1 to 5, the lower average score (the greatest level of agreeing) is about paying bills on time (1,35), thinking before making a purchase (1,92) and close personal watch on financial affairs (1,98). The greatest level of disagreeing is about not thinking about the future (3,56) and satisfaction to spend money rather than saving it (3,41). The relatively high score is given to the statement regarding risk taking (2,69). Those results are aligned with the results of financial literacy research in Croatia, where Croats are generally financially responsible (cautiously manage their financial transactions, costs, financial purchases and timely settlement of bills and debts) and risk-averse. (HNB) When making a comparison about gender, there are some small differences aligned to not thinking before purchasing, not thinking about tomorrow and greater satisfaction to spend money for female students.

The fourth part of the questionnaire was dealing with the level of financial knowledge of the examinees. Students had to answer 12 basic financial questions regarding

Table 4: Percentage of correct answers to basic financial questions

Question	Percentage of correct answers						
	Total	Employed	Unemployed	Economic study	Non-economic study	Female	Male
1. Imagine that five brothers are buying together a gift of 1.000 HRK. If the brothers have to share the money equally how much does each one give?	87,18	86,67	87,25	93,18	83,56	93,18	88,64
2. Imagine that a person has to wait for one year to get his share of the 1.000 HRK and inflation stays at 3 percent. In one year's time will they be able to buy: a) more, b) the same amount c) less than he could today	44,44	66,67	41,18	36,36	49,32	31,38	54,55
3. You lend 200 HRK to a friend one evening and he gives you 200 HRK back the next day. How much interest has he paid on this loan?	80,34	93,33	78,43	72,73	84,93	79,55	84,09

4. Suppose you put 1.000 HRK into a savings account with a guaranteed interest rate of 2% per year. You don't make any further payments into this account and you don't withdraw any money. How much would be in the account at the end of the first year, once the interest payment is made?	37,61	33,33	38,24	27,27	43,84	22,73	52,27
5. And how much would be in the account at the end of five years? Would it be a) more than 1.100 HRK, b) exactly 1.100 HRK or c) less than 1.100 HRK?	28,21	26,67	28,43	29,55	27,40	27,27	29,55
6. An investment with a high return is likely to be high risk (true or false)	82,91	86,67	82,35	84,09	82,19	86,36	84,09
7. High inflation means that the cost of living is increasing rapidly (true or false)	82,91	86,67	82,35	77,27	86,30	72,73	95,45
8. It is usually possible to reduce the risk of investing in the stock market by buying a wide range of stocks and shares (true or false)	48,72	66,67	46,08	43,18	52,05	52,77	52,27
9. Investing in stock is safer than having money at bank account (true or false)	83,76	86,67	83,33	72,73	90,41	79,55	84,09
10. Overdraft on current account is a type of credit to which a client pays interests (true or false)	59,83	66,67	58,82	56,82	61,64	65,91	63,64
11. When investing in stocks, you ensure a future yield (true or false)	68,38	80,00	66,67	59,09	73,97	63,64	79,55
12. If you get a loan at longer term (5 years), you will pay more interest in comparison to shorter term loan (3 years) (true or false)	65,81	60,00	66,67	75,00	60,27	75,00	63,64
Total	64,17	70,00	63,32	60,61	66,32	60,14	69,96

Source: author

According to the data above, the level of financial knowledge for students is not satisfactory but is more than 50%. In total 64,17% of students answered questions correctly. The less financial knowledge is in the sphere of compound interest, the effect of inflation, risk-taking at the financial market and some basic banking products like overdraft on current account.

As was supposed, better financial knowledge has employed students (70% in comparison to 63,32% for unemployed students) and male students (69,96% in comparison to 60,14% for female students). But, regarding the type of study, the opposite results are given students enrolled in economic studies have lower financial knowledge (60,61% of correct answers) than students enrolled in non-

economic studies (66,32% of correct answers). One reason for those results can be because of the sample – a big number of students of first-year economic study.

However, students still don't have experience in personal finance management while they receive pocket money from their parents and therefore there is a significant room for improvement in term of financial knowledge. Karlovac University of Applied Sciences is welcome to organize financial workshops for student population to which interested public in Karlovac should be invited. Further research in this field should be made each year on a bigger sample of students, including those who attended some financial workshops. At the end of few-years constantly education progression should be seen on results of similar researches.

3. CONCLUSION

Authors of the paper represented results of the research related to basic elements of financial literacy of Karlovac University of Applied Sciences students: financial knowledge and financial behavior. The research was conducted in January 2019 at the student population enrolled in economic and non-economic bachelor studies, as well as employed and unemployed students. The questionnaire was based on the OECD methodology for financial literacy measurement and adjusted to national conditions.

Results of the study point that students overall are not using a big set of financial products and they still are not informed of some basic financial products because they don't have experience in personal finance management. Furthermore, the results show that students are generally financially responsible and risk-averse, which is in line with other research results in the Republic of Croatia.

The total level of financial knowledge of students is 64,17%, whereas better financial knowledge is of employed students, students enrolled in non-economic studies and male students.

It is important for Karlovac University of Applied Sciences to organize workshops of financial literacy for students and other interested individuals because of the importance of financial literacy for making long-term financial decisions that affect the lives of every individual. The University should find

the most effective approach to improve the level of student's financial literacy through various learning opportunities.

Abstract

This paper discusses how the presence of international students is materialized in economic benefits for a university, university city, and destination country. These benefits are directly realized in tuition fees and living costs. Money spent on accommodation, living costs, recreation, and transport has a positive effect on the local economy. Together with tuition fees, they indirectly contribute to the gross domestic product and job creation. Besides evidence found in related international literature, our research team focused on providing local experience. Our empirical research, which was carried out in three major university cities in Hungary, found that international students spend 47,478,301 euros annually, maintain 13,200 jobs (one student “finances” 1.2 jobs) and contribute to 0.47% of the three counties’ gross domestic product. Their presence, therefore, is a significant factor in bolstering economy on an international scale.

Keywords: *international students, mobility, economic impact, Hungarian regional university centers*

JEL Classification: L21, L29

1. INTRODUCTION

In the higher education of the twenty-first century, relying on knowledge-based economies and human capital, internationalization is coming to the forefront worldwide. The main catalysts in this process are globalization and the expansion of higher education with its main indicator being international student¹ mobility. Accordingly, OECD numbers reflect the growing trend in student mobility; as a result of the constant growth of the past decades, there are now more than 5 million students studying abroad. Similarly to other Eastern European post-socialist countries, Hungary joined the process of internationalization after the fall of communism. Currently, there are more than 28,000 international students in the Hungarian higher education, two-thirds of whom take part in foreign language programmes – meaning that they do not come to Hungary as part of ethnicity-based student mobility fuelled by Hungarian minorities living in neighboring countries. In the Eastern and Central European post-socialist countries ethnicity-based student mobility is significant, reflecting border changes and break-ups of countries in the twentieth century.

¹ The present study uses the terms “international student” and “foreign student” as synonyms.

The presence of international students, besides creating cultural diversity and building international relations between universities, shows significant economic benefits for the receiving institution, city, and on a broader scale for the national economy. In many countries, as an impact of neo-liberalization, the public expenditure on higher education was reduced considerably in the last two decades of the twentieth century, and a kind of “regulated market” came into existence which is supervised by the state with the help of different market mechanisms. For the universities (especially the private institutions operating under market conditions) the tuition fees paid by international students mean direct economic benefit. In addition to talent attraction, therefore, today revenue disbursement is also a central issue for the universities related to the recruitment of international students. The presence of international students means advantages for the university, the city hosting its campus and, in a broader sense, the whole country. The advantage is primarily realized in tuition fees and the number of money students spends but there are also indirect advantages like economic co-operation are established between two institutions and two countries (Brooks-Waters 2011). It is particularly true in the case of Hungary where the tuition fees paid by international students constitute considerable income for the universities. Beyond these, the presence of international students has a major impact on the social and economic development of the host cities. In our study, we rely on international research results and provide a case study for three Hungarian provincial cities to illustrate the impacts of international students on the national economy.

2. BACKGROUND - INTERNATIONAL CONTEXT

The increasing volume of student mobility materializes significantly both in economic and political terms. Its increasing contribution to tourism flow constitutes a considerable source for the recipient countries (Michalkó 2012). Financial motives are increasingly taken into consideration when recruiting international students (Knight 2004; Teichler 2007). Knowledge-based economies with their increased need for highly-trained individuals have boosted the demand for higher education while there has been a lack of available public resources for financing higher education. Consequently, governments started to pressurize universities to achieve “more on less” (Gürüz 2011). Many universities facing financial dire straits looked upon international education as the

perfect response to a shortage of financial means (Waters 2008). In addition to harnessing the talent pool, nowadays, acquiring incomes is a central factor in recruiting students for universities. However, tuition fees also play an important role in the students' choice of the institution (Beine et al. 2014; Perkins-Neumayer 2014), and thus too high tuition fees can be a disincentive in the present global market. Moreover, as confirmed for the students, those who spent part of their education abroad are more likely to be mobile later in life and to find jobs in foreign countries (Teichler-Jahr 2001; King-Ruiz-Gelices 2003). So, in the case of the most significant recipient countries, the economic advantage does not only translate into students paying tuition fees and spending money during the time of their stay but also into long-term consequences. In these countries, the students usually choose such places for their studies which are academically more advanced than their higher education environment at home or would like to attend specializations which are either not available, or available only to a limited extent, in their own countries (Rivza-Teichler 2007). Besides, the various world university rankings are given more and more emphasis: the more prominent place in these lists has a great influence on the international demand for these institutions (Jöns-Hoyler 2013). The main motivation for these recipient countries is to harness the talent of the most gifted students in the long run ("brain drain"). Recipient countries testify to the trend present from the beginning in international student mobility: to acquire highly-trained workforce later. This, in turn, attracts more students to the country and increases demand for the country's universities, sending those higher up in a real or imaginary global ranking (Findlay et al. 2012).

In the United Kingdom, certain researchers called attention to the regional economic impacts of overseas students already in the previous century (Love-McNicoll 1988). Examining international students in the United Kingdom at a national scale, it can be observed that money spent on tuition fees and living costs come from outside the country whereas it is spent within the UK. Furthermore, there are other positive aspects of the country in their staying there. One of them is the fact that students familiarise themselves with British brands and look for them or purchase them after they return home. Furthermore, they popularise them to their friends and families, too. International students (especially those coming from outside the EU) pay high tuition fees which function as capital injections for the economy. In 2004 the total amount of tuition fees paid by international students was 1.39 billion pounds (Vickers-Bekhradnia

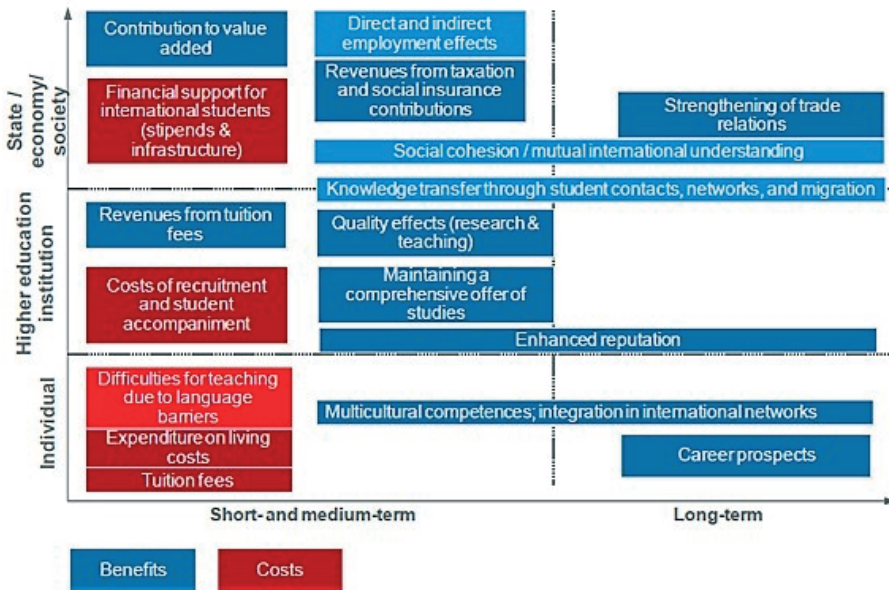

2007). Tuition fees and living costs combined, international students spent 3.74 billion pounds in the academic year 2004-2005 in the UK. In addition to this, thousands of students stay in the country to join the workforce after graduation which can also be detected in economic terms (Vickers-Bekhradnia 2007).

In Italy, international students spent 715.5 million euros in the academic year 2010-2011 (15 421 euros per student) equalling 0.05‰ of the Italian GDP. They spent proportionately the most on accommodation (20%), transport (16%), and food (13%). Tuition fees came only fourth place (10%) (Montanari-Staniscia 2014).

The best example of how international students impact the economy is none other but the biggest recipient country, the USA. According to a 2015 NAFSA (Association of International Educators) Report the previous year international students contributed to the economy with 27 billion dollars, a 12% increase from 2013. The study found that every seven international students in the US maintain three jobs in the country, which means that 340,000 jobs were related to international students in the academic year 2013-2014. (Ortiz et al. 2015)

The DAAD (German Academic Exchange Service) published a study (Münch-Hoch 2013) examining the economic benefits brought about by international students in Germany and five other European countries (the Netherlands, Austria, Switzerland, Poland, and Spain). Based on the literature, *Figure 1* illustrates in a complex way the short-, medium- and long-term impacts of international student mobility on the economy and other factors from the perspective of individuals, higher education institutions and the broader society.

Figure 1. An overview of international student mobility in terms of costs and benefits

(Source: Prognos AG (DAAD) 2013)

Costs only appear for every participant in the short-term realm, whereas benefits are realized mostly over the medium- and long-term. There is no direct short-term benefit for the individual, as studying abroad is a certain kind of investment for the future, while for institutions and the national economy direct benefits coming from tuition fees materialize already in the short run (although there are costs too). In the long run, it is not only individuals but also universities and the state that benefit from the process, although in a way that is harder to measure than the direct impact of tuition fees and living costs.

The study shows the economic consequences of inward student mobility in each of the six countries, calculated on the basis of average cost per student and the number of international students. The biggest economic impact can be demonstrated in the case of Germany (based on absolute figures); in 2011 there were 161,000 international students studying in the country, which is the highest number in terms of the six examined countries. Based on living costs per capita, it can be calculated that international students spent more than 1.2 billion euros in Germany (tuition fees not included). The same number is the lowest in the case of Poland, 90 million euros, which is not surprising given that the living

costs per capita and the number of international students are the lowest there (Poland shares this spot with Switzerland, but living costs are much higher in the latter – more than four times that of the Polish numbers). As shown in *Figure 1*, money spent on living costs during studies can be considered as short-term profit, however, writers of the study used a model to calculate long-term direct incomes tied to student mobility if the student stays to work in the given country. This model showed that revenue per capita is the highest in Switzerland (19,500 euros), the lowest in Poland (4,000 euros), whereas in Germany, Austria, Spain, and the Netherlands it ranges between 7,500 and 10,000 euros. Another important aspect is how many jobs international students create in any given country. In the six examined European countries the figures were as follows: Poland came first in terms of the created jobs (0.23 jobs per international student), followed by Switzerland (0.18), Spain (0.16), Austria and the Netherlands (0.15) and finally Germany (0.14). However, these figures were taken into consideration for the time of the students' education. When the focus is expanded also to students who stay after graduation, we get different figures: Switzerland leads with 0.34 and Austria has the lowest value (0.26). (Münch-Hoch 2013)

Based on all the above, we can conclude that the money spent by international students on living costs, recreational activities, travel, and tuition fees has a clear impact on the local economy and thus also on the gross domestic product (GDP) and job creation in the given country. Studies cited above recommend that we take into consideration also taxes derived from students' expenses as well as taxes coming from jobs created by international students. Moreover, if students choose to stay and work in the country after their graduation, there is also the additional benefit of taxes and health insurance/social security paid by them.

The Oxford Economics examined the short-term (while the students are at university) and long-term (post-graduation when they may join the local labor market) impacts of international students at Sheffield-based universities that they had on the local economy, both in terms of costs and benefits, in the academic year 2012-2013. Short-term effects were calculated based on the phenomenon of direct revenue and then the impact on the local GDP was estimated, taking into consideration direct, indirect and induced effects as well. The analysis of long-term impacts was mainly qualitative in lieu of substantial longitudinal data. The findings showed that benefits greatly outnumbered costs, contributing 120.3 million pounds to the local GDP. The overwhelming majority of this contribution was generated directly, whereas an additional 24.8 million pounds was raised via induced and indirect effects. (Oxford Economics 2013)

Brown and Heaney found that the traditional economic base model attains more reliable estimates of local economic impacts (Brown-Heaney 1997). Our research relied on the same model, calling attention to the importance of universities to national economics and its multiplication effect.

Summing up, the related literature and their empirical evidence strengthened our hypothesis that the presence of international students means economic benefits for the given university, the city hosting it and, in a broader sense, for the recipient country. In general, there exists a strong interrelationship between international student mobility and economic development both in terms of costs and benefits. The consulted literature opened new dimensions and encouraged us to explore the specific nature of this economic contribution in the case of Hungary.

3. METHODS APPLIED FOR THE PRESENT ANALYSIS

3.1 SAMPLE AREA SELECTION

Our research, empiric in nature, focused on the economic impact of international students in the three most significant university cities in the Hungarian countryside, Debrecen, Szeged, and Pécs. These are the cities that stand out regarding inward student mobility besides Budapest, which is in a different category both in terms of size and in the opportunities it provides. All three universities share the same treat, namely that the number of enrolled international students has risen in the past years. According to statistics, the number of international students is rising steadily; from 8,300 students in 2015 to 10,729 in the spring semester of the academic year 2016/17. This is a considerably high number given the size of the cities: compared on a proportional basis, the total number of international students parallel those studying in Budapest (population: 1.76 million)², although the combined number of inhabitants in those three cities is only approximately half a million. This also implies that the proportion of international students in the three cities is getting higher (currently above 15%) compared to the number of students at each university, but also that their presence is much more significant in relation to the population of

² In the lack of updated statistics, we could only rely on figures for 2015/16: accordingly, at the four biggest universities of Budapest receiving the majority of international students 8,000 of them studied. Given the growth in number nationally it is supposed that this figure has reached 10,000 by now.

the whole city. The reason for the high number of students is that these are the only universities in Hungary apart from the Semmelweis University in Budapest which offer medical training, which is the most popular type of education among international students coming to Hungary.

It is worth mentioning, however, that the international catchment area of the three large universities outside Budapest show differences which is due to their specific international relations and recruiting policies. Furthermore, the foreign language training programmes offered by the institutions do not totally overlap either. The most notable sending countries of the foreign language training of each university are summarised in *Table 1*.

Table 1. Major source countries regarding students on the foreign language programmes of the three universities at the time of the survey

University of Debrecen (UD)	University of Pécs (UP)	University of Szeged (USZ)
Nigeria (652)	Germany (691)	Germany (412)
Iran (300)	Norway (267)	Iran (156)
Israel (276)	Iran (200)	Israel (107)
Turkey (203)	China (125)	Turkey (89)
United Kingdom (192)	Jordan (105)	Nigeria (82)
China (138)	Spain (90)	Spain (77)
Saudi Arabia (136)	South Korea (87)	Japan (75)
Vietnam (132)	Brazil (60)	China (74)
University of Debrecen (UD)	University of Pécs (UP)	University of Szeged (USZ)
South Korea (112)	Turkey (51)	South Korea (70)
Iceland (107)	Sweden (49)	United Kingdom (67)

Source: constructed by the authors based on data provided by the institutions

As can be seen above, while in the case of Pécs and Szeged the most significant source country is Germany, in Debrecen the highest number of international students come from Nigeria. This is not by accident as there is English as well as German language medical training programmes available in Pécs and Szeged whereas in Debrecen these programmes are available only in English.

3.2. DATA PROCESSING METHODS USED IN THE ANALYSIS

The available input data allow us to determine the annual expenses of the students, taking into account that an international student spends 9.6 months annually in Hungary on average.

It may be established in the context of the selected confidence level that the results represent data related to students not involved in the survey with a probability of 95%, which makes our deductions appropriate for drafting relevant conclusions for the population.

In addition to the interval, the analysis also uses point estimates which apply equally to the mean value (the arithmetic means of each indicator) and the adjusted (trimmed) mean. The use of adjusted mean was necessary in order to eliminate the distorting effects of the responses falling into the upper and lower 5% categories and typically representing extremely high or low values. In the calculation of the trimmed mean, before defining it, the values belonging to the upper and lower 5% (based on professional standards) of the sample were omitted.

Where data was not given, it was treated as follows: in the case of costs where 0 was a possible answer (i.e. because the given cost is unnecessary), blank rubrics got 0 value, whereas in cases where the number reasonably had to be higher than 0 (food, accommodation etc.) it was filled with the average of a given variable.

The research analyses the weight of the students' expenses compared with the regional and county GDP, the budget of the settlements and the total annual income from entrepreneurial activities. These secondary data are provided by the CSO (Central Statistical Office), TeIR (Land Information System), NAV (National Tax and Customs Administration) databases, and the municipal reports on final accounts.

Our research is based on the in-depth study of the related international literature offering a geographically wide range of case studies. The approaches, methods, and results discussed by the international research groups were partly applicable for the research that allowed us to draw internationally relevant and stimulating conclusions which either fit into the studied structures or provide new aspects. Then we selected the three university towns in Hungary (intentionally neglecting Budapest which is in a special situation as being the capital of the country) where the presence of international students is significant. The empirical work is based on questionnaire surveys that were conducted among the international students at the selected universities, namely at the University of Pécs (UP), University of Szeged (USZ) and the University of Debrecen (UD).

3.3. QUESTIONNAIRE SURVEY

In the questionnaire survey used in the research, we focused on the impact international students had on the economy of the three university cities through analyzing the international students' spending habits. Our research used paper-based questionnaires in Pécs and Szeged, and online format in the case of Debrecen. Our sample only featured students who take part in foreign language study programmes. *Figure 2* shows the most relevant detail of the questionnaire from the aspect of the present paper.

Figure 2. Details of the questionnaire used during our research

What is the average monthly amount of money that you spend on the following things?

- a. housing expenses (dorm fee / rents / overheads): _____
- b. basic necessities (food, hygiene items etc.): _____
- c. other buyings (clothing, accessories, cigarettes, technical items, novels, computer games etc.): _____
- d. transport (maintenance of own vehicle, fuel, taxi fees, public transport fees etc.): _____
- e. tuition fee: _____
- f. other expenses related to studies (lecture notes, books, exam fees etc.): _____
- g. leisure expenses (theater, cinema, recreation, sports, pubs, partying etc.): _____

Source: own editing

4. RELEVANT DATA ANALYSIS

4.1. ECONOMIC CHARACTERISTICS OF THE UNIVERSITY CITIES IN THE HUNGARIAN COUNTRYSIDE

All three university cities are regional centers (NUTS 2) as well as county seats (NUTS 3) of their respective counties. Debrecen is the center of the Northern Great Plain region and of Hajdú-Bihar County. In 2016 the city with a total population of 204,156 residents was the second largest in Hungary. Pécs is the center of the Southern Transdanubian region and Baranya County located in the southern-southwestern part of Hungary. In 2016 it had a total population of 150,046 residents and was the fifth largest city in the country. Szeged is the center of the Southern Great Plain region and Csongrád County. In 2016, the total population of Szeged was 164,647, which was almost 8 thousand less

than in the year of the last census in 2011. It is the third most populous city in Hungary (*TeIR 1*).

A common feature of the three cities is that higher education institutions (HEIs) were integrated on 1 January 2000, and the universities which were thus formed are among the five most significant ones in Hungary today. From the aspect of the number of international students, it is a very important shared feature of the three universities is that they offer medical training with strong traditions in foreign languages.

There are also common characteristics in terms of human resources. All three cities had a population peak in 1990. Since then, Debrecen (1990: 212,235 residents) and Szeged (1990: 169,930 residents) have entered into a stagnating or slowly declining phase. In the context of the natural demographic indicators, the decline in the number of population is slower in both cities than the national average and they are destination areas for internal migrants which ensures adequate workforce. In the case of Pécs, the economic transition had a more intensive impact on the demography, there has been a steady decline in the number of the population since its peak in 1990 (170,039 residents) reaching 145,347 at present which is below the lowest figure seen in 1970.

The population in all three cities boasts a highly qualified population as a result of their extensive secondary school networks and integrated universities. This makes them ideal hosts for knowledge-intensive economic areas. The research, development and innovation activities concentrated on the county seats also significantly contribute to the above.

The intellectual potential is considerable in the named university cities which is a basic prerequisite for establishing knowledge-based industries. Competitive economic structures typically demonstrate the presence of a host of (technologically) innovative companies and suppliers. There are also differences between the three cities based on their economic history, location, and different development after the fall of communism.

In **Debrecen**, knowledge industry is based on the highly developed network formed by the universities, research institutes, health institutes, pharmaceutical companies, IT industries, and agricultural commodities manufacturing. The chief economic units of the city are represented by pharmaceutical industry, measurement-control, automatization, mechanical engineering, food industry, printing industry, and service industry. In Debrecen, the fastest growing eco-

conomic sector of the past few years has been the so-called SSC (*shared services center*) sector with an estimated 2,000 employees at present. This sector has the specific feature of exercising activities which can be conducted from great distances using computer networks and relying on the work of local experts (e.g. IT services, customer service, accounting).

In Pécs, provided by the university, training related to innovative industries supports the development of the blue economy, energy design, environmental industries, smart technologies, creative industries, health industries, and health tourism. The city underwent an economic structural change after the transition, during which the mines were closed, deindustrialization started, and as a consequence of these Pécs suffered from the economic structural change more than most of the other middle and large towns in the country. Recovery is further hindered by the fact that Pécs was left out of the considerable wave of green-field investments in the second half of the 1990s due to the lack of factors of industrial location, in particular, the lack of utility infrastructure. Therefore, the major investments are missing from the city.

In Szeged, the economic transition following the change of regime gave a new impetus to post-industrial development. The size, capitalization and weak productive links of the successive businesses built on the ruins of the socialist industry, however, could not generate considerable development for a long time. Szeged is an outstanding intellectual center, the university, and the research institutes ensure development for knowledge-intensive sectors (information technology, biotechnology). The ratio of intellectuals living in the city is high which is reflected in the high share of quaternary sectors in the economy (information, communication, professional, scientific, technical activities).

Debrecen (dairy industry, milling industry) and Szeged (meat industry, milling industry) have considerable (based on the particularly favorable conditions of the regions for agricultural production and their production traditions) food processing capacities.

All three cities are important tourism centers. The attractive urban landscape, the internationally acknowledged cultural programmes, conferences, fairs, and the opportunities related to thermal and wellness tourism result in major income for the cities. The significance of the universities is illustrated with statistical data in *Table 2*.

Table 2. The weight of universities in the Hungarian university cities in the countryside (2016)

	Debrecen	Pécs	Szeged
Number of population *	204,156	150,046	164,647
Total income of the city budget [million euro] **	186.9	156.4	124.9
Number of university students ***	27,375	19,882	22,702
Number of international university students ****	4,321	3,200	3,208
Income of university budget [million euro] *****	218.0	181.4	277.1
Number of employees at the university ***	1,981	1,705	2,038

Source: *TeIR 1, ** TeIR 2., ***TeIR 3., ****Berács, 2017, *****UD, UP, USZ management data

In Debrecen the total number of students at the university was 27,375 in 2016, constituting 13.4% of the total population of the city. The number of international university students in the city in the same period was 4321, representing 15.78% of the student population of the university and 2.11% of the population of the city.

In Pécs, the university can counterbalance the declining student numbers, a benefit for both the university and the city. The role of international students, who are present in growing numbers, is becoming more and more central to the economy of the city as the number of students at the University of Pécs (UP) and also the population of the city is decreasing (currently the proportion of university students is 13.25% of the total population of the city). In 2016 international students constituted 16.09% of all university students and 2.13% of the total population of the city.

In Szeged, university students account for 13.78% of the population of the city, and this ratio is 1.94% for international students. International students make up 14.13% of the total student population.

The University of Debrecen is the biggest employer of Debrecen. The total number of employees at the university nears the aggregated number of employees of the first five employees in the real sector. The total income of the budget of Debrecen in 2016 was 186.9 million euros, which is considerably lower than the income of the budget of the university. Similarly, the weight of the University of Pécs (UP) in the economy of the city is also obvious as its incomes exceeded that of the city: in 2016 the UP had a total budget of 181.4 million euros, while the budget of the city of Pécs amounted only to 156.4 million euros. The

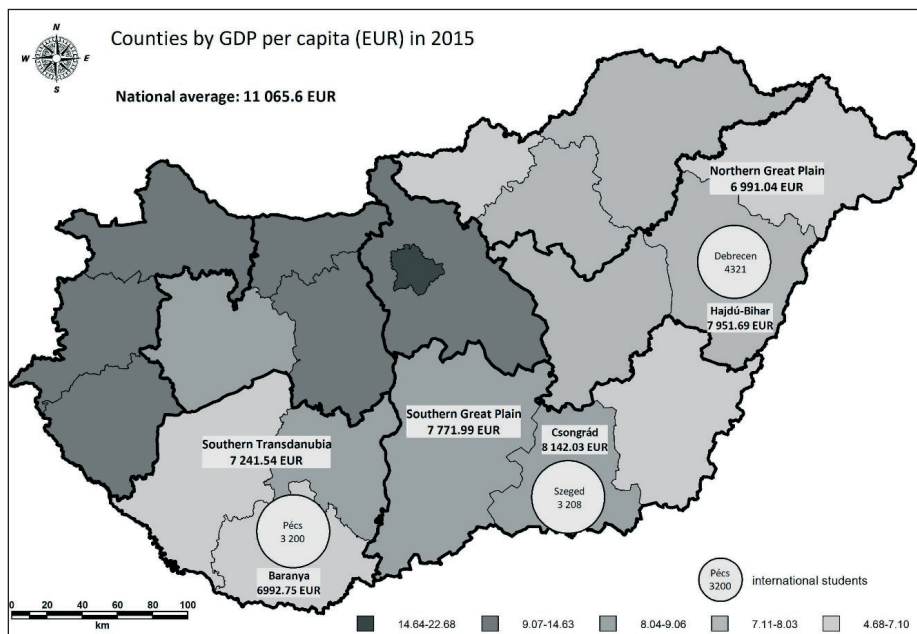

total income of the University of Szeged (USZ) exceeded 277.1 million euros in 2016, which was more than double of the total incomes of the budget of the city of Szeged (124.9 million euros). In all three cities, the biggest employer is the university, each employing 6,500-7,000 people.

The studied university cities are the centers of regions and counties which are lagging behind the national average with regard to their socio-economic development. In this context, higher education institutions have an especially important role.

4.2 THE SITUATION OF THE THREE COUNTIES REGARDING THEIR GDP'S

Considering the GDP of each county as the regional GDP is regarded as a standard procedure even by the professionals. The Hungarian GDP per capita in 2015 was 11,065 euros with well-documented regional differences (Figure 3).

Figure 3. GDP per capita on the county and regional levels (2015)

Source: CSO

In terms of GDP per capita, the university cities examined in our research are centers of regions and counties below the national average. The highest fig-

ure (Budapest) is two or three times higher (22,660 euros) than in those regions. The GDP in Csongrád county (Southern Great Plain region), the most developed among underdeveloped counties/regions, is still lagging behind the national average. Among the regions, the Northern Great Plain has the lowest figure, whereas in terms of counties it is Baranya County.

Table 3. GDP in 2015

Territorial unit	Amount (million euros)
Budapest	39 849
Baranya	2 586
- Southern Transdanubia	6 557
Csongrád	3 302
- Southern Great Plain	9 852
Hajdú-Bihar	4 265
- Northern Great Plain	10 330
Hungary	108 971

Source: https://www.ksh.hu/docs/hun/xstadat/xstadat_eves/i_qpt012b.html

If we look at the absolute numbers, we get the same picture. The region with the worst conditions is the one with Pécs as a center. Due to differences in population, Hajdú-Bihar County (Northern Great Plain region) and Csongrád County (Southern Great Plain region) swapped places on the list. All three regions are underdeveloped, consequently, higher education plays a key role in their development and economic growth (*Table 3*).

5. ECONOMIC IMPACTS OF THE PRESENCE OF INTERNATIONAL STUDENTS IN HUNGARY – RESEARCH RESULTS

5.1. GENERAL FINDINGS OF THE SURVEY

Our survey was conducted in Pécs in the spring of 2015, in Debrecen in the autumn of 2015 and in the spring of 2016, and in Szeged in the autumn of 2016³. Only international students who take part in non-Hungarian language programmes were surveyed (quantitative research) (*Table 4*).

³ In Debrecen the students received online questionnaires which made the survey period longer.

Table 4. Basic data acquired in the survey

	University of Debrecen	University of Pécs	University of Szeged
Period the sample was taken	2015	2015	2016
Number of sampled pool	500	546	441
The proportion of respondents within those taking part in foreign language programmes	14.92%	23.21%	22.45%
Median age	22.92 years	22.06 years	22.9 years
Distribution of sexes	44% M; 44,2% F; 11,8% n.a.	45.97% M; 48.35 F; 5.68% n.a.	53% M; 47% F

Source: Authors' own calculations

The highest number of international students was questioned at the University of Pécs, whereas the highest proportion of international students was representative of the University of Szeged, but all the samples can be regarded as representative. As for the most important data retrieved, which is the distribution among faculties and by sending countries, it is important that those answering the survey represent the markers of the whole examined group (i.e. international students at the universities). The present study focuses only on summarising our findings concerning the spending habits of international students.

5.2. SPENDING HABITS OF INTERNATIONAL STUDENTS

In our survey, we examined specifically the spending habits of international students. The data were analyzed in terms of costs regarding accommodation (dormitory, rented flats, utility costs), basic needs (food, personal hygiene) transport, entertainment (theatre, movies, recreation, sports, going out), and other (clothing, accessories, tobacco, books, video games, etc.). The data were also studied as to how costs on education were spent in addition to tuition fees (textbooks, books, exam fees, etc.). Based on the grouping of the costs, observations could be made about the students' spending portfolio and the differences between groups of students.

The research revealed that in 2016 in all three cities the 8,130 international students contributed to the local economies with an amount ranging from 4.8 to 5.09 million euros (tuition fees not included). This can be translated into an annual amount of 46.17 to 48.89 million euros (*Table 5*). Differences in spend-

ing can be attributed to several factors. One of the differences is in students' monthly expenditures (also linked to different price levels in different cities), the other is the uneven distribution of student numbers. The lowest spending per capita can be found in Pécs, ranging from 503 to 556 euros, from 607 to 670 euros in Szeged and from 641 to 704 euros in Debrecen. In Debrecen, the 3,290 international students mean 2.11–2.31 million euros monthly for the shops and entrepreneurs of the city. In the case of Pécs and Szeged, the number of international students is 2,935 and 1,905 respectively. Monthly students' expenses are ranging from 1.48 to 1.63 million euros at the University of Pécs, and from 1.16 to 1.28 million euros at the University of Szeged. On a yearly projection, calculating with the 9.6 months international students spend in Hungary on average, this means 14.17–15.67 million euros in Pécs, 11.09–12.25 million euros in Szeged and 20.24–22.22 million euros in Debrecen.

Table 5. Students' yearly expenses in 2016, an estimate based on separate costs, 2935 (University of Pécs, UP), 1905 (University of Szeged, USZ), 3290 (University of Debrecen, UD), as well as 8130 (total) and per capita (euros, 2016)

City	Confidence interval (with a level of 95% accuracy)			5% trimmed average
	lowest margin	average	highest margin	
Monthly				
UP	1 475 762	1 554 088	1 632 414	1 451 216
USZ	1 155 723	1 216 034	1 276 346	1 161 426
UD	2 108 289	2 211 537	2 314 785	2 100 267

UD	20 239 578	21 230 757	22 221 936	20 162 562
Total	46 174 091	47 535 152	48 896 214	44 787 993

Source: Authors' calculation

There are differences in the students' spending patterns, but no marked trends can be identified. For example, in Pécs non-European students spend considerably less than Europeans, but this is not true in Szeged and Debrecen. The sums can be compared with the total income of businesses in Pécs, Szeged and Debrecen in 2014, which is 0.73–0.81, 0.27–0.29 and 0.36–0.39% respec-

tively⁴. The biggest proportion can be observed in the case of Pécs. If the number of international students is taken into consideration, this reflects a considerable consumer potential, a sum of 592-626 euros per student can be realized from it.

The structure of spending was found to be uneven; the largest proportion of it is spent on accommodation (44%), followed by basic expenses (28%). In the third place came the other expenses (11%), followed by groups of costs related to studies and leisure activities (7-7%). Transport costs came last (4%) (Figure 4).

Figure 4. Structure of expenditures (%) in the group of international students (UP, USZ, UD, and total sample)

Source: Authors' own work

The second biggest group of expenses were basic needs (26-30%). Expenses in the “other” category represent 10-11%, with little variation. Money spent on education and leisure activities came in fourth and fifth (5-8%). The least amount of money spent on transport can be observed in Szeged (3%) but in the other two cities, it also does not account for more than 5% of expenses. If the

⁴ Our own calculations, based on data of TeIR (2014).

total amount of money spent is compared to the GDP, it can be established that total income derived from students at the three universities reach 0.04% of the national, 0.17-0.18% of the regional and 0.45-0.48% of the county level GDP (Table 6).

Table 6. The total amount of international students' spending in relation to national, regional and county GDP (2015, %)

Geographical unit	Confidence interval (with an accuracy of 95%)			5% trimmed average
	Low	Average	High	
South Transdanubia	0.22%	0.23%	0.24%	0.21%
Baranya	0.55%	0.58%	0.61%	0.54%
Southern Great Plain	0.11%	0.12%	0.12%	0.11%
Csongrád	0.34%	0.35%	0.37%	0.34%
Northern Great Plain	0.20%	0.21%	0.22%	0.20%
Hajdú-Bihar	0.47%	0.50%	0.52%	0.47%
Hungary	0.04%	0.04%	0.04%	0.04%
Southern Transdanubia, Southern Great Plain and Northern Great Plain in total	0.17%	0.18%	0.18%	0.17%
Baranya, Csongrád and Hajdú-Bihar county in total	0.46%	0.47%	0.48%	0.44%

Source: Authors' calculation, based on the current survey and https://www.ksh.hu/docs/hun/xstadat/xstadat_eves/i_qpr012b.html

There are significant differences between the different regions: students at the University of Pécs bear the most considerable weight in their spending (0.22–0.24% of the regional GDP and 0.55–0.61% of county GDP). Students at the University of Szeged are at the other end of the spectrum, their spending was proportionately lower, 0.34–0.37% of the GDP on a county level and 0.11–0.12% on a regional level. The median is represented by the students of the University of Debrecen, their spending amounting to 0.47–0.52% of the county and 0.20–0.22% of the regional GDP. Based on trimmed averages, estimates are more conservative (0.34–0.54% and 0.11–0.21% respectively). This, as referred to above, is realized mostly in relation to accommodation and basic needs. At the same time, leisure activities mostly pertaining to the realm of tourism have a 7% share of the spending portfolio.

6. CONCLUSIONS

The three cities, locations for our research, share many similar characteristics, besides some differences in their economic development. One of the similarities is that these cities are centers of regions and counties which are underdeveloped. Consequently, higher education has certain economic benefits and these, in turn, materialize as development potentials for the economy. A positive sign is that the number of international students is growing in all three cities (currently and on average it stands at 2% of the local population). The biggest asset of universities is medical training as it is the most popular among international students. International students at the universities account for 13-16% of the students but the demand for the three universities engaged in the international sphere in accordance with the trends drafted by Findlay, et al. (2012). The international catchment area of the universities in Debrecen, Szeged, and Pécs show differences which are due to their specific international relations, recruiting policies and the available training programmes. In Pécs and Szeged, it is Germany, while in Debrecen it is Turkey that constitutes the biggest European source country. As for the international students from outside Europe, Iran is outstanding in all three universities, and Nigeria Debrecen.

Spending habits occupied a central role in our questionnaire survey aimed at examining international students who take part in foreign-language study programmes. We formulated feasible estimates built on students' responses. Our findings show that students as consumers contribute to the cities' economies with 46.2 million euros. There are some differences in the structure of spending in Pécs, Szeged, and Debrecen, which can be derived both from differences in monthly expenditures per capita (also related to differences in prices at a given place) and from the uneven distribution of student numbers. The structure of spending shows great extremes, although differences between cities are small in scale. The most significant part of expenses was spent on accommodation and basic needs, followed by "other" costs, education, leisure activities and finally, transportation. If tuition fees, worth 67.3 million euros, are added to this, a yearly income of 113.5 million euros can be demonstrated in the three cities. In the three university cities, five international students finance, on average, six workplaces which – regarding the settlement as the basis for comparison – is much higher than the value calculated for certain destination countries in former researches (Münch-Hoch 2013; Ortiz et al. 2015). Naturally, the presence

of international students leaves its mark on the three cities in ways other than generating income.

The universities are major actors in their cities' economies, not in the least because they are significant employers. The incomes of the universities surpass those of the cities significantly. Tuition fees paid by students who are enrolled in international foreign-language programmes mean a direct economic profit for universities, so recruiting international students becomes more and more essential for HEIs. The above universities offer training that is good value for money, and their seats offer highly favorable costs of living in international comparative terms (Montanari-Stanisicia 2014). On the whole, in accordance with previous studies, it can be concluded that international students' money spent on accommodation, living costs, recreation, transport, and tuition fee plays a significant role in the development of local economies. This, in turn, is realized in further benefits, such as attracting talented students, more tuition fees, resources for local economies, a growing service sector, job creation and more taxes for local and national governments.

ZUR UNABHÄNGIGKEIT EINES AUFSICHTSRATSMITGLIEDS – EINE ERSTE SITUATIONSANALYSE SAMT BILDUNG VON FALLGRUPPEN

Urban BACHER , Ph. D.
Hochschule Pforzheim

e-mail: urban.bacher@hs-pforzheim.de

Abstract

Bilanzskandale und die Banken- und Finanzkrise haben eine Professionalisierung des Topmanagements und dessen Kontrolle zur Folge. Der Auswahl der einzelnen Mitglieder im Aufsichtsrat und deren effizienten Aufgabenerfüllung wird mehr Aufmerksamkeit geschenkt. Im Mittelpunkt des Beitrags steht die Frage, welche Rolle Interessenkonflikte von einzelnen Aufsichtsratsmitgliedern spielen und wie diese zu regeln sind. Dabei werden wichtige Fallgruppen dargestellt.

Schlagwörter: Corporate Governance, Aufsichtsrat, Treuepflicht, Unabhängigkeit, Interessenkonflikt, Unternehmensinteresse, Beratungsleistung, Business Judgement Rule.

JEL Classification: G30, G34

1. PROBLEMSTELLUNG

Deutsche Kapitalgesellschaften – gerade Aktiengesellschaften – haben eine duale Führungsstruktur. Der Vorstand leitet das Unternehmen in eigener Verantwortung, der Aufsichtsrat überwacht und berät dabei den Vorstand. Damit der Aufsichtsrat seinen Aufgaben nachkommen kann, gibt es für das Gremium insgesamt und für jedes einzelne Mitglied Anforderungen, die größtenteils nicht ausdrücklich im Gesetz stehen. Eine Anforderung ist die Unabhängigkeit der Aufsichtsratsmitglieder. Aufsichtsräte sollen in Erfüllung ihrer Aufgabe unabhängig agieren und allein dem Unternehmensinteresse dienen. Welche Fallgruppen und Anforderungen die Unabhängigkeit mit sich bringen, wird in diesem Beitrag dargestellt.

2. FUNKTION UND AUFGABE DES AUFSICHTSRATES

Das Gesetz sieht Aufsichtsräte nur bei managementgeführten Unternehmen vor. Für eigentümergeführte Unternehmen, in der klassischen Rechtsform Einzelunternehmen oder Personengesellschaft mit privater Haftung des Gesellschafter-Geschäftsführers (OHG, KG), ist dieses Kontrollorgan nicht vorgesehen. Grund hierfür ist die private Haftung des Unternehmers und der daraus abgeleitete Grundsatz, dass, wer privat haftet, auch alle zentralen Funktionen selbst ausführen und alle Entscheidungen allein treffen darf. Eine unternehmerische Kontrolle findet in dieser Konstellation nicht statt. Freilich gibt es bei Personengesellschaften eine Gesellschafterversammlung, bei der sich die Gesellschafter gegenseitig informieren, abstimmen und insoweit kontrollieren. Die Satzung kann vorsehen, dass sich die Gesellschafter durch einen Beirat oder Verwaltungsrat beraten lassen und Zustimmungsvorbehalte definieren (Schewe, 2.3).

Bei management- bzw. fremdgeführten Unternehmen werden die zentralen Entscheidungen – also die Vertretung und Geschäftsführung – an Manager (Vorstände) übertragen, die das Unternehmen in eigener Verantwortung führen und leiten. Die Gesellschafter wirken über den Aufsichtsrat und/oder über die Gesellschafterversammlung bei den Entscheidungen und bei der Kontrolle mit. Ab 500 Mitarbeitern haben die Arbeitnehmer bei Kapitalgesellschaften und Genossenschaften ein unternehmerisches Mitwirkungsrecht im Aufsichtsrat. Nach dem Drittelbeteiligungsgesetz erhalten sie ein Drittel der Aufsichtsratsmandate; hat das Unternehmen mehr als 2.000 Mitarbeiter, so steht ihnen jeder zweite Sitz zu (§ 4 DrittelbG und § 7 MitbestG.).

Aufgabe des Aufsichtsrates ist es, den Vorstand bei der Leitung des Unternehmens regelmäßig zu beraten und zu überwachen. Das „Königsrecht“ des Aufsichtsrates ist die Entlohnung sowie Bestellung und Abberufung des Vorstandes. Der Aufsichtsrat wirkt auch bei der Rechnungslegung mit. Zusammen mit dem Abschlussprüfer prüft er den Jahresabschluss und den Lagebericht und stellt den Jahresabschluss fest (§ 48 GenG, § 42a GmbHG).

Der Aufsichtsrat muss das Handeln des Vorstandes im Hinblick auf dessen Rechtmäßigkeit (Recht und Gesetz), Ordnungsmäßigkeit (angemessene Planung und Organisation) sowie Zweckmäßigkeit und Wirtschaftlichkeit **überwachen** (Kremer, Rz 913 ff.). Bei Entscheidungen von grundlegender Be-

deutung ist der Aufsichtsrat einzubinden. Die Rollen sind dabei klar verteilt: Die Strategieentwicklung und Umsetzung obliegt dem Vorstand, der sie mit dem Aufsichtsrat abstimmt. Der aktive Part bei strategischen Maßnahmen liegt beim Vorstand, der Aufsichtsrat ist in die Diskussion einzubinden. Seine Rolle kommt im Nachgang – er stimmt zu! Da der Vorstand das Unternehmen in eigener Verantwortung leitet (§§ 76 AktG, 27 GenG), darf der Gesellschafter und der Aufsichtsrat keine Geschäftsführungsmaßnahme übernehmen und sich nicht in die Erledigung des laufenden Tagesgeschäfts einmischen. Bei einer GmbH ist das rechtlich anders: Hier können die Gesellschafter und, wenn es die Satzung vorsieht, auch der Aufsichtsrat Weisungen hinsichtlich der strategischen Ausrichtung und für das Tagesgeschäft erteilen (§ 37 GmbHG).

3. ANFORDERUNGEN AN AUFSICHTSRÄTE

Anforderungen an den Aufsichtsrat und an seine Mitglieder ergeben sich aus Gesetz, aus Rechtsprechung und je nach Branche auch nach aufsichtsrechtlichen Regeln. Nach dem BGH hat jedes Aufsichtsratsmitglied Mindestkenntnisse allgemeiner, wirtschaftlicher, organisatorischer und rechtlicher Art zu besitzen, die erforderlich sind, um alle – normalerweise anfallenden – Geschäftsvorgänge ohne fremde Hilfe zu verstehen und sachgerecht beurteilen zu können (BGHZ 85, 293, 295). Im Nachgang der Bank- und Finanzkrise standen auch die Aufsichtsräte generell und deren Kontrollpflicht in öffentlicher Kritik. Die Anforderungen an die Aufsichtsräte steigen, die Erwartungen an deren Arbeit werden höher.

Generell können die Anforderungen an Aufsichtsräte (differenziert) wie folgt dargestellt werden (BGH Urteil vom 15.11.1982 („Hertie“); ACI, S. 38; Potthoff, Kap. 1 III 3; Semler, § 2 Rz 75 ff.):

- Sachkunde: Erfahrung im Geschäftsmodell, Branchenwissen, betriebswirtschaftliche bzw. rechtliche Ausbildung, Managementwissen, unternehmerische Erfahrung je nach Tätigkeit des Unternehmens auch international.
- Pflichtgemäßes Verhalten: Ein Aufsichtsrat muss gewissenhaft und verschwiegen sein und die Arbeit des Vorstandes konstruktiv kritisch begleiten.
- Zuverlässigkeit und Vorbildfunktion: Ein Aufsichtsrat muss glaubhaft und gewissenhaft agieren. Man muss ihm Vertrauen schenken können.

- Unabhängigkeit: Es dürfen keine Mandatsverbote und keine gravierenden Interessenkonflikte bestehen.
- Ein Aufsichtsrat muss dem Amt ausreichend Zeit widmen können.
- Im Team des Aufsichtsrates ist auf „Diversity“ zu achten.

Bei der Sachkunde sind neben Erfahrungen im jeweiligen Geschäftsmodell wichtige Geschäftsfelder wie „Strategie, Planung und Organisation“, „Recht und Compliance“, „Finanzwirtschaft und Rechnungslegung“, „IT (EDV, Prozesse, Digitalisierung)“, „Vertrieb, Marketing und Kommunikation“ vom Aufsichtsrat abzudecken. Dabei muss nicht jedes einzelne Aufsichtsratsmitglied alle Kompetenzen mitbringen. In der Summe ist jedoch dafür Sorge zu tragen, dass der Aufsichtsrat in seiner Gesamtheit die erforderlichen Kenntnisse, Fähigkeiten und Erfahrungen zur Erfüllung seiner Überwachungsaufgabe besitzt (ACI, S. 35.). Dabei sind die relevanten Geschäftsfelder abzudecken, Kernbereiche – wie die Rechnungslegung – sind mehrfach zu besetzen.

Übernimmt ein Aufsichtsratsmitglied besondere Aufgaben im Aufsichtsrat – z. B. Vorsitz des Aufsichtsrates, Vorsitz eines Ausschusses, Mitglied im Prüfungsausschuss – so muss es über die hierfür erforderliche Expertise verfügen (§ 107 AktG, vgl. auch ACI, S. 38; Kremer, Rz 986, Semler § 8 V. Zur Rechnungslegung, insbesondere zum formellen Bilanzrecht vgl. Bacher, Kap. 2.). Andernfalls riskiert es ein Überforderungs- bzw. Übernahmeverschulden. Mitglieder, die vorschnell ein nicht qualifiziertes Aufsichtsratsmitglied mit besonderen Aufgaben betrauen, können ebenfalls in eine Ersatzpflicht geraten (Auswahlverschulden).

4. DIE UNABHÄNGIGKEIT EINES AUFSICHTSRATES

4.1, VORRANG DER UNTERNEHMENSINTERESSEN

Der Aufsichtsrat agiert eigenverantwortlich, er handelt frei von Aufträgen und Weisungen und muss der Gesellschaft seinen Rat und Dienste umfassend zur Verfügung stellen. In Ausübung des Amtes ist jedes Mitglied des Aufsichtsrates dem Unternehmensinteresse verpflichtet und schuldet dem Unternehmen seine unabdingbar verbundene Treue und strikte Loyalität (DCGK Ziffer 5.5; Potthoff, Kap. 1 III 3 b, Kremer, Rz 1112 ff.). Die vorrangige Verpflichtung auf

das Unternehmensinteresse beschränkt sich auf die Tätigkeit im Aufsichtsrat. Außerhalb des Aufsichtsrats kann jedes Mitglied seinen eigenen Beruf und Interessen nachgehen.

4.2. ZURÜCKHALTUNG BEI INTERESSENKONFLIKTEN

Gesellschaften haben Gesellschafter und die können Interessen haben, die nicht in voller Übereinstimmung mit den Unternehmensinteressen sind. Gesellschafter sind üblicherweise prominent im Aufsichtsrat vertreten. Insofern gibt es durchaus Abhängigkeiten. Um eine unabhängige Beratung und Überwachung zu ermöglichen, sollen dem Aufsichtsrat unabhängige Mitglieder in ausreichender Anzahl angehören (DCGK Ziffer 5.4.2). Ein Mitglied ist dann unabhängig, wenn es in keiner geschäftlicher oder persönlicher Beziehung zur Gesellschaft oder deren Vorstand steht, die einen Interessenkonflikt begründet (DCGK Ziffer 5.4.1 Satz 2. Vgl. hierzu noch deutlicher Malik, S.188 ff.).

Da das Mandat eines Aufsichtsrats ein Nebenamt ist, existieren oft mehrere Interessen (Ulmer, NJW 1980, 1603 ff.). Ein Mitglied kann Doppelämter ausüben und damit einer Doppelverantwortung unterliegen. Nach h. M. ist eine Verteidigung mit dem Argument „eine Person unterliege einfach kollidierenden Pflichtenkreisen“ abzulehnen. Es gilt indes: In Ausübung des Mandats muss das Unternehmensinteresse stets Vorrang vor eigenen Interessen haben (BGHZ 64, 238; BGHZ 69, 207, BGH NJW 1978, 425; DCGK Ziffer 5.5; Potthoff, Kap. 1 III 3 b, Kremer, Rz 1112 ff; Ulmer, NJW 1980, 1603.). Das Unternehmensinteresse unterliegt einem Wandel und ergibt sich auch aus der strategischen Ausrichtung und der daraus abgeleiteten Geschäftspolitik. Es inhaltlich ganz konkret zu fassen, ist meist ein schwieriges Unterfangen.

Wenn es Interessenkonflikte gibt, sind diese offenzulegen und angemessen zu behandeln. Hierzu haben sich in der Rechtsprechung und Praxis Fallgruppen entwickelt.

4.3. AUSGEWÄHLTE FALLGRUPPEN

4.3.1. Fallgruppe „Gesetzliches Verbot“

Das Gesetz kennt wenige Verbote für das Mandat eines Aufsichtsrates (ACI S. 39, Semler, § 12 RZ 90.). So können Mitglieder in Aufsichtsräten nur

natürliche Personen sein. Ein Mitglied der Regierung darf grundsätzlich keinem Aufsichtsrat angehören (Art. 66 GG). Auch darf ein Mitglied des Exekutivorgans (Vorstand/Geschäftsführer) nicht zugleich Aufsichtsrat sein (§ 105 AktG). Eine Person, die in den letzten zwei Jahren Vorstandsmitglied war, soll nicht Mitglied des Aufsichtsrates werden; insgesamt sollen ihm nicht mehr als zwei ehemalige Vorstände angehören (DCGK Ziffer 5.4.2 und ACI, S. 37.). Überkreuzverflechtungen sind verboten, d. h. Exekutivorgane mehrerer Unternehmen dürfen nicht jeweils im anderen Unternehmen im Aufsichtsrat sitzen. Auch die Ämterhäufung ist beschränkt. So darf eine Person nicht mehr als zehn Aufsichtsratsmandate haben, der Vorsitz eines Aufsichtsrates zählt dabei doppelt. Für Banken und Versicherungen und börsennotierte Gesellschaften gelten strengere Regeln, vgl. § 25d KWG und die Merkblätter der BaFin für Aufsichtsratsmitglieder für Banken bzw. Versicherungen.

4.3.2. Fallgruppe „Kredite und Überschuldung“

Kredite an Mitglieder des Aufsichtsrates der Gesellschaft dürfen nur nach vorheriger Zustimmung des Aufsichtsrates vergeben werden (§ 115 AktG) (DCGK Ziffer 3.9 und Semler, § 8 Rz 98 ff.; Spindler/Stilz § 115; Schmidt/Lutter §§ 115, 89 Rz 5 ff.). Ein überschuldetes Aufsichtsratsmitglied, deren Gläubiger die Gesellschaft ist, ist nicht mehr unabhängig und muss sein Amt niederlegen.

4.3.3. Fallgruppe „Mandat bei einem Wettbewerber“

Kontrovers wird die Frage diskutiert, ob Aufsichtsratsmandate in konkurrierenden Unternehmen zulässig sind. Ein Interessenkonflikt drängt sich dann auf, wenn ein Aufsichtsrat wesentliche Funktionen bei einem Konkurrenten ausübt, z. B. als Vorstand, leitender Mitarbeiter, Aufsichtsrat, Bankier oder Berater. Der Konflikt besteht darin, dass der Aufsichtsrat in konkurrierenden Unternehmen besonderes Wissen erlangt, das er gegenseitig verwerthen kann. Diese Fallgruppe ist gesetzlich nicht geregelt, es gibt kein gesetzliches Mandatsverbot! Die h. M. ist der Ansicht, dass ein Mandat in dieser kritischen Konstellation zwar unerwünscht, aber zulässig sein kann (BGHZ 39, 116, 123; Semler, § 12 Rz 139 ff.; Kremer, Rz 1029, 1051. Ausführlich Matinek, WRP 2008, 51-67.). Je nach Einzelfall kann die Doppelfunktion indes einen schwerwiegen-

den und dauerhaften Interessenkonflikt begründen und dann einen Sanktions- oder Inkompatibilitätsgrund darstellen.

Nach dem Governancekodex (DCGK Ziffer 5.4.2 Satz 4) „soll“ ein Aufsichtsrat keine Organfunktion oder Beratungsaufgaben bei wesentlichen Wettbewerbern ausüben. Wesentlich ist ein Wettbewerber mit Gewicht, der dem Unternehmen auf seinen Märkten Wettbewerb macht und in der Kernleistung identische Tätigkeitsfelder hat. *Semler* entwickelte hier die Formel vom „sensiblen Wissen im Kerngeschäftsfeld“ (*Semler/Stengel*, NGZ 2003, 5.). In Anlehnung an *Lutter* ist es zu recht unerträglich, wenn man beispielsweise im Aufsichtsrat von Daimler die neue Modellpolitik erörtert und ein Mann von Audi dabei sitzt (*Lutter*, Rechte und Pflichten des Aufsichtsrates, § 1 Rz 9.). Ähnlich gravierend können interne Diskussionen um ein gravierendes Straf- oder Kartellverfahren, um den Einsatz neuer Technologien, um die internationale Kooperationsstrategie oder ähnliche grundlegende Themenbereiche sein.

4.3.4. Fallgruppe „Interessenkonflikte im Konzern“

Bei Unternehmen im Konzernverbund finden sich vielfältige personelle Verflechtungen. Das Gesetz verbietet in § 100 II Nr. 2 AktG den Fall, dass der gesetzliche Vertreter einer Tochtergesellschaft gleichzeitig im Aufsichtsrat der Muttergesellschaft sitzt. Praxisrelevant und zulässig ist der umgekehrte Fall: Ein Vorstand der Muttergesellschaft sitzt im Aufsichtsrat der Tochtergesellschaft. Rechtlich zulässig ist auch der Fall, dass jemand Aufsichtsrat bei Mutter- und Tochtergesellschaft ist. Als Grundregel gilt im Konzern, dass ein Aufsichtsrat das Konzerninteresse zu wahren hat, die Interessen des herrschenden Unternehmens – also der Muttergesellschaft – haben grundsätzlich Vorrang (§§ 308, 323 AktG; *Semler*, § 12 Rz 130 ff.).

4.3.5. Fallgruppe „Vertreter eines Großaktionärs oder eines Familienstammes“

Ist ein Aufsichtsrat ein Vertreter eines Großaktionärs oder eines Familienstammes kann es zu einem Konflikt zwischen den „Interessen des Großaktionärs bzw. der Familie“ und des Unternehmens kommen. Aufsichtsräte sind an Aufträge und Weisungen nicht gebunden, sie haben kein imperatives Mandat. So wörtlich „Sie sind an Aufträge und Weisungen nicht gebunden“ in § 4 III 2

MontanMitbG. Dieser Grundsatz gilt für alle Aufsichtsräte unabhängig von Größe und Rechtsform des Unternehmens. Dabei müssen die Interessen des Großaktionärs bzw. die Interessen der Familie zurückstehen, soweit sie den Interessen der Gesellschaft widersprechen.

4.3.6. Fallgruppe „familiäre bzw. persönliche Verquickung“

Enge familiäre oder persönliche Beziehungen innerhalb eines Organs oder zwischen den Organen (Ehepartner, Geschwister, Verwandtschaft in gerader Linie, Liebesbeziehungen etc.) können zu einer besonderen Vertrautheit führen, die jede sachliche Entscheidung überlagert oder sogar ausblenden kann. Innerhalb der Familie oder bei gescheiterten Liebesbeziehungen kann es dauerhaft zu Streit und unsachlichen Auseinandersetzungen kommen. Beides – zu enge Vertrautheit oder Fehde in der Familie – sind dem Unternehmensinteresse nicht dienlich. Je nach Art der Vertrautheit und der Schwere des Interessenkonflikts sind angemessene Maßnahmen erforderlich, die das betroffene Mitglied und die Organe prüfen, bewerten und schlussendlich entscheiden müssen. In Frage kommen je nach Einzelfall ein generelles Mandatsverbot (z. B. Ehemann ist Vorstandsvorsitzender, die Ehefrau soll ihn als Aufsichtsratsvorsitzender kontrollieren; Eltern sind alleinige Vorstände, deren Kinder sollen als alleinige Aufsichtsräte bestimmt werden) oder einschränkende Maßnahmen je nach Sachlage (z. B. Bestellung weiterer unabhängiger Mitglieder; Enthaltung bei Fragen der Anstellung, Vergütung oder Entlastung des Familienmitgliedes). Besonders heikel sind Liebesbeziehungen, die nicht offenkundig sind. Wenn z. B. der oder die Aufsichtsratsvorsitzende ein Verhältnis mit einem Vorstandsmitglied beginnt und über mehrere Quartale aufrecht unterhält, ist eine Amtsniederlegung – entweder die des Aufsichtsratsvorsitzenden oder des Mitglieds im Vorstand – unabdingbar.

4.3.7. Fallgruppe „Arbeitnehmervertreter im Aufsichtsrat“

Arbeitnehmervertreter im Aufsichtsrat können verschiedene Rollen im Unternehmen haben, die zu Interessenkonflikten führen können (Semler, § 12 Rz 125 ff.). In ihrem Hauptamt unterliegen die Arbeitnehmer dem Direktionsrecht des Vorstandes, im Nebenamt sind sie Mitglied im Kontrollorgan und überwachen insoweit als Aufsichtsratsmitglied den Vorstand. Insofern gibt es eine vom Gesetzgeber vorgesehene Überkreuzüberwachung, die nicht un-

problematisch ist. Auch hier gilt: Als Arbeitnehmervertreter im Aufsichtsrat sind die Mitarbeiter ausschließlich dem Unternehmensinteresse verpflichtet. Im Konfliktfall (z. B. Fusion, Wegfall des Arbeitsplatzes, Schließung einer Betriebsstätte) haben eigene Interessen und die Interessen der Belegschaft, des Betriebsrates oder die Interessen der Gewerkschaft zurückzustehen.

Schwierig ist die Rechtslage im Arbeitskampf, z. B. aktive Mitwirkung eines Aufsichtsratsmitglieds beim Streik gegen das Unternehmen. Nach h. M. ist hier eine gewisse Zurückhaltung des jeweiligen Mitglieds geboten (Semler § 12 Rz 128m. w. N.).

Wenn die Arbeitnehmervertreter überlegt argumentieren, kommt es bei Arbeitnehmerinteressen kaum zu Interessenkonflikten. Grund hierfür ist, dass die Interessen der Arbeitnehmer stets einen wichtigen Teil des Unternehmensinteresses darstellen (vgl. § 2 BetrVG). Sie müssen insofern nicht strikt einem „Vorstandsinteresse“ oder „Mehrheitsinteresse im Aufsichtsrat“ untergeordnet werden, sondern stehen als gewichtiger Teil des Unternehmensinteresses daneben. Arbeitnehmerinteressen können also im Rahmen der laufenden Aufsichtsrats-tätigkeit stets mitverfolgt werden. Mehr noch: Die unternehmerische Mitbestimmung erwartet gerade dieses Engagement von den Arbeitnehmervertretern.

4.3.8. Fallgruppe „Verträge mit Aufsichtsratsmitgliedern“

Bei Verträgen mit Aufsichtsratsmitgliedern und deren Angehörigen ist Zurückhaltung geboten. Besonders kritisch sind Beraterverträge zwischen der Gesellschaft und den Mitgliedern des Aufsichtsrates zu sehen, zumal die Beratung des Vorstandes durch die Aufsichtsratsmitglieder ureigene Aufgabe des Aufsichtsrates ist und mit dem Amt und dessen Vergütung abgegolten ist. Die Einzelheiten regeln §§ 113, 114 AktG. Danach muss bei einem Dienst- oder Werkvertrag höherer Art zwischen der Gesellschaft und einem Mitglied des Aufsichtsrates der Aufsichtsrat zustimmen (Semler, § 12 Rz 109 ff.).

Zu Anschauung werden vier Fallbeispiele vorangestellt:

Fall A: Der Aufsichtsratsvorsitzende ist Rechtsanwalt und bittet seinen Kanzleisozius kurz vor der Hauptversammlung um Mithilfe bei der Erstellung eines Verhandlungsleitfadens. Er erteilt ihm insofern einen kostenpflichtigen Auftrag!

Fall B: Ein Aufsichtsrat ist Steuerberater und wird vom Vorstand zur Abwehr eines Steuerstrafverfahrens inklusive Verteidigung beauftragt.

Fall C: Ein Aufsichtsrat ist bisher Organisations- und Finanzberater und wird als Aufsichtsrat neu bestellt. Er will seinen Beratervertrag fortführen. Dort heißt es u. a.: „Der Berater erhält monatlich 4.000 € für die Beratung in wesentlichen Fragen der Geschäftsführung, insbesondere in Fragen der Organisation, der Datenangelegenheiten, von Finanzierungen und Versicherungen und beim Erwerb von Beteiligungen im In- und Ausland.“

Fall D: Ein Aufsichtsrat ist Schreibwarenhändler. Bei ihm kauft die Gesellschaft Büroartikel.

Erfasst von § 114 AktG sind nur Dienst- und Werkverträge höherer Art, also Verträge mit geistigem Anspruch. Im Kern sind damit Beratermandate gemeint. Fall D behandelt einen Kaufvertrag. Diese Fallgruppe ist unproblematisch und braucht im Aufsichtsrat nicht behandelt werden, wenn und soweit die Kaufbedingungen angemessen sind. Die Gesellschaft darf also schlichte Umsatz- und Tagesgeschäfte mit einzelnen Aufsichtsratsmitgliedern jederzeit tätigen (z. B. Kauf von Backwaren bei einem Aufsichtsrat, der im Hauptberuf Bäcker ist; Autoreparatur bei einem Aufsichtsrat, der ein Autohaus führt; Auftrag einer Elektroinstallation bei einem Aufsichtsrat, der selbstständige Elektromeister ist).

Zu den ureigenen Aufgaben des Aufsichtsrates gehört die Beratung des Vorstandes, zu den ureigenen Aufgaben des Aufsichtsratsvorsitzenden gehört die Versammlungsleitung. Diese organschaftlichen Pflichten schuldet das Organmitglied der Gesellschaft aus seinem Amt heraus. Typischerweise erhält ein Aufsichtsratsvorsitzender hierzu Unterstützungsleistungen vom Vorstandsbüro der Gesellschaft. Eine Auftragserteilung im Kernbereich der organschaftlichen Pflichten an sich selbst oder an seine Kanzlei – wie im Fall A – ist nicht zulässig. Ein derartiger Vertrag ist auch nicht genehmigungsfähig. Er ist unwirksam. Im Fall A darf der Vorsitzende weder selbst eine Zusatzrechnung für die Erstellung eines Verhandlungsleitfadens schreiben noch seinen Kanzleikollegen dazu kostenpflichtig beauftragen.

Grundsätzlich hat jedes Mitglied seine gesamten Fähigkeiten in den Dienst der Aufsichtsratsaufgabe zu stellen, inklusive seiner professionellen Spezialkenntnisse. Ein hoher Arbeitsaufwand allein ist noch kein Grund für eine

zulässige Mandatierung. Ein Aufsichtsrat hat in erster Linie den Vorstand zu beraten und zu überwachen. Die Beratung und Kontrolle bezieht sich nicht nur auf abgeschlossene Sachverhalte, sondern erstreckt sich auf grundsätzliche Fragen der Geschäftspolitik und auf aktuelle Sachverhalte. Im Fall C betrifft das Beratungsverhältnis durchweg allgemeine Bereiche der Unternehmensführung. Diese Beratungsaufgabe zählt zu den ureigenen Aufgaben eines Aufsichtsrates und kann schuldrechtlich nicht extra beauftragt und vergütet werden (vgl. BGHZ 114, 131 f.). Ein Beratungsverhältnis ist insoweit unwirksam (§ 114 AktG).

Bei Spezialfragen oder bei Unterstützung des Vorstandes im Tagesgeschäft kann etwas anderes gelten. In diesem Fall darf die Gesellschaft ein Beratungsverhältnis „höherer Art“ (Werk- oder Dienstvertrag) mit vorheriger Zustimmung des Aufsichtsrates eingehen. Die Beauftragung muss also vom Aufsichtsrat sorgfältig geprüft und entschieden werden. Im Fall C gibt es für eine Beauftragung keine Möglichkeit, zumal es um eine allgemeine Dauerberatung des Vorstandes geht.

In der Praxis besteht die schwierige Abgrenzungsfrage darin, wie weit die Beratungspflichten eines Aufsichtsrates reichen. Nach h. M. (BGH Urteile vom 25.03.1991 und 04.07.1994 (BGHZ 114, 131 f.; 126, 344 f.)) gilt für dieses Problem folgendes (Semler, § 12 Rz 739; Spindler/Stilz § 114 Rz 5 ff; Schmidt/Lutter § 114 Rz 5 ff.):

- Ein Vertragsverhältnis mit einem Aufsichtsrat über eine allgemeine (laufende) Beratung der Gesellschaft bzw. des Vorstandes ist unzulässig. Sie ist Teil der Aufsichtsratsfunktion und mit deren Vergütung abgegolten (§ 113 AktG).
- Eine Spezialberatung in einem konkreten Einzelfall oder im Tagesgeschäft ist nach sorgfältiger Prüfung genehmigungsfähig, weil dieser Aufgabenbereich weder eine Frage der Strategie noch zur laufenden Überwachungsaufgabe des Aufsichtsrates gehört. Fall B ist damit zulässig, wenn vor der Mandatierung der Gesamtaufichtsrat angehört und den Vertragsbedingungen mittels Beschlusses zugestimmt hat. Mittels Aufsichtsratsbeschluss – das betroffene Mitglied hat dabei ein Stimmverbot – sind also nur Dienstleistungsverträge mit einem „spezifischen Leistungsprogramm“ genehmigungsfähig, also Verträge, die spezifische und nicht allgemeine Fragen der Geschäftsführung betreffen und nicht im

normalen Feld der Aufsichtsratsstätigkeit liegen. Je spezieller die Fragen sind, desto eher können sie Gegenstand einer Beauftragung sein. Ebenso sind Fragen zu behandeln, mit denen sich der Aufsichtsrat gewöhnlich nicht befasst, wie z. B. anwaltliche Vertretung im Einzelfall, die Erstellung von Steuererklärungen, einer Werbekonzeption oder eines Personalkonzepts oder die Erbringung von Routinedienstleistungen.

- ✦ Dem Wortlaut nach betrifft § 114 AktG nur die Gesellschaft und das jeweilige Aufsichtsratsmitglied. Der Anwendungsbereich von § 114 AktG ist jedoch weiter zu fassen: Vom Verbot bzw. Zustimmungsvorbehalt werden auch Tochtergesellschaften der Gesellschaft und nahestehende Personen bzw. Personengesellschaften des Mitglieds (Partner einer Sozietät, Ehepartner oder nahe Angehörige des Mitglieds) umfasst.
- ✦ Dritte sind unbefangen bzw. unabhängig und können jederzeit vom Vorstand sowohl mit strategischen Fragen als auch mit Einzelfragen oder einem Dauermandat beauftragt werden.
- ✦ Genehmigungsfähige, aber „nicht richtig“ oder „nicht“ genehmigte Beratungsverträge sind unwirksam. Eine gezahlte Vergütung ist zurückzugewähren (§ 114 II AktG). Der Aufsichtsratsbeschluss ist nur wirksam, wenn der Inhalt der Beratungsleistung spezifiziert ist (genaue Bestimmung des Arbeitsprogramms bzw. der Aufgabenstellung) und die Höhe der Vergütung offengelegt ist (Transparenzgebot!). Zweck dieser Regelung ist, dass keine Sondervergütung für einen Aufsichtsrat ausgekehrt wird, zumal hierfür gemäß § 113 II AktG ausschließlich die Hauptversammlung zuständig ist.

4.4 VERHALTENSGRUNDSÄTZE BEI INTERESSENKONFLIKTEN

Da das Mandat im Aufsichtsrat ein Nebenamt ist und das Mandat höchstpersönlich auszuüben ist, nimmt der Gesetzgeber Interessenkonflikte hin. Der Aufsichtsrat muss jedoch alles tun, um die Interessenkonflikte gering zu halten und zu beschränken, idealerweise sind sie zu vermeiden. Schon bei der Auswahl und Nominierung der Aufsichtsratsmitglieder müssen die Organe einschätzen, ob und gegebenenfalls mit welcher Intensität mit dem Auftreten von Interessenkonflikten zu rechnen ist. Sind Interessenkonflikte wahrscheinlich, sollte ein Kandidat erst gar nicht zur Wahl vorgeschlagen werden.

Auf Interessenkonflikte und deren Vermeidung hat der Aufsichtsratsvorsitzende, jedes Mitglied im Aufsichtsrat und auch der Vorstand zu achten. Die Sorgfaltspflicht trifft besonders das betroffene Mitglied selbst. Jedes Mitglied im Aufsichtsrat muss Interessenkonflikte, insbesondere solche, die aufgrund einer Beratung oder Organfunktion bei Kunden, Lieferanten, Kreditgebern oder sonstigen Beziehungen entstehen können, dem Aufsichtsrat gegenüber klar und deutlich offenlegen. Je nach Interessenkonflikt unterliegt das betroffene Aufsichtsratsmitglied einem Stimmverbot. Hierüber entscheidet der Aufsichtsratsvorsitzende. Ist der Interessenkonflikt besonders intensiv, so kann das betroffene Mitglied auch von der Beratung bei diesem Tagesordnungspunkt ausgeschlossen werden (Ulmer, NJW 1980, 1604; ACI, S. 144.). Denkbar ist das zum Beispiel in einer Übernahmesituation, wenn ein Aufsichtsrat auch der Bietergesellschaft angehört. Bei dauerhaften und gravierenden Interessenkonflikten ist das Aufsichtsratsmitglied verpflichtet, sein Mandat niederzulegen (Beispiel: Liebesbeziehung zwischen den Vorsitzenden des Leitungs- und des Kontrollorgans). Kommt das befangene Mitglied seiner Pflicht nicht nach, so muss der Aufsichtsrat einen Antrag auf Abberufung stellen.

Bei der Ausübung seines Amtes muss der Aufsichtsrat stets den Vorteil des Unternehmens wahren und Schaden von ihm abwenden. Ansonsten besteht eine Treupflichtverletzung, die zu weiteren Rechtsfolgen (Abberufung, Zwang das Amt niederzulegen, Schadenersatzpflicht) führen kann.

Eine Pflichtwidrigkeit besteht nicht, wenn der Aufsichtsrat bei unternehmerischen Entscheidungen vernünftigerweise auf der Grundlage angemessener Informationen und Abwägungen annehmen durfte, zum Wohle der Gesellschaft zu handeln (sog. Business Judgment Rule nach §§ 116, 93 I 2 AktG). Insofern kann die Business Judgment Rule ein „sicherer Hafen“ für den Aufsichtsrat sein. Dieses Prinzip findet jedoch keine Anwendung, wenn das Aufsichtsratsmitglied nicht ausschließlich im Unternehmensinteresse handelt oder wenn konkrete Gesetzespflichten verletzt werden. Unter Juristen ist streitig, „ob“ und „wie“ dabei der gesamte Aufsichtsrat von Interessenkonflikten „infiziert“ ist (ACI, S. 145.). Eine höchstrichterliche Entscheidung liegt hierzu bisher nicht vor.

5. ZUSAMMENFASSUNG

Kapitalgesellschaften werden von Organen geleitet und jedes Organ – Vorstand wie Aufsichtsrat – darf sich nur vom Interesse des Unternehmens leiten lassen. Da das Amt des Aufsichtsrats ein Nebenamt ist und höchstpersönlich auszuüben ist, können zum Unternehmensinteresse weitere unternehmerische, finanzielle oder persönliche Interessen treten. Der Gesetzgeber nimmt solche Interessenkonflikte in Kauf. Der Aufsichtsrat muss jedoch alles tun, die Interessenkonflikte zu beschränken oder zu vermeiden. In erster Linie **zählt es zur Pflicht des betroffenen Mitglieds** seinen eigenen Interessenkonflikt offenzulegen. In gravierenden Fällen hat sich das betroffene Mitglied der Beratung zu enthalten und darf nicht mitstimmen. Besteht der Interessenkonflikt dauerhaft und wiegt er schwer, ist eine Amtsniederlegung zu prüfen.

Praxisrelevant ist die Fallkonstellation, dass ein Aufsichtsrat bzw. sein Unternehmen oder Kanzlei neben seinem Mandat einmalig oder laufend Beratungsleistungen erbringt. Grundsätzlich sind Beratungsleistungen mit dem Aufsichtsratsmandat abgegolten. Will das Mitglied für sich, seine Angehörigen oder sein Unternehmen einen Werk- oder Dienstvertrag schließen, so bedarf dieser Vertrag einer sorgfältigen Prüfung und Beratung im Aufsichtsrat und einer ausdrücklichen Zustimmung.

Zusammenfassend zeigt sich, dass die Diskussion um eine „Good-Governance“ Konturen zur Problemlösung herauskristallisiert, die eine klare Tendenz erkennen lassen: Die Toleranz hinsichtlich Interessenkonflikte von Aufsichtsräten nimmt ab. Verfahren werden eingefordert („Interessenpolicy“) mit den Bausteinen „Offenlegung/Transparenz“, „Diskussion und Bewertung im Aufsichtsrat“ samt angemessener „Sanktion“ am besten anhand von Fallgruppen.

Abstract

The need for efficient management for spending State Budget in the Republic of Croatia, which is a crucial problem, has led to the implementation of a single salary information system for employees whose salaries are funded from the State. That information system is the Central Payroll System for monitoring expenditures and staff data of public sector employees.

Purpose of the paper is to give a review of research results made by Ministry of Administration of Republic of Croatia and Financial Agency about the usage of income calculations outside the Central Payroll System focused on Brod - Posavina County. The research took its part during January and February 2017 which covered Public Sector in the Republic of Croatia. The aim of the paper is to prove that making all calculations, salaries, material rights, other incomes, etc., by using Central Payroll System will be easier to manage and control the spending of State Budget and to reduce the additional costs of using additional programs in that purpose. There is a strong correlation between the

inefficient expenditure of budget resources and the use of various payroll and income calculations programs that generate additional costs.

Keywords: Central Payroll System (CPS), management, expenditure, reduction, State Budget

JEL Classification: H61, M10

1. INTRODUCTION

Management is a complex category and has five important functions which are planning, organizing, staffing, leading and control (Barković, 2009,13). Through political decision-making process, these five mentioned management functions were used to bring rationalization, stabilization, and optimization of public sector system to reduce expenditures for employees because these expenditures are the highest. The analysis method of problems through a list of activities (“procedures”) provides us to perceive important dimensions of one process and to get ideas about its improvement (Srića, 2003,87). According to that, the successful and efficient public sector is an indicator of the success of a modern state.

On the June 12th2015, according to 81st article of Croatian Constitution, Croatian Parliament brought Development Strategy of Public Administration for period 2015 – 2020 which is the frame for development of all bodies in the property of the State. The emphasis of Strategy was informatization in the purpose of easier data managing, control and better connection between services, which means less paperwork. It also contains results of previous strategies and the most important mechanism for Public Sectors was a project of Central Payroll System implementation and human resource management. At the moment, Information system RegZap/COP (Register of Public Sector Employees/ Central Payroll System), is one of the largest services of Republic of Croatia which will be described in the second part of the paper. Better human resource managing in Public Sector, better managing, and control of State Budget expenditures for salaries and material rights, was enabled by launching above mentioned project. The result is also, expenses reduction to local programmers for every institution individually before using Central Payroll System, along with monthly and yearly reporting about paid wages on an institutional level, group

of institution and on the level of the system in general, because of further planning, savings, and allocation of State Budget resources.

In the second part of the paper briefly will be described Register of employees in Public Sector as well as Central Payroll System, apropos implementation and managing with these two information systems and their advantages and disadvantages. Following that, will be described management of expenditures for employees. In the fourth part of the paper will be processed researched data and methodology of research and in the end conclusion.

Purpose and aim of the paper are the establishment of quality and efficient Central Payroll System and Human Resource Management to improve Public Sector in general. Collected data and statistical processing were made on basis of the poll made by Ministry of Administration of Republic of Croatia and Financial Agency, in period January – February 2017, about using systems for income calculations outside the Central Payroll System, in the meaning of upgrading new functionalities. The research covered all Public Sector institution in the Republic of Croatia. Paper research is focused on institutions in Brod – Posavina County.

2. PUBLIC SECTOR EMPLOYEE REGISTER

Nowadays, quality computers and information systems are instruments without its existence is unimaginable the business of a company, private or public. They facilitate the business of the company, contribute acceleration of business processes and using them managers bring decisions faster and easier. With global Economy Crisis, Government of Croatian also took some activities to fight against it, and one of the results was activities of establishment Register of Employees in Public Sector, further RegZap, and after it was developed Central Payroll System. The largest critics pointed to Governments in present and in the past are huge amounts of employees in Public Sector and high expenditures of State Budget. Unification of data, quality Human Resource Management and managing with salaries in the Public Sector was the result of the implementation of RegZap and Central Payroll System. Establishment and managing of RegZap were given to Financial Agency by Government of Republic of Croatia Decree from June 10th2010 (Narodne novine 83/2010). RegZap covers data from every employee in state firms and public companies and it ensures moni-

toring and changing of existing data. RegZap users are all institutions beneficiaries of State Budget.

At the beginning of May 2012, informatics infrastructure for central data collecting was implemented and was covering 250 000 employees. The web application was developed and to use contemporary and safe security mechanisms all beneficiaries were ensured with Public Key Infrastructure (PKI). At that moment 4000 users registered and all of them had an opportunity to participate in workshops in regional centers through a system of users support. RegZap creates conditions to develop a system for effective and successful Human Resource Management in public and State companies as well as the Central Payroll System for beneficiaries who use State Budget resources for salaries. Basic preconditions to use the application are:

- + Internet
- + installed support for smart card or USB
- + smart card reader or USB token.

The URL address is <https://zaposleni.javnisektor.hr>, after choosing received certificate it is needed to enter PIN code received with a smart card or USB.

At the end of logging into application, approval had to be verified. After entering application new window with modules classification was opened.

Figure 1. Register of employees in the public sector – main menu

Source: Financial Agency (April 2019)

All modules have sub-modules with their logical unities. For example, module ZAPOSLENICI (employees) has few sub-modules connected to different data. There are two field categories for module entries: 1. Structure and method of data entry (free entry field, drop down menu and search window); 2. Possibilities of data entry (mandatory fields – marked with blue color, optional field – marked white, protected fields with no data entry -grey color). Data entered for employees, for example, are a first and second name, personal ID, IBAN account, residence address, employment date, working experience/years before employment, education data, level of education, foreign language competences, different suspensions, etc. Within Register of Employees in Public Sector data about every employee are covered and through the System, all data are managed, followed, and corrected. Quality management of mentioned data is correlated to one of the five main management function and that is human resource management and leading, motivating and controlling of employees which will be mention and discussed in a subsequent part of the paper.

3. EMPLOYEES COST MANAGEMENT AND ITS POTENTIAL

3.1. COST MANAGEMENT

Expenditure emerges every time when we invest one resource into the process of realization, e.g. materially in the shape of current or fixed assets, financial assets and physical or mental work of the human, or for making outcome (service/good). Expenditures are values of resources which needs to be immolated for maintaining life and accomplishment certain goals every physical and legal person. Two main financial performance components are revenue and expense. Their relation is measured by profit. Nowadays, when global competition is high, profit is crucial for the existence of every company. Many economists explore to find proper and perfect models for cost management (Belak, 2017). For every company is important to figure out how costs emerge, methods for cost calculations. It can be concluded that costs are an investment which will result in future benefit. Theoretically, goal to engaging costs/expenditures is to score a profit. Reduction of costs is not easy work (Belak, 2017). Main activities of cost management are:

1. foresight, planning, budgeting, following and controlling of costs
2. cost behavior analysis caused by changes in environment
3. analyzing causes of cost deviation (Belak, 2017).

Cost calculations process includes identification and budget of planned costs, apropos measuring appeared costs and placement on their holders. A most common method of costs reduction is saving, which can produce large damage to an organization. Organizations usually combine different models of cost management. And the goal is to accomplish a kind of organization which has developed cost management and the result will be the optimization of costs. Cost, as an economic category, has two components amount of used production elements and their purchase price (Belak, 2017). Therefore, mathematically cost (value – V) is the product of quantity (q) and price (p), $V = q \times p$. At the end of every business period objective (real) costs are determined, and for the next period are planned (evaluated). The most common guideline in the praxis of cost management is low costs, the phrase: “reduction of costs cause profit”, added value and revenue. Selection of the main directive of cost management will depend on the manager (Belak, 2017). Totally low cost means to put all cost on minimum which has negative results (low standard) repercussion of it more theoretical than real and leads the company to loss. Phrase “reduction of costs cause profit” on the other words, if lower costs bring lower revenue, profit will be reduced, and it is damaging for a company and it is not a good guideline for cost management. Added value as a guideline for cost management has focused on reduction of activities that result does not bring added value, and it contains salaries and reimbursements to employees, interest rates, tax on income, net profit. The connection between added value and profitability are non-transparent and the appliance of these models are relayed on intuition, not on empirical proves. Added value is not a good guideline for cost management in a time of crisis (Belak, 2017). When revenues are low profit does not appear and it is the most distinct guideline for cost management. The most important is to develop awareness between managers to adopt uncritical cuts of all kinds of costs. In the period of crisis and problems, companies can lose their sensitivity for social problems and they focused only on their own survival and the result of it is the dismissal of employees. Is it good for the economic state of the company and are the results positive? To authors opinion, when dismissals are caused by managers incompetence to ensure satisfying volume products and services. It is easier to reduce workforce than making revenues.

Employees are most valuable goods to every company and large dismissal have disadvantages like a high level of fear, low morals, the appearance of animosity, negative behavior, negative selection, loss of competitive employees, work effectiveness collapse, etc. In that case, companies should avoid dismissals as far as possible (Belak, 2017). How that situation would not happen, a key role has management. In case when employees are not the most valuable good of the company and when values of it are not connected to their competences, with large dismissal companies are not in the big losses. Thereby they reduce working force costs. Cost management, in the time of crisis, needs to base itself on empirical foundations that are easy operating in praxis (Belak, 2017).

Different researches show how the strategical costs and investments planning per employee is a precondition to company competitiveness, the accomplishment of efficiency of management and further development and existence on the market. There is a significant role of cost reports in the process of management in subjects of the private and public sector. Expenditures, the broader term of costs present reduction of economic benefits within a specific period in the form of flowing of assets and creation of debts that results in principal sum decrease. Regular and exceptional expenses are followed by expenditure structure and MSFI and HSFI that are important to determinate financial result and efficient financial management in the private and public sector. Budget fund for salaries of public sector employees was a good tool for that because they are a significant part in the structure of total costs. The principal of good financial management means that budget funds need to be economically, efficient and effective used.

Because of nonrational state budget management for salaries in public sector, illogicality was seeking in the system, to make efficient financial management and payroll system, as well as efficient control of purpose spending of State Budget, on the level of the entire system and costs of salaries in public sector were put under control. The outcome was the implementation of the Register of Public Sector Employees and Central Payroll System (RegZap/COP) that is one of the biggest state systems.

3.2. CENTRAL PAYROLL SYSTEM

One of the main reforms and fiscal consolidation measures for the period from 2014 – 2016, was the Central Payroll System. By the Croatian Republic

Government decree about the establishment of an informatic system for calculating salaries for all state companies and public sector, institutions enabled quality human resource management in the public sector. Likewise, it provided state resources for salaries in public sector management, reporting about salaries individually and in total. Implementation of the System started in 2012 for bodies of state administration and production in 2013. In 2013 it spread to public sector institutions. System was established in 2100 institutions for 250 000 employees and in 2015 salaries were calculated and paid through it for employees financed from State Budget.

Central information system provided a division of duties – human resources services for RegZap and financial services for COP. Set goals were legality, fiscal responsibility, and paperless system. On Figure 2, below can be seen Register of employees in the public sector in numbers.

Figure 2. Register of employees in the public sector in numbers

Source: Ministry of Administration (2019)

According to Law about Register of Employees in the public sector (NN 34/11) to fool implementation were make special evidence about the number and structure of employees. There were also a well-structured 10 reports in the Registry application and 20 new improvements to the Registry were pre-

pared. Several dozen working sessions between the Financial Agency and State bodies were held with the aim of further enhancing/developing the Register of employees in the public sector (HRM system and COP system). With the aim of preparing strategic documents, legal and our laws, for the needs of EU monitoring and the preparation of responses to media and citizens, data from state bodies were compiled and reports from the RegZap and interpreted data were produced for over 350 reports. Government of the Republic of Croatia authorized Financial Agency, with the contract signed on October 25th2013, to manage implementation and support of the System (Official Gazzette, 2011).

The informatic system provides efficient managing of budget resources allocated for salaries in the public sector. Scope and aim of the project were to provide access to data about human resources, need for education, employee placements, pension planning, need for employment, etc. in the purpose of upgrading the efficiency of the public sector. It also ensures supervision on salaries calculations, paid salaries overview in different sectors, the effect of salaries elements (coefficients and additions), etc. A system is a tool for efficient centralized human resource management. In every moment Government can follow expenditures for employees in the public sector, it can receive different reports and simulations of calculation which is the basis for clear and transparent management (Official Gazzette, 2011). It also has access to public sector human resources register.

With its dimensions and data quantity the System RegZap / COP is one of the biggest state services in this moment (from everyday evidence of every 250 000 employees in 2100 institutions whose salaries are financed from the State Budget in total amount of about 31 billion HRK per year) – monthly cost of the System (development, processing and data protection) is 5,5 HRK per employed person (16,5 million HRK yearly cost).

Table 1. Monthly costs of COP system (development, processing and data protection)

Employees in the Public Sector	Monthly cost per person in HRK	Total monthly cost in HRK	Number of months in a year	The total yearly cost of system RegZap/COP in HRK
250.000	5,5kn	1.375.000,00	12	16.500.000,00

Source: Authors elaboration of data received from the Ministry of Administration, December 2017

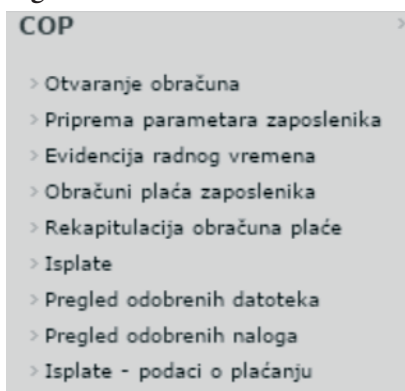

Further digitalization will bring possibilities of employees and expenditures reduction for software in the part of human resources and salaries payment. It has enormous potentials to connect with other systems and registers (Health insurance- HZZO, Retirement insurance- HZMO, State Treasury) and further optimization and digitalization, as well as paper-free administration. Linking the System with e-Citizens (e-Građani) there are opened new possibilities in the part of employee data using and entering of new data (e.g. education, work reports, etc.), like “self-service” portal in the future. For example, from 2009 Estonia has a similar system with personal userbox for employees in Register where they can enter and check and change their own data.

Visible results of the System are as followed:

- ✦ improvement of fiscal responsibility in every level
- ✦ duties dive – HRM and financial
- ✦ standardized and controllable system
- ✦ HRM- fast mobility
- ✦ correction of deviations (coefficients, bonuses, etc.)
- ✦ higher effectiveness and less paperwork
- ✦ faster decision making on the level of State (Ministry of Administration).

Module Central Payroll System (COP) contains 9 sub-modules for the salaries calculations in public sector shown on Figure 3, below.

Figure 3. Content of module Central Payroll System

Source: Financial Agency, April 24th2019

Sur-modules on Figure 3 are by the order calculation opening, preparation of parameters of employees, working hours notes, salaries calculation, recapitulation, payments, files review, orders reviews, payment data. By choosing sur-module Otvaranje obračuna (calculation opening) it can be access to calculations basic data and conditions of calculations research and there need to fill in fields with data about institution name, ID or RKP number, a period of calculation, name of the calculation, expected day of payment, etc. Steps of calculation process choosing of proper calculation, preparing of parameters, then working hours record, salary calculation, and verification, after that JOPPD form needs to be sent and checked in e-Porezna on-line application, and at the end of process sum up the order must be formed. When calculation status is completed, i.e. completed order generation means (all orders are made, including Message Pain001) changes are impossible. Central Payroll System is simple to use but there are few disadvantages, it is slow under the system load and there are some unnecessary steps.

4. RESEARCH METHODOLOGY AND RESULTS

4.1. RESEARCH METHODOLOGY

For the purpose of the research, authors used data collected from poll made by the Ministry of Administration of the Republic of Croatia and Financial Agency. All Public Sector users of Central Payroll System were conducted to survey about the use of income calculations outside the System. Survey took its part during January and February 2017. The main objective of the survey was collecting data for the further development of the Central Payroll System in the sense of additional functions. Authors focused their research results on Brod – Posavina County and institutions which are covered by it. There was a total of 60 Central Payroll System users in Brod – Posavina County and analysis showed how 58 of questioned institutions were using additional programs for income calculations outside the CPS Information System. Results of the survey were processed with statistical methods.

The survey was formed as a questionnaire and it contained 24 questions. Questionnaires were filled by persons who were responsible for financial management or salary calculation of the institution. All questions and data asked were mandatory to fill in.

4.2. RESULTS OF RESEARCH

The results of the research showed that the costs of all systems of income calculations which were used before implementation of the Central Payroll System for all 60 respondents in Brod – Posavina County totaled 817.695,82 HRK per month. One-fifth of the respondents answered that before implementation hasn't had any extra costs for income calculation and average monthly expenditures of other 48 respondents were 17.035,33 HRK. Total system costs per month (November 2016 invoice) at the moment of the survey were 831.906,87 HRK or 13.861,11 HRK on average. Furthermore, 25% of institution did not have any expenditures, they were 0,00 HRK.

Yearly (2016) expenditures of 75% (45) institutions were 9.723.296,36 HRK which is on average 216.073,25 HRK.

Figure 4. Income calculation made outside of CPS

Source: Authors elaborations of data based on a survey of Ministry of Administration, January to February 2017

According to the pie chart above (Figure 4), most of the institutions, 75%, made income calculations in some additional program systems outside the CPS, no calculations outside of system 23,3% and 1,7% calculations outside the CPS, but without any expenditures. It can be assumed that the percentage of calculations made outside of the CPS will be reduced during the future years.

Most of the respondents, 96% answered positively when asked whether they use another system for income calculations and a number of monthly calcula-

tions is made for 536 persons and reason for that are connections with other systems and use of their own program for calculation. 15% of institutions which make income calculations outside of the System, but financial resources are secured from State Budget bring that reasons are unemployment benefits for disabled people, reimbursements for mentors, reimbursement for services contract of persons who are not employed in the institution.

All respondents, 100% of them answered that there were no reimbursements to employees assigned abroad which means there are no expenditures. According to the question about salaries on other base or coefficients for calculation (workplace regulations, determinations and similar) 36,37% of public sector institutions in Brod - Posavina County had that kind of calculations in the amount of 270.000,00 HRK.

For the purpose of payment other income calculation, 65% of respondent answered positively. There were 84 calculations for 366 persons with total spending of 121.423,82 HRK per institution (total 4.735.528,82 HRK). Other 35% of institutions had zero expenditure for that purpose.

There were no expenditures for non-residents.

Transport costs paid for October 2016 in 35 institutions for 2608 persons were in total 643.816,17 HRK. Expenditures for contribution for persons included in the program of professional training without employment were 86.177,51 HRK in 32 (53%) institutions.

The needs of the institution, covered by the survey, for other types of calculations were travel order, project help, an extended stay of pupils in the school, reimbursements for working on projects, mentoring, part-time studies teaching, etc.

Key points apropos activities that need to be carried out to completely abandon other calculation programs and to only use Central Payroll System, according to research, are as followed: salaries (1), salaries based on regular base or coefficients for calculation (provided from State Budget)(2), salaries based on other base or coefficients for calculation (other resources)(3), salaries for employees assigned abroad (4), salaries based on other base or coefficients for calculation (5), other income (6), reimbursements for non-residents (7), transport costs (8), salaries for coordinators community service (9), contribution for persons included in program of professional training without employment (10)

and other payments (11). Results in percentage will be presented in Figure 5. Numbers marked on Figure 5 are linked to numbers of specified conditions in this paragraph. Figure marks: abscissa - requirements, ordinate - percentages of institution's needs, light gray parts mean yes and dark gray no.

Figure 5. Requirements for abandoning other programs for income calculations

Source: Authors elaborations of data collected from Ministry of Administration, RegZap-CPS for Brod – Posavina County

Presented results in Figure 5 shows that the lowest percentage (1,67%) of institutions which could abandon other programs because of requirements 4 and 7 that result is expected because none of the correspondents had that kind of payments. The strongest two requirements for abandoning other programs are 6 (65%) and 10 (70%). The conclusion is, in general, that institutions in Brod – Posavina County are not ready to completely abandon other additional programs for calculations.

According to the answer on the question about ease of using COP 65% institutions rate it with 5 (the system fully meets their needs), and 35 % rate it with 4 (the system is very good and needs small updates). Central Payroll System, in Brod – Posavina County has been highly rated well.

User support was also rated well, 95% (55) of institutions covered by survey rated COP with 5 – fully accomplished their needs.

It can be assumed that the research carried out on the territory of Brod – Posavina County is sufficient. Register of Employees in the Public Sector is data set about employees in the public sector and its purpose is to compare the quality and efficiency of Central Payroll System and human resource management.

The most productive part of the research is one that refers to requirements and implementation needed conditions for abandoning other program solutions.

5. CONCLUSION

Human resource management is one of the most important fields for reforms of public administration. In accordance to noticed Register of Employees in Public Sector (RegZap) has been established and the Government has an instrument for monitoring all data about civil servants and employees, and civil servants and employees in public services at one place in one moment. The RegZap / COP system is one of the largest state-owned services at the moment (from the daily records of each of about 250000 employees in approximately 2100 institutions receiving salaries from the State Budget in total budget of around 31 billion HRK per year) - monthly amount of costs (development, processing and data protection in the System) is 5,5 HRK per employee (16,5 million HRK annual cost of the System). The purpose and aim of establishing a Register of Public Sector Employees were to ensure monitoring and data exchange, thus creating the preconditions for effective and efficient human resources management in state and public services, also to provide basic prerequisites and elements for centralized payroll - COP. Centralized payroll allows financial management and payroll structure, both at the level of the whole system and at the level of individual groups and at the employee, to be more effective control of State Budget spending. The system has its advantages and disadvantages as challenges to be faced and to deal with in the way of further system development to ensure the needs of the public sector as a whole. Further development and investment are present and justified through the conducted Questionnaire about use of the payroll system outsourced of Central Payroll System (COP) in terms of additional functionalities under the comprehensive system of income calculation by the Ministry of Administration and Finance Agency during January and February 2017. The most productive part of the questionnaire in the survey is one that concerns the determination of data for

the implementation of the necessary conditions to abandon other software solutions, so that the COP is a system that can fully respond to the requirements and specifics of the activity and further automation of the process in the respective ministries at the level of the bodies themselves involved in the income calculation system, or without the use of other software solutions that require additional costs.

Other software solutions, that are used out of COP in the amount of 75% during 2016, require additional costs, as the survey results show, the annual costs for 2016 (including December 2016 and other work on the income calculations) amount to a significant 9.723.296,36 HRK. Through the conducted research authors come to the conclusion of justification of the goal set in the paper that the Register of employees in the Public Sector is a set of data about public sector employees that are led to establishing a quality and efficient system of centralized payroll (COP) and Human Resources Management (HRM).

The system ultimately provides a centralized payroll that includes high-quality and accurate billing control, different forms of reporting on key policy planning and monitoring elements, and simulation of payroll and Centralized Human Resource Management. The Government of the Republic of Croatia as the client obtains a complete and unique system in which it can monitor expenditures for public sector employees, which are secured from the state budget. In addition to managing expenditures, the Government has insight into the complete staff record of public sector employees. RegZap and COP will be further upgraded in the direction of adding a quality application solution for reporting and managing human resources, as well as upgrading for calculation, reporting, and managing the salary system.

Because of research made by Ministry of Administration of the Republic of Croatia and Financial Agency about use of income calculations outside the Central Payroll System is the first one and only, and the System is relatively new and has some imperfection there is potential for further researches about its development and cost management control.

Abstract

Impulsive buying is a complex purchasing behavior which includes quick decision-making and tendency for immediate acquisition of the product. This study aimed to investigate relations between impulsive buying and HEXACO personality traits.

These traits show different relationship patterns with other constructs, and these relations may differ in men and women. Data were collected from the sample on 260 undergraduate students (54% women) from various colleges and faculties located in Zagreb using the Buying Impulsiveness Scale (Rock & Fisher, 1995) and the HEXACO Personality Inventory (HEXACO-60; Ashton & Lee, 2009; Babarović & Šverko, 2013). This research showed that personality plays an important role in explaining impulsive buying. The results of regression analyses indicated that low Conscientiousness is the best predictor of impulsive buying in both men and women. The negative relationship between impulsive buying and Honesty-Humility was found only in women. Only in men, Agreeableness predicted low impulsive buying.

In addition, gender has a moderating role in the relationship between traits of Honesty-Humility and Agreeableness and impulsive buying, indicating that these personality traits protect men from impulsive buying more than women.

Keywords: *Impulsive buying, HEXACO, personality, sex differences.*

JEL Classification: D18, D91

1. INTRODUCTION

1.1. IMPULSIVITY AND IMPULSIVE BUYING

Impulsivity (also called impulsiveness) is a relatively stable personality trait which comprises different cognitive, behavioral and emotional features including low inhibitory control, sensation seeking, risk-taking, novelty, irresponsibility, impatience, unreliability, and a lack of planning (e.g., Depue & Collins, 1999; Moeller et al., 2001; Stanford et al., 2009). Impulsivity is a multidimensional construct. According to Eysenck and Eysenck (1977), impulsivity consists of four dimensions: narrow impulsivity, risk-taking, non-planning, and liveness. Some of the most dominant models of impulsivity are the BIS model (Patton, Stanford, & Barratt, 1995) and the UPPS-P model (Cyders et al., 2007; Whiteside & Lynam, 2001). According to the BIS model, three second-order factors reflecting the different dimensions of impulsivity: attentional, motor, and nonplanning impulsivity (Patton et al., 1995). Attentional impulsivity refers to an inability to focus attention, motor impulsivity involves acting without thinking, and non-planning impulsivity reflects a lack of future orientation or forethought. The UPPS-P model includes five dimensions of impulsivity: negative urgency (tendency to act rashly under extreme negative emotions), lack of premeditation (tendency to act without thinking), lack of perseverance (inability to remain focused on a task), sensation seeking (tendency to seek out novel and thrilling experiences) and positive urgency (tendency to act rashly under extreme positive emotions).

The term impulsive buying has a long history, and it was connected to immaturity, primitivism, stupidity, “defects of the will,” lower intelligence, and social deviance lifestyle (e.g., Bohm-Bawerk, 1959; Freud, 1911; Mill, 1848/1909). Rook (1987, p. 191) was defined impulse buying as “Impulse buying occurs when a consumer experiences a sudden, often powerful and persistent urge to buy something immediately”. A definition of this kind of consumer behavior

includes lack of premeditation, non-planning, irresistible urge to buy and immediate gratification. Rook (1987) quoted that impulse buying especially has been linked to postpurchase financial problems, product disappointment, guilt feelings, and social disapproval. Results of DDB Needham Annual Lifestyle (1974-1993) showed that 38 percent of the adults think of themselves as “impulse buyers.” Research on mall shoppers (Nicholls, Li, Roslow, Kranendonk, & Mandakovic, 2001) showed that nearly half of US shoppers made unplanned purchases and that 80% sales in luxury goods are associated with impulsive purchase (Ruvio & Belk, 2013). In this time of e-commerce impulsive buying represents a significant amount of total purchases (Chen & Lee, 2015).

Previous studies have shown that impulsive buying is associated with high maladaptive narcissism (Cai, Shi, Fang, & Luo, 2015), high hedonism (Kacen & Lee, 2002), and high materialism and individualism (Zhang & Shrum, 2009). Moreover, the results of the recent study (Saad & Metawie, 2015) indicated that two personality factors (impulsivity and excitement), two shop environment factors (music and layout), as well as shop enjoyment, were related to impulse buying tendencies.

Two twin studies have demonstrated that the tendency for impulsive buying is heritable. Findings in a twin sample from China (Cai et al., 2015) have shown that genetic factors accounting for 34% of the variations for impulsive buying measured by the Impulsive Buying Scale (Rook and Fisher, 1995). Additionally, this study found that the associations between impulsive buying and overall and maladaptive narcissism (which is related to high neuroticism, anxiety, depression, Machiavellianism, impulsive antisociality, and low empathy and conscientiousness) were heritable. The results of the twin study conducted by Bratko and colleagues (2013) showed that both impulsive buying and its associations with impulsivity, neuroticism, and extraversion are heritable.

1.2. PERSONALITY AND IMPULSIVE BUYING

Impulsive buying is related to fundamental individual differences, including gender, age, values, attitudes, self-control, and personality. Previous studies have shown that impulsive buying has a strong basis in personality. However, the findings on the relationship between impulse buying and the Big Five model of personality are inconsistent. For example, Bratko et al. (2013) find significant positive associations between impulsive buying and extraversion and neuroti-

cism, while a study conducted by Verplanken and Herabadi (2001) has shown a positive relationship between impulsive buying and Extraversion, and negative between impulsive buying and Conscientiousness. The study (Thompson, & Prendergast, 2015) indicates that impulse buying is negatively associated with Conscientiousness, but positively with Neuroticism and Extraversion.

However, to our best knowledge, there is no study investigating impulsive buying within the framework of the HEXACO model of personality (Lee & Ashton, 2004). The HEXACO model posits six personality dimensions: Honesty-Humility, Emotionality, Extraversion, Agreeableness, Conscientiousness, and Openness to Experience. There are some similarities and differences between the Big Five and HEXACO models of personality. Agreeableness and Emotionality in the HEXACO model represent rotated variants of Big Five Agreeableness and Emotional Stability, while Extraversion, Conscientiousness, and Openness to Experience are the similarity in both models (De Vries, Lee, & Ashton, 2008; De Vries & Van Kampen, 2010).

One of the essential characteristics of the HEXACO model is Honesty-Humility dimension which represents a key novelty compared to the Big Five model. Namely, Honesty-Humility represents individual differences in tendencies to be sincere, honest, fair and modest versus greedy, manipulative, pretentious and unassuming (Lee & Ashton 2008). It is especially valuable to investigate impulsive buying in relation to the HEXACO model of personality because Honesty-Humility is negatively related to hedonism (Anglim, Knowles, Dunlop, & Marty, 2017) and narcissism (Lee & Ashton, 2005; Wertag & Bratko, 2019), given that high hedonism and narcissism are the key features of impulsive buying (e.g., Cai et al., 2015; Kacen & Lee, 2002; Khuong & Tran, 2015).

1.3. AIMS AND HYPOTHESES

This study aimed to investigate relations between the HEXACO model of personality and impulsive buying, as well as gender differences within these relationships.

Hypothesis 1: Based on the theoretical description that Honesty-Humility entails modesty and greed-avoidance, and based on previous findings showing hedonism and narcissism to be positively related to impulsive buying (e.g., Cai et al., 2015; Kacen & Lee, 2002; Khuong & Tran, 2015) and negatively re-

lated to Honesty-Humility (Anglim, Knowles, Dunlop, & Marty, 2017; Lee & Ashton, 2005), we predict that impulsive buying would be negatively related to Honesty-Humility.

Hypothesis 2. Consistent with the notion that Emotionality entails anxiety (Lee & Ashton, 2004) and based on empirical evidence showing that anxiety or the emotional distress leads people to make an impulse purchase (Shahjehan, Jaweria, Qureshi, Zeb, & Saifullah, 2012; Silvera, Lavack, & Kropp, 2008) we predicted that impulsive buying would be associated with high Emotionality.

Hypothesis 3. Consistent with the notion that Extraversion includes excitable and dramatic interpersonal style, social boldness, tendency to enjoy conversation, social interaction, and parties (Lee & Ashton, 2004), such as a tendency to enjoy to explore new things in life (Judge, Simon, & Hurst, 2014; Leong, Jaafar, & Sulaiman, 2017) and in line with previous empirical work showing that impulsive buying is positively associated with Extraversion (e.g. Farid & Ali, 2018; Thompson & Prendergast, 2015; Verplanken & Herabadi 2001), we expect that impulsive buying would be positively related to Extraversion.

Hypothesis 4. Based on the theoretical description that impulsive buying includes persistent urge to buy something immediately and an automatic action activated by psychological impulses (Lins, 2012) and based on previous findings showing that Agreeableness is associated with self-control (De Vries & Van Gelder, 2013), we expected that impulsive buying would be related to low Agreeableness.

Hypothesis 5: Based on evidence that low self-control is key feature of impulsive buying (Baumeister, 2002) and consistent with the notion that self-control and cautiousness appear to be essential characteristics of Conscientiousness (De Vries & Van Gelder, 2013), as well as on the basis prior empirical findings (e.g. Bratko et al., 2013; Thompson, & Prendergast, 2015), we expect that impulsive buying would be related to low Conscientiousness.

Hypothesis 6. Based on previous findings showing that Big Five Openness is not related to impulsive buying (e.g. Bratko et al., 2013; Thompson, & Prendergast, 2015) we expect similar results in this study.

Hypothesis 7. Finally, although there is not a sufficient basis in the literature to state an a priori hypothesis, we expect that gender moderates the relationship between impulsive buying and HEXACO personality traits because of the dif-

ferences in the manifestation of impulsive buying and HEXACO personality traits across genders (e.g., Ashton & Lee, 2009; De Vries, De Vries, De Hoogh, & Feij, 2009; Dittmar, Beattie, & Friese 1996; Dittmar, Beattie, & Friese, 1995; Lee & Ashton, 2004).

2. METHOD

2.1. PARTICIPANTS AND PROCEDURE

The sample consisted of 260 Croatian college students (54% woman), $M_{age} = 22.31$, $SD = 5.98$. The study protocol was approved by the ethics committee of the Faculty of Arts and Humanities at the University of Zagreb. All students provided informed consent after the nature of the study had been explained to them. The students participated on a voluntary basis during regularly-scheduled classes. The questionnaires were administered before a class started with the permission of the course lecturers. The research was anonymous and voluntary, and students received no reward.

2.2. MEASURES

2.2.1. HEXACO-60 (Ashton & Lee, 2009, for Croatia version, see Babarović & Šverko, 2013)

Personality was measured with a short version of HEXACO-PI-R (Lee & Ashton, 2004). The HEXACO-60 contains six broad factor-level scales: Honesty-Humility, Emotionality, Extraversion, Agreeableness, Conscientiousness, and Openness to Experience. Each item uses a five-point response scale (1 = *strongly disagree* to 5 = *strongly agree*).

2.2.2. Impulsive Buying Scale (Rook & Fisher, 1995)

Impulsive buying was measured with the Impulsive Buying Scale. The scale includes nine items, such as the statements, “I often buy things without thinking”,

“Sometimes I am a bit reckless about what I buy”. Items are presented in 7-point Likert-type format (from 1 = *completely disagree* to 7 = *completely agree*).

The scale was translated into Croatian and back-translated.

3. RESULTS

3.1. DESCRIPTIVE STATISTICS AND CORRELATION ANALYSES

We first examined gender differences for personality traits and impulsive buying variables. These results are reported in Table 1. Women had significantly higher scores on Honesty-Humility, Emotionality and impulsive buying, with effect size estimates ranging from small to large. There were no gender differences on Extraversion, Agreeableness, Conscientiousness, and Openness to Experience. As shown in Table 1, all scales demonstrate adequate reliability.

Table 1. Descriptive statistics (means and standard deviations) and internal consistency values. Men (n = 120), Women (n = 160).

	Men	Woman	t	d	α
Honesty-Humility	30.90(7.23)	33.84(5.94)	-2.96*	0.44	.78
Emotionality	27.46(5.28)	34.12(4.95)	-8.63**	1.30	.74
Extraversion	35.12(4.91)	34.22(5.96)	1.09	0.16	.74
Agreeableness	30.84(5.80)	29.71(5.37)	1.35	0.20	.70
Conscientiousness	34.73(5.56)	35.31(5.59)	-.69	0.10	.73
Openness to Experience	32.89(6.48)	33.92(6.54)	-1.05	0.16	.78
Impulsive buying	22.87(7.84)	27.41 (8.02)	-3.75**	0.57	.92

Note: d = Cohen's d index. According to Cohen's (1988) interpretation of effect size, effect sizes around 0.2 are considered small, 0.5 medium, and 0.8 large. α = Cronbach's α .
** $p < .01$. * $p < .05$.

Bivariate correlations among measured variables for men and women are presented in Table 2. Both men and women's Honesty-Humility scores were significantly positively related to Agreeableness and Conscientiousness, while both men and women's Extraversion scores were positively related to Conscientiousness.

Emotionality scores were significantly negatively related to Agreeableness for men but not women, while Extraversion scores were positively related to Agreeableness and Openness to Experience only in women.

For impulsive buying, both men and women's scores were significantly negatively related to Conscientiousness, as expected. The positive relationship between Honesty-Humility and impulsive buying was found only in women but not in men. Openness to Experience showed an unexpected negative association with impulsive buying in men. Contrary to the hypothesis, in both men

and women, Emotionality, Extraversion, and Agreeableness were not found to be significantly associated with impulsive buying.

Table 2. Zero-order correlations among study variables in Men (n = 120) and Women (n = 160).

	1	2	3	4	5	6	7
1. Honesty-Humility	-	-.05	-.09	.27*	.23*	.21	-.10
2. Emotionality	.03	-	-.07	-.24*	.06	-.05	.00
3. Extraversion	.08	.13	-	.08	.38	-.04	-.06
4. Agreeableness	.41	.00	.22*	-	-.04	.09	-.18
5. Conscientiousness	.21*	-.05	.31	-.03	-	.16	-.50
6. Openness to Experience	.11	-.07	.24*	.31	.08	-	-.25*
7. Impulsive buying	-.30	.02	-.10	.00	-.44	.03	-

Note: Data for men are presented above the diagonal and below the diagonal for women. Bolded values of r are significant at $p < .01$. * $p < .05$.

3.2. PREDICTION OF IMPULSIVE BUYING FROM THE HEXACO PERSONALITY DOMAINS

In order to determine the unique contributions of the six HEXACO personality domains to impulsive buying, as well as to explore possible gender differences, we used hierarchical regression analyses. A significant increase in R^2 on the third step would indicate gender differences in the relation between the impulsive buying as the criterion and HEXACO scores as predictors.

The HEXACO domains significantly predicted impulsive buying (Adjusted [Adj.] $R^2 = .26$, $p < .01$), and gender was a significant predictor ($\beta = .30$, $p < .01$).

The results have shown that there was a significant increase in R^2 in the third step of analysis for impulsive buying ($\Delta R^2 = .05$, $p < .01$) with a significant interaction between gender and Honesty-Humility ($\beta = -.66$, $p < .01$) as well as gender and Agreeableness ($\beta = .51$, $p < .05$), suggesting that the association between these personality traits and impulsive buying differed across gender.

Graphical representation the interaction between gender and Honesty-Humility (Figure 1) show that men low in Honesty-Humility traits have the lowest levels of impulsive buying tendencies, compared to men high in Honesty-Humility and women both high and low in these traits.

Figure 1 The interaction between Honesty-Humility and gender in the prediction impulsive buying

The interaction between gender and Agreeableness (Figure 2) shows that men high in Agreeableness traits have the lowest levels of impulsive buying tendencies, compared to men low in Agreeableness and women both high and low in these traits. Moreover, high Agreeableness reduces the tendency to impulsive buying, especially in males. These results are in line with Hypothesis 7. Therefore, subsequent regression analyses were performed for men and women separately.

Figure 2 The interaction between Agreeableness and gender in the prediction impulsive buying

Gender effects in the HEXACO prediction of impulsive buying were then followed up by conducting multiple linear regression on impulsive buying

scores for men and women separately, with scores on the age and six HEXACO domains as predictors (see Table 3 and Table 4). Only in women, Honesty-Humility uniquely predicted impulsive buying ($\beta = -.27, p < .05$), thus partially confirming Hypothesis 1. Contrary to Hypothesis 2 and Hypothesis 3, in both men and women, Emotionality and Extraversion were not found to be significantly associated with impulsive buying. Agreeableness negatively predicted impulsive buying only in men ($\beta = -.24, p < .05$) but not in women ($\beta = .10, p = .41$), thus partially confirming Hypothesis 4. In line with Hypothesis 5, Conscientiousness uniquely predicted impulsive buying in men ($\beta = -.61, p < .01$) and women ($\beta = -.34, p < .01$) which is consistent with the bivariate correlations reported in Table 2. The negative relationship between impulsive buying and Openness to Experience in men (see Table 2) dropped to nonsignificance after controlling for other HEXACO dimensions ($\beta = -.15, p = .14$). This result is in line with Hypothesis 6.

Table 3. Multiple regressions predicting impulsive buying from the HEXACO dimensions in Men (n = 120).

Criterion	Predictors	β	t	R^2	$Adj. R^2$	F
Impulsive buying						
	Age	-.03	-.26	.37	.30	5.64
	Honesty-Humility	.15	1.37			
	Emotionality	.00	.00			
	Extraversion	.20	1.79			
	Agreeableness	-.24	-2.28*			
	Conscientiousness	-.61	-5.41			
	Openness to Experience	-.15	-1.5			

Note: Bolded values are significant at $p < .01$. * $p < .05$.

Table 4. Multiple regressions predicting impulsive buying from the HEXACO dimensions in Women (n = 160).

Criterion	Predictors	β	t	R^2	$Adj. R^2$	F
Impulsive buying				.24	.18	3.76
	Age	-.05	-.44			
	Honesty-Humility	-.27	-2.46*			
	Emotionality	.02	.24			
	Extraversion	-.03	-.31			
	Agreeableness	.10	.83			
	Conscientiousness	-.34	-3.00			
	Openness to Experience	.24	.23			

Note: Bolded values are significant at $p < .01$. * $p < .05$.

4. DISCUSSION

In the current study, we examined relations between HEXACO personality traits and impulsive buying, as well as gender differences within these relationships.

Our study has shown the importance of personality in explaining impulsive buying; the HEXACO domains, after controlling for demographical variables, explained 20% of impulsive buying variance. For comparison, the Big Five model, after controlling gender, age and state effect, explained about 8% of impulsive buying variance (Thompson & Prendergast, 2015).

The results showed that women had significantly higher scores on impulsive buying and Honesty-Humility and Emotionality traits, but there were no gender differences on Conscientiousness, which is in line with previous findings (e.g., Dinić & Wertag, 2018; Dittmar, et al., 1995; Lee & Ashton, 2004).

The results of regressions analysis indicated that Honesty-Humility negatively predicted impulsive buying in women but not in men, which partially confirmed our first hypothesis. Additionally, gender moderate relationships between Honesty-Humility and impulsive buying; men low in Honesty-Humility trait had the lowest values on impulsive buying. A possible explanation of these results is that impulsive buying manifests differently in men and women under influence situational and dispositional factors such as socialization, affects, value orientations (Amos, Holmes, & Keneson, 2014). For example, men exhibit higher hedonistic and lower self-realization values than women (Ljubin Golub & Sokić, 2016), and impulsive buying is positively related to hedonism (Kacen & Lee, 2002).

Unexpectedly, Emotionality did not show a relation with impulsive buying. This HEXACO domain includes facets of fearfulness, anxiety, dependence, and sentimentality, and unlike Big Five Neuroticism, does not contain impulsivity and irritability. It seems that facet of Anxiety contained in the HEXACO Emotionality domain does not lead to impulsive buying. However, it should be kept in mind that Impulsive Buying Scale (Rook & Fisher, 1995) consist of items referring to cognitive aspects of impulsive buying. Therefore, future research should be examined the relationship between HEXACO Emotionality domain and impulsive buying using measures which can detect affective aspects of impulsive buying tendencies, such as The Verplanken and Herabadi (2001) scale.

Contrary to our hypothesis and previous studies (Farid & Ali, 2018; Thompson & Prendergast, 2015; Verplanken & Herabadi 2001) results of this study showed that Extraversion is not related to impulsive buying. A possible explanation of these results is that HEXACO Extraversion, unlike Big Five Extraversion, does not include excitement-seeking. Namely, impulsive buying is positively related to thrill-seeking (Sharma, Sivakumaran, & Marshall, 2010) and it may be that this aspect of Extraversion is most strongly associated with impulsive buying.

Agreeableness domain showed a negative relationship with impulsive buying in men but not in women. This result is in line with previous findings showing that Agreeableness is positively associated with self-control (De Vries, & Van Gelder, 2013) which is one of the fundamental features of impulsive buying.

In addition, it has been shown that gender moderate relationships between Agreeableness and impulsive buying; men high in Agreeableness had the lowest values on impulsive buying. This results showed a protective effect of Agreeableness in regards to impulsive buying. Moreover, our results are consistent with a recent study (Međedović, Wertag, & Sokić, 2018) showing that Lifestyle traits of psychopathy which includes impulsivity and stimulation seeking, are more adaptive in men, compared to women,

As expected, Conscientiousness showed a strong negative association with impulsive buying in both men and women. This result is consistent with the results from previous studies (Bratko et al., 2013; Thompson & Prendergast, 2015) and evidence that low self-control is a key feature of impulsive buying (Baumeister, 2002). Self-control and cautiousness are essential characteristics of Conscientiousness (De Vries & Van Gelder, 2013). Namely, Conscientiousness encompasses facet of prudence that shows a propensity to be cautious and self-controlled (Lee & Ashton, 2004).

Finally, according to hypothesis and previous studies (e.g. Bratko et al., 2013; Thompson & Prendergast, 2015) results of this study shown that Openness to Experience is not related to impulsive buying.

5. LIMITATIONS AND CONCLUDING REMARKS

Findings of this study must be considered in light of some limitations. First, we used a fairly homogeneous college sample which limits external validity.

Therefore, future studies should also use general population samples. Second, the use of self-report measures is also a limitation given the impact of shared method variance. Using behavior measures of impulsive buying would be an advance over the current design. Namely, a tendency to buy on impulse, may not necessarily result in real behavior (Rook & Fisher, 1995). Besides, future research should be investigated mechanisms that link personality and impulsive buying and examined the role of meditation and moderator variables such as income, age, the standard of living, level of education, cultural effects and intrinsic and extrinsic factors to cause impulse buying.

Despite the limitations, the findings of the present study expand our understanding of the role of personality in impulsive buying. This is the first study on the relationship between impulsive buying and the HEXACO model of personality. Our findings are shown that the HEXACO Honesty-Humility and Agreeableness predict impulse buying, as well as that gender moderates relationship between these personality domains and impulsive buying. It seems that these personality traits are more protective in men as compared to women.

Finally, our results showed that the HEXACO model of personality outperformed Five-Factor model in explanation variance of impulsive buying, and therefore this model should be used in future research of relationships between personality traits and impulsive buying.

Abstract

The concept of perceived benefits and perceived costs of using social media in organizing vacation was proposed as the theoretical model in order to explain the factors determining the intentions to use social media when organizing and taking vacation trips. This model was then tested on a sample of residents who use the Internet and had traveled on vacation in the previous 12 months. By applying the concept of tourists visiting a destination, the purpose of this paper is to examine its suitability in relation to tourist destination visitors. Data were collected through a self-administered questionnaire on a sample of tourists staying in hotels in nine tourist towns in Istria County, Croatia. This study was conducted from July through September 2015. A total of 1554 responders were taken into analysis. For measuring the perceived benefits and costs a five-point Likert scale was used. Responders were asked to state the level of agreement for items measuring the perceived benefits and perceived costs of using social media in organizing vacation. Exploratory and confirmatory fac-

tor analyses were used to examine the reliability and validity of the constructs. The dataset was split randomly into the half, so that the first half of the sample was used for conducting exploratory factor analysis, while the second half was used for confirmatory purposes. Through exploratory factor analysis, two dimensions of perceived benefits were determined, while perceived costs formed one dimension. Through confirmatory factor analysis, a certain modification regarding items was made but the previous structure was retained. The main changes were made in factor measuring perceived costs. The original structure of perceived benefits and perceived costs was not confirmed. The results suggest that the proposed concept cannot be fully applied to tourist destination visitors.

Keywords: social media, perceived benefits, perceived costs, tourist destination visitors

JEL Classification: L83, Z33

1. INTRODUCTION

The Internet has revolutionized all aspects of our lives (namely social, commercial, business and political life, educational and health sector, travel sector) and has changed the way people search for information (Alalwan et al., 2017; Amaro et al., 2016). It provides different benefits like permanent availability of information under reasonable conditions, the global character of the data and it helps in assessments of various products and offers (Popescu, 2014).

Purchase of tourist products can be risky so potential consumers, i.e. tourists, require more information processing before making a decision (Amaro et al., 2016). There are several difficulties that tourists face when they organize vacation (Amaro et al., 2016; Kim et al., 2009; Werthner & Klein, 1999): only descriptions are available, consumers cannot try travel products/services before purchasing, making it difficult to evaluate the value for money before the actual experience. Due to these reasons, social media can be a great media to minimize these difficulties. It provides a way to search, organize, share and annotate their travel stories and experiences resulting in facilitation of word of mouth that the hospitality and tourism industry heavily relies upon (Huang et al., 2010; Leung et al., 2017). Consequently, in the last decade, user-generated content has grown parallel to the rise of information and communication technologies (ICT) and social media (Marine-Roig, 2017).

Thus, social media provides different benefits for tourists searching for information relevant to the organization of their vacation. However, there may also be certain obstacles to the usage of social media for travel purposes. This paper focuses on the perception of benefits and costs of using social media in the process of organizing vacation. By applying the concept of perceived benefits and perceived costs proposed by Parra-López et al. (2011), on tourists visiting a destination, this paper examines its suitability in the context of using social media in organizing a vacation in relation to tourist destination visitors.

2. THEORETICAL BACKGROUND

Social media in tourism and hospitality fields has been researched from different aspects. Leung et al. (2013) and Zeng & Gerritsen (2014) summarized the research, while Ukpabi & Karjaluoto (2017) identified research related to customers' using social media in the travel purpose context. Thus, according to Ukpabi & Karjaluoto (2017), research related to customers' using social media in travel purpose context focused on four areas: 1. factors influencing consumers' travel purchases online (Al-havari & Mouakket, 2012; Escobar-Rodriguez et al., 2014; Kim et al., 2013; Lee & Cranage, 2011; Nunko & Ramkisson, 2013; Sahli & Legohérel, 2015), 2. website and booking intentions (Ku & Chen, 2015; Wu et al., 2011), 3. the role of social media in booking travel online (Ayeh et al., 2013; Book et al., 2015; Parra-López et al., 2011) and 4. the role of mobile technology on travel planning and use (Chang et al., 2016; Kim et al., 2015; Lai, 2015; Okazaki & Hirose, 2009).

Although social media is currently very interesting research field, especially since 2008 (Kim et al., 2017), there is no universally adopted definition of social media (Sotiriadis, 2017). Ihsanuddin & Anuar (2016) point out that all definitions are more or less similar highlighting social media as a form of communication where users can create, edit and share content with other online communities. The definition of social media changes as social media continues to evolve and its uses change and expand (Zeng & Gerritsen, 2014). So, a number of different terms like social software, social media, user-generated content (UGC), consumer-generated media (CGM), online social networks (OSN), social networking sites (SNS), Web 2.0 and Travel 2.0 (Alizadeh & Mat Isa, 2015; Lange-Faria & Elliot, 2012; Popesku, 2014) are used interchangeably in

literature. Although the terms are very connected, there are certain differences among them. Thus, in this paper, we use the term social media.

Travelers use social media to search, organize, share and annotate their travel stories and experiences (Leung et al., 2013), so social media is used before, during and after travel. Before travel, it is used for decision-making purposes, e.g. which destination, airline company or hotel to choose (Cox et al., 2009; Marine-Roig, 2017; Öz, 2015; Pabel & Prideaux, 2016; Xiang et al. 2015). During travel, it is used to get more information related to tourist destination and to share experiences, while after travel it is solely used to share experiences (Fotis et al., 2012; Zavodna & Zavodny Pospisil, 2018).

There are many different contents that are available to tourist like blogs and microblogs (e.g. Blogger and Twitter), online communities (e.g. Facebook, RenRen and TripAdvisor), media sharing sites (e.g. Flickr and YouTube), social bookmarking sites (e.g. Delicious), and social knowledge sharing sites (e.g. Wikitravel) (Leung et al., 2013). These Internet sites, commonly referred to as social media offer different tourists' experiences (good or bad) that are spread through countless sites. Thus, research on perceived benefits and perceived costs of using social media for travel purposes is becoming highly researched research area (Agag & El-Masry, 2016; Amaro & Duarte, 2015; Amaro et al., 2016; Andelić & Grmuša, 2017; Ayeh et al., 2013; Bilgihan et al., 2016; Cox et al., 2009; Davies & Cairncross, 2013; Di Pietro & Pantano, 2013; Di Pietro et al., 2012; Dina & Sabou, 2012; Fabricius & Eriksson, 2017; Fotis et al., 2012; Ghandour & Bakalova, 2014; Hua et al., 2017; Matikiti et al., 2017; Munar & Steen Jacobsen, 2013; Nemeč Rudež & Vodeb, 2015; Pabel & Prideaux, 2016; Parra-López et al., 2011; Tom Dieck et al., 2017; Varkaris & Neuhofer, 2017).

Research on perceived benefits and perceived costs of using social media for travel purposes intensified since the beginning of 2010 following the interest of researching the social media field. However, they are mostly focused on social media users who travel and who use this media for getting travel-related information (Agag & El-Masry, 2016; Amaro & Duarte, 2015; Ayeh et al., 2013; Bilgihan et al., 2016; Cox et al., 2009; Di Pietro et al., 2012; Dina & Sabou, 2012; Fotis et al., 2012; Hua et al., 2017; Parra-López et al., 2011; Varkaris & Neuhofer, 2017). Additionally, although the concept of perceived benefits and perceived costs is gaining importance in research terms, the definition of perceived benefits and perceived costs is not unanimous (Fabricius & Eriksson, 2017; Matikiti et

al., 2017; Parra-López et al., 2011). Fabricius & Eriksson (2017) use the terms enablers (e.g. finding good hints and tips, enjoyment, convenience) and barriers (e.g. privacy, trust etc.). Matikiti et al. (2017) examine perceived usefulness as the benefits derived from using social media for trip organization, thus they consider this concept through perceived functional benefits, perceived social benefits and perceived risk, namely time risk (e.g. the time wasted through searching and learning how to use social networks), social risk (e.g. the potential loss in one's set of friends as a result of using social media) and privacy risk (e.g. the potential loss of control of personal information). Parra-López et al. (2011) consider perceived benefits as functional, social, psychological and hedonic, while perceived costs relate to effort, the difficulty of use and loss of privacy. Hence, the perceived benefits of using social media include different user's perception of the benefits that social media provides, while the perceived costs benefits of using social media in organizing vacation encompass various user's perception of the sacrifices. Other research related to this concept examine different risks, e.g., giving data to third parties, spreading of fake news and trust issues (Pabel & Prideaux, 2016), possibility of abuse and reliability of information (Davies & Cairncross, 2013) and various benefits, e.g., up to date information (Amaro et al., 2016; Cox et al., 2009; Nemeč Rudež & Vodeb, 2015), enjoyment, pleasure, (Ayeh et al., 2013; Di Pietro et al., 2012), ease of use (Ayeh et al., 2013; Davies & Cairncross, 2013; Di Pietro & Pantano, 2013; Ghandour & Bakalova, 2014; Hua et al., 2017; Nemeč Rudež & Vodeb, 2015) similarity of interest (Agag & El-Masry, 2016; Ayeh et al., 2013), time saving (Agag & El-Masry, 2016).

3. METHODOLOGY

The main research study was conducted from July through September in 2015. The target population included tourists who were staying in hotels located in Istria County. For the purpose of sampling, a list of accommodation facilities in Istria County (Tourist board, 2015) was obtained. Hotels were mostly categorized as either three or four-star hotels (54 hotels in each category) so, hotel category was used in designing the sample. The hotels where the research was conducted were situated in Umag, Novigrad, Poreč, Vrsar, Rovinj, Pula, Medulin and Rabac. A minimum sample size of 60 responders per hotel was set. The survey was carried out in 20 hotels. Hotel guests were approached by the researchers and asked to participate in the survey. The researchers explained

the purpose of the survey, stated that the survey was anonymous, and handed out a questionnaire in the appropriate language. In the process of onsite data collection, the researchers were stationary while the responders were mobile (Veal, 2006). Data were collected through a self-administered questionnaire. The questionnaire consisted of 16 questions that were divided into six sections: 1) general usage of Internet, tourist web sites and social networking web sites, 2) usage of Internet and social networking web sites for the purpose of organizing vacation, 3) benefits and obstacle in using social networking web sites for tourism purposes, 4) usage of Internet and social networking web sites during vacation, 5) usual usage of Internet and social networking web sites after returning home and 6) respondents' socio-demographic characteristics (country of origin, age, gender, income level, occupation, size of settlement, traveling party) and trip characteristics (number of visits, length of stay and sources of information). It was originally designed in Croatian and then back-translated into English, German, Italian, and Slovene.

Data were processed using statistical methods consisting of descriptive statistics, exploratory factor analysis, and confirmatory factor analysis. Descriptive statistics were used to provide a general description of the sample, exploratory and confirmatory factor analyses were used to examine reliability and validity of the perceived benefits and perceived costs, as proposed by Parra-López et al. (2011), in order to determine its suitability in tourism settings. The individual items were examined through checks for accuracy of data entry, missing data, and distribution. The cases with the missing values were replaced using the MCMC method for item imputation. The dataset was split randomly into the half so that the first half of the sample was used for conducting exploratory factor analysis while the second half was used for performing confirmatory factor analysis. Exploratory factor analysis was done using maximum likelihood factor analysis and promax rotation with an eigenvalue of 1.00 or more being used to identify potential factors. Internal reliability was determined by computing Cronbach's alpha.

The concept of the perceived benefits and perceived costs of using social media in organizing vacation defines the perceived benefits functional (exchange information and experiences, easy access to a greater amount of relevant information, keep up to date with knowledge about tourist sites and activities of interest), social (communication, the construction of relationships, the exchange of ideas and opinions, involvement in the exchange of information), and psychological and hedonic (belonging to communities, pleasing and fun using of social

media), while perceived costs includes effort costs: time and monetary), difficulty of use (registration, many websites and pages) and loss of privacy (public exposure) (Parra-López et al., 2011). For measuring the perceived benefits and perceived costs of using social media in organizing vacation, a five-point Likert scale (1 = “strongly disagree” to 5 = “strongly agree”) was used. A total of 16 items were used for measuring perceived benefits and perceived costs (Parra-López et al., 2011). A total of 2000 questionnaires were prepared and distributed, while 1554 questionnaires were taken into the analysis (77.7% return rate).

4. RESULTS AND DISCUSSION

On average, 60 questionnaires were collected per hotel. Most of the responders stayed in four-star hotels (60%). The proportion of female responders (54%) was slightly higher than that of males (46%). The majority of responders were between 35 and 54 years of age (53%). Most of them had obtained a higher education (58%). Generally, the responders were full-time employees (45%), 13% were self-employed, and approximately 12% were managers. Most of them were from Austria (23%), almost 19% were from Italy, and about 17% originated from Germany. The most frequent monthly net income was between €1.000 and €2.000 (30%). Most of the responders (80%) visited the hotel for the first time, but most of them (52%) have already visited the region.

Table 1. Descriptive statistics for items measuring perceived benefits and perceived costs

Items	M	SD
<i>Perceived benefits</i>		
Keep up to date with knowledge about the tourist sites and activities of interest	3.58	1.243
Save costs and get the most from the resources invested in the trip	3.36	1.198
Possibility to provide and to receive information about tourist sites and activities of interest	3.81	1.164
Stay in contact with others who share the same interests regarding tourist trips	2.55	1.283
Provide a strong feeling of belonging to a group	2.01	1.145
Usage is pleasing and fun	2.76	1.247
Proud of sharing opinions and tourist experiences	2.44	1.257
The increase of personal relationships with people with similar motivations	2.18	1.191
<i>Perceived costs</i>		
Excessive and not worthwhile effort and time to find trip-related information	2.66	1.159
Too high monetary costs of the equipment and services required to collaborate on the Internet	2.43	1.112
Difficult to find the time needed to monitor the Internet sites that might be interesting	2.47	1.187

Very high risk of losing privacy	3.03	1.274
Not wanting for others to see posts	2.97	1.353
Not wanting transparency and public exposure related to Internet	2.82	1.277
Complicated or bothersome processes required by travel websites for contributors	2.77	1.298
Too many travel websites	2.70	1.248

Source: Data processed by authors

The scale measuring perceived benefits and perceived costs proposed by Parra-López et al. (2011) focused on people using the Internet in order to get information about tourist destinations but in this study, it has been used on tourists staying in hotels in a tourist destination. The perceived benefits item means (Table 1) varied from 2.01 (‘Provide a strong feeling of belonging to a group’) to 3.81 (‘Possibility to provide and to receive information about tourist sites and activities of interest’), while the perceived costs item means varied from 2.43 (‘Too high monetary costs of the equipment and services required to collaborate on the Internet’) to 3.03 (‘Very high risk of losing privacy’). In general, the costs were not perceived as obstacles in using social media in organizing vacation. On the other hand, tourists perceived benefits as unimportant.

Table 2. Results of exploratory factor analysis

Variable	1	2	3
The increase of personal relationships with people with similar motivations	.812		
Provide a strong feeling of belonging to a group	.786		
Proud of sharing opinions and tourist experiences	.770		
Stay in contact with others who share the same interests regarding tourist trips	.703		
Usage is pleasing and fun	.621		
Keep up to date with knowledge about the tourist sites and activities of interest		.858	
Possibility to provide and to receive information about tourist sites and activities of interest		.797	
Save costs and get the most from the resources invested in the trip		.703	
Not wanting for others to see posts			.727
Complicated or bothersome processes required by travel websites for contributors			.720
Not wanting transparency and public exposure related to Internet			.672
Too many travel websites			.610
Cronbach's alpha	.846	.827	.744
% accumulated variance	26.439	40.842	55.459

Source: Data processed by authors

Exploratory factor analysis (EFA) was performed on 16 items measuring perceived benefits and perceived costs of using social media in organizing

vacation. Items with loading below .04 and cross-loadings were deleted, resulting in retention of 12 items. Using eigenvalues greater than 1.0, as criteria, three factors representing perceived benefits and perceived costs formed clear factor structures (Table 2). Jointly, they accounted for 55.46% of the accumulated variance, and all of the factor loadings was greater than .60. They were labeled functional benefits, social and psychological benefits, and costs. Cronbach's alpha coefficients were between .744 and .846.

The same items were subjected to CFA using the second half of the data in order to examine the relationship between the items and their corresponding latent construct (Table 3). The model fit indices for the measurement model were acceptable and all indicators significantly loaded onto their respective latent construct and were higher than 0.50 (Hu & Bentler, 1999). Each construct (Table 4) had estimated composite reliability that exceeded the value of 0.60 and an extracted variance higher than the recommended threshold of 0.50 (Hair et al., 2014). The results for the correlations showed that functional benefits and social and psychological benefits were interrelated. The correlation was positive and not very excessive.

Table 3. Results of confirmatory factor analysis

Factor	Item	Standard load
Social and psychological benefits	The increase of personal relationships with people with similar motivations	.89
	Provide a strong feeling of belonging to a group	.74
	Proud of sharing opinions and tourist experiences	.72
Functional benefits	Keep up to date with knowledge about the tourist sites and activities of interest	.82
	Possibility to provide and to receive information about tourist sites and activities of interest	.84
	Save costs and get the most from the resources invested in the trip	.70
Costs of losing privacy	Not wanting for others to see posts	.83
	Not wanting transparency and public exposure related to Internet	.66

Note: $\chi^2 = 69,784$, $df = 17$, $p\text{-value} = 0,000$; $CFI = 0,975$; $SRMR = 0,049$; $RMSEA = 0,063$; $PClose = 0,073$

Benefits of using social media for organizing a vacation were perceived as important but also as rather unimportant. Those benefits perceived as important depict functional benefits, while the benefits that were not perceived as important include psychological and social benefits. Costs of using social media for organizing a vacation were generally not perceived as important suggesting that tourists do not think of them as obstacles. However, the risk of losing privacy was perceived as somewhat important suggesting that privacy may present a certain obstacle in the future. Through exploratory factor analysis, two dimensions of perceived benefits, namely functional, social and psychological, were determined, while perceived costs formed one dimension, i.e. they included items measuring effort, privacy and difficulty of use. Still, confirmatory factor analysis refined this structure but the number of dimensions was detained. The structure of perceived costs was the most affected, thus the new structure focused on costs related to losing privacy. Items measuring the dimension of the perceived benefits were also purified, but only those measuring social and psychological benefits. They were mostly centered on the social component.

Although the concept of perceived benefits and perceived costs was adopted from Parra-López et al. (2011) the results are not comparable because was not confirmed entirely in this research. This research confirmed the existence of functional benefits, while social and psychological benefits were perceived and as one dimension. Also, this research highlighted the issue of privacy as the perceived cost, thus, partially supporting the findings of Parra-López et al. (2011). Perceived costs of losing privacy identified in this research are partially supported by the findings of Davies & Cairncross (2013), Fabricius & Eriksson (2017), Matikiti et al. (2017) and Pabel & Prideaux (2016) while perceived benefits are

partially supported by Agag & El-Masry (2016), Amaro et al. (2016), Ayeh et al. (2013), Cox et al. (2009) and Nemec Rudež & Vodeb (2015).

The finding in this study provide insights to tourism and hospitality managers related to tourist's behavioral intentions in the usage of social media for planning vacation. These results help them to better understand and provide a tool to identify obstacles and prospects of social media usage for the purposes of destination selection and travel planning related activities. Managers need to ensure the trustworthiness of the information placed on different social media sites and reduce to a minimum the perceived costs, namely costs related to privacy risk.

Although the study helps to fill a gap in knowledge in the literature on this issue, there are some limitations. These results are based on a sample of tourists who stayed in selected hotels in Istria County. Therefore, the results could not be generalized to the overall Istria County's tourism market or to the user of social media in general. Future studies could include different populations (e.g., tourists in different accommodation facilities, one day visitors, visitors of certain cultural and natural sites), different parts of Croatia, tourists staying in Croatia in low and pre/post season. This research did not focus on particular social media sites, thus, future research could be centered on a particular social media like Facebook, Twitter, Instagram, TripAdvisor, because each of them offers different opportunities (e.g. posts, photos, videos etc.). Social media and Internet usage is a fast evolving area due to the development tools that provide the user experience. Considering that, findings will need to be periodically revised.

5. CONCLUSION

Social media can be a great way to minimize various difficulties related to vacation planning because it provides a way to search, organize, share and annotate travel stories and experiences in different tourist destinations. Thus, how tourists perceive obstacles and prospects of social media usage for the purposes of destination selection and travel planning related activities is becoming a highly interesting research area.

This study aids in understanding consumer behavior in relation to the use of social media in travel-related context, through the concept of perceived benefits and perceived costs. This concept primarily included three dimensions of perceived benefits and three dimensions of perceived costs. It was applied to general users of social media who traveled as tourists. However, when it was ap-

plied to the different population, namely hotels guests of various nationalities, the structure was only partially confirmed. This suggests that redefinition of the perceived benefits and perceived costs concept is needed for tourism settings.

Abstract

Online purchases grow rapidly and competition among online providers is getting fiercer. Customer loyalty has become a key metric for e-tailers and it is frequently assessed “through the lenses” of repurchase and recommendation intention. Following the customer value-oriented approach; we suggest an in-

tegrated SEM model, which combines important aspects of a webshop (quality perception, trust, usefulness, satisfaction) with the construct of online opinion leadership. Based on a large sample (1000 respondents) of online purchases we have tested the model with partial least square (PLS) path modeling. Results suggest that six of the suggested effects are strong (trust on usefulness, the quality of trust and satisfaction, satisfaction on recommendation and repurchase intention). However, the offline opinion leadership construct has a low effect (Cohen's f^2 value) on recommendation intention. The effect size of online opinion leadership on the same variable is higher but still low ($f^2=0.07$). The results are useful to predict online and offline word-of-mouth intentions and future purchases. However, there are many limitations to this research, which result mainly due to the applied research method (online questionnaire) and among further research directions, we would name the test of the proposed model on company data as a top priority.

Keywords: repurchase intention, recommendations, integrated SEM model

JEL Classification: M31, M37

1. THE EMERGING ROLE OF MEASURING AND PREDICTING FUTURE CUSTOMER BEHAVIOR

In today's world, digitalization is present in every aspect of our life. According to Statista (2019) in 2017, retail e-commerce sales worldwide amounted to 2.3 trillion US dollars and e-retail revenues are projected to grow to 4.88 trillion US dollars in 2021. The top 3 online stores' revenue amounted to almost 100 billion US dollars in 2017. Not just key players but smaller web shops are also focusing on understanding customers' omnichannel purchase behavior, its different consequences, and opportunities. They strive to identify everyone who has an interest in their offers, monitor the customer journey, and gather enough data to build valuable relationships, evoke customer loyalty and not just get into price wars with competitors. Automatization, predictive algorithms, and machine learning do not only enable to personalize offers but to select those, who really matter to the company: the most valuable customers. Many authors have already pointed out (Kumar et al., 2010) that besides traditional monetary focused customer valuation models the role of non-monetary elements cannot be underestimated. Among these components, word-of-mouth, personal recommendations, customers' opinion leadership behavior are outstanding factors.

It can be stated that the retailing industry is going through a major shift (Kahn 2018). The Internet is now a central element in business' sales processes from the stage of information search to the actual purchase and follow-up of the order, or even the delivery of the products or services (e.g. software, e-banking). As websites should live up to dynamically rising consumer expectations, it is crucial to be aware of the criteria by which they evaluate website quality and the influence of these criteria on their level of satisfaction and repurchasing as well as recommendation intentions, which ultimately add up to loyalty. In order to stay competitive, this knowledge is critical for businesses. The continuously improving and growing body of research on competitiveness has a major contribution to economic development (Tukker & Tischner 2017) which warrants more detailed scrutiny of online solutions as significant opportunities of the present and the future.

In our research, we aim at developing an integrated model in an online environment that combines a personal trait – opinion leadership – with the perceived effectiveness of a webshop in order to predict loyalty, measured by planned behavior dimensions such as recommendation (online and offline word-of-mouth intention) and repurchase intention. In this manner, the model can serve as a basis for calculating a non-monetary customer value as well.

2. STRUCTURAL MODEL – UNDERLYING ASSUMPTIONS, INTEGRATED CONSTRUCTS AND RELATIONSHIPS

Consumers tend to buy products on the internet even if they encounter risk due to lower trust in online shops. They get many impulses by advertisers, but they rely more frequently on their personal network or on other customer's choice. According to Hennig-Thurau et al. (2004, p. 39) electronic word-of-mouth is "any positive or negative statement made by potential, actual, or former customers about a product or company, which is made available to a multitude of people and institutions via the Internet". Consequently, the role of word-of-mouth and listening to recommendations by other customers is increasing. the eWOM source is likely to be perceived as more useful by consumers with high susceptibility to informational influence than neutral/third party and manufacturer/retailer sources (Chen et al., 2016). Among studies that have investigated interpersonal influence in online contexts, two groups can be identified. Those

looking at the structure of online platforms as an enabler of interpersonal influence (e.g. Chu & Kim, 2011), and those investigating the actual process of interpersonal influence as it happens online (e.g. Kozinets et al., 2010). We focus our attention on the latter and use informational influence as an exogenous latent variable.

As Schäfer & Taddicken (2015) state media environments have changed significantly in recent decades, however, opinion leadership still exists and many roles that have been identified previously in this research field still hold up. Word-of-mouth (WOM) communication as a personal influence has always played an important role in the purchase process of products and services. Extensive research results pointed out that the behavior of customers is heavily influenced by interpersonal communication (Herr et al., 1991). With the advent of the internet, many different channels of communication can be used in order to convince others and share experiences. In cyberspace, a dynamic and interactive communication is enabled, where a single person can take on multiple roles. Initially, based on the direction and underlying motives, three major behavior dimensions can be differentiated (Flynn et al. 1996, Sun et al. 2006): opinion seeking, opinion giving and opinion passing.

Consumers with a high level of opinion seeking behavior tend to search for information and advice from others when making purchase decisions (Flynn et al. 1996). Conversely, individuals with a high level of opinion giving behavior, known as opinion leaders, may exert great influence on others' attitudes and actions (Price and Feick 1987). Many opinion leaders may also be opinion seekers because they desire more knowledge or expertise, partly due to their interest in a specific topic or product. Even though, information seekers are not necessarily opinion leaders. Sun et al. (2006) suggest that opinion forwarding/passing is an important and yet overlooked (Norman – Russel 2006) behavior consequence of eWOM and it accelerates the flow of information. Opinion passing behavior is more likely to occur in an online social context, as the unique characteristics of the Internet can facilitate multidirectional communication, and with a few clicks of the mouse, consumers can 'spread the word' on a global scale (Chu and Kim 2011).

In the early stage of the Internet's expansion retailers believed that low prices and web presence can guarantee success (Minocha et al., 2003). However, with the accumulation of consumer and corporate experience in online shopping,

and as the competition got stronger as well as online purchases became a routine, companies had to realize that they had been mistaken. If consumers do not find the required information on the website, if e-mails are not answered in time or if the product is not delivered at the requested time, consumers do not hesitate to give a much lower rating in the quality assessment and switching to another e-tailer has never been easier. Recognition of this fact gave rise to changes in strategic thinking and quality became a crucial factor in the online channel as well. However, electronic-service quality is a complex concept that includes aspects of the buying process that precede and follow the actual purchase. It covers not only the information-seeking processes and the use of a website, but also purchase, fulfillment, goods delivery, and occasional return and compensation. In the same way as in the offline world, but much faster. A broadly accepted definition of perceived e-service quality is “the extent to which a Web site facilitates efficient and effective shopping, purchasing, and delivery.” (Parasuraman et al., 2005 p. 5). The relationship between perceived quality and satisfaction as well as the role of emotions in consumer satisfaction decisions are well-researched topics (Oliver, 1993). E-satisfaction that occurs in online environments can be interpreted on the model of previous satisfaction definitions because consumers’ evaluation of the given webshop has regard also to the prior online purchase experience (Anderson – Srinivasan, 2003). In the case of e-commerce, we can distinguish between transaction-specific satisfaction pertaining to a particular encounter with a webshop (e.g. booking a room), and cumulative satisfaction, which stems from repeat purchases. In the literature on information systems, which are an integral part of e-commerce, satisfaction is the sum of opinions about a specific system’s attributes, with special attention to efficiency in which design and implementation play a leading part.

Many researchers agree that the evaluation of quality for online stores is not limited to the transaction itself, but includes the entire range of provided electronic services (Montoya et al., 2000; Wolfinbarger & Gilly, 2002; Bauer et al., 2006). These include all interactive services, which are conveyed via information-communication technologies (Sousa & Voss 2006). Accordingly, quality assessment should take into account, besides in transaction events, the pre- and post-service aspects, such as information gathering process, transaction accomplishment, customer service, or even refunds and problem management. To measure e-SQ several concepts exist in the literature, unfortunately, there is no consensus about its dimensions. In our opinion, when evaluating the existing

e-SQ scales, the primary considerations should be their compliance with the definition of electronic service quality and the extent to which they account for the heterogeneity of e-commerce by types of products/services. Thus our choice was made for the RECIPE scale (Francis, 2009).

As Delone and McLean (2016) state their information systems success model (see Figure 1) can be adapted to the measurement challenges of the new e-commerce world.

Figure 1. The updated Delone and McLean information system success model

Source: Delone and McLean (2003, 24)

The six dimensions of the updated model are a parsimonious framework for organizing the e-commerce success metrics identified in the literature. Out of the service quality construct, we have highlighted and included in our model the importance of trust and it served as an antecedent to the most important aspect of perceived value: usefulness.

Customer satisfaction is of strategic importance for businesses as it contributes to effectiveness through loyalty (Kenesei & Kolos, 2007). The relationship between perceived quality and satisfaction (de Ruyter et al., 1997) as well as the role of emotions in consumer satisfaction decisions are well-researched topics (Oliver, 1993). Veres (1999) suggests that consumer judgments about service quality should form the basis of the measurement of satisfaction. Others assert that complete satisfaction is the direct product of perceived service quality (Parasuraman et al., 1988; Cronin, 1994; Ribbink et al., 2004). Wolfenbarger and Gilly (2003) carried out a study on this topic in an online context, which revealed that e-service quality dimensions show a positive correlation with satisfaction. Their hypothesis was confirmed as well by Bressolles et al. (2007).

The disconfirmation paradigm has a central role among customer satisfaction measurement techniques, where satisfaction or dissatisfaction is a result of the relationship between expectations and performance (Hofmeister-Tóth et al. 2002). The degree and level of satisfaction have far-reaching consequences. In an online context, where the medium allows easy access to competing for offers and switching between providers involves lower costs, revisiting and repurchasing intentions, which may on the long-term lead to loyalty, gain in importance. Although loyalty is a continuing relationship established between a consumer and a brand; it is an emotional connection that binds a consumer to a business/brand when making purchases (Ltifi – Gharbi, 2012), a number of researchers believe that behavioral intentions are the key to success (Venkatesh et al., 2003).

Based on the previous considerations we could draw up an integrated model (see Figure 2), aiming at predicting planned purchase and WOM behavior. The model consists of two major parts. One of them is focused on the relationships between informational influence and online and offline opinion leadership. Beside first-order constructs and their relationships, we have included two-second order constructs (Allard et al. 2017) in order to combine offline and online opinion leadership factors. The other major part is based on the information system success model and follows the well-known quality-satisfaction-repurchase “chain”. As final dependent variables online and offline word-of-mouth, as well as repurchase intention, are included.

3. RESEARCH METHOD AND MAIN RESULTS

In order to verify the model, we have chosen validated scales (Table 1) from the literature and composed an online questionnaire. Data collection took place in 2017; the sample consists of 2000 respondents, who have purchased something on the internet in the previous 3 months and are between 18-65 years old. It is a representative sample of the Hungarian population regarding age, gender, and region. Questions were directed towards their latest online purchase experiences and their general traits. The analysis of data took place with the use of IBM SPSS and ADANCO. However the huge sample size would have guided us towards the CB-SEM method, we have chosen to use PLS for path analysis because it minimizes residual variance by each step of estimation either in the external or in the internal model and is more appropriate for prediction.

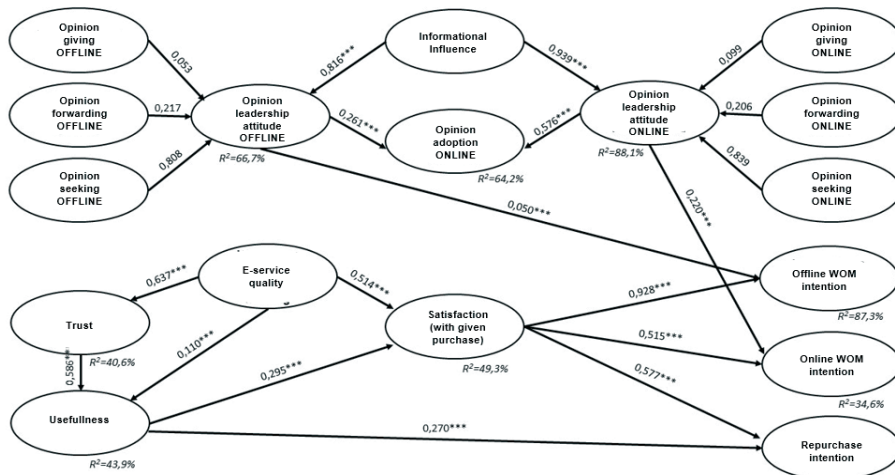

Table 1. Factor loadings of latent variables

Usefulness (Teo et al., 2003)		Informational influence (Bearden et al., 1989)	
Usefulness _1	0,8190	Informational influence _1	0,8140
Usefulness _2	0,7662	Informational influence _2	0,8067
Usefulness _3	0,8800	Informational influence _3	0,7530
Usefulness _4	0,8427	Informational influence _4	0,7201
Usefulness _5	0,8514	Online opinion leadership (Sun et al., 2006; Chu and Kim, 2011))	
Usefulness _6	0,8564	Opinion giving - ONLINE	
Trust (Suh and Han 2002)		Opinion giving _online_1	0,8861
Trust _1	0,8901	Opinion giving _online_2	0,9283
Trust _2	0,8887	Opinion giving _online_3	0,8832
Trust _3	0,8892	Opinion forwarding - ONLINE	
Trust _4	0,9222	Opinion forwarding _online_1	0,9491
Trust _5	0,9270	Opinion forwarding _online_2	0,8641
Opinion adoption (Cheung et al., 2009)		Opinion forwarding _online_3	0,8991
Opinion adoption _1	0,8607	Opinion seeking – ONLINE	
Opinion adoption _2	0,8649	Opinion seeking _1	0,8474
Opinion adoption _3	0,8887	Opinion seeking _2	0,8429
Opinion adoption _4	0,8879	Opinion seeking _3	0,8965
Opinion adoption _5	0,8827	Opinion seeking _4	0,9029
Offline opinion leadership (Sun et al., 2006; Chu and Kim, 2011))		Quality (RECIPE scale by Francis, 2009)	
Opinion giving - OFFLINE		Efficiency and system availability	0,9048
Opinion giving offline_1	0,9270	Fulfillment	0,8352
Opinion giving offline_2	0,9314	Security	0,6773
Opinion giving offline_3	0,9134	Compensation and contact	0,2630
Opinion forwarding – OFFLINE		Satisfaction (Chang et al. 2009)	
Opinion forwarding _offline_1	0,9425	sat_1	0,9294
Opinion forwarding _offline_2	0,9045	sat_2	0,9033
Opinion forwarding _offline_3	0,9016	sat_3	0,9643
Opinion seeking - OFFLINE		Offline recommendation intention (Yang and Peterson, 2004)	
Opinion seeking _offline_1	0,8871	offline word-of-mouth intention_1	0,9810
Opinion seeking _offline_2	0,8978	offline word-of-mouth intention_2	0,9217
Opinion seeking _offline_3	0,9200	offline word-of-mouth intention_3	0,8810
Opinion seeking _offline_4	0,8846	Online recommendation intention	
		Electronic word-of-mouth intention	1,0000
		Repurchase intention	
		Repurchase intention	1,0000

Source: own compilation and results

Results (see Figure 2) indicate that all of the proposed effects are significant at 0,95 reliability. Out of the addressed relationships, six have a strong effect according to their Cohen f^2 value: trust on usefulness ($f^2=0,36$); quality on trust ($f^2=0,68$) and satisfaction ($f^2=0,40$); satisfaction on offline ($f^2=6,7$) and online recommendation ($f^2=0,40$), as well as repurchase intention ($f^2=0,55$). Although offline opinion leadership has a significant direct effect on offline recommendation intention, it does not seem so relevant ($f^2=0,02$). Regarding online opinion leadership, direct influence on the online recommendation intention is still low, but more notable ($f^2=0,07$). The effect of quality on usefulness is also lower compared to the other relationships. Two endogenous variables have good explanatory value – offline recommendation intention ($R^2=87,3\%$) and repurchase intention ($R^2=57,4\%$) – but the value of online recommendation intention ($R^2=34,6\%$) suggests to look further into underlying motives.

Figure 2. Integrated structural model and results

Source: own compilation and results

Using the values of the latent variables in the integrated model, we can draw up prediction functions with multivariate linear regression.

(1) function:

$$\text{Offline WOM intention} = -0,065 + 0,085 * \text{usefulness} + 0,206 * \text{trust} + 0,044 * \text{quality} + 0,722 * \text{satisfaction}$$

(2) function:

$$\text{Online WOM intention} = 0,349 + 0,249 * \text{usefulness} + 0,313 * \text{trust} + 0,117 * \text{quality} + 0,346 * \text{satisfaction} + 0,085 * \text{informational influence} + 0,273 * \text{online opinion leadership} - 0,102 * \text{opinion adaption}$$

(3) function:

$$\text{Repurchase intention} = -0,231 + 0,280 * \text{usefulness} + 0,108 * \text{trust} + 0,652 * \text{satisfaction}$$

Results of this multivariate linear regression (Table 2) show that four effects are not significant, however, all the others are at the regular 0.05 significance level. Satisfaction has the strongest effect in every case, but trust is also notable when calculating online recommendation intention. The models can be accepted based on R² values.

Table 2: Effects in the suggested predictive functions

INDEPENDENT VARIABLES	DEPENDENT VARIABLES		
	Offline recommendation intention	Online recommendation intention	Repurchase intention
usefulness	0,085	0,249	0,280
trust	0,206	0,313	0,108
quality	0,044	0,117	not significant
satisfaction	0,722	0,346	0,652
informational influence	not significant	0,085	Based on the integrated model it has no direct or indirect effect
online opinion leadership	Based on the integrated model it has no direct or indirect effect	0,273	
offline opinion leadership	not significant	Based on the integrated model it has no direct or indirect effect	
opinion adoption	not significant	-0,102	
R ² value	90,5%	63,2%	75,0%

Source: own compilation and results

4. CONCLUSIONS, MANAGERIAL IMPLICATIONS

There is an emerging need to assess the effectiveness of a webshop and to predict customers' future behavior. In our research, we have drawn up an integrated model as one potential solution that is focused on webshop specific factors and

a special customer related factor (opinion leadership). According to our model, several aspects of a webshop can be influenced by the marketer in order to reach higher satisfaction, which is the most important variable in predicting recommendation and repurchase intention. Out of the addressed personal traits, online opinion leadership has a significant effect on online recommendation intention but this relationship needs further investigation and research. When companies try to measure customers' value, they apply monetary approaches; however, we would like to advise to focus on the non-monetary elements of the proposed integrated model as well. Especially to consider customers online and offline word-of-mouth as well as repurchase intention.

Abstract

Managing a brand today implies that consumers participate actively in marketing activities and communication. In the past, it was more of one-way communication from brands to consumers through traditional marketing channels such as television, radio, etc. Digital environment and social media enabled constant dialogue between brands and their users. Dialogue through brand communities inside the social network environment as well as fan pages on social media offers a possibility to brands to reach a large target group in a short amount of time. The purpose of this article is to explore how brands adapted to this new, dynamic way of communicating by using previous research as a methodology and available literature. Also, through the paper the goal is to determine, is branding, with all these new possibilities and communication platforms easier or more complicated for brand owners? Is it a relationship where everybody benefits, companies and consumers?

Keywords: brands, social media, communication

JEL Classification: M31, M37

1. INTRODUCTION

The relationship between brands and consumers is a long evolving one. Brand management as it is used today, started around 1950s and has evolved since. Social media definitely speeded up that process and changed the game. Brands and consumers have never been in closer communication and interaction than in the present time, but also their relationship has never been more challenging and fragile.

The main objective of this paper is to determine how brands adapted to social media, and what are the main challenges of brand owners today. Is the success of a brand in total control of brand managers and brand owners or has the power shifted to the consumer? Are we in an era of the empowered consumer?

To understand how the relationship between brands and consumers functions in today's digital and virtual environment, it is important to understand how that relationship evolved during history. The paper will also try to explain the evolution of branding and the history of branding, how social media affected the communication between brands and consumers and empowered consumers, as well as brand communities inside social media and what impact they have on brands today.

2. EVOLUTION OF BRANDING

According to different marketing researchers such as Khan and Mufti (2007), we can trace brands as far back as ancient Egypt where it was used as a symbol of the quality of cattle that were being sold or bought, as well as a way to discourage theft. A farmer that had a reputation for quality cattle was high in demand, unlike those who offered the opposite. Khan and Mufti (2007) also say that in that way brands as a symbol of quality and a choice were established and that is what they symbolize in the present time.

As can be expected, a lot has changed from the period where cattle were branded so people would know which herd belongs to each owner. Hampf and Lindberg (2011) say that in today's time almost everything we use is branded. From clothes, cars, food to water. During the course of history consumers and brand owners have developed a very complicated and delicate relationship. Some of those relationships last a very long time, some for a short period of time. Some of these relationships are very loyal, and others are a one-time thing.

Market researchers devoted a great deal of time trying to determine what is key to a successful brand, loyal consumer, repeated purchase. Moore and Reid (2008) say that those are the topics of most marketing research focuses as well as brand choice, brand loyalty, brand switching, and brand extensions. What also changed is the way that brands and consumers communicate today from traditional communication channels such as TV, magazines and daily papers to social platforms. This shift accrued with the ever-growing importance and presence of social media. And this shift in communication also brought a change in how brands create value, because today, more than ever, a consumer is a co-creator of brand value as well as the brand owner. A good consumer – brand relationship in today's era of endless choices and fast communication on social media is more important and more fragile than ever.

2.1. WHAT IS BRANDING?

There is a lot of available information on this subject, and often readers and students, are not sure what is the difference between product, brand, and branding. While researching for this article, we came across a lot of different definitions, perhaps the one that is the more clearest is the one from the Branding Journal where it is explained what is a product, a brand, and what is branding. A product can be considered everything from a toothbrush, food, clothes, a language course, etc. (www.thebrandingjournal.com). Kotler and Keller (2015) also point out that anything that can be offered to a market, more specifically a consumer, in order to satisfy a want or a need can be considered a product. This includes ideas, events, services, properties, places, etc. A product is crucial in creating a brand.

According to American Marketing Association, a brand is a key feature that identifies a seller good or service from those of another. This can be a name, symbol, designed (www.ama.org). Let's take the example of coffee. One of the most beloved beverages on the planet. How to choose in the sea of available products. This is where brands come in. Coffee is a generic product, but Lavazza is a brand, or Starbucks, Nescafe, etc. Brand, their name, logo, perception of quality, design, that is what influences our choices and preferences. Moore and Reid (2008) explored in great details the history of brands, from ancient time until today in their article "The birth of Brand: 4000 years of branding history" and what market researchers in the 20th century define as brand and how their

biggest influence is in the part that enables a consumer to express themselves. Moore and Reid (2008) also state that the personality traits of people who are associated with the brand are often transferred to the brand itself. After defining what is a brand, it is also important to define what is branding.

Kotler and Keller (2015) define it as giving the power of a brand to a product or a service. Branding is a strategy, a process that gives meaning to a product or a company by shaping a brand in a consumer mind.

Branding is a promise that a brand gives, by always delivering the same level of service and quality for their products and services (www.thebrandingjournal.com). Perhaps one of the most known brands in the world today is Apple who revolutionized the way technology looks and is used today, and the way we communicate and perceive brands. Steve Jobs who was the founder of the company had a vision of what he wants his company and its products to be. Quality, functional products with trendy design. Mobile phones in the past did not have cameras or could make videos. Today you can make a short movie on your iPhone, and edit it on your Apple computer, as well as record and edit music. Apple is constantly working on its branding. The most recent example is their marketing campaign called Today at Apple which completely transformed the way their retail store's function. Because of the popularity of online shopping Apple retail stores experienced a sale drop. New CEO Angela Ahrendts changed all that. Apple stores were transformed into community points, where besides being able to buy an Apple product you can participate in many events using Apple products. For example, iPhone photography courses where you can learn basics on how to take professional photos. Programming classes for children, families, and teachers, which Apple described is a way of giving back to the community (www.forbes.com). The branding part of this campaign was done impeccably, and Apple showed once more that it kept its promise to consumers, present and future.

2.2. THE HISTORY OF BRANDING

Brands like Apple, Coca-cola, Burberry, BMW, etc. are landmarks of the branding of the 20th century, but what led up to the way we perceive brands today? What influenced and shaped relationships consumers and brands have in the present time?

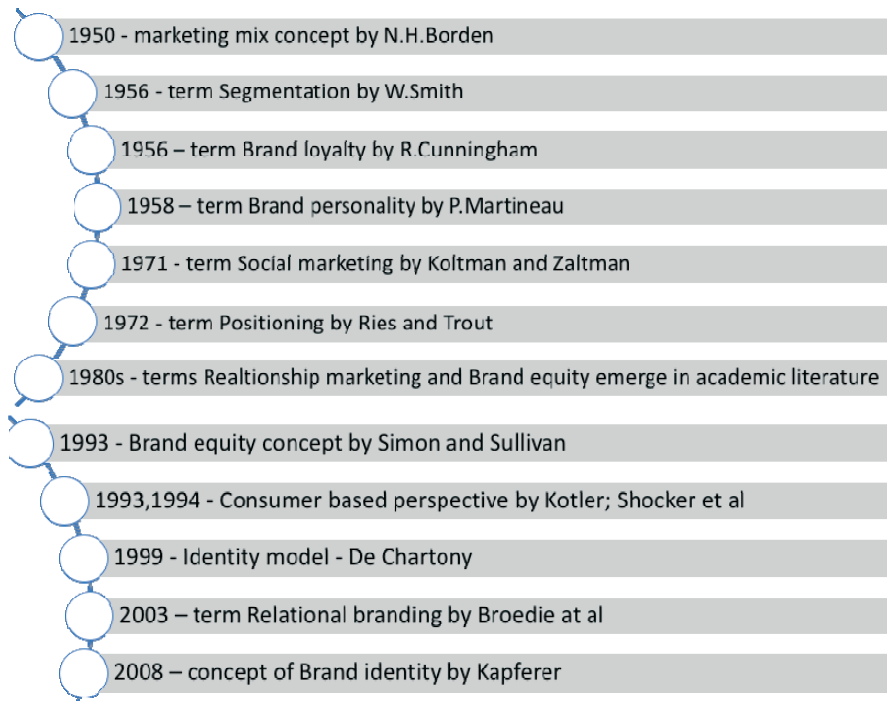

Hampf and Lindberg (2011) say that the brands most similar to the ones we have today were shaped in the 16th century. Brands like Wedgwood that was founded in England by ceramist Josiah Wedgwood and Bertin founded in France by fashion designer Rose Bertin. Khan and Mufti (2007) mention that the first ever recorded brand on the Western hemisphere were one of Hernan Cortez and its Three Latin Crosses in 1519.

In 1936 Robinson – Patman act was passed in America, which was a federal law that wanted to outlaw price discrimination. The act required a business to sell its products at the same prices regardless who the buyer is (www.investopedia.com). In more simpler words this act created a legislative obstacle for companies to price similar products differently (Hampf and Lindberg, 2011). Since the pricing was determined by law, sellers needed another way to distinguish one product from another, and this could be achieved by different brands of the same product.

But with brands came a question of how much a company should emphasize its brand or how much do consumers care about brands, so several market types of research wanted to determine just that.

Hampf and Lindbergh (2011) through their research explained the influence of several marketers and their contribution to the evolution of branding by introducing crucial marketing terms and calling them 12 millstones of branding. These terms can be considered as today's backbone of branding (Figure 1).

Figure 1. 12 Branding milestones

Source: Authors, adapted from Hampf, A. & Lindberg-Repo, K. (2011). Branding: The Past, Present, and Future: A Study of the Evolution and Future of Branding. Hanken School of Economics Working Papers. Available at: https://helda.helsinki.fi/bitstream/handle/10138/26578/556_978-952-232-134-3.pdf

As it can be seen through Figure 1., today’s branding, and its key elements took more than fifty years to develop, and we can conclude that the process is not over. Why? Because new terms evolve every day due to social media. Terms such as influencers, consumer-generated content, company generated content, digital advertising, brand communities, etc. All these terms are now used in marketing. So once again we are witnessing how social media speeded everything up, not just marketing, but marketing research in general, and how challenging it is for the academic community to keep up. They are not the only one under pressure to keep up, marketers and brand managers have to adapt to changing values of all stakeholders: consumers, employees, business partners, institutions and society in general (Khan and Mufti, 2007)

3. HOW COMMUNICATION BETWEEN BRANDS AND CONSUMERS CHANGED DUE TO SOCIAL MEDIA

Until social media became popular as a channel of communication, traditional channels such as tv, newspapers, radio were the only way brands communicated with consumers. Communicating through those channels was more a one-way street, without consumer input, which can also be considered as their biggest disadvantage. Traditional channels of communication did not give power to the consumer but gave it to the brand. Social media made it a two-way communication, where there is constant interaction between brands and their users. Social media on the other hand also offers more content, more information and more possibilities of communication, and consumers now have as much influence on the brand's success as the brand owners. That consumer influence is one of the most important elements of how social media changed communication between brands and consumer. Consumers started to form groups and communities online, exchanging information between them and by that changing the balance of power from brands to consumers (Bernoff and Li, 2008). It made brands to try harder, be more alert, to fight more for its consumers. Social media transformed the Internet into a platform where people themselves become the media by sharing information and their user experience (Leung et al, 2013) Until social media, it was a one way street in terms of communication between brand and its consumers. Brands would advertise through different channels to its target groups and the only response they would get from consumers, and if their product is good, was in sales numbers and if the numbers were rising or dropping. There was no immediate response, especially not in a sense of expressing their opinion about the brand or any kind of user experience. Brand managers realized that the one-sided communication model was not suitable for the dynamic computer motivated environment (Christodoulides, 2009). Simmons (2008) determined that the internet is a great medium for brands because it enables them to communicate directly to its consumers. Social media had an enormous impact on marketing communication. What was considered "rules" in marketing communication and marketing in general, changed in a very short amount of time, but brands adapted, brand managers adapted, consumers, adapted. It is a whole new world that came with social media, and its impact on social interaction and communication between people, and not just brands is yet to be determined in the future.

3.1. CONSUMER EMPOWERMENT THROUGH SOCIAL MEDIA

Social media today represents the global community of every nationality in the world that is estimated to be the size of China in terms of population. Facebook as the biggest crossed 1 billion users in January of 2015, WhatsApp users were 600 million, and Twitter 284 million users (www.brandba.se). Social media also brought consumer empowerment. As earlier mentioned, the consumer is now a co-creator of brand success as much as brand owners. Consumers today not only have the power to influence the success of a brand but also to destroy it, leaving brands more vulnerable than ever. Kaplan and Haenlein (2010) detected the signs of a change, and that the shift in power is going to the consumers. Before companies would manage the information about their company or its products with PR or press releases, but in the age of social media more than often companies are observers in the information that are provided about their companies with practically no way to control the situation. Consumers today have an influence on other consumers by sharing their experience and by generating content which eventually has an impact on decision making for buying, brand image and word of mouth (www.brandba.se). Social media sites allow the consumer to express a positive or negative opinion about any brand (Christodoulides, 2009).

A good example of an empowered consumer is the case of the United airline company in America that removed a passenger from the plane due to airlines overbooking error (www.theforbes.com). The incident went viral because the passenger sustained injuries during the flight due to the fact that he didn't want to leave the plane. First the airline company denied its responsibility but the pressure on social media was immense and to avoid more negative publicity they apologized to the passenger and in the end, suspended the security guard who injured a 69-year-old passenger. The whole incident raised questions about the fact that airlines in America often overbook their flights, and rarely apologize to passengers because of it, but this time a passenger sustained injuries while other passengers were shocked.

This was a negative example of a company who was "forced" by social media to put the customer first. There are also positive examples of companies who decided by themselves to put their customer first and to fully adapt to social media (www.forbes.com). A brand like Burberry set out to be the first digital luxury brand and it grabbed every chance it could to get closer online to their customer and their wants and needs. Burberry enabled its customers to buy clothes

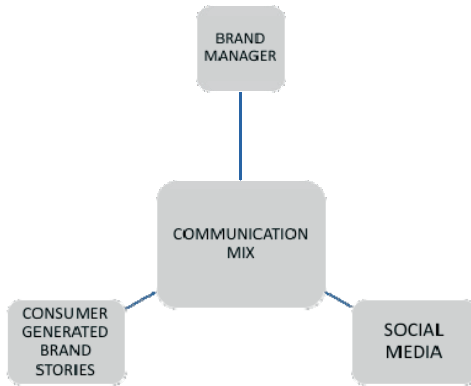

from the catwalk from their mobile phones and not wait for six months for the new looks to appear in stores. Their customers wanted this change, Burberry enabled it and the company thrived (www.theforbes.com). Social media gave consumer enormous power, a fact that will not change in the near future. It is very clear that the more brand adapts their communication to the consumer on social media, the more successful the brand will be. Yes, this communication has its risks, it often leaves the brand vulnerable and exposed, but perhaps the example of Burberry is a beacon for other brands to follow. Perhaps social media can bring empowerment to brands, and not only consumers.

3.2. CONSUMER-GENERATED BRAND STORIES

Consumers are becoming pivotal authors of brand stories due to new dynamic networks and brands formed through social media and the easy sharing of brand experiences in such networks. Firms need to pay attention to such consumer-generated brand stories to ensure a brands success in the marketplace (Gensler et al, 2013, p. 243).

Singh and Sonnenberg (2012) say that brand stories provide meaning to the brand. In the past, only companies created brand stories through traditional advertising, but through social media, consumers are now becoming the ones who create stories about brands. Consumer voice can no longer be ignored by companies and brand managers, nor it is wise to do so, and they also have to accept that mistakes will be made do to loss of control (Gensler et al, 2013). Henning - Thera et al. (2010) also state that brands stories told through social media will have a greater impact on consumers than the ones told through traditional marketing channels, because they occur in real time and are dynamic. Puzakova et al. (2013) emphasize that humanization of brands generates more positive consumer attitudes and, in that way, improves brand performance. Consumer influence on brands is making a brand manager work very challenging. Brand managers have to balance between consumer-generated stories that they have no control over and how they are presented on social media. Trying to include consumer generated brand stories in the communication mix can also be achieved by sharing their stories on official brand pages on social media. Maintaining control over fast social media communication is less difficult if consumer stories can be integrated into the communication mix by brand managers (Figure 2.)

Figure 2. Brand managers communication mix in social media

Source: Authors

It is obvious that in the era of social media, brands and brand managers need to find the best way to communicate with consumers and try to make them an ally in their brand's success, especially when brand stories are concerned. Most companies today crave for organic content, the one that is created and shared by consumers about their products or services. This is not easy to achieve. Content that is written correctly and by consumer or user with knowledge in different areas speaks the most to the reader's interest (www.kmguru.com)

Excellent way of including users in their communication mix is the way NASA communicates with the public on social media. They share behind the scenes of workdays in NASA, and their stories are shared further by their followers (www.adweek.com). Another great story that was created by NASA but shared further by users is their literacy programme. Astronauts that are on a mission in space, read every week a different children's book. It was the idea of Patricia Tribe, the former director of education at Space Centre Houston who came up with the idea to merge STEM and literacy that would be interesting to children. Their videos are shared through social media with a very large number of positive comments from users who were thrilled with the idea (www.huffingtonpost.co.uk). Not only were followers thrilled with the idea, but media from all over the world wrote about Story Time from Space.

We will conclude this part with a consumer-generated brand story. It is about an American with Croatian roots that moved from America to the small town of Šestanovac near Makarska in Croatia and open a burger bar. He uses

all local ingredients and very soon became a social media sensation. Users wrote about their good experience to that extent that one newspaper decided to write a story about Mikes burgers. All this would not perhaps be so interesting if the burger bar isn't in rural Dalmatian area, and from Split, you have about half hour drive, maybe even more. The same from Makarska and people come from all over Split county to try the burgers. When Mike was interviewed he not only told his life story but also emphasized how he loves living in Croatia, in spite of the hierarchy and political situation. A positive and refreshing consumer-created a brand story that not only makes you think but also makes you want to go and try Mikes burgers, which only confirms the influence of today's consumers and the influence social media as their communication channel. (www.slobodnadalmacija.hr).

4. BRAND COMMUNITIES INSIDE SOCIAL NETWORKS

The main characteristic of a brand community is an interaction between its members (www.brandbe.se). A brand community is a community that has no geographical restrictions, and it is based on social relations between brand admirers. Brand communities exhibit a sense of moral responsibility, rituals and traditions, and shared consciousness. (Muniz, O, Guinn, 2001). Storytelling is an important part of communities, and stories based on brand experience give meaning to the brand and to its community members (Muniz, O, Guinn, 2001.) A brand community from a consumer's point of view includes the relationship between the consumer and product that is used, between the consumer and the brands, and between consumer themselves (McAlexander et al., 2002).

McAlexander et al (2002), also debated that brand communities should be observed as customer-centric and that the focus should be on users experience of the brand and not the brand of which that experience revolves. The consumer is the focal point as is showed in Figure 3.

Figure 3. Customer-Centric Model of Brand Community

Source: McAlexander, J.H, Schouten, J., Koenig, H.F. (2002). Building Brand Community, *Journal of Marketing* 66(1), p. 38-56

McAlexander et al (2002) wanted to emphasize that this broader model of brand community is necessary to observe in full so the perspective of interaction inside the community is more accurately described and understood. Zaglia (2013) considers brand communities to represent customer relationship tool innovation management and valuable marketing tool.

Virtual environments such as social media enable brand communities to organize in sub-groups around a specific brand, and most of the market research so far researched social media and brand communities separately. (Zaglia, 2013).

The online social network provides a platform where people with similar interests gather and communicate, exchange information, form relations and discuss ideas (Raacke, Bonds-Raacke, 2008). How powerful channel of communication social media is best shows the most recent example in Croatia is a facebook group #spasime (save me), that became a movement within a few days. The group was formed after one post from a Croatian actress after a horrific case of child abuse he became the subject of public debate. More than 30.000 people joined the group in less the five days and the purpose of the group is to organize peaceful protest demanding the laws in Croatia concerning abuse are changed (www.telegram.hr)

When researching brand communities and social media Zaglia (2013) noticed that within social networks additional sub-groups develop embedded communities. It is possible to find on a social network such as Facebook communities or groups that discuss topics like celebrities, education, pets, children, education, political topics, have from several hundred to several thousand members.). There are also examples of other groups on different social media.

LinkedIn users join groups that focus on business events, etc. Facebook offers a different kind of user activities such as fan page or groups. A fan page is formed by either a company or brand or by users themselves. To receive data from the fan page, the user has to click like button and after that, every time there is a change in the content of the fan page, fans received in their newsfeed. On the other hand, groups on Facebook can be open, closed or private and usually have fewer members than fan page. Private groups are not visible to all Facebook users, and one can become a member only if a group administrator includes you as a member. A closed group is visible through a Facebook search engine but to become a member one must be approved by the group administrator. Open groups are visible to everyone and everyone can become a member.

Brand communities can be an important marketing tool and understanding who joins the and why can have powerful managerial implications (Ouwensloot, Odekerken-Schoerder, 2008).

The positive aspect of brand communities on social media for companies is that they have the opportunity to collect first – hand consumer insights. If companies listen and participate in the discussion by members, they could have a better insight into their consumer's needs (www.brandba.se). The negative aspect is that when a company or a brand has a fan page that is available for comments 24 hours a day, 365 days a year it is impossible to avoid negative comments from the community.

We can conclude that brand communities present on social media allow users to freely express their satisfaction or dissatisfaction with a brand or its products. Users definitely have an upper hand because of their undeniable influence. The internet enables the consumer to have influential power and companies need to adapt. Listening to consumers, taking their requests seriously, and staying to consumers as close as possible is imperative for companies on social media. A long lasting bad reputation is sometimes only one post away, and that is the reality of social media communication for companies (www.brand.ba).

5. CONCLUSION

This paper main objective was to explore how well brands adapted to social media. It soon became very clear that brands adapted. Perhaps they are struggling at times, but they are trying to keep up because they understand that social media is where the consumers are, and where all brands need to be if they want to succeed. What also can be concluded researching for this article is that social media empowered the consumer and made him an equal participant of the brand success as much as brand managers and brand owners are. This is also what will be a future obstacle for all brands who do not put the customer as the focal point of their marketing strategy. We can also conclude that the today's consumer is very aware of its power and influence which leaves brand managers in a position where they have to understand that trying to have complete control of the brand and its communication on social media is impossible. Social media interaction is happening 24/7 and 365 days a week, and there will always be more consumers than there are brand managers. The only way for brands to be successful in the social media era is to be closer to consumers and their wants and needs. This can be in great deal achieved through brand communities, fan pages, blogs as well as collaboration with influencers. Influencers and their impact on brand success are also what should be further researched and determined if it is a trend or a more permanent marketing tool. No matter what media is popular at the moment, humans will always be social beings, and telling stories and experiences, sharing our opinions and worries will always be a necessity. Social media made that need global, erasing all physical borders for people to interact. Today it is perfectly normal that if you are a part of a brand fan group that you can read about experiences of brand users from all parts of the world, also reviews on products and services present on social media. Consumers will always believe another consumer brand story rather than the ones created by companies because they can relate to other people experiences. They see them as equals as opposed to brands. This is the biggest threat to brands and companies, because the difference between success or failure, despite all the work on the behalf of brands and brand managers, in the end, can be in one post. This is also the biggest strain on the relationship between consumers and brands. Social media made companies try more, work more to keep their customers, making them more creative, and keep them in a constant state of alert (not to say fear). On the other hand, consumers are more vocal, not afraid to criticize or demand what they consider is their right, and due to social media, they definitely have more power than ever and are very aware of it.

Abstract

Experience can be regarded as a personal occurrence with highly emotional significance obtained by the consumption of products and services. To develop a distinct value-added service, practitioners attempt to provide memorable experiences for customers. The positive experience of the event meets the visitors' needs but is also a prerequisite of a revisit intention as well as of the level of consumption. The subject of this paper is the analysis of the Karlovac Advent Fair visitor experience and the relatedness between experience and expenditure intent. The aim of this paper is to demonstrate the relatedness between visitor experience (independent variable) and their expenditure intent (dependent variable) at the Advent Fair.

The main hypothesis is as follows:

MH - There is a relatedness between the experience and expenditure intent of the Karlovac Advent Fair visitors.

The study also tested the following hypotheses:

H1 - There is a correlation between the overall atmosphere of the Karlovac Advent Fair and visitor expenditure intent.

H2 - There is a correlation between the novelty of the Karlovac Advent Fair experiences and visitor expenditure intent.

H3 - There is a correlation between the experience based on the spirit of Christmas in terms of warmth and aesthetics of the Karlovac Advent Fair and visitor expenditure intent.

H4 - There is a correlation between experiences based on the local culture and visitor expenditure intent.

Exploratory research of visitor attitudes of the Karlovac Advent Fair was conducted on a convenience sample, which is a form of non-probability sampling, in the period from December 14th to December 30th, 2018. The hypotheses were tested using the correlation and linear regression method. The observed variables were described using descriptive statistics. This exploratory research was carried out with the purpose of highlighting the significance and the role of the visitors' event experiences on expenditure intent.

Keywords: experience, memorable experience, Advent, visitors, visitor expenditure intent

JEL Classification: Z32, Z33

1. INTRODUCTION

The subject of this paper is the analysis of Karlovac Advent Fair visitors' experiences and the analysis of their expenditure intent during the visit. The aim of this paper is to demonstrate the correlation between the visitor's experience (independent variable) and their expenditure intent (dependent variable) at the Advent Fair.

The research questions were:

1. What was the experience of Karlovac Advent Fair visitors?
2. Were Karlovac Advent Fair visitors in the year 2018 ready to spend more money in order to reach a memorable experience?

Exploratory research of visitors' attitudes on Karlovac Advent Fair was conducted on a convenience sample, which is a form of non-probability sampling, in the period from December 14 to December 30, 2018. The hypotheses were

tested using the correlation and the linear regression method. There were conducted interviews on 350 Karlovac Advent Fair visitors, 202 domestic visitors (57.7%), 113 trippers (32.3%) and 35 tourists (10%). The size of the main sample is estimated at the level of the daily visit of Karlovac Advent Fair in the year 2018 based on the data from the organizer's web site (Association Izvan Fokusa, 2018). The daily data size of the Karlovac Advent Fair visitors according to the relevant source is 3.000 visitors per day, the significance of the sample of Karlovac Advent Fair visitors is estimated on a daily basis and is 11.66%. The questionnaire contains 23 closed questions and 1 open question. Attitudes of the respondents were measured by the Likert scale ranging from 1 to 5 (1-lowest score, 5-highest score). The observed variables were described using descriptive statistics. This exploratory research is being carried out with the purpose of highlighting the significance and the role of the visitors' event experiences on visitor's expenditure intent. The results of this exploratory research are of benefit to those subjects who manage the organization of various manifestations in order to improve the quality of the service. The data was processed in Microsoft Office Excel. The questionnaires were anonymous.

2.THEORETICAL BACKGROUND

2.1. TOURIST EXPENDITURE

Nowadays, tourism becomes one of the main drivers of the development of cities and regions. The success of the tourism sector most often affects the success of many other sectors such as agriculture, manufacturing, transport, retailing and many other production and service sectors. Literature review shows that most of the authors (Nicolau and Mas, 2005; Fredman, 2008; Brida and Scuderi, 2013; Craggs and Schofield, 2009) analyzed tourism demand at macro level in which the unit of analysis is aggregated data (total arrivals, nights spent at tourist accommodation establishments and total tourist receipts). Yet, research of the level, structure, and determinants of micro-level tourist expenditure is an essential issue in determining the economic impact of tourism for a destination (Soldić Frleta, 2017).

The analysis of individual tourist expenditure and of visitor spending behavior (consumer behavior) can play a crucial role in achieving a better understanding of the tourism economic benefits for a destination (Disegna and

Osti, 2016). The consumer's behavior is the study of how, where, when and why people purchase or do not purchase a service or a product. It combines elements from psychology, sociology, social anthropology and economics (Fotiadis, Vassiliadis and Piper, 2013; Kamenidou, Mamalis and Priporas, 2009; Kamenidou and Priporas, 2010). According to Narayan and Prasad (2008) and Blackwell, Miniard and Engel (2010) the consumer behavior is a multidisciplinary science which not only studies the decision-making process and the actual purchase of the product, but also the further activities of the consumer after the purchase of the product, such as use, evaluation and disposal of the product or service. The main goal of consumer behavior theory is to understand the decision-making process of individuals or group of people. It studies the characteristics of individual consumers, such as the demographic and behavioral variables and the influence of the consumer experiences (Fotiadis, Vassiliadis and Adronikidis, 2014).

2.2. THE CONCEPT OF EXPERIENCE

The experience is the direct result of the consumption of products and services. The search for experience is something that is inherent to all indicators between tourists and tourists service providers (Lončarić, Dlačić, & Kavran; 2018, 104). Experience co-creation can create added value for visitors and hosts and also helps to enhance the authenticity and distinctiveness of a destination. Customers have the opportunity to choose from a wide selection of products and services, but they may still be dissatisfied if there is a lack of products or services that could enrich them with valuable experience (Lončarić, Dlačić & Kavran. 2018, 105).

Experience marketing is based on the experience economy theory of Pine and Gilmore (1998), who claimed that experience is a distinct economic offering, alongside commodities, goods, and services (Lončarić, Dlačić, Kavran; 2018, 105). Pine and Gilmore (1998) focused on the emotional, physical, spiritual and intellectual impressions that are felt by individuals during an event (Tung & Ritchie, 2011, 1368) more research must be done to uncover the essence of what exactly makes certain experiences special, spectacular, and fittingly, memorable. This study sought to explore the essence of MEs based on research from the field of psychology, with a view to understanding the cognitive processes that impede individuals from paying attention to their experi-

ences, as well as the conceptual processes of memory formation and retention. In-depth interviews revealed four key dimensions of MEs: affect, expectations, consequentiality and recollection. Finally, we propose several avenues for future research on MEs. © 2011 Elsevier Ltd.

From the customer perspective, there are four realms of consumption experience (the 4Es): entertainment, educational, escapist and aesthetic (Pine II & Gilmore, 1998, 102) a gram-negative enteric bacterium, is capable of secreting a number of proteins extracellularly. The types of activity found in the growth media include proteases, chitinases, a nuclease, and a lipase. Genetic studies have been undertaken to investigate the mechanisms used for the extracellular secretion of these exoproteins by *S. marcescens*. Many independent mutations affecting the extracellular enzymes were isolated after chemical and transposon mutagenesis. Using indicator media, we have identified loci involved in the production or excretion of extracellular protease, nuclease, or chitinase by *S. marcescens*. None of the mutations represented general extracellular-excretion mutants; in no case was the production or excretion of multiple exoproteins affected. A variety of loci were identified, including regulatory mutations affecting nuclease and chitinase expression. A number of phenotypically different protease mutants arose. Some of them may represent different gene products required for the production and excretion of the major metalloprotease, a process more complex than that for the other *S. marcescens* exoproteins characterized to date.

veloped a scale based on the model focusing on the bed-and-breakfast industry (Oh et. al.; 2007, 126). Hosany and Witham (2010) further tested the scale on cruisers' experience (Hosany & Witham, 2010, 358), Lee and Jan (2015) tested the scale on recreation experience and environmental attitude on the environmentally responsible behavior on community-based tourists in Taiwan (Lee & Jan, 2015, 11) and on recreation experience on environmentally responsible behavior of Liuqiu Island in Taiwan (Lee, Jan, & Huang, 2015, 10). Experience level is significantly correlated with happiness and perceived quality of life (Schmitt; 2010, 98). Verbauskienė and Griesienė (2014) in their analysis of experience types suggest that the experience of each person is individual, subjective and constantly changes the parts of human life (Lončarić, Dlačić, Kavran, 2018, 105). It depends on the time factor, the phase of buying and the level of experience a customer is at (pre-experience, experience, post-experience). Clawson and Knetsch (1966) incorporated the influences and personal outcomes that begin before the trip and after the tourist returns from the destination (Tung & Ritchie, 2011, 1368).

Tourist experience is an individual's subjective evaluation and undergoing (i.e. affective, cognitive and behavioral) of events related to his/her tourist activities which begin before (i.e. planning and preparation), during (i.e., at the destination) and after the trip (i.e. recollection) (Tung & Ritchie, 2011, 1369). Many authors researched the tourist experience by exploring connections between concept, authenticity, and motivation (MacCannell; 1973 Feifer, 1985; Ryan; 2002). Two research paths have diverged from the original research source exploring tourism experiences. The first is social science approach (Cohen, 1979; Lee & Crompton, 1992, Urry, 1990, Zatori & Beardsley, 2017, 19). The second approach is marketing and management centered. This customer-oriented approach integrates supporting customer experience that is driven from the experience.

Experience marketing efforts are seen as one of the ways of motivating tourists to visit a specific destination, as tourists are ready to spend more on products and events that will provide them with a different memorable experience (Schmitt; 2010, 63). Collaboration in creating experience should be approached from the perspective of the individual tourist who is engaged with an event on an emotional, physical, spiritual or intellectual level (Pine & Gilmore, 1998; Lončarić, Dlačić, Kavran, 2018, 106). Tourist travel can enrich someone's everyday life as it involves new experience (Neal et. al., 2007) in visiting specific

destination and experiencing destination offers like culture, gastronomy, or natural landscapes (Lončarić, Dlačić, Kavran, 2018, 106).

2.3. EVENT EXPERIENCE

There have been a number of conceptual studies of the tourist experience and memorable experience but the literature on event experience is understudied and under-conceptualized with focus on motivations, satisfaction and economic impacts (Gursoy, Kim & Uysal, 2004; Berridge, 2007, Morgan, 2008; De Geus et. al., 2015; Marković et al., 2018, 232). Planned event experience and the meanings attached to them are the core phenomenon of event studies (Getz; 2014) and it is recognized that special event experience should be unique, fluid, engaging and memorable, creating an ever-changing perceptual novelty (Schmitt, 1999; Marković et. al. 2018, 232). Beard (2014) highlights the important role of creative event programming in facilitating engaging and memorable attendee experience (Marković; et. al., 2018, 232). Events have been defined as a one-time or infrequently occurring event of limited duration that provides the consumer with leisure and social opportunity beyond everyday experience (Jogo & Shaw, 1998; Marković et. al., 2018, 232). Many definitions of “special events” exist, with a general academic consensus that they are unique, infrequent transient occasions, characterized by celebration, festivity, tradition, community spirit and the opportunity for special, social, cultural and leisure experiences (Getz, 1997; Goldblatt, 1997; Yeoman et. al., 2004, Shone and Parry, 2013; Marković; et. al. 2018, 233). Special events provide opportunities for a memorable experience.

2.4. MEMORABLE EXPERIENCE

Memory is an important dimension of the tourist experience (Pine & Gilmore. 1999; Larsen, 2007; Zatori & Beardsley, 2017, 22). Memories can be defined as filtering mechanisms which link experience to other attitudinal outcomes of the tourist event (Oh et al., 2007, 123). In other research, perceived overall quality and customer satisfaction have been used as global evaluations immediately following a consumption experience or a destination visit (Oh et al., 2007, 123). The importance of a memorable tourist experience is underpinned by the theory of experience economy (Pine & Gilmore, 1999) which argues that memorable experience is what created value for a business and defines

its competitive advantage (Zatori & Beardsley, 2017, 18). Memorable tourism experience refers to the memory of visitors, their feelings and emotions experienced during a tourism activity (Lee, 2015; Coelho, 2018, 15).

Ali (2016) found that a creative-tourist experience may significantly impact an individual's memories, satisfaction and their intentions to revisit and recommend (Ali, Ryu & Hussain, 2016, 85) few empirical studies have focused on the constituents of creative tourists' experience and its consequences. This study aims to bridge this research gap by examining the effect of creative tourists' experience on their memories, satisfaction, and behavioral intentions. Data were collected from 296 creative tourists, selected through purposive sampling, at selected resort hotels in the Malaysian states of Terengganu and Kedah. The results show that creative-tourist experience is a second-order factor with five dimensions, namely escape and recognition, peace of mind, unique involvement, interactivity, and learning. The results of structural equation modeling show that creative tourists' experience is a good predictor of their memories, satisfaction, and behavioral intentions. The proposed model and findings can greatly help researchers and practitioners understand the concept of creative-tourist experience and its complex relationships with their memories, satisfaction, and behavioral intentions.

A total of 447 respondents completed a survey conducted at four main heritage sites in Tainan, Taiwan. Using structural equation modeling (SEM, creative experience of visitors in pottery-making activities (Hung, Lee, & Huang, 2014, 38) and the influence of core-consumption experience on the nostalgia intensity, word-of-mouth activity and revisit intentions in Greek summer campers (Triantafylli-

dou and Siomkos, 2013, 197). Creating a memorable experience is the essence and *raison d'être* of the hospitality industry (Pizam, 2010, 343). More research must be done to uncover the specific elements of what makes certain experience special, spectacular, and memorable. The central role of tourism planners is to facilitate the development of an environment that enhances the likelihood that tourists can create their own memorable tourism experience (Tung & Ritchie, 2011, 1369). Destination managers cannot directly deliver a memorable experience to tourists since individuals recall experience subjectively and uniquely even though tourism planners may have, provided objectively equivalent services, events, and activities. It is crucial to understand the underlying essence of memorable experience so that tourism planners can enhance the probability of delivering the tourists those experience that is special, cherished and truly memorable (Tung & Ritchie, 2011, 1369).

Many researches investigate memorable experiences (Kozak, 2001; Lehto et al. 2003; O'Leary & Morrison, 2004), memorable tourist experience (Tung & Ritchie, 2011; Kim et al., 2012; Kim et al. 2012; Kim & Ritchie, 2013; Aroeira, Dantas & Gosling, 2016; Knobloch, Robertson & Aitken, 2016; Kim & Jang, 2016; Tsai, 2016) memorable experience with experience outcomes such as loyalty, word-of-mouth, or returning visitors, or subjective well-being (Oh, Fiore, & Jeoung, 2007) potentially, tourism research across various destinations. Focusing on the bed-and-breakfast industry, the authors conducted preliminary qualitative studies and a subsequent field survey to collect data from bed-and-breakfast owners and guests to develop and test a proposed model of experience economy concepts. The proposed measurement model includes four realms of experience and four theoretically justifiable nomological consequences. The data supported the dimensional structure of the four realms of experience, providing empirical evidence for both face and nomological validities of these realms and a starting point for measuring emerging experience economy concepts and practices within lodging and tourism settings. The authors discuss ways the measurement scale can be further refined for adoption by destination marketers and directions for future research.

Kim, 2010) hedonic activity, and local culture positively affected the autobiographical memory of recollection and vividness of past experiences. Specifically, the experiential factors of involvement and refreshing experiences are found to increase an individual's ability to recollect past travel experiences and retrieve the experiences vividly. Alternatively, the experience of local culture enhances the recollection of past travel experiences, albeit not as vividly. The findings of the present study suggest that marketing efforts used at the anticipation stage of travel experiences are necessary to provide memorable travel experiences. The theoretical and managerial implications of the results obtained are discussed in detail.", "author": [{"dropping-particle": "", "family": "Kim", "given": "Jong-Hyeong", "non-dropping-particle": ""}, {"parse-names": false, "suffix": ""}], "container-title": "Journal of Travel & Tourism Marketing", "id": "ITEM-1", "issue": "8", "issued": [{"date-parts": [{"2010"}], "page": "780-796", "title": "Determining the Factors Affecting the Memorable Nature of Travel Experiences", "type": "article-journal", "volume": "27"}, {"uris": [{"http://www.mendeley.com/documents/?uuid=216da175-fb6a-4a58-a324-a6c5c369cdc7"}], "mendeley": {"formattedCitation": "(J.-H. Kim, 2010; Uysal, Perdue & Sirgy, 2012; Kim, 2014; Kim & Ritchie, 2014; Manthiou et al. 2016; Mathis et al. 2016; Zatori & Beardsley, 2017, 18). Other factors such as eWOM, mindfulness level, and hedonic happiness were investigated on tourist experience in on-site conditions (Zeng & Gerritsen, 2014; Zatori & Beardsley, 2017, 18). A positive memorable tourism experience has been defined as a tourism experience positively remembered as recalled after the event has occurred. Many authors researched feelings such as sociability, pleasure, happiness, irritation, guilt, sadness and worry (Wirtz et. al. 2003; Larsen & Jenssen, 2004; Kim et al., 2010, 13). The personal memory of purchase experience is a valuable information source for future decision –making (Hoch & Deighton, 1989; Kim, 2014, 36).

Kim et. al. 2012 and Kim et. al. 2012 developed the memorable tourism experiences scale after cross-referencing the literature of memory with that of tourism experience (Kim & Ritchie, 2014, 330) The study of Kim Jong-Hyeong (2014) suggested that memorable tourist experiences are composed of the

following seven dimensions: hedonism, refreshment, social interaction, and local culture, meaningfulness, knowledge, involvement and novelty (Kim, 2014, 36). When consuming tourism products (experiences), unlike other activities and products, people primarily seek enjoyment (**hedonism**/pleasure) (Kim, 2014, 36). In empirical tourism studies, researchers found that hedonic experiences allow tourists to construct memorable experience (Dunman & Mattila, 2005; Tung & Ritchie, 2011; Kim, 2014, 36). **Refreshment** and recuperation were among the major motivations of tourists who attend special events and festival (Leblanc, 2003), feeling of being refreshed positively influences people`s memories of travel (Morgan and Xu, 2009, 216). **Novelty-seeking** has been consistently reported as another important component of the subjective tourism experience and a popular motivation for an individual to travel (Dunman & Mattila, 2005; Farber & Hall, 2007; Kim, 2014, 36). Chandralal & Valenzuela (2013) confirmed that the perceived novelty, experiencing something new (e.g. culture, food, accommodation) and encountering different types of tours is a component of memorable holiday experience (Kim, 2014, 36). **Involvement** in a customer experience reinforces an individual`s effective feelings when evaluating experience and stimulates cognitive analysis at the deep level (Block & Richins, 1983; Blodgett & Granbois, 1992; Craik & Lockhart, 1972; Swinyard, 1993; Kim, 2014, 37). Pine & Gilmore (1999) indicate that when individuals find themselves immersed in an activity, the individuals are more likely to have a memorable experience (Kim, 2014, 37). Numerous respondents indicated that the tourism experience from which the visitors gained new knowledge concerning the destinations visited were among the most memorable (Kim, 2014, 37). Customers search for **meaningful** experiences within their travel and tourism activities (Kim, 2014, 37). Meaningful tourism experiences were found to last longer in human memory (Tung & Ritchie, 2011, 37). Tourist can unexpectedly realize negative emotions or feelings during their tourism experiences if these emotions are sufficiently intense, the emotions can result in **adverse feelings** (e.g. anger and frustration) which leads to negative memorable experience (Kim, 2014, 37).

3. RESEARCH RESULTS

The objective of this study is to identify the constituents and factors which contribute to the memorability of visitors` experience on Karlovac Advent Fair.

The research instrument was divided into six parts, comprising five main research constructs (overall atmosphere, novelty, the spirit of Christmas experience, local culture and visitors' expenditure intent) and respondents' demographic characteristic. All measures were derived from previous literature and modified according to the context of the present research. Measures for overall atmosphere, novelty, spirit of Christmas experience and local culture were taken from the literature on memorable tourism experience (MTE) scale (Kim, Ritchie & McCormick, 2012, 18) and measure for expenditure (tourist's level of expenditure dedicated to the lived experience) were taken from the literature on tourists level of expenditure dedicated to the experience (Buonincontri et al., 2017, 269) a survey was designed, and data was collected from 385 tourists visiting Naples, Italy. A path analysis revealed that the interactions among tourists and tourism service providers and the active participation of tourists are antecedents of experience co-creation in the tourism industry. Experience co-creation positively affects the satisfaction of tourists, their level of expenditures, and their happiness. Study results also revealed that the attitude of tourists of sharing their experiences with others does not influence experience co-creation. As one of the first studies in this area in the field of tourism, this study contributes to the body of knowledge by proposing and empirically testing a model that shows three antecedents and three consequences of experience co-creation in tourism.

The sample consisted of 350 respondents classified into three target groups, mostly domestic visitors (57.71%), trippers (32.3%) and tourists (10%). There were more females (60.29%) than males (39.71%), approximately mature ages.

Tourists stayed mostly in hostels (37.14%), lodgings (39.71%) and hotels (11.43%).

Table 1. General characteristics of Karlovac Advent Fair visitors in the year 2018

GENERAL CHARACTERISTIC		PERCENTAGE
GENDER	FEMALE	60.29
	MALE	39.71
AGE	16 - 25	20.86
	26 - 35	13.71

The coefficient of simple linear correlation, in particular, the Pearson coefficient, was used while testing the hypothesis of this paper. Pearson's correlation coefficient assumes a range of minus one to plus one. The authors (Dawson & Trapp, 2004) find that the values of correlation coefficients from 0 to 0.25 or 0 to -0.25 indicate that there is no correlation, while the values from 0.25 to 0.50 or from -0.25 to -0.50 indicate a weak correlation among variables. Correlation coefficient values from 0.50 to 0.75 or from -0.50 to -0.75 indicate a medium correlation and values from 0.75 to 1 or from -0.75 to -1 point to very good to the excellent correlation between variables.

The tables below show the values of the Pearson coefficient of correlation between the independent variable of this research, which states, "visitor experience" and the dependent variable "visitor expenditure intent".

Table 2: Correlation of aggregate elements of visitor's expenditure intent and aggregate elements of visitors' experience

ALL VISITORS		EX Visitor Experience	VEI Visitor Expenditure Intent
EX Visitor experience	Pearson correlation Sig. (1-side) N	1	,508(**) ,000
VEI Visitor Expenditure Intent	Pearson correlation Sig. (1-side) N	,508(**) ,000	1

** Correlation is significant at the level 0,01 (1-side)

Source: Authors' on the basis of research results (N=350)

The Pearson correlation coefficient value is 0.508 and indicates a positive medium correlation between variables "visitor experience intent" and "visitor expenditure".

Table 3: Correlation of aggregate elements of visitors expenditure intent and overall atmosphere experience

Table 3 shows the result of the correlation of the aggregate elements of the dependent variable “visitor expenditure intent” an independent variable “overall atmosphere”. The Pearson correlation coefficient value, in this case, is 0.439 and indicates a positive weak correlation between “overall atmosphere” and “visitor expenditure intent”. The following stands out: the Pearson correlation coefficient value is the highest in the case of tourists (0.515) and indicates a positive medium correlation between the variables.

Table 4: Correlation of aggregate elements of visitors expenditure intent and novelty

Table 4 shows the result of the correlation of the aggregate elements of the dependent variable “visitor expenditure intent” and the independent variable “novelty”. The Pearson correlation coefficient value, in this case, is 0.384 and indicates a positive weak correlation between “novelty” and “visitor expenditure intent”. The following stands out: the Pearson correlation coefficient value is the highest in the case of tourists (0.656) and indicates a positive medium correlation between the variables.

Table 5: Correlation of aggregate elements of visitors expenditure intent and the spirit of Christmas experience

Table 5 shows the result of the correlation of the aggregate elements of the dependent variable “visitor expenditure intent” and the independent variable “the spirit of Christmas experience”. The Pearson correlation coefficient value, in this case, is 0.449 and indicates a positive weak correlation between “the spirit of Christmas experience” and “visitor expenditure intent”.

The Pearson correlation coefficient value, in the case of domestic visitors, is the highest (0.490) and indicates a positive weak correlation between variables.

Table 6: Correlation of aggregate elements of visitors' expenditure intent and local culture

The table 6 shows the result of the correlation of the aggregate elements of the dependent variable “visitor expenditure intent” and the independent variable “local culture”. The Pearson correlation coefficient value, in this case, is 0.364 and indicates a positive weak correlation between “local culture” and “visitor expenditure intent”.

The following stands out: the Pearson correlation coefficient value is the highest in the case of trippers (0.463) and indicates a positive weak correlation between the variables.

Source: Authors' on the basis of research results (N=350)

The linear regression analysis of the independent variable "visitor experience" and dependent variable "visitor expenditure intent" was created. All variables have a small "p" value and are statistically significant. The coefficient of the independent variable is positive, and it has a positive impact on "visitor expenditure intent". The highest coefficient is for "overall atmosphere experience" (0,561835) and the lowest for "novelty" (0,376224).

Table 8: Elements of visitors' experience (mean, mode)

Source: Authors' on the basis of research results (N=350)

Table 8 shows the result of the most frequent response of visitors (local visitors, trippers, tourists) regarding the overall atmosphere, novelty, the spirit of Christmas, the local culture. The results of the survey for the question related to the overall atmosphere show an average rating of 4.37 by domestic visitors, 4.04 by trippers, 4.11 by tourists which implies an agreement with the statement of the survey questionnaire: "I am delighted with the overall atmosphere of the Karlovac Advent Fair because of the unique experience that delivers". Also, the results of the survey for the question related to the novelty show an average rating of 3.84 by local visitors, 3.48 by trippers, 3.57 by tourists which implies agreement with the statement of the survey questionnaire: "I experienced something new and more different than usual". The results of the survey for the question related to the spirit of Christmas show an average rating of 4.09 by domestic visitors, 3.89 by trippers, 3.89 by tourists which implies agreement with the statement of the survey questionnaire: "I experienced the spirit of Christmas in the true sense of warmth and beauty". The results of the survey for the question related to the local culture show an average rating of 4.31 by domestic visitors, 4.13 by trippers, 4.20 by tourists which implies agreement with the statement of the survey questionnaire: "The local residents are friendly, autochthonous and contribute to a greater intensity of experience".

Since the initial hypotheses of conducted research were: MH - There is a relatedness between the experience and expenditure intent of the Karlovac Advent Fair visitors, H1 – There is a correlation between the overall atmosphere of the Karlovac Advent Fair and visitor expenditure intent, H2 – There is a correlation between novelty of the Karlovac Advent Fair experience and visitor expenditure intent, H3 – There is a correlation between the experience based on the spirit of Christmas in terms of warmth and aesthetics of the Karlovac Advent Fair and visitor expenditure intent, H4 – There is a correlation between experience based on the local culture and visitor expenditure intent, it can be concluded that all aforementioned hypotheses have been confirmed.

4. CONCLUSION

Tourists are the target group that is more willing to spend more money in order to get a memorable experience that completely fulfills them. The correlation of aggregate elements of visitor expenditure intent and overall atmosphere experience is the strongest for tourists. The Pearson correlation coefficient value is the highest in the case of novelty and visitor expenditure. It may be concluded that the motivation of tourists for visiting Karlovac Advent Fair is specific and more oriented to the memorable experience that is the case with other target groups. The linear regression analysis has confirmed that the independent variable “the overall atmosphere” of the Karlovac Advent Fair is the most important for the dependent variable “visitor expenditure intent”. Considering the independent variable i.e. one that the most frequently describe the influence on the dependent variable, in this case, it is the independent variable „overall atmosphere“ of the Advent in Karlovac.

It is suggested a continuous adaptation of the research instrument (survey questionnaire) to the future focus of the researcher's interest and the needs of the target groups (domestic visitors, trippers, tourists). It is recommended to use the results of research conducted to all actors in the formation of the same or similar manifestations in order to improve the quality of services. Improving the quality of services tailored to target groups will have a positive impact on target groups expenditure. Future research could investigate the role of the demographic characteristic on visitors' motives to visit Karlovac Advent Fair and event experience. Also, future research could include comparative analysis with other cities in Croatia.

Abstract

Sector for EU programs and projects (SEPP) is a strategic business unit within the Ministry of Science and Education in the Republic of Croatia. It is also a part of the system for management and control of EU funds for Research, Development, and Innovations. Marketing orientation of the SEPP as a non-profit organization is analysed through processes of planning, implementation, monitoring, and evaluation. Grant schemes and relevant Calls for proposals are products that are offered to scientific organizations, universities, research institutes, and companies at the market. This paper analyses the systemic marketing orientation of the SEPP and activities that are necessary for a better understanding of market needs for the development of new products and for achieving policy goals. The results show that it is important for the SEPP as a non-profit organization to undertake marketing activities in a strategic and

systemic way: to analyze the market and the market needs, and to develop marketing information system, in order to improve the system for management and control of EU funds in the SEPP, its products and services and generally to accomplish better long-term policy results.

Keywords: *marketing orientation, non-profit marketing, science, research, innovations*

JEL Classification: M31, M38

1. INTRODUCTION AND LITERATURE REVIEW

Marketing recognizes and fulfills customers' needs through the process of exchange and transaction. The exchange refers to the process of obtaining the desired product from someone by offering them something in return. Transaction means the exchange of values between two or more subjects (Kotler and Keller, 2008, p. 6-7). The fundamental goal of marketing could be defined as an effective and profitable satisfying of customers' needs.

Marketing has become a framework for understanding the overall human activity and has gone through several phases, from the production phase, the sells phase and the demand phase to the phase of justifying what has been doing (Meler, 2003, p.48). In that context, Meler (2003, p.48) stresses that marketing will be more and more focused on the quality of life and other social goals and less focused on sales. In other words, it has deepened its function in relation to wider social relations and focused more on the qualitative dimension of satisfying the needs of the targeted groups. Marketing can be profit (conventional) and non-profit. However, both are primarily focused on societies (their targeted groups within society) where operate (Meler, 2003, p.49). It is important to note that the division of marketing into profit and non-profit is essentially declarative because non-profit marketing uses techniques, tools, and instruments of generic marketing (Meler, 2003, p.49).

Furthermore, non-profit marketing can be divided into two categories: marketing of non-profit organizations and social marketing. While the marketing of non-profit organizations is focused on the activities of these organizations, social marketing is a tool for a change of social behavior, primarily for the benefit of the target group(s) or society as a whole (Meler, 2003, p.53). Non-profit marketing is applied in various institutions, such as state bodies, local and re-

gional self-government bodies, and civil society organizations, while social marketing is limited to social change initiatives (Meler, 2003, p.53). "Marketing of non-profit organizations is a set of activities designed and directed to planning, implementing, distributing and communicating the activities of organizations that have a certain public interest, but their basic purpose of existence is not profit-making" (Pavičić 2003, p.31). That is the basic difference between conventional and non-profit marketing. Both strive to meet the needs within the exchange process, but while one seeks to achieve the profit, the other's focus is on social benefit or change (Meler 2003, p.62). Moreover, the exchange process for non-profit marketing takes place at the so-called "quasi-market" where the relationship of supply and demand occurs, not always and exclusively of material goods, but very often of intangible ones or their specific combinations (Meler, 2006: 90).

While Meler (2006,p.64) states that the basic forms of non-profit organizations in the Republic of Croatia are associations and foundations, Pavičić (2003,p.24) defers humanitarian, religious organizations, scientific research organizations, educational and nurturing organizations, health and social protection, culture and art, sports and recreation, political organizations and trade unions, associations and ideas movements and other related organizations such as: *state and state institutions*. However, the key to understanding the non-profit organizations is in understanding their purpose, which is not in gaining the profit. If a non-profit organization generates income, it has to be re-invested in activities of the non-profit purpose/mission.

There are many scientific and expert discussions that point out the benefits resulting from the systematic marketing orientation of organizations. Thus, the implementation of the marketing concept in an organization is known as market(ing) orientation (Modi and Mishra, 2010, p.2). Theoretical contributions (Kholi and Jaworski, 1990; Slater and Narver, 1990) and empirical studies point out a positive relationship between market orientation and business performance (Jaworski and Kohli, 1993; Pelha and Wilson, 1996; Slater and Narver, 1990). Modi and Mishra (2010, p.4-5) also show that in various empirical studies on marketing orientation including a large variety of non-profit organizations in different sectors (universities, public services organizations, cultural organizations, and hospitals) there is a positive link between marketing orientation of non-profit organizations and their performance.

Therefore, the marketing orientation of non-profit organizations is an organizational culture that most efficiently shapes the behavior that is needed to create superior value for customers. Benefits of using marketing tools in non-profit organizations depend on the organization and its specifics. In general these organizations have better possibilities (methods) of research the needs of the target group and ways of satisfying them, better options (methods) of securing financial, human and other resources for action, better opportunities (methods) in planning, organizing, conducting and controlling the overall activities of the organization, better understandings among employees/volunteers/departments inside the organization, and the overall innovation activities of the organization (Pavičić, 2001, p.103). In short, non-profit organizations that are using marketing systematically (have marketing orientation) are achieving better results than those that are using marketing activities only rarely/sporadically or do not use them at all (Pavičić, 2001, p.103).

2. CONCEPTUALIZATION

Most of the empirical studies used versions of MARKOR scale developed by Kohli, Jaworski, and Kumar to measure non-profit market orientation, while on the other hand most profit market orientation studies used Narver and Slater measure (Modi and Mishra 2010, p.7). For part of the analysis in this paper, we use three components of the concept developed by Modi and Mishra (2010, p. 9-12). These are beneficiary and donor/stakeholder orientation, peer orientation (competition orientation) and inter-functional coordination (marketing organization). For the purpose of this paper in concept, we use stakeholders' orientation rather than donor because of the nature of the non-profit organization (part of the governmental system).

The marketing orientation will be put in correlation with the activities and the achieved results of the SPPEU. Activities will be analyzed through the current *Manual of proceeding* of the employees within the SPPEU and its importance as an official document defining procedures of business processes. Achieving results in the case of the SPPEU and other organizations within the system of management and control of EU funds is measurable with the rates of absorption of funds and indicators stated in Operational programs. Thus, the main focus of this paper is the connection of marketing orientation with results of usage of EU funds.

In that context official data on absorption developed by the European Commission as well as internal analysis of the Croatian management system for the EU, funds will be used. Therefore, this paper puts in correlation the level of marketing orientation of the non-profit organization (SBU – SPPEU) and its performance results. As the marketing theory shows, at the open market there is a very strong link between the usage of marketing tools and achievement of results, primarily in terms of profit, hereby of the usage of available funds. The lack of marketing orientation has a negative influence on achieving results. We will analyze the current SPPEU results, defined in the percentage of contracting and payment, and the activities that employees of the SPPEU undertake, aiming for the most efficient usage of the EU funds available and for the achievement of the set results.

3. THE SPPEU AS A NON-PROFIT ORGANISATION

Sector for EU programs and projects (SPPEU) is a strategic business unit (SBU) within the Ministry of Science and Education (MSE) in the Republic of Croatia. It is also a part of the System for management and control of EU funds.

SPPEU has been chosen as the subject of this paper's analysis for several reasons: the MSE is a large body that operates in a variety of fields: education, science, technology development, and innovation. This includes various beneficiaries and customers: from kindergartens and pre-school organizations/institutions, primary and secondary education institutions, to higher education institutions, public and private scientific institutes, scientific technology parks, centers of research excellence and private companies that have research and development (R&D) potential/capacity. Furthermore, the SPPEU is a strategic unit in charge of the relevant activities under the Management and Control System of EU Funds, the Specific Objective 1 of the Competitiveness and Cohesion Operational Program 2014 - 2020 (OPCC). Although the scope of the analysis is narrowed to one particular organization, it still remains rather complex. The analysis becomes more interesting and complex given the diversity of goals, organizational tasks, and constellations of relationships between different stakeholders.

The current form of the SPPEU was set in 2017 (by the Regulation of the Government of the Republic of Croatia at its session held on 24 August 2017). Originally, it was established in 2012 as the Sector for International Cooperation and EU Programs and Projects. Before that, the activities (to a lesser extent)

were carried out by the EU Programs and Projects Department (established in 2009). The organization rapidly grew within a decade, adding new functions and responsibilities, while taking charge of substantially higher amounts of EU funds available to the Republic of Croatia from the operational programs for every new financial period.

The scope of work of the SPPEU includes planning, development, and coordination of the relevant strategic documents: the Partnership Agreement, Operational Programs, National Strategies, Smart Specialization Strategies, calls for proposals, evaluation, and selection process of project applications, management of financial allocation, monitoring of the implementation of measures and instruments and their evaluation, risk management, information and visibility measures, the information and publicity activities. In the current financial period (2014 - 2020), the SPPEU is in charge of more than EUR 385 million (85% of which is the EU contribution and 15% is national contribution).

The SPPEU as an organizational unit (sector) is divided into two services, and each service is divided into two departments. Programming and Monitoring Services has two departments: the Programming Department and the Monitoring Department. The Contracting and Financing Services has another two: Contracting Department and Financing Department. There are currently 38 job posts in the sector.

The Manual of Proceedings (Manual) defines all business processes of the SPPEU. In respect to marketing activities, it includes visibility activities that are part of the promotion and therefore part of the marketing mix. Other processes that could be related to marketing activities are defined by the Manual (Chapter J.a.- Preparation of granting procedure) in three segments:

- stakeholders can be invited to work in a working group for the development of selection criteria (6.2.1)
- stakeholders can be invited to contribute to the development of Call documentation (point 6.5.1.)
- public consultation - all public including target groups are able to contribute to the development of Call documentation (6.5.4.).

In this respect, stakeholders and target groups are to some extent included in the definition and improvement of products.

However, when talking about visibility activities, they are defined by Regulation (EU) No. 1303/2013, Article 115, as obligations for the EU Member

States (MSs) relating to the activities of developing communication strategies, providing a single Internet site with all relevant information on EU funds, providing timely information, informing and advertising on results and calls/tenders. These activities have been elaborated in more detail in the Communication Strategy of the European Structural and Investment Funds, which was issued by the MRDEUF in July 2015 and was updated in June 2017. The Communication Strategy of the Operational Program Competitiveness and Cohesion 2014 – 2020 has defined an organizational framework, a communication plan and an annual communication plan with detailed activities and tasks.

The subject activities are defined as “information and visibility” and are transposed into parts of the rules and procedures for managing bodies within the EU funds system. They are coordinated by the Managing Body (the MRDEUF), which has the organizational unit that deals exclusively with these tasks. Likewise, the beneficiaries of the EU funds (products/services) are obliged to implement information and visibility measures when implementing their projects.

In this context, according to the Manual (Chapter M. - Information and Visibility), the SPPEU contributes to the development of Communication strategy (of the whole System), Communication plans, and has appointed a visibility officer for these activities. The Manual also defines the organization of info days, press conferences, publicity and visibility materials, reporting procedures, management of news related to Operational program, informing and graphical and other standards within visibility materials. Activities related to the annual communication plan are also defined by the Manual.

SPPEU participates in all these activities and contributes to the strategy and stated plans. Visibility materials have been developed and disbursed on several occasions. Also, visibility officer regularly communicates with beneficiaries regarding visibility standards and graphics.

The complexity of the SPPEU activities and therefore marketing activities lies in its dual role of both national and EU cohesion policy requirements. While the national policy in the field of science and technology is more focused on the science system itself, financing of research projects, the EU (cohesion) policy requirements are quite different, namely economic growth and increase of employment. In other words, on one hand we focus on pure (primary) science (with the exception of written words in some strategies and rare initiatives of officials with the desire to support innovations), while on the other hand it

is about orientation towards innovations and the aspiration to fund applied science that is oriented more towards the needs of economy. Furthermore, with regard to the target groups (which will be analyzed furthermore), while “national policy” is addressed to all scientists, the EU is mainly addressed to scientists and institutions working in areas defined by the Smart Specialization Strategy.

4. MARKETING PROGRAMME

The marketing program of non-profit organizations consists of the elements of the marketing mix, which is similar to profit organizations while respecting the particular features and particularities of individual elements as well as their mutual structure. (Meler, 2003, p.212).

4.1. PRODUCT/SERVICE

Kotler and his associates define the product as all that can be offered in the market with the purpose of attracting attention, encouraging purchase, usage, consumption and meeting the wishes or needs (Kotler et al, 2006, p. 537). Services are products that consist of activities, benefits or satisfaction that are offered for sale. However, from a consumer perspective in the context of non-profit marketing, the product is a set of material and non-material elements that, in their joint operation, meet the needs of the customer (Meler, 2003, p.215).

The aforementioned concept that takes into account the material and immaterial elements of a product is called the *total product* (Meler, 2003, p.215). Thus, the product does not have to be tangible, but it can be a service or a combination. For the purpose of this paper, the term product will be understood as the total product. A product should in principle meet the needs of a particular customer or group. Products that meet the same need form the product line, while the product program (or mix) represents the totality of product lines or individual products within them. The number of products within the line makes the depth of the product line and the number of lines within the program makes the product width. Optimization of the product program (mix) is a continuous process of providing the best choice for customers in order to meet their needs (Meler, 2003, p.217 - 218).

A product's life cycle includes life stages similar to stages of human life. There are stages of creating ideas, product development, market introduction, product growth, product maturity, aging and dehumidification (Meler, 2003, p.215).

It is important to note that any serious non-profit organization must continuously improve its products as part of its policy if they aim to be more successful than their competitors, to make/keep users loyal and to eventually win the competition.

The SPPEU products (or product program) are non-refundable funds that are provided through calls for project proposals. These funds are, according to a predefined plan, organized in 15 calls (products) that could be grouped in several product lines as follows:

Line 1: Calls / Products related to investments in scientific infrastructure and so-called large projects. The objective of this line is it to meet the needs for building, upgrading, modernizing scientific infrastructure and equipment.

P1.1. Investment in organizational reform and infrastructure in the sector of research, development, and innovation

- ♦ Designed for large infrastructure investments into public scientific organizations (colleges and scientific institutes).
- ♦ Most of the allocated funds: approximately 760 million kunas.
- ♦ Permanent character, there is a likelihood that the product will be offered in the future (continuation of the investments).

P1.2. Preparation of Industrial Research and Innovation (IRI) Infrastructure Projects

- ♦ Designed for the preparation of infrastructure investment documentation for public scientific organizations
- ♦ A smaller amount of funds: approximately 45.6 million kunas
- ♦ Permanent character, the third call of this character during several years; is likely that the product will be offered in the future (continuation of the investments).

P1.3. Large project: “Children’s Centre for Translational Medicine “Children’s Hospital Srebrnjak

- ♦ About 430 million kunas

P1.4. Large project: Open scientific infrastructural platforms for innovative applications in the economy and society – O-ZIP

- ♦ About 461 million kunas for Institute Ruđer Bošković

P1.5. Project CALT

- ♦ About 121.5 million kunas for Institute of Physics

These three products/calls have no permanent character and relate to large individual investments

Line 2: Calls/products for conducting RDI activities

P2.1. Support to Centers of Research Excellence

- For research activities and investment in scientific equipment
- 380 million kunas
- The product may be placed in the future (medium durable character).

P2.2. Science and Innovation Fund (SIIF)

- Designed for RDI activities of two or more scientific organizations; focus on research results that need to respond to market needs.
- About 158 million kunas
- This is already the 3rd call (the third placement of funds), a possible continuation of investments (durable character).

P2.3. Strengthening Capacities for Research, Development, and Innovation (STRIP)

- Designed for collaborative research activities between scientific organizations and companies
- Around 181 million kunas
- Permanent character.

Line 3. Calls/products aimed at creating synergies with HORIZON 2020 investments

P3.1. The building of scientific excellence through synergy with the European Research Council (ERC) - 22.8 million kunas

P3.2. Development and strengthening of synergy with horizontal activities of the OBZOR 2020 program: Twinning and ERA chairs -9 million kunas

P3.3. Development and strengthening of synergy with horizontal activities of the OBZOR 2020 program: Teaming - 152 million kunas

Line 4. Calls and products aimed at strengthening the ecosystem

P4.1. Project "Scientific and Technological Foresight" – 15.5 million kunas

P4.2. Project 'HR_ZOO- Croatian scientific and educational cloud' - 196.8 million kunas

4.2. PRICE

The price has a great significance in relation to the customer in non-profit marketing. With regard to the prices of products in non-profit marketing, we generally have the following situations: (a) the product has the price and is entirely paid by the customer, (b) the product has a price but the price is paid only partly by the customer and (c) the product has a price but the customer pays for it indirectly (through contributions and taxes). What matters is the fact that the product has a certain value (its usefulness). Depending on the level of marketability, its price can be a full price, partial, differentiated or product free for users (Meler, 2003, p.240). It should be noticed that consuming/using a particular product could have a certain cost for customer/beneficiaries (Meler 2003, p.247 - 249).

The SPPEU products (services) are free for users (paid indirectly by EU citizens through taxes). However, some counter-claim is requested. In other words, they do not pay the price of the product but are expected to do certain activities and achieve pre-defined indicators. The SPPEU products are most similar to those of financial institutions (banks, investment companies, etc.) such as loans, equity, and venture capital investments. Unlike the latter, where a customer has to pay for a product a certain price (interest, ownership, etc.) in the case in question, the customer does not pay interest but has to achieve pre-defined required indicators (as a policy requirement) and in some cases to co-finance the usage of the product. This means that the usage of certain products is conditioned by own contribution, thus there are products where the customer/beneficiary is obliged to contribute from 15% to 50% of the total project (product) value. In addition, there is also cost of preparing project documentation and administration costs during implementation that in some cases is arranged within the call (is free to the customer) and sometimes the customer has to secure the costs from its own resources.

In regard to the costs related to the policy requirements the customer, in return for the money received, has to achieve certain goals and indicators. Often these indicators are in line with what a customer plans and needs, but often they are settled in such a way that customers are required to perform the certain extra engagement. For example, in case of a product/call for modernization of infrastructure and equipment, users are required to achieve results related to scientific productivity or economic responsibility: more and better scientific publication, better co-operation with the economic sector.

When defining the price, competition should be considered. In the case of the SPPEU products, the market is not saturated yet and strategic marketing is only partly used. Thus, it could be stated that the price mechanisms are not been systematically used.

4.3. DISTRIBUTION

Distribution is an element of a marketing mix that relates to the way how a product comes from the producer to the consumer. The task of distribution is to deliver the product at the right time to the right place. In non-profit marketing, the distribution may be direct or indirect, meaning with or without an intermediary, and in its nature, it may be extensive, selective and exclusive, but in any case, it should be directed towards the customer (Meler, 2003, p.251-252). Extensive distribution brings the product as close as possible to the customer. In selective distribution, products are distributed through a small number of sales points on a number of intra-local markets, so the customer has to make a certain effort that generates certain costs. In the context of exclusive distribution, the products are distributed over a small number of sales spots/outlets to one or several local markets. However, today the electronic distribution (internet) has become extremely important and it became a dominant channel of distribution.

In terms of product distribution, the SPPEU uses electronic/internet distribution. Distribution is made via electronic service eFunds for all processes and communications. That way product became available to everyone under the same conditions. Thus, we have the combination of wide availability and exclusivity of the site (one portal, one e-place). On one hand, the product is moved closer to a customer and is easily reachable on the internet, but on the other hand, all customers are required to come to the same spot (move to the product), to a particular internet portal.

4.4. PROMOTION

Promotion is an element of the marketing mix that relates to the form of communication with the purpose of informing, persuading or reminding people of products, services, images, etc. (Meler, 2003, p.257). In this context, the effect of the promotion is directed to helping potential customers find the product that will meet their needs. The overall marketing communications set consists of advertising, personal sales, sales promotion, public relations and direct marketing (Kotler, et al, 2006, p. 719).

The SPPEU in its promotional activities uses the platform of the system for management and control of EU funds. All relevant information is published on the web pages of the Structural Funds www.struktturnifondovi.hr as a focal point of information about the possibilities and activities of all actors and stakeholders in EU funds system in Croatia. The same communication is done also via the *eFunds* platform. Visibility activities are defined within the Manual of Proceedings and represent the most advanced part of business procedures in regard to marketing activities.

These activities aim to bring products closer to customers/beneficiaries and to promote the idea of cohesion policy and the EU itself as a supranational instance that takes care of the well-being of its citizens.

5. BENEFICIARIES AND STAKEHOLDERS

“Beneficiary orientation is the organizational focus on understanding the explicit and latent needs of beneficiaries, designing services to meet those needs and regularly monitoring beneficiary” (Modi and Mishra 2010, p.11). Beneficiaries and customers of non-profit organizations are often very heterogeneous groups with different characteristics. Therefore, in order to qualitatively plan how to meet their needs, it is necessary to segment them into groups. Segmentation is a process when the heterogeneous market is divided into smaller parts with certain homogeneity characteristics (Meler, 2003, p. 197). Segmentation is required because organizations often have scarce resources and they have to focus their efforts in order to fulfill the market needs. Until an organization decides on its targeted market segment, it cannot undertake any strategic marketing decisions (Renko, 2005, p. 210). Each established market segment for a non-profit organization means a specific target/beneficiary group which needs a particular program (product) to meet their needs. Market segmentation criteria may be different due to market diversity. The most common criteria are demographic, socio-economic, geographical, cultural, behavioral and psychological criteria (Meler, 2003, p. 198). Well-established segments should have internal homogeneity, heterogeneity to each other and have to be large enough to be cost-effective and operable (Meler, 2003, p. 198).

The SPPEU target groups/beneficiaries are defined within the OPCC: students, scientists, researchers and enterprises (business sector). However, the beneficiaries of the SPPEU products/services in the form of grants are higher

education institutions, public and private research institutes. The measures/products are directed towards the STEM (science, technology, engineering, and mathematics) area as defined within the Smart specialization strategy. Besides this, more detailed segmentation of the market has not been carried out.

The stakeholder concept was firstly introduced by the Stanford Research Institute in 1963. It includes all parts interested in a non-profit organization's successor without whose support a non-profit organization would cease to exist (Meler, 2003, p.96). Stakeholders could be divided into four groups: those affecting a non-profit organization, those that have the same mission and share the same values as the organization, those interacting with the organization and those who are influenced or affected by it (Meler, p.97). The SPPEU stakeholders are product customers/beneficiaries, higher education institutions, public and private research and development institutes (RDI), researchers, students, managers (directors, rectors, deans, etc.), project organizational units at the aforementioned bodies, technology parks managers, centers, etc. State/regional and local authorities and management (officials) and employees are also stakeholders. Furthermore, public bodies within the System of Management and Control of the EU Funds are the Ministry of Regional Development and EU Funds (MRDEUF) as the Managing and Coordination Body, the Central Finance and Contracting Agency (CFCA) as the Implementing Body, the Ministry of Economy, Entrepreneurship and Crafts (MEEC), the Ministry of Labour and Pension System, small businesses, Innovation and Investment Agency (Implementing Body). The Agency for the Audit of the European Union Funds, the National Science Foundation, the Agency for Mobility and EU Programs (as an implementing agency), counties, cities, and municipalities. Also, there are Central Strategic Bodies: National Council for Science, Higher Education and Technological Development, National Innovation Council. And finally, there are covering EU institutions: European Commission, Directorate General for Regional and Urban Policy, Directorate General for Research and Innovation, Directorate General Joint Research Centre (JRC).

The distribution of the above-mentioned stakeholders by importance is as follows:

- The ones that influence the non-profit organization are the bodies in the management and control system of EU funds (MRDEUF as the most important), EC (Directorate-General for Regional and Urban Policy) as well as central strategic bodies.

- ♦ The stakeholders serving the mission and its values: MRDEUF, implementing agencies (CFCA and other relevant agencies and implementing bodies), beneficiaries.
- ♦ Stakeholders in the largest interaction with a non-profit organization: bodies in the management and control (MRDEUF, CFCA), beneficiaries/customers.
- ♦ Stakeholders affected or influenced by a non-profit organization: first and foremost, customers (beneficiaries) of products/programs but also bodies in the Management and Control System of the EU Funds.

6. PEER/COMPETITION ANALYSIS

Competition between non-profit organizations is reduced to the following areas: quality of the program and technical superiority; product and service quality; price. (Meler, 2003, p. 104). Often this competition is more collaborative, therefore Modi and Mishra (2010 p.11) have introduced term *Peer* rather than competition. However, non-profit organizations, as well as organizations in the profit sector, must be able to identify competitive advantages in relation to peers/competitors (services/products). For our selected subject the competition includes other ministries that carry out similar programs (primarily the MEEC which also manages the OPCC R&D funds). Another important competitor is the EC with its European Research Program - HORIZON 2020. There are also other bodies that allocate funds to the targeted market. Funding resources that include national co-financing are allocated in accordance with national legislation, the National Foundation for Science, private investors, Venture Capital Funds.

Modi and Mishra (2010 p.12-13) have conceptualized inter-functional coordination as the coordinated way of functioning and the utilization of resources by organizational units – the way how marketing activities are organized.

The organization of marketing activities should have at least strategic and operational level but often non-profit organizations have no specific organizational units and do not perform marketing activities systematically (Meler, 2003, p. 273). Accordingly, the SPPEU does not perform its marketing activities in a strategic and systemic way. Most of these activities are fragmented and managed through several organizational units and processes separately, often lacking the coordination and strategic approach. Market research and moni-

toring performance is implemented through the programming and monitoring departments, while the promotion activities are currently carried out by two persons (in line with the defined EU funds management requirements). The promotional activities represent the only systemic part of the marketing activities that are being performed by the SPPEU.

7. DATA PRESENTATION

The European Commission monitors results of six funds (Cohesion fund, Agricultural Fund for Rural Development, European Maritime and Fisheries Fund, European Regional Development Fund (ERDF), European Social Fund, Youth Employment Initiative). In this paper, we are analyzing the management performance of one part of the ERDF that is intended for the R&D in Croatia. The following data, collected and monitored by the European Commission, include resources for research and innovations.

Picture 1. Research and Innovation implementation by MSs

The Croatian absorption and spending of the Cohesion funds for Research and Innovations is low in comparison with other 27 MSs. Croatia is underper-

forming both in the sense of allocating and contracting projects and in spending. By the end of 2018, out of the planned amount of EUR 811,618,244 for research and innovations, Croatia has contracted only 48% and 6% was spent by particular projects. These results show that current activities are not effective enough to achieve the set program goals in the RDI field.

After presenting the financial performance in this chapter we will give an overview of non-financial indicators that are planned in the Operational program as the criteria for measurement of successful implementation and spending of allocated funds. For better insight, we have presented indicator achievements for the Investment priority 1a, namely resources for research and development managed by the MSE (SPPEU).

Table 1. Non-financial indicators defined by the OPCC

Indicator MSE - SPPEU IP1a	Measurement unit	Target value (2023)	Total achieved (2018)	%
Number of researchers in improved RDI infrastructure facilities	Fulltime equivalents	1.215,00	0	0
Number of enterprises cooperating with research institutions	Enterprises	30,00	0	0
Number of R&D&I infrastructural projects	Number	6,00	1	16,6
Number of Centres of Research Excellence supported projects	Number	6,00	0	0
Number of R&D projects conducted by research organizations	Number	75,00	0	0
Scientific publications published in journals indexed in the platform Web of Science (core collection)	Number	36.430,00	54.966,00	160.2

These indicators are to be achieved by the end of the year 2023 for the financing period 2014 – 2020, as three extra years are planned for the achievement of results. Nevertheless, the indicators that monitor the achievements of the portfolio under the jurisdiction of the SPPEU show very low performance at the end of 2018, at half of the financial perspective.

8. DISCUSSION

From the data presented in the previous chapter, it is obvious that Croatia (here primarily the SPPEU as focused and analyzed part of the system) is un-

derperforming in the context of absorption of EU funds and reaching the targeted indicators. This underperformance is especially seen in the research and innovation sector in which the SPPEU operates. This could relate to the lack of marketing orientation, adequate knowledge of market needs, understanding of the beneficiaries and stakeholders, competition and better organization of the marketing activities.

In the broader sense, it could be said that currently no systemic initiative towards marketing orientation (and related activities) in the context of improvement of overall business performance is seen within the SPPEU.

Beneficiary orientation is low performed. Limited market research efforts during the process of developing strategies and operational programs cannot be considered as strategic and systemic marketing activities but may represent a certain experience for the future (marketing) activities. This is a certain disadvantage since the measures/programs/products have to be better market fitted to better respond to the needs of the market. In that context, a more detailed segmentation should be carried out. The market should be divided into different scientific fields/areas, given that research activities and results differ from one field/area to another. For example, in the information and communication technology (ICT), the results can be seen very quickly, while in biomedicine this path is much longer and rather different. In other words, not all researchers and entrepreneurs have the same needs to meet. The segmentation should focus on several target groups. One of them is young researchers (without experience or with little experience) and their retention within public and private research and development sector. Also, special attention should be given to postdoctoral researchers who should become the leaders of the research activities. Additional focus should be on companies with research and development capacity. However, without serious beneficiary orientation, specialized products do not adequately satisfy the needs and do not achieve wanted results. As previously mentioned, the products or grants that the SPPEU provides are placed/invested in one or more of the thematic and sub-thematic areas of the Smart Specialization Strategy. This covers mainly research institutions and companies in the so-called STEM areas, which largely excludes socio-humanist and arts areas of science. This is the only segmentation that exists in the programs (product program/mix) and they (programs/calls) are designed rather genuinely in order to cover as many potential beneficiaries/customers.

In relation to stakeholder orientation, improvement and coordination with stakeholders are also important. They are very important for SPPEU's business processes, especially in terms of impact and sustainability. Although the system of public policy organization is determined and structured, it is important to maintain good business relations.

The peer/competition orientation: decision-makers within the SPPEU should bear in mind that the Croatian market is relatively small. In Croatia, there is a relatively small number of researchers and companies who are beneficiaries/customers of relevant products/services. In addition, there are several other sources through which the market can meet its needs: other domestic and international sources (the MEEC, the Croatian Science Foundation, and the EU Program: HORIZON 2020). Failure to perform its function or poor performance can cause loss or reduction of the resources for future activities. In accordance with the aforementioned, the SPPEU officials should be aware of it and act like active market participants if they want to keep the competitive advantage. It is very important in this context to have well-developed products and services presented to potential customers/beneficiaries, thus directly involving market actors in the process of addressing and stating their needs. This can be achieved by simplifying procedures, improving the calls for proposals' documentation, digitization, which can result in higher quality, faster processes and mutual satisfaction. It is crucial to have good quality and continuous communication with the market. In respect to inter-functional coordination or marketing organization, a lack of decision about introducing strategic marketing activities into business processes represents the real systemic problem. There is no serious, systematic market research. Following the market research, it is necessary to develop a marketing information system that should contain all relevant market data: beneficiaries/customers, stakeholders, products, monitoring performance, efficiency. The Monitoring department can perform the tasks of collecting and analyzing marketing data. These activities should also be linked to the monitoring system of the Ministry which is in the development phase. This system should be functionally linked to a system developed by the MEEC which similarly establishes organized monitoring of the part of the private RDI system.

9. CONCLUSION

This paper presents and analyses the marketing orientation of an independent business unit - the SPPEU within the MSE, from the perspective of non-profit marketing, where the SPPEU in the exchange process seeks to meet the needs of its customers/beneficiaries and to achieve certain objectives of public policy. There are many scientific and expert discussions that point out the benefits resulting from the systematic marketing orientation of organizations. The marketing orientation is put in correlation to achieved results of SPPEU. Achieving results in the case of SPPEU and other organization within the system of management and control of EU funds is the absorption of funds and achieving indicators planned within Operational programs. The data show the connection between the lack of marketing orientation and the current low performance in achieving results.

Although there are certain marketing activities that are well organized and performed (visibility and promotion), there is a space for business improvement which starts with strategic decisions on the introduction of marketing activities and improvement of all business processes especially in regards to beneficiary/customers and stakeholder relations, better understanding competition and improving organizational concepts. The marketing orientation of non-profit organization means more efficient business processes which reflect in satisfaction of the market needs and in the achievement of targeted results.

Abstract

Despite the increasing importance of cultural consumption, the majority of existing research focuses on certain cultural areas, e.g. museums, festivals. There are only a few approaches to examine cultural consumption in general. There are still fewer studies which compare the cultural profiles of lifestyle groups. To fill this hiatus our paper explores the cultural consumption differences among Hungarian consumer lifestyle groups.

Our examination is based on the quantitative research of Töröcsik et al. (2018), which highlights the characteristics of lifestyle groups of 15-74-year-old Hungarian consumers. Our primary research examines the differences in cultural consumption patterns among these lifestyle groups. The research was conducted in 2018 face to face with 2001 respondents.

The latest overall cultural research took place in Hungary in 2008. Therefore it is particularly valuable in our study to give an overview of the cultural habits of the Hungarian population in 2018. In addition to quantifying cultural consumption, cultural analysis works increasingly focus on the cultural background, mentality, and value orientation. The basis of our analysis is provided by the results of lifestyle research, in which the lifestyle groups were separated along the fast and slow pace of life, as well as modern and traditional values. Therefore, the results of our work can trigger the interest of the profession also through the lifestyle groups presented.

Keywords: *cultural consumption, lifestyle, Hungary, consumer behavior*

JEL Classification: D19, G40

1. INTRODUCTION

As marketing professionals and academics, we experience significant changes in consumer behavior: always experiencing new patterns of behavior, new content, and expression forms. The beauty of this work is that we can always find new phenomena in this exciting exploratory journey, the knowledge of which is constantly expanded by the results of social sciences (Töröcsik, 2016). Marketing primarily focuses on shoppers, consumers, their behavior, the reasons for their choices, and their drives. However, new features of behavior have been emerging, such as non-consumption and non-purchase. We can see that these

phenomena also deserve great attention in connection with cultural consumption (Töröcsik et al., 2018b).

Today, we are seeing a new direction of non-buying, labeled pseudo-buying, which is unique in that it is neither shopping nor consumption. Pseudo-buying is a demonstrable habit of the young generation to carry out the purchasing decisions process, but it does not end with actual purchases. They enjoy being informed, seeking, sharing, making a wish list, asking their peers for their opinion. They deal with products/brands before buying and consuming very much and the process seems to satisfy them (Prónay - Hetesi, 2014). The reason for this, on one hand, is the thickness of the wallet; on the other hand, this activity seems to be excellent for leisure. We can see that, like other markets, decision-makers face these new challenges in the field of culture.

Another important consequence of these phenomena is that there is increasing pressure on cultural institutions. For example, because of the low attendance of public (state) cultural institutions financed by public funds, there is a need to prove their social utility (Kay et al., 2009).

Participation in cultural consumption is significantly determined by the socio-economic characteristics of individuals. Cultural consumption is differentiated by demographic variables (e.g. age, gender, parental status) (Chan, 2013). It is also stratified by education level, income and social status (Bennet et al., 2009; Chan 2010). People who are highly educated, have higher incomes, and work in prestigious occupations shows higher participation in cultural consumption than people in less advantaged social positions (Chan 2013) Jaeger and Katz-Gerro's (2010) longitudinal research has also shown, that the predictive power of these stratification variables has not decreased over 40 years in Denmark. The results of Reeves and de Vires (2019) show that consuming certain cultural activities increases the likelihood of upward social mobility, of becoming a supervisor, and of being promoted, so cultural consumption predicts future earnings. Cultural consumption has a higher impact on future earnings like family background, education, cognitive ability, and personality, and it is one of the mechanisms through which inequality is reproduced.

Previous research based on demographical and social status approach gives us detailed information about the different groups with certain cultural consumption patterns and social status. So-called omnivores with higher cultural consumption level tend to be female, well-educated, of higher social status, liv-

ing in urbanized areas, and without young children at home (see Chan 2010). But we have only a little information about their social and political values and personality traits (Chan 2013). Dimaggio (1996) examined the social, cultural and political values of American art-museum visitors, and found that they are somewhat more secular, trusting, politically liberal, racially tolerant, open to other cultures and lifestyles, and much more interested in high culture than non-visitors.

Lifestyle research provides a good starting point for consumer differences, characterization of the segments.

Recognizing the changing market signals, our focus is on examining the cultural consumption of Hungarian consumers. The aim of our study is to explore the cultural consumption differences among Hungarian consumer lifestyle groups. Our examination is based on the research conducted with questionnaires and it highlights the characteristics and lifestyle groups of 15-74-year-old Hungarian consumers with 2001 respondents in 2018.

2. CULTURAL CONSUMPTION PATTERN TENDENCIES, ESPECIALLY IN HUNGARY

The latest European Culture Commission survey was published in 2013 (Special Eurobarometer, 2013). The survey shows a remarkable result that, compared to the previous survey in 2007, we can record a decrease in most cultural activities by 2013. These activities are as follows: watching or listening to a cultural programme on TV or on the radio, reading a book, visiting a historical monument or site, a museum, a gallery, a concert, a public library, a theatre. Only the activity of visiting a cinema shows an increase in participation (with a one-percentage-point rise). The comparison of surveys also shows a decrease in participation rates and frequencies. As the study highlighted, many of these activities involve spending money (to take part in and/or to travel to the venue). The decline in participation may, therefore, reflect on the difficult economic circumstances since the financial and economic crisis began in 2008.

To help identify levels of engagement in cultural activities among citizens from the 27 EU Member States, a simple index of cultural practice has been created based on the frequency of participation and access to the different cultural activities included in this survey. The index distinguishes 4 levels of cul-

tural engagement: very high, high, medium, and low. The average of the EU27 recognizes a decline in participation in cultural activities among citizens. The very high and high levels of cultural engagement changed from 21% to 18%, medium scores fell just one percentage point, from 49% to 48%, and the portion of low engagement increased from 30% to 34%. There are huge differences among the Member States. The Northern European countries' citizens practice the highest level of cultural engagement in general (the proportion of very high and high categories in Sweden is 43%, in Denmark 36%, in Finland 29%, the European average is 18%). The greatest rises in "low" cultural index scores have occurred in Poland (from 31% to 50%) and in Hungary (from 28% to 54%).

An analysis of the reasons may explain the decline in participation rates, and the European survey also provides information. Respondents answered a general question about the main barriers they need to overcome to access culture: "lack of time" was the first answer given (42%), followed by "too expensive" (29%) and "lack of interest" (27%). Lack of interest and lack of time are the main obstacles to participating also in a particular activity (Figure 1).

Figure 1. Barriers to accessing the cultural activities: "And for each of the following activities, please tell me why you haven't done it more often in the last 12 months?"

Source: Special Eurobarometer (2013)

Lack of interest is the main reason for not going to more concerts (29%), visiting a museum or gallery (35%), a theatre (36%), a public library (43%) or attending a ballet, dance performance or opera (50%). Lack of time is the main reason for not going to the cinema (30%), watching or listening to a cultural program on the TV or radio (31%), visiting a historical monument or site (37%), or reading a book (44%). In addition, cost (“too expensive”) is also an important factor and mentioned as a reason for not going, or going less often, to the theatre (20%), the cinema (22%), or a concert (25%). However, the expense is not the main obstacle mentioned by respondents for any one of these cultural activities. The demographical analysis shows that working hours, education and income situation are important factors in participating in cultural activities. The age groups that are most likely to be in work (24-39 and 40-54 years old) and respondents with higher educational level are also more likely to cite lack of time as a reason for not participating in a given cultural activity. Those who left education at an early stage are more likely to say that they have no interest in the given activity. Expenses are a significant factor for those who frequently have difficulties paying bills, as might be expected. In terms of the index of cultural practice, those with a “low” index score are more likely to give lack of interest as a reason for lack of participation than other reasons. Lack of time is more likely to be mentioned by those with a “very high” or “high” score, who given the choice would participate more.

Research in Hungary highlights that there is a huge decline in cultural interest after the 2000s. This decline was not the result of a rearrangement towards popular cultural genres, as we could record a decline in all genres (Hunyadi, 2005; Antalóczy, 2009). These results are therefore in line with EU trends, although we have experienced it before the economically difficult period. The changes can be traced back to several reasons (Kuti 2009).

The group of people interested in high culture has become older over time, and younger generations are no longer involved in the consumption of these areas. We also see that young people have a strong interest in popular music and cinema, but because of the (cheaper) entertainment opportunities provided by the internet, these areas are also somewhat downshifted. Educational qualifications continue to be a decisive differentiating factor: this is also the most influential factor in the quantity and quality of cultural consumption. Although there are significant differences in economic activity. Students with the most leisure time and intensive use of info-communication tools have dropped their

cultural interest significantly. Interesting and most active groups are left out of consumption due to lack of time.

More important findings are highlighted on the basis of major cultural retention studies conducted from the mid-1980s to the present (Pavluska, 2014) (Table 1).

Table 1. Types of cultural consumers in Hungary from the mid-1980s to the present day

In the middle of the '80s	In the middle of the '90s	Millennium	2003	2008	2013
Autonomous culture oriented (15%)	Autonomous culture oriented (15%)	High culture oriented (8%)	Consolidated, traditional consumer culture (9%)	Cultural elite (10,1%)	Various traditional culture lovers (13,7%)
Open-minded – hoarder (24%)	Youthful, entertainment oriented (24%)	Culturally "omnivores" (18%)	Youthful "omnivores" (7%)	All use consumer (8,6%)	Traditional culture picker (10,7%)
Clinging – recreator (26%)	Stay at home – reader (15%)	Recreation/ amusement oriented - (23%)	Monotone revelling, movie watcher - partying (14%)	Easy enjoyment lovers (13,8%)	Culturally diverse (11,9%)
Passive (35%)	Passive – others (17%)	Passives (28%)	Monotone reveling, community center attender (10%)	Culturally curious (20,5%)	Easy enjoyment searchers (16,8%)
	Passive – stay at home, never reader (26%)	Lack of culture consumption/ isolated (23%)	Stay at home – reader (17%)	Culturally passive (47,1%)	Mass event attender, linear revelling (15,2%)
			Passive, outside the culture, bleak (43%)		Culturally passives (31,6%)

Legend: High culture oriented, culturally „omnivores”, enjoyment searchers, passives
Source: Pavluska, 2019

Pavluska (2014) identified the following major trend phenomena of Hungarian culture consumption in the light of consumer typology:

- ♦ The basic structure of cultural stratification is discernible from the beginning of the Hungarian culture research. There has not been any significant rearrangement of cultural consumer types during this period.
- ♦ There is no pronounced rearrangement among the different types, only a shift can be observed towards mass culture and passive behavior.
- ♦ The biggest group consist of people who don't use the cultural institutional network et all:
 - Culturally completely passives, whose cultural consumption is limited to television. The members of the group include the elderly and the low-skilled from disadvantaged areas.
 - Stay at home, classic culture consumers, who are older but qualified people from larger cities.
 - Stay at home, Internet users, which is a major leisure activity among young adults.
- ♦ The portion of classic elite culture consumers is decreasing but they show a homogeneous segment.
 - Members are typically adults (natural decline), who are highly educated intellectuals with good income, high status.
 - Young adults are also consuming popular culture (omnivores).
- ♦ The ratio of leisure time of the middle class is increasing, they are located between intense and passive consumers.
 - Omnivores are new types of consumer culture, in addition to high cultural consumption, they are also widely selected from the more popular genres.
 - A new class, preferring simple and basic entertainment can be differentiated based on the genres. For them, cultural consumption is basically a community experience that serves to relax.

European and Hungarian research findings on cultural consumption patterns show a similar picture of today's cultural market. On the one hand, we recorded a decrease in the intensity and quality of consumption, on the other hand, we also see that these processes cannot be fully explained by the economic downturn and the scarce spendable income: the direction and intensification of interest and taste have changed as well. With the aging of high-culture groups, new generations show different patterns of consumption, shifting towards more popular, easier-to-eat, shared experiences.

3. METHODOLOGY

Our empirical research is based on a personal interview in April-May 2018. During the period of the survey, we interviewed a total of 2001 respondents aged 15-74. The sample represents the adult Hungarian population aged 15-74 by gender, age group (10-year intervals) and the region of residence. In the course of the survey, the behavior and opinion of the Hungarian population will be examined in relation to several topics. These are aging, health innovations, tourism, eating habits, cultural participation, lifestyle. For this reason, research has provided an opportunity to conduct cross-analyzes on larger issues, and to examine the existence of relationships between different topics. Table 2 shows the demographic characteristics of the sample.

Table 2. Sample characteristics (N=2001)

Demography	Percent	Demography	Percent
Gender (total)	100.0%	Settlement (total)	100.0%
Male	48.6%	Budapest	18.6%
Female	51.4%	Chief town of a county	21.2%
Generations (total)	100.0%	Town	32.7%
Young (15-29 years)	23.1%	Village	27.6%
Middle-aged (30-59 years)	54.1%	Household monthly net income (Total)	100.0%
Older (60-74 years)	22.8%	NA	3.6%
Social status (Total)	100.0%	They live very well and they can save.	7.5%
Single	21.9%	They can save only a little.	39.5%
Married	43.3%	It is enough to make a living out of it, but they can't put aside anymore.	43.4%
Lives apart	10.3%	Sometimes it is not enough to make a living (s) of it.	4.8%
Widow	8.1%	There are regular daily living problems.	1.1%
Lives in partnership	16.4%	Legal status (Total)	100.0%
Educational qualification (Total)	100.0%	NA	1.2%
NA	0.5%	Active intellectual worker	42.0%
Primary school	47.6%	Active physical employee	18.7%
Vocational training	32.2%	Student	6.2%
University/college	19.7%	Retired	23.6%
		Unemployed	2.1%
		Another inactive earner	5.3%
		Dependant	0.9%

4. NEW CONSUMER LIFESTYLE GROUPS IN HUNGARY

The starting point for this study is the results of the research of Törőcsik et al. (2019), which carried out on the basis of our survey presented above. The authors defined lifestyle groups using a multivariate analysis of the above-described sample. The basis of lifestyle groups was the model of Törőcsik LifeStyle Inspiration model (Törőcsik 2011). It based on two dimensions, determines the differences between lifestyle groups according to the life pace (fast and slow poles) and values (modern and traditional poles). Figure 2 illustrates the dimensions of the LifeStyle Inspiration model.

Figure 2. Dimensions of LifeStyle Inspiration model

Source: Törőcsik, 2011, p. 344.

Researchers identified 9 lifestyle groups as a result of multivariate analyses. Figure 3 shows the location of these lifestyle groups in the model, Figure 4. compare the socio-demographic characteristics of these lifestyle groups.

Among the groups, career builders and well-off young adults follow trends most: live fast, young, free from responsibility for others, highly educated, live in a good income, and live in the capital. Based on responses to attitudes scales,

career builders are interested in technological novelties, innovations, new products. Shopping is a lovely activity for them, and they can also spend more than before. Regarding their leisure activities, they are happy to undertake outdoor activities that require stronger physical endurance activity (hiking, hiking, skiing, etc.). They are in good health conditions, but they deal with their health a lot. They are looking for gastronomic experiences. They spend their cultural activity outside of the home, and also it is increasingly connected to the internet. The group of well-off young adults still consists of young or young adults who typically do not live alone. They are interested in technological novelties, innovations, new products. They deal a lot with their health. They are good financial opportunities, spend more than they used to. They are increasingly interested in cultural programs, especially outside the home. At the same time, it is also characteristic of them that their cultural activity is increasingly linked to the Internet.

Life enjoying people are a middle-aged feminine group with a slower lifestyle and more traditional values. They are active intellectual and also physical workers. They love to buy, although their financial resources have more limitations than the previous ones. They are eager to participate in natural activities and eating plays an important role in them. Cultural interest is less present in their leisure activity. Recognition desiring people are also a middle-aged group, they are primarily educated from smaller settlements. They are also interested in technological novelties and innovations. Their cultural activity is outside the home, they also traveled last year somewhere on vacation. They feel disadvantaged because of their appearance. Digital tabloids are a young - middle-aged group, those who are disadvantaged in many ways: because of their financial opportunities, physical conditions and also gender. They are interested in new products, however, because of their financial resources, they are more like followers. Resigned is a female group with middle-aged and elderly generations. Because of their financial resources, they have significant limitations. Although they traveled last year somewhere on vacation, they have to take medication permanently for their illness and are therefore limited in their lifestyle. The security aspiring people are from elderly generations. They are typically female with a higher educational degree. They live in rural cities with average income. They make purchases as fast as possible. They are more and more eager to experience nature. Because of their illness and their limited health conditions, they travel for medical tourism.

The precarious and introvert lagging groups perceive the processes that determine the trends and the dynamics of the markets the least because of the slow pace of their life which is coupled with traditional values. These groups are older, low-skilled, are in necessity, and in bad health conditions. Precarious group lives in Budapest, or in major cities, introvert lagging groups in major cities. It is characteristic of both groups that they feel multiply disadvantaged: because they age, physical conditions, appearance, and because they live alone. Because of their health barriers, they spend time for culture mainly at home.

It is noticeable that we do not find any groups in the area of the active-balanced and the countertrend groups.

5. RESULTS - CULTURAL CONSUMPTION PATTERNS OF HUNGARIAN LIFESTYLE GROUPS

In order to compare the participation of lifestyle groups in cultural consumption, we conducted a multivariate analysis. During the interview, we asked the respondents how often they participated in the given cultural leisure time during the past year (once, 1-2 times, 3-5 times, more than 5 times). We examined the following cultural activities: visiting a ballet or other dance performance, a circus performance, a jazz concert, a festival, a classical music concert, a popular music concert, a cinema, a museum or gallery, monuments, historical monuments, sites, being in a community center, visiting a folk music or world music concert, a public library, an opera performance, an operetta or Hungarian song performance, a theatre, being in places like e.g. disco, music club, club, cafe).

As the first step in our research, we conducted a factor analysis using these 16 different cultural activities. We have identified cultural factors that can be used to describe the cultural interest and consumption of Hungarian lifestyle groups.

Factors are terminated by the principal component method with varimax rotation. During the analysis, we had to switch from multiple variables because of their bad behavior. As a result, we could involve 13 different cultures in the study: visiting a ballet or other dance performance, a jazz concert, a festival, a classical music concert, a popular music concert, a cinema, a museum or gallery, monuments, historical monuments, sites, being in a community center, visiting a public library, an opera performance, a theatre, being in places like e.g. disco, music club, club, cafe. Using these variables, we identified 3 factors to describe cultural consumption patterns and direction of cultural interest. Table 3 presents the rotated component matrix resulted from factor analysis. The statistical parameters of these results are acceptable: KMO and Bartlett's Test: 0.881, Chi-Square: 7301.283, and significance level is 0.000. Factor's eigenvalues are > 1 and they explain the 56.108% of the total information.

Table 4. Rotated component matrix with cultural consumption variables

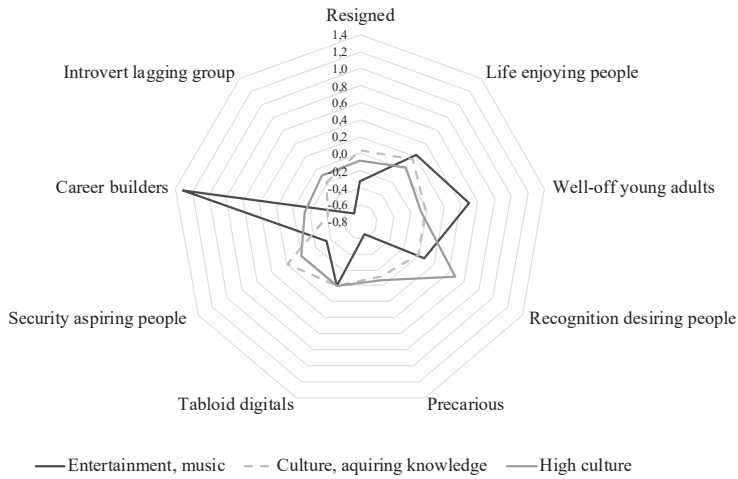

Factors	Variables	Components		
		1	2	3
1	being in places like e.g. disco, music club, club, cafe	0.794		
	visiting a cinema	0.768		
	visiting a popular music concert	0.752		
	visiting a festival	0.704		
2	visiting monuments, historical monuments, sites		0.786	
	visiting a museum		0.720	
	visiting a community center		0.689	
	visiting a public library		0.661	
	visiting a theatre	0.359	0.554	
3	visiting a classical music concert			0.727
	visiting an opera performance			0.673
	visiting a ballet or other dance performance			0.670
	visiting a jazz concert	0.360		0.538

Source: own construction

The first factor includes popular cultural products as visiting places like disco, music club, club, cafe, a cinema, a popular music concert, a festival, so we called it “entertainment and music”. The second factor called “culture and acquire knowledge”, it consists of visiting monuments, historical monuments, sites, a museum, a community center, a public library, and a theatre. The third factor gives the element of “high culture”: visiting a classical music concert, a ballet or other dance performance, an opera performance, a jazz concert.

Using the factors obtained, we examined the differences between lifestyle groups, see Figure 3.

Figure 4. Cultural characteristics of Hungarian lifestyle groups

Source: own construction

As the result shows entertainment and music is the main characteristic of a career builders lifestyle group and most of the other groups. This cultural consumption area is dominated also the patterns of the well-off young adults. The introvert lagging group' displaced position from the mainstream, that their participation is the lowest in the area of entertainment and music.

In high culture, the recognition desired people are in primarily concerned, whose life a moderate life pace with modern values. Only looking at the other groups is a striking difference, or rather a homogeneous characteristic, that the groups show the smallest differences in consumption in the dimension of high culture.

For groups that are primarily members of the older generation, the culture and knowledge acquisition and the high culture can move together, from which the entertainment and the music dimension fall apart. Therefore, we can assume those cultural products that are readily available to popular and broad groups, as emerging market supply elements, could not gain more space in the consumption patterns of older generation culture.

We do not see a segment that is primarily elderly, highly educated and of high social status, who are usually identified as consumers of high culture. The reason for this is that in the dimensions of the lifestyle inspiration model, the social status appears only indirectly, we cannot identify this segment due to their varied characteristics based on values and pace of life.

6. CONCLUSION

Recognizing the deficiency in the academic literature that only a few researches that comprehensively examines cultural consumption patterns. From time to time, studies are being conducted to investigate the differences in consumption and preferences from the socio-demographic and social status side, but the use of lifestyle research is negligible in this market area. One of the reasons for this is that the level of education is still heavily determined by the level of education and the quality of participation in cultural consumption. However, we suggest that lifestyle-based approaches that are well-suited to different markets can bring useful results in terms of the culture that can help understand the behavior of target groups or the lack of consumption.

Earlier research on cultural consumption has shown that cultural consumption is significantly reduced for many years due to the unfavorable economic environment. The situation in Hungary is further undermined by the fact that researchers have registered a decline before the economic recession. Although the structure of consumption in Hungary has not changed significantly, however, we are seeing a shift in the consumption of massive segments of mass culture and passive consumption.

To give an overview of the cultural consumption patterns of the Hungarian population, we conducted a representative survey in 2018. The identification of the lifestyle groups was done by Töröcsik et al. (2019). Based on these results our study examined the cultural consumption differences of the identified 9 lifestyle groups.

In our analysis, we have identified three dimensions of cultural consumption: entertainment and music; culture and acquiring knowledge; and high culture. The differences between the lifestyle groups show that in the dimension of mass culture, as entertainment and music there are huge differences. On the contrary, in the dimension of high culture, most of lifestyle groups show similar low consumption level or the lack of consumption.

Abstract

Today's saturated and competitive market is a great challenge for a company – it is necessary to create competitive advantages in order to be successful.

It is often said that people are the key to success, so when a company has top professionals and experts satisfied with their career and how a company is treating them, that makes a strong base for creating value for customers, too. Care for the employees, from the moment that they joined the company until they leave the company becomes a standard, of furthermore - an imperative - if a company wants to keep its high-quality professionals and attract new talents that can enhance its existence.

Customers today do respect and value good employers and give them support through their loyalty, so employer branding is a long-term and sustainable strategy that empowers corporate brand in total.

The purpose of this paper was to research the marketing aspects of employer branding. The research was conducted through an online survey among students regarding students' perspective on employer branding, for students are future professionals that companies should want to recruit and keep.

The results of the research can serve as a good base for selecting the characteristics that will be communicated inside and outside the company to exist and attract new professionals or talents and also to raise awareness of the importance of employer branding - that will become as important as a corporate brand or a product brand. Satisfied employee means satisfied consumer – and that makes a win-win situation for society as a whole.

Keywords: marketing, employer branding, company's differentiation, employer of choice

JEL Classification: M31, M37

1. INTRODUCTION

Today's saturated and competitive market is a great challenge for a company – it is necessary to create competitive advantages in order to be successful.

It is often said that people are the key to success, so when a company has top professionals and experts satisfied with their career and how a company is treating them, that makes a strong base for creating value for customers, too. Care for the employees, from the moment that they joined the company until they leave the company becomes a standard, of furthermore - an imperative - if a company wants to keep its high-quality professionals and attract new talents that can enhance its existence.

Branding is an important strategy every company can benefit from, for it is a way to differentiate one company from another. Ways to brand a company are numerous, but today we see so many successful companies brand themselves as good employers, the ones that care for their staff... it implies that they care for people in general, so that includes the customers, too. Customers today do respect and value good employers and give them support through their loyalty, so employer branding is a long-term and sustainable strategy that empowers corporate brand in total.

The purpose of this paper was to research the marketing aspects of employer branding. The research was conducted through an online survey among students regarding students' perspective on employer branding, for students are future professionals that companies should want to recruit and keep and we also did an overview of the subject matter.

The importance of communication in human life is unquestionable. Communication is the interaction of at least two sides that results in a certain way. We communicate for different purposes and in so many forms and ways, but always to fulfill the need for social interaction. For people to be able to create new values, both privately and professionally, communication as an art of interaction is the one that enables it.

Communication management is one of the business strategies of our modern era. When we look at communication through the aspects of marketing, we can say that communication as an exchange represents a source of valuable information about the market and about consumers especially. Successful communication is a precondition for a good understanding and satisfying of consumers and their needs and desires. Long-term relationships with consumers lead to creating loyal consumers – consumer loyalty is of multiple values for the company.

2. BRANDING

A brand, in general, represents the name, the value and the association with a company and what it stands for.

According to American Marketing Association, “a brand is a name, term, design, symbol, or any other feature that identifies one seller’s good or service as distinct from those of other sellers” (Schneider, 2003). “Brands can be distinguished from the more generic constructs of products and services, which can be defined as anything offered for sale to a market to satisfy a need or a want. Unbranded products and services are commodities (flour, soap, beer, banking). Brands allow for the differentiation of generic products and services by associating them with particular producers, meanings, and qualities. A brand is the total constellation of meanings, feelings, perceptions, beliefs, and goodwill attributed to any market offering displaying a particular sign. Branding refers to the advertising, marketing, and managerial practices designed to develop, build, and sustain the characteristics, properties, relationships, and signifiers of a particular brand.” (Wiley Online Library, 2015)

Branding is “the process involved in creating a unique name and image for a product in the consumers’ mind, mainly through advertising campaigns with a consistent theme. Branding aims to establish a significant and differentiated

presence in the market that attracts and retains loyal customers.” (Business Dictionary, 2019) It is also a way a customer see us as a company. Keller and Kotler say “Branding is endowing products and services with the power of a brand.” (The Branding Journal, 2018)

When we think of a brand, we think about our customer experience in total, not just the sign, a logo, or a motto... but a quality brand doesn't just happen... it is a result of a planning process and a strategy. Branding helps companies to: gain recognition through consistent communication so customers recognize them more easily; it helps to differentiate a company from another; speaks about a company, what it stands for, describes its core; acts as a motivator and a direction for the staff, too (how to achieve the organization's goals); helps customers to identify with the brand (people do love to be a part of a group, a community, to belong somewhere...); communicates a level of service quality (what a customer can expect when they experience the brand); represents a claim but also a promise to customers (what value will be delivered); helps maintain a focus on a company's original mission and vision as an organization; helps to connect emotionally with customers (having a strong brand helps people feel good at an emotional level when they engage with the company. (Strategy New Media, 2018)

Branding is a strategic way to make the desired impact on many aspects of a company's business. Branding affects:

1. Consumers: As discussed above, a brand provides consumers with a decision-making-shortcut when feeling indecisive about the same product from different companies.
2. Employees/shareholders/third-parties: Besides helping consumers to distinguish similar products, successful branding strategies are also adding to a company's reputation. This asset can affect a range of people, from consumers to employees, investors, shareholders, providers, and distributors. As an example, if you don't like or don't feel connected to a brand, you would probably not want to work for it. However, if you feel like the brand understands you and offers products that inspire you, you would probably desire to work for it and be part of its world. (The Branding Journal, 2018)

Figure 1 Branding and what does it involve?

Source: Your Listing Expert blog, <https://yourlistingexpert.com/why-branding-is-important-for-businesses/> (20-12-2018)

3. EMPLOYER BRANDING

The term employer brand represents how a company is perceived as an employer. Employer brand is vitally important in today's market and there is a big competition for attracting talents to the company. (Attracting Top Talent with a Strong Employer Brand, 2019)

“There are a lot of ways that companies define success: employee satisfaction, customer service rating, profits, sales, number of investors, and the list goes on and on. No matter what your definition is, or if it's a combination of several pieces, there are several things that go into making that success a reality. One of the most important things in the foundation of business success is having the right employees in place. Success grows from having passionate, capable individuals in each of the positions in your company. Start-ups live or die on the dedication and flexibility of their hires, while other businesses might need talent that is extremely tech-savvy, highly educated, and has many certificates and credentials. No matter what kind of employees your business needs, employees are crucial to the success of your business. To attract and retain the best talent, you need to make sure you've positioned yourself well with employer branding.” (Why Employer Branding Is Critical to Company Success, 2019)

Figure 2 Employer branding

Source: Why Employer Branding Is Critical to Company Success, [https://www.techfunnel.com/hr-tech/why-employer-branding-is-critical-to-company-success/\(02-02-2019\)](https://www.techfunnel.com/hr-tech/why-employer-branding-is-critical-to-company-success/(02-02-2019))

Employers today are in a position where they have to clearly define their so-called value proposition. It stands for a value set that a company can provide to its employees. A strong employer brand enhances the organization's ability to attract, retain and continuously motivate its employees. It also contributes positively to the ability of the company to satisfy more efficiently customer's need and desires. The quality of the employer's image will lead to higher employee engagement and dedication, which will again produce higher profits and overall higher return on investment. One should not ignore the fact that employer branding is not only a strategy of communicating the desired perception of the company out. It must be based on real experience and the existing values that the organization advocates and implements. As an employer, a company should follow and implement the golden rule to promise only what it can and will deliver, that is – to be what it really is and what it truly stands for. (Kajinić, 2017, 5)

Ambler and Barrow (1996) were some of the first academics to acknowledge the concept of employer branding, acknowledging its ability to attract potential employees and retain current talent. They defined the topic initially as a package of benefits provided by an employer during employment (Ambler & Barrow, 1996). Further research into the concept by Backhaus and Tikoo (2004) stated that employer branding is the process in which an identifiable and unique identity as an employer is built. More recently, Sivertzen, Nilsen, and Olafsen (2013) proposed that employer branding is the development of an organiza-

tion's image and reputation as a prospective employer and would affect its ability to retain employees. (Gilani, H., Cunningham, L., 2017)

Employer branding is a relatively new approach toward recruiting and retaining the best possible human talent within an employment environment that is becoming increasingly competitive. We can also call it a strategy for a company to be separated from its competition. Employer branding has the potential to be a valuable concept for both managers and scholars. Integrating recruitment, staffing, training and development, and career management activities under one umbrella will have a substantially different effect than each of the processes would have alone. The employer branding concept can be especially valuable in the search for an organizing framework for strategic human resource management. (Backhaus, K., Tikoo, S., 2004, 513)

Employer branding combines three concepts:

- ✦ Corporate culture and identity,
- ✦ Internal marketing and
- ✦ Corporate Reputation.

Corporate culture and identity define the values that the organization defines as its mission, the values that it implements through its strategy and what it is trying to build its identity. A positive effect, ultimately, is the cohesion of employees, the identification of consumers and employees with a vision of the company and, undoubtedly, a good reputation of the company. Internal marketing, by Kotler, is: "Successful employment, training, and motivation of capable employees to serve consumers." They accumulate what we call later a corporate reputation (made of competencies, being consist and creating integrity built on honesty and consequent trust in the business entity and it's brand by all interested public). (Kajinić, 2017, 13)

In order to develop a successful employer brand strategy, by Minchington, key elements we should take into consideration are: to clearly define a strategy (it is always a key to success), with very clear objectives; to develop distinctive assets of a company (those many creative elements such as color, logos, slogans... that make an association with the brand to the employees, so they can connect to a company); to engage leadership to implement an employer brand strategy across the organization (identify a team); empower staff (create a positive corporate culture that motivates, unleashes creative potential and gives staff a chance to make its contribution); to be unique; to train and develop leaders in

creating and managing the employer branding strategic function and lead from the front (so that leaders responsible for the employer brand strategy are visible to a company's staff. (Employer Branding College, 2016)

There is no point attracting the best talent if you cannot inspire, motivate and retain them. To develop and implement an employer brand strategy that builds a competitive advantage is complex and involves multiple stakeholders, often with competing interests. The successful organizations beyond 2020 will be those that:

1. Adopt a strategic approach to employer branding,
2. Build employer brand leadership capability across the leadership functions to manage the employee experience through the full employment lifecycle,
3. Understand how value is created through integrated stakeholder experiences (human resources, freelancers, candidates, employees, customers, and investors), and
4. Deploy a business model and organizational structure that is agile enough to respond to changes in the political, economic, social (e.g., how people connect and communicate today) and technology (e.g., AI, neuroscience, robotics) environments faster than their competitors. A corporate culture that nourishes continuous learning, empowerment, transparency, and trust will give the best results. (Minchington, B., 2017)

Impressive information of 72% of recruiting leaders around the world agree that employer brand has a significant impact on hiring, hence that makes a significant impact on your business's success. Salary is important to candidates, but it's not the most important factor - CareerBuilder reports that 67% of candidates would essentially accept lower pay if the company they were interested in had very positive reviews online. Stats show that 78% of people will look into a company's reputation as an employer before applying for a job and 88% of millennials believe that being part of the right company culture is very important. It is also very important that employer branding is communicated on social media platforms like Facebook, Twitter, Instagram, and LinkedIn, for 79% of job seekers are likely to use social media in their hunt for their next job. A strong employer brand leads to 50% more qualified applicants. Employer branding becomes even more important in highly competitive sectors where niche skill sets are in demand. (Ansari, K., 2018)

To conclude the marketing aspects of employer branding, we will agree that “Every employee should be treated as a customer and every customer should be treated as a part of a company.” (Gronroos, C., 1990, 10)

4. RESEARCH

4.1. RESEARCH METHODOLOGY

The purpose of this paper was to research the marketing aspects of employer branding. The research was conducted through an overview of relevant literature and an online survey in 2017 among students (108 respondents) regarding students’ perspective on employer branding, for students are future professionals that companies should want to recruit and keep. The research analysis was descriptive.

Hypothesis was:

H1 - More than 50% of respondents are familiar with the term employer branding.

H2 - Dynamic organization is more important to respondents as a characteristic that marks them an ideal company from the financial strength.

H3 - Respondents value more a possibility of personal advancement (promotion) within a company than high pays.

H4 - Respondents consider building an employer brand as important as building a brand name for a product. (Spajić, 2017, 8-9)

4.2. FINDINGS

Gender structure of the respondents showed us that 69% were women and 31% men. The age of the respondents - students varied from 22 to 29 years, so all of the respondents are young people, all students of graduate studies.

H1 - More than 50% of respondents are familiar with the term employer branding. *Supported.* Exactly 63,9% respondents said they are familiar with the term of employer branding. These results are positive; hence it is very important for young educated people to be aware of the importance of their personal role at a company – their employer in the future.

H2 - Dynamic organization is more important to respondents as a characteristic that marks them an ideal company from the financial strength. *Not supported.* Students perceive the “ideal” company through some characteristics: primarily by “gender equality”, “interesting products and services” and “good/inspirational management”. Also important are “financial strength”, “strong organizational culture”, “constant innovation” and “acceptance of employees with disabilities”, while a “conservative working environment” seems irrelevant.

H3 - Respondents value more a possibility of personal advancement (promotion) within a company than high pays. *Not supported.* Students perceive high pay as a more valuable element of an “ideal” company than the possibility to progress at a current work position. We must say that respondents perceive the two elements similarly important. Among the other features highlighted by the respondents are “extremely flexible working hours”, “paid overtime”, “safe work” and “hygienic work conditions”.

H4 - Respondents consider building an employer brand as important as building a brand name for a product. *Supported.* This result implies that employer branding is perceived among students (respondents) as a key asset for a company to achieve long-term business success for it is known that people are a company’s biggest strength, so a struggle for talents is strong. (Spajić, 2017, 52)

Important information to this and similar issues companies should consider and use in creating a marketing strategy to become an employer brand. When talents are attracted to a company, they give more value, motivate others and a company creates more value in general.

5. CONCLUSION

A brand, in general, represents the name, the value and the association with a company and what it stands for. Employers today are in a position where they have to clearly define their so-called value proposition. It stands for a value set that a company can provide to its employees. A strong employer brand enhances the organization’s ability to attract, retain and continuously motivate its employees. It also contributes positively to the ability of the company to satisfy more efficiently customer’s need and desires. “Every employee should be treated as a customer and every customer should be treated as a part of a company.” Customers today do respect and value good employers and give them support

through their loyalty, so employer branding is a long-term and sustainable strategy that empowers corporate brand in total.

The results of the survey show that young educated people are aware of the importance of employees' role at a company – their employer in the future. Students perceive the “ideal” company through some characteristics: most important are “gender equality”, “interesting products and services” and “good/inspirational management”. Also important are “financial strength”, “strong organizational culture”, “constant innovation” and “acceptance of employees with disabilities”. Students perceive high pay as a more valuable element of an “ideal” company than the possibility to progress at a current work position. Respondents consider building an employer brand as important as building a brand name for a product. The result implies that employer branding is perceived among students (respondents) as a key asset for a company to achieve long-term business success for it is known that people are a company's biggest strength.

The results of the research can serve as a good base for selecting the characteristics that will be communicated inside and outside the company to exist and attract new professionals or talents and also to raise awareness of the importance of employer branding - that will become as important as a corporate brand or a product brand. Satisfied employee means satisfied consumer – and that makes a win-win situation for society as a whole.

Reasons and benefits for building an employer's brand are many. The brand can help in creating competitive advantage, reducing recruitment costs, attracting professionals, and improve employee productivity. In order to create a successful employer brand, it is necessary to perceive the employer branding as a strategic way of being a company that is aware of the importance of human resources and attracting and retaining the best talent on the market.

The role of employees in building an employer's brand and transferring value is important, as employees, directly and indirectly, influence the brand image creation in the minds of the internal and external public.

For that reason, the employment process needs to be approached very seriously and strategically. The basis for building an employer's brand is to define the employer's bid value that is communicated to current and potential employees and which provides a positive relationship between the promised and the provided. The results of the research give an insight into the characteristics of the employer and the value of the employer's value.

Abstract

Today's market is significantly different when compared to the markets ten, twenty, or fifty years ago, which is especially true for the technological products market. The presence of many similar, related, and competing products has forced the manufacturers to think about the situation in a new way. The products no longer are, or can be, the result of exclusive production; they are instead the result calculated on the basis of market demand, i.e. consumer needs. Smartphones are a very good example of this, considering that we cannot imagine a world without them. All the products available at the market have a lifecycle. Considering a large number of products at the market today and the strong market competition, it is not rare to see products that used to have a long lifecycle and represented powerful brands disappear from the market. The aims of this paper are to analyze the condition of the smartphone market, determine the position that smartphones have on the lifecycle curve, and investigate the representation of individual smartphone brands, the reasons for replacing, purchasing, and using smartphones. The research was conducted us-

ing a survey questionnaire on a sample of 233 study participants. The results have shown that the lifecycle of an individual smartphone model, regardless of the manufacturer, is regularly two to three years, which was recognized by telecommunication service providers, who defined their marketing strategy according to this information. The participants are replacing their mobile phones with increasing frequency; they are keeping up with trends and spending an increasing amount of time on their smartphones. Implications of our findings are discussed in the paper.

Keywords: *lifecycle, smartphones, marketing strategy, brand*

JEL Classification: M20, M31

1. INTRODUCTION

All business entities, whether they are selling products or services, should be implementing the marketing concept and all of its features. It is necessary to start with the market, more accurately from the consumers and their needs, wants, expectations, and similar. Based on the information they receive, they make decisions on the products that should be made, along with all of their aspects.

All the products on the market have a lifecycle. It can be only several hours or up to several decades. Today, considering a large number of products on the market and the high level of competition, it is not unusual to see products that used to have a rather long lifecycle and a powerful brand disappear from the market. One could say that it is very similar to human life, products are born, live a life, and ultimately die. When we observe a product, we can see that it goes through several stages during its lifecycle. Naturally, a product cannot stay on the market forever and keep up the large revenues that generate profit for the company, i.e., once a product reaches its peak success, it is logical that it would slowly begin to decline. That fact is the reason for constant product innovations and improvements through marketing strategies, to enable them to survive on the market as long as possible.

The research goals in this study were to analyze the condition of the smartphone market and to determine the position of smartphones on the lifecycle curve. The purpose of the implemented primary research was to attempt to determine the presence of smartphones in Osijek and the surrounding area, us-

ing a sample of 233 study participants. The marketing strategies were proposed based on primary and secondary data.

2. PRODUCT LIFECYCLE

The product lifecycle theory has been applied in research in the last fifty years. Previšić (2011, 856, 857) stated that the lifecycle of a product is a concept used when trying to describe the sales, profit, consumers, competition, and the marketing efforts related to a product, from the moment it appears until it is removed from the market. The duration of specific stages of the product lifecycle on the market is not uniform and it depends on all the elements related to the product or the service and the relevant environmental aspects. Its most common graphical representation is in the shape of a semi-circular, bell-shaped curve, but there are also some alternative shapes of course (Kotler, 2001, 347). There are various stage distributions, but the following stages are most commonly mentioned (Meler, 2005, 195):

1. Creating the idea about the product
2. Product development stage
3. Market introduction stage
4. Product growth stage
5. Product maturity stage
6. Product aging and decline

“As the economic business conditions change, the market, and consequently the product, goes through new stages of interest and the consumer’s set new requirements, new competition appears, so the business entities change the product lifecycle strategy. Namely, every business entity wants to extend the product lifecycle. The method for achieving that result depends on the established business goals, the current market position, consumer habits and needs, and the willingness to invest financial assets into the improvements for the existing product or creating a new product” (Lulić, 2009, 58). Furthermore, Lulić (2009, 58) states that it is necessary to emphasize the following:

- Every product has a lifecycle;
- Its sales go through specific stages, each of which represents challenges, possibilities, but also problems for the business entity;

- ♦ Profits rise and fall differently in the various stages of the product lifecycle;
- ♦ Every product demands certain strategic management in the areas of marketing, finances, raw material acquisition, and human resources, in each stage of the product lifecycle.
- ♦ There are many factors that affect the product lifecycle curve, we will list the following (Kotler et al, 2006, 606):
- ♦ Consumer needs and wants, as well as their attitudes and behavior – these, determine the amount of time required for a new product to be accepted, some are accepted faster and some slower;
- ♦ Technological changes;
- ♦ Competitor activities – these can be anticipated up to a point and their effect can be increased or reduced using economic policy; e.g. a product can be protected by a patent or a license, or copyrighted;
- ♦ Marketing activities by a business entity – every business entity want to keep the product in the transition period between the growth stage and the maturity stage for as long as possible because the most favorable business results are created in that period.

The product lifecycle concept is very important for making product-related decisions. It shows both the sales curve and the profit curve. It enables marketing experts to anticipate the changes in consumer tastes, competition, and similar. Considering it is a theoretical model for monitoring and anticipating sales and profits for the product, it cannot be applied always and for every product. This is also the main criticism of this concept. Furthermore, there is certain criticism related to the practical application of the concept, as well as the fact that there is an alternative product evolution cycle concept, which is based on the constant growth and development of a product, as opposed to the product lifecycle concept, which is based on the birth and ends with the death of a product. One of the criticisms is that the concept does not have an accurately determined sequence of stages or their duration and that in some rare situations it is very difficult to precisely determine the stage in which the product is at the observed moment. Determining the lifecycle of a product can be exceptionally difficult, even if some sort of a time analysis can be performed. This is related to the complex issue of measuring the market share. (McDonald, 2004, 210). The simplicity of the product life cycle concept makes it vulnerable to criticism,

especially when it is used as a predictive model for anticipating when changes will occur and one stage will succeed another, or as a normative model which attempts to prescribe alternative strategies should be considered at each stage. According to these criticisms, there are five basic issues that must be faced in any meaningful application of the concept (Day, 1981, 60):

- ✦ How should the product-market be defined for the purpose of life cycle analysis?
- ✦ What are the factors that determine the progress of the product through the stages of the life cycle?
- ✦ Can the present life cycle position of the product be unambiguously established?
- ✦ What is the potential for forecasting the key parameters, including the magnitude of sales? The duration of the stages and the shape of the curve?
- ✦ What role should the product life cycle concept play in the formulation of competitive strategy?

The following chapter will give a brief overview of various recommended marketing strategies since it is needed to change them over the lifecycle in order to create and keep the competitiveness of the product.

3. MARKETING STRATEGIES IN SPECIFIC STAGES OF THE PRODUCT LIFECYCLE

As previously stated, the product lifecycle concept provides the business entity with a solid foundation for making business decisions and strategies and realizing goals. If they want to keep the sales of a product profitable throughout the lifecycle, there are several things they can do. In that regard, it is important to know how the product lifecycle affects all the elements of the marketing mix. McDonald (2004, 208) states that the product must change throughout its lifecycle, and regarding that, every other element must also change, and all of that must correspond to the relevant elements from the environment (pricing policy, competition, the influence of suppliers and distributors, technology...).

“Using the term lifecycle for the development of a marketing strategy can also be difficult because the strategy is both the cause and the consequence of the product lifecycle. The current position of a product in its lifecycle can sug-

gest the best marketing strategies, and the marketing strategies created in such a way affect the product performance in the subsequent stages of its lifecycle. Nevertheless, the product lifecycle concept, if used cautiously, can help in the development of good marketing strategies in various stages of the product lifecycle.” (Kotler et al, 2006, 606).

Table 1 shows marketing strategies in specific stages of the product lifecycle, regarding the specific elements of the marketing mix.

Table 1. Marketing strategies in specific stages of the product lifecycle

	INTRODUCTION	GROWTH	MATURITY	DECLINE
PRODUCT	Offer a basic product	Offer accessories for the product, service, warranty	Introduce various brands and models	Gradually withdraw low-performing products
PRICE	Apply the cost-plus method	Determine the price for market penetration	Determine the price that matches or is better than the competitors' prices	Gradually lower the price
PLACE	Develop selective distribution	Develop intensive distribution	Develop even more intensive distribution	Gradually cancel unprofitable sales points
PROMOTION	Develop product awareness among early adopters and mediators	Develop awareness and interest in a mass market	Emphasize brand differences	Lower to the level required to keep the loyal customers
SALE INTENSITY	Push strong sales activities to encourage demand	Reduce to take advantage of high consumer demand	Increase to encourage brand change	Reduce to minimum levels

Source: Kotler et al (2006, 613)

The abovementioned leads to the conclusion that the business entity can and should manage their product by determining appropriate strategies for specific stages in the cycle. With the appropriate marketing strategy and business activities, it is definitely possible to influence the reduction and extension of specific stages in the product lifecycle.

4. SMARTPHONES - BRAND REPRESENTATION AND LIFECYCLE

There are hardly any devices that impacted us and our lives more than smartphones. Over 2 billion people own at least one, and today everybody is more concerned about bringing their phone than their keys when they leave

the house. Smartphones, or mobile phones with advanced options and much more processing power than “regular” mobile phones, appeared on the market in the late 1990s, but they reached their *boom* with the launch of the Apple iPhone in 2007. The iPhone revolutionized the market with its features like the touchscreen and the virtual keyboard. The first smartphone with the Android operating system appeared on the market in late 2008, which is when the market “battle” between the iPhone and Android began. Since that moment, the smartphone market has a stable growth, and as time went by, numerous manufacturers appeared that “embraced” Android as their operating system.

In the next years, an additional one billion people are estimated to become mobile phone subscribers. The smartphone adoption rate is already at 60 % in the developed world and will lead smartphone growth over the next five years as the average selling price of smartphones continues to decline. This is estimated to add a further 2.9 billion smartphone connections by 2020. (SMART, 2019)

People are now spending more time on their smartphones than any other device. Smartphones are taking the central stage of consumer life. In the blog of Counterpoint (2017) states that almost half of respondents spent more than 5 hours per day on their smartphone. One in four users now spend more than 7 hours every day on their smartphone, these are true power users mostly running businesses on their phones or consuming digital content for long hours. Looking at regional trends, users spend more time on their smartphones in emerging countries than in developed countries. Malaysian consumers spend the most time on their smartphones across regions. More than 55% of users reported that they spend more than 5 hours per day on their smartphone. This trend will be prevalent in most emerging markets. Japanese smartphone users spend the least time with their smartphones. 43% claimed to spend less than 3h per day on their device (Counterpoint, 2017).

Most people replace their smartphones after a period of 2-3 years. It's not because the smartphone has stopped working, but because of the fact that the smartphone may have become slow. The other motives can be: try something new, the operating system may have become old and may not be supporting new apps or newer versions of old apps, might want to upgrade to a smartphone offering more storage space or RAM, battery life etc. (NewsPatroling, 2017). As we can see from the graph 1, smartphones have changed the world in a remarkably short time frame. Mexican users replace their smartphone fastest, replacing

every 18 months. This behavior is likely a consequence of the high percentage of used devices in Mexico; almost one-third of the base uses a used device. One in three users in Mexico is likely to upgrade their devices every twelve months. On the other end of the scale, Japanese users reported that they replace their device every 26 months, the longest among all participating countries. This is partly due to the mature and aging user base with access to more premium, durable devices that do not require frequent upgrades (Counterpoint, 2017).

Graph 1. Average global smartphone replacement cycle

Source: Counterpoint (2017). Available at <https://www.counterpointresearch.com/smartphone-users-replace-their-device-every-twenty-one-months/>, access January 29, 2019

More than half of the Australian, Chinese, German and Saudi smartphone users revealed that they would be willing to spend more than US\$400 to replace their current device. These would be the target markets for brands looking to promote their premium portfolio. More than one-third of German and Australian users would be willing to spend more than US\$500 in their next smartphone purchase. Perhaps not coincidentally, Apple dominates the installed base in both countries, and more than 85% of the Apple users would not switch brands. Only 13% of Japanese users were willing to spend >\$400 for the purchase of their next device – even though Apple is also the dominant smartphone brand in Japan. This also explains the slowing upgrade cycles as Japanese consumers are generally more conservative than their peers in other markets (Counterpoint, 2017). The above can be seen in graph 2.

Graph 2. Percentage of Users Willing to Pay >\$400 for Their Next Smartphone

Source: Counterpoint (2017). Available at <https://www.counterpointresearch.com/smartphone-users-replace-their-device-every-twenty-one-months/>, access January 29, 2019

Browsing the Internet and Gaming are amongst the most popular activities on a smartphone across different countries. On average, 64% of the respondents browse the internet on their smartphone daily, while 62% use their smartphone for gaming. Voice calls remain as the preferred choice of communication across many markets (such as Germany and Japan) ahead of messaging compared to emerging markets in Asia and Africa, where messaging took the front seat. Watching videos and spending time on social networks are the fifth and sixth most popular activities on a smartphone (Counterpoint, 2017). The above can be seen in graph 3.

Graph 3. Top Use-Cases for Smartphone Users

Source: Counterpoint (2017). Available at <https://www.counterpointresearch.com/smartphone-users-replace-their-device-every-twenty-one-months/>, access January 29, 2019

Today, the most valuable brand on the global level is the American “Apple” (Figure 1). The top 10 also includes the Korean Samsung in the smartphone category, which is in seventh place. Based on all of that, Apple took full advantage of all the options and benefits that a brand can offer. Apple created a large circle of loyal consumers, which greatly facilitated the launch, promotion, and sale of new products. Whether it is the iPhone, the iPad, or the iMac, it is essentially, all the same, there are new models coming out every year and they find their buyers without any issues, due to a large, loyal consumer base. This data would not be very impressive if those products were not rather expensive. Even though there were never any issues regarding the quality of Apple products, a large number of their consumers buy their products regardless whether they are better than the competing products at that time, or whether the investment/return ratio is better for the competition, which is actually an ideal demonstration of loyal consumers. A specific example of that is the release of iPhone 7 on the American market, which practically caused chaos and “camping” for several days before the launch in front of Apple stores. Furthermore, the long-time supply chain leader and last year’s runner-up McDonald’s joined Apple, P&G, and Amazon in qualifying for the “Masters” category, which Gartner introduced in 2015 to recognize sustained leadership over the last 10 years (Supply chain management review, 2018).

Figure 1. The world's most valuable brands (2018)

	Rank	Brand	Brand Value	1-Yr Value Change	Brand Revenue	Company Advertising	Industry
	#1	Apple	\$182.8 B	8%	\$228.6 B	-	Technology
	#2	Google	\$132.1 B	30%	\$97.2 B	\$5.1 B	Technology
	#3	Microsoft	\$104.9 B	21%	\$98.4 B	\$1.5 B	Technology
	#4	Facebook	\$94.8 B	29%	\$35.7 B	\$324 M	Technology
	#5	Amazon	\$70.9 B	31%	\$169.3 B	\$6.3 B	Technology
	#6	Coca-Cola	\$57.3 B	2%	\$23.4 B	\$4 B	Beverages
	#7	Samsung	\$47.6 B	25%	\$203.4 B	\$4.5 B	Technology
	#8	Disney	\$47.5 B	8%	\$30.4 B	\$2.6 B	Leisure
	#9	Toyota	\$44.7 B	9%	\$176.4 B	\$3.8 B	Automotive
	#10	AT&T	\$41.9 B	14%	\$160.5 B	\$3.8 B	Telecom

Source: Forbes (2019). Available at <https://www.forbes.com/powerful-brands/list/#tab:rank0>, access January 3, 2019.

It is interesting that Apple, despite its position as a global leader concerning brands, is in the third place when it comes to market share (13.2%), after Korean Samsung (20.3%) and Huawei (14.6%). The reason for that is that Apple only sells smartphones in the high price range, while Samsung and Huawei also offer phones in the lower price range. Other manufacturers hold approximately 50% of the global market share (Figure 2).

Figure 2. Market shares held by smartphone manufacturers

Quarter	2017Q1	2017Q2	2017Q3	2017Q4	2018Q1	2018Q2	2018Q3
Samsung	23,2%	22,9%	22,1%	18,9%	23,5%	21,0%	20,3%
Huawei	10,0%	11,0%	10,4%	10,7%	11,8%	15,9%	14,6%
Apple	14,7%	11,8%	12,4%	19,6%	15,7%	12,1%	13,2%

The way that the public perceives brands like Apple and Samsung greatly facilitates their sales and the market positions that they hold. The reason for it is the image that they created in the public, i.e. the perceived quality of their products. This fact is confirmed every time a new smartphone is launched, but also during the launch of other related products that they “dropped” to the market in the last several years. This is also one of the reasons for the occurrence of the “halo effect”, which further strengthens the mentioned manufacturers, especially Apple. Apple products often appear in American films today, as part of stealth advertising along famous actors, and they have become status symbols in a way, which is used quite efficiently in generating revenue.

If we take 2007 and the launch of the first iPhone as the beginning of the smartphone era, looking through the prism of the lifecycle of a smartphone as a generic product, this marks its market introduction stage. The period before the mentioned year can be considered as the product development stage in which no revenue was generated, instead, it only created costs resulting from investments into product development.

Graph 4 shows the total global sales and the sales projection for smartphones in the 2007 to 2021 period. During the first year, from today’s perspective, a “low” number of 122 million smartphones were sold, the following two years saw a growth in sales of 10% and 20%, respectively. After that growth, we can say that the market introduction stage ended. The growth stage started in 2010 when almost 300 million smartphones were sold. That year is also the first year when Samsung smartphones appeared, which will become the greatest competitor to Apple’s iPhones. In the following four years, the sales of smart-

phones grew in every cycle for almost 50%, and they reached 1.25 billion units in 2014, which is almost one-fifth of the world population. In 2015 and 2016, the growth in sales significantly reduced, i.e. the growth in 2015 was a little over 15%, while the growth for 2016 is about 5% and the total sales are almost 1.5 billion units. It is clear that the curve is shaping to be a classic product lifecycle curve and its growth rate is declining. The sales projection for smartphones shows and anticipates a mild drop in sales. This deviation is justified due to the fast-growing Asian, or more precisely the Chinese market.

Graph 4. Total sales and sales projections for smartphones in millions of units in the period 2007-2021

Source: Statista (2018). Available at <https://www.statista.com/>, access January 14, 2019.

It can be concluded that smartphones are in the maturity stage of the product lifecycle. The new competitors (mostly Asian) are entering the market, developing brand recognition and taking their market share, mostly based on competitive pricing. Advanced technology is not being the point of differentiation anymore, because the differences are decreasing. However, the brand still remains very important as a feature of a smartphone with which consumers identify themselves. For that reason, the lifecycles of leading brands, that have created this market from the very beginning, will be analyzed in the following chapter.

4.1. THE LIFECYCLE OF APPLE AND SAMSUNG SMARTPHONES

Considering that Apple and Samsung are among the 10 most valuable brands at the global level (Figure 1) and that together they hold about 30% of

the global smartphone market (Figure 2), further in the study we will show the position of Apple and Samsung smartphones on the product lifecycle curves.

Since their first smartphone (in 2007 and 2010), Apple and Samsung combined have sold over 2.5 billion units on the global market and in 2016 alone they had an income of \$160 billion. Graph 5 shows the global iPhone sales for the 2007 to 2018 period. During its first year, a little over one million iPhones were sold and 10 years later its sales were about 200 million units. In 2016, 212 million iPhones were sold, which is a drop of almost 10% when compared to 2015. It is interesting that it is the first drop in sales recorded since 2007 and the first iPhone series. The graphical representation of iPhone sales looks very similar to the representation of sales for all smartphones, and if we look at it as a lifecycle curve, it is also clear that the iPhone is transitioning from the growth stage into the maturity stage.

Graph 5. Unit sales of the Apple iPhone worldwide from 2007 to 2018 (in millions)

Source: Statista (2019). Available at <https://www.statista.com/statistics/276306/global-apple-iphone-sales-since-fiscal-year-2007/>, access February 6, 2019.

Graph 6 shows the global sales of Samsung smartphones for each quarter, in the 2010 to 2016 period. Very similar to Apple, Samsung shows exponential growth in the first four years of their presence on the smartphone market, from 23 million units sold in 2010 to 316 million in 2013. In the following years, the growth rate was declining, until it reached, almost identical to Apple, a drop in sales of approximately 5% in 2016.

All of this suggests that Apple, i.e. iPhone, and Samsung smartphones are in similar positions if they are observed from the product lifecycle perspective. The mentioned manufacturers are constantly extending the lifecycles of their smartphones by launching new and improved models at regular intervals (once a year). However, if the product lifecycle concept is applied on several specific models (e.g. Samsung Galaxy S5, Samsung Galaxy S6, and Samsung Galaxy S7) that appeared on the market consecutively, in that case we can observe it in an alternative way, the one that creates a wave-like pattern with each new model that replaces its predecessor. That is, once each of these new models are launched, there is a sudden spike in sales which reaches a peak, followed by the launch of a new model and the marginalization of the older one (lower price, discounts, deals with telecommunication service providers, and similar), finally resulting in discontinuation. As mentioned previously in the text and Figure 3, the average time before a smartphone is replaced in the USA, China, and the EU (Great Britain, France, Germany, Italy, and Spain) is a little over two years. A good example of that can also be seen on the Croatian market, where telecommunication service providers today offer high-end models. Samsung offers models with a 2 to the 3-year gap, while Apple offers even somewhat older models at a significantly reduced price when compared to the current high-end models.

Figure 3. Average use of smartphones in months (USA, China, EU5) from 2013 to 2016

The total smartphone sales in 2016 (Graph 7) have not experienced a drop like Apple and Samsung, instead, they grew for almost 10% and they are almost \$430 billion today. This interesting situation is explained by the sudden growth of Chinese smartphone manufacturers (Xiaomi, Elephone, Meizu, ZTE, and others) that operate on the largest market in the world.

Graph 7. Income from smartphone sales on the global market for the 2013 – 2016 period

Source: Statista (2018). Available at <https://www.statista.com/>, access January 14, 2019.

Another thing that confirms the fact that smartphones are approaching the maturity stage is their average price, which has been constantly reducing from 2010 until today (Graph 8). In 2010, the average price of a smartphone was \$440 and in 2016 it was \$283. In the last several years, mid-range smartphones accounted for almost 50% of the total annual deliveries, which resulted in a constant reduction in prices. Samsung's Galaxy S series and Apple's iPhone dominate the high-end category. The mentioned numbers indicate that there is numerous and powerful competition on the global smartphone market today, and that is one of the main characteristics of the maturity stage.

5. RESEARCH

The research was conducted using an online questionnaire. The questionnaire contained 19 questions that were used to investigate the representation of specific smartphone brands and the main focus of the study, how often the study participants replace their devices and what were the reasons for their purchases. The research was conducted using a sample of 233 study participants and the aim was to determine the presence of smartphones in Osijek and the surrounding area. Table 2 shows a sample description of the research.

Table 2. Sample description

		N	%
Gender	Male	92	39,5
	Female	141	60,5
Age	18-25	148	63,5
	26-32	50	21,5
	33-40	22	9,4
	41-65	13	5,6
Monthly income (EUR)	200 - 350	127	54,5
	351 - 600	42	18
	601 - 1000	40	17,2
	>1000	24	10,3

Of the 233 study participants, only one does not own a smartphone. This says a lot about smartphones in the world today. Regarding brand preference, as expected, Samsung is in the first place (42.5%), followed by the iPhone (13.3%), while Huawei (7.7%), Sony (7.3%), HTC (6%), and LG (5.6%), respectively, are behind the market leaders. The shares held by other manufacturers are almost negligible. The listed six encompass almost 85% of all the study participants, Samsung and iPhone alone account for 56% of the study participants. The results are very similar to the already mentioned market share of the first three (Samsung, iPhone, Huawei).

The deciding factors when buying smartphones for approximately 60% of the study participants were features, price, and quality. A third of the participants mentioned brand and design as deciding factors, and the benefits provided by service providers are in the last place. The main properties that designate quality are advanced features and a long-lasting battery, for approximately 80% of the participants. The durability of the materials was mentioned by 60% of the participants, followed by design, price, and brand.

Half of the study participants (52.3%) are prepared to spend up to €250 for a smartphone, 29.2% of the participants are prepared to spend up to €500, and a small number of them (12%) are prepared to spend even more. The reason for that is the sample structure, consisting of mostly younger people with lower monthly expenditures. Even though we are aware that most people use popular brands and follow trends, it can be concluded that some of them purchase their mobile phones on the gray market (low prices), while some others buy their mobile phones from telecommunication service providers. The research has also shown that approximately one-half of the study participants are buying their

phones from telecommunication service providers, while the second and third place is taken by specialized stores and ads, with 29% and 15% respectively. Telecommunication service providers today offer numerous options, various plans tailored to all target groups, and mobile phones at affordable prices. The most common reason for buying a smartphone mentioned by the study participants is the affordable price (44.3%). After that, they are buying it for fun and the options offered by the phone (42.1%), for business (32.5%), to follow trends (19.7%), and as a status symbol (7.9%).

33% of the study participants own phones that are between one and two years old. If we also look at the participants with “younger” devices, it is easy to conclude that the Croatian people are very close to the average results of the EU countries mentioned earlier (Figure 3). Mentioned is also partially confirmed by the answers to the question “How often do you replace your smartphone?”. Namely, 43% of the participants answered that they do it every two years, while 50% of them answered with more than two years. The fact that 53% of the study participants have signed a service contract with one of the telecommunication service providers correlates to everything mentioned previously. A vast majority of participants (83%) have signed a 24-month service contract, which actually explains the smartphone replacements every two years, i.e. when the contract expires. Half of the study participants, 52% more accurately, are changing their smartphones after the contract expires. In addition, the most common reason for replacing smartphones is a malfunction, followed by the fact that their current smartphone is obsolete, that their service contract expired, and that a newer model of the phone appeared on the market. All of this information indicates that a lifecycle of a specific model is regularly two to three years. It is obvious that the telecommunication service providers have adapted to that, which results in the two-year contract offers, aside from that, the warranty period for most smartphones is two years.

The final question is very interesting and it offers even more interesting answers. The answer is given by 122 study participants (53.5%) to the question of how much time they spend using their smartphones every day was more than 120 minutes. This answer indicates a smartphone phenomenon that started 10 years ago.

6. CONCLUSIONS, LIMITATIONS AND IMPLICATIONS FOR THE FUTURE

The world we live in, the period of major technological achievement and a fast pace of life, reflects in everything around us, including products and their lifecycles. Product lifecycles are becoming shorter and this is most obvious in the area of high technology (“smart” phones, computers, and similar). Consequently, the business entities that want their products to be competitive must take into account the lifecycle stage in which their product currently is and simultaneously work to innovate and upgrade their products. All of this is necessary because the competition is more persistent now than it ever was.

The product lifecycle concept, as clearly shown in the study, represents a significant tool for managing a marketing policy, and ultimately, for managing the entire business policy of a business entity. If one is well acquainted with it and it is properly applied, business entities can react to market requirements in a timely manner and obtain a competitive advantage. However, along with all the positives of the product lifecycle concept and the benefits it provides, many authors are also critical, the most prominent criticism is definitely regarding the inability to accurately predict the duration of a specific stage, along with the fact that it is very difficult to determine the stage in which the product currently is. Of course, the final conclusion is that the usefulness of the product lifecycle concept is undeniable.

The research results have shown that Apple and Samsung hold the leading positions in the smartphone market and they are defining the higher price strategy accordingly. Considering a large number of other smartphone manufacturers, Apple and Samsung are responding to market requirements. They are currently in the maturity stage, in which they are collecting the highest revenues and achieving their highest success on the market. However, the average smartphone lifecycle has reduced significantly, due to the fast evolution of mobile technology which makes them obsolete prematurely and turns them into a disposable product. All of this is supported further through marketing campaigns, which indicates that the mobile phone industry is extremely competitive. The results of the primary research show that other smartphone manufacturers are also increasingly dominant among the users, mostly because of the lower price strategy, which was confirmed by more than half of the study participants. The users spend many hours using their smartphones today and they expect smart-

phones to satisfy all of their needs in life, including fun (internet, games, music), practicality (m-banking, m-wallet, organizer) and communication (voice calls and messaging through various applications). Communication was the reason for mobile phones appearance and nowadays is the least important necessity for many consumers.

In order to avoid the transition from the maturity stage to the decline stage, the observed smartphone manufacturers (Apple and Samsung) should seek a position on the market that utilizes their smartphone quality. Which means emphasizing brand differences, introducing various models to meet the requirements of all target groups (avoiding the focus on the higher price range), and developing an even more intensive distribution while simultaneously intensifying sales. One of the keys to success on the current market is continuous innovation, where existing products are modified or new products are created. In this way, business entities can obtain advantages and push back the competition. Of course, the innovation process is risky and if it is implemented improperly it regularly results in failure, significant financial loss, and a damaged image.

Even though the secondary research is limited only to Apple and Samsung, the authors believe that the research should be repeated and that other smartphone manufacturers that are conquering the smartphone market with their models and innovations, and affecting the competition (either by reducing prices or by constantly innovating and upgrading smartphone performances), should be included. In addition, the primary research has only been implemented in Osijek and the surrounding area, which is also a limitation, considering that it cannot be generalized to include the whole of Croatia, due to the lower standard of living, lower purchasing power, and reduced options for consumers at the observed area. Also, the research should be expanded to other areas in Croatia, and beyond, to discover and compare the reasons for purchases, the representation of specific brands, and consumer behavior.

Abstract

Influencer marketing has become very popular in the past few years and a crucial strategy within digital marketing to boost the company's sales and visibility. Since the expansion of the Internet and social media, platforms have affected the way of communicating with consumers, making it more personal, brands and companies are looking for a way to reach their audience more effectively; their targeted audience turn their back to mass media and spread attention to more than one social media platforms. In addition, consumers are more likely to positively perceive a message that comes from a trusted persona over sponsored content. The aim of this paper is to provide an overview of the of the current situation in influencer marketing in Croatia in order to show opportunities in this segment whose importance nowadays is obvious. This paper claims that influencer marketing in Croatia is in its growth stage, but still providing a lot of benefits for companies. There is room for improvement and growth and it is undeniable that this way of advertising will increase in usage in the future, as organizations become more and more aware of the benefits that this form of promotion delivers. The methodology is based on methods of compilation, analysis, synthesis and quantitative method in a descriptive approach to describe trends in Croatia's influencer marketing market. This research is of explorative nature and it attempts to provide an insight into the present scope of influencer marketing in Croatia and to anticipate future trends in this matter. There is a lack of prior scientific research studies

on the topic, so this paper's research is based on secondary data obtained from the relevant websites. In terms of scope, this paper focuses on the analysis of influencer marketing as an advertising channel in Croatia.

Keywords: *influencer marketing, digital marketing, social media*

JEL Classification: M31, M37

1. INTRODUCTION

Since the growth of internet marketing communication has changed remarkably. The Internet has brought a completely new way of communicating especially after the expansion and growing popularity of social media platforms. These platforms offer for their users a chance to be more interactive, publish and consume content more freely (Aula, 2010, 44). In 2017 a number of social media users passes 3 billion, and growth trend shows no signs of slowing, with the number of active social media users growing at a rate of one million new users per day over the past quarter (Kemp, 2017). Social media marketing is related to relationship marketing, where the firms need to shift from „trying to sell“ to „making connections“ with the consumers (Gordhammer, 2009) and using social media does not only generate more business but connects with consumers on a higher level. Users are spending 1,72 hours per day on social platforms, which makes up 28% of all online activity. While the audience is certainly there, the power of influence is too, with 74% of consumers relying on social media to influence their purchasing decisions. With social media continuing to grow and having a great impact on consumers' purchasing decisions, advertisers have been forced to find new and unique ways of reaching consumers on these platforms (Woods; 2016, 5).

2. INFLUENCER MARKETING – THEORETICAL BACKGROUND

Influencer marketing – the term that has become very popular in the world of online marketing and a crucial strategy in digital marketing. But the concept behind influencer marketing is not new – companies have been using famous people to promote their products or services for years, even decades. Marketing campaigns featuring celebrity endorsers are thought to have a positive impact on people's attitudes and lead to positive behavioral intentions. The idea behind

celebrity-endorsed destination campaigns is simple: to draw attention to the endorsed destination and to complement the desired image values. Celebrities are the preferred choice because they act as role models and are powerful cultural, financial, and media figures and image creators (Van der Veen & Song; 2013, 1). Although celebrities have been endorsing products and services for years and impacting people's purchase decisions, for the past few years many companies and brands in all industries have been switching to influencer marketing as a form of social media marketing (Nujić et al.; 2018, 1262).

There is several difference between celebrity endorsements and influencer marketing; they are both connected to the product, brand or service promotion through an influential individual, but one of the biggest differences is their expertise. Influencers are usually considered as experts in the product or service segment they are promoting, which is why they are considered relevant and trustworthy, while celebrities do not necessarily have to be involved with product and they are only „lending“ their popularity to the product or service. Influencers create their own content; the brand they are representing creates a brief and influencers have the freedom to create content they know will work best with their audience, while celebrity endorsement involves agencies to create content; the brand creates and distributes the content. Another difference is that influencers are communicating with their audience (two-way communication) regarding the product they endorse, while celebrities usually do not interact with their fans (Nujić et. al; 2018, 1262-1263)

Social influence marketing is defined as a technique that employs social media (content created by everyday people using highly accessible and scalable technologies such as blogs, message boards, podcasts, microblogs, bookmarks, social networks, communities, wikis, and vlogs) and social influencers (everyday people who have an outsized influence on their peers by virtue of how much content they share online) to achieve an organization's marketing and business needs (Singh et al.; 2012, 19). Consumers trust recommendations from a third party (an influencer) more often than a brand itself. Aligning with an influencer does not only bring their audience, but they bring their audience's network as well. Because of the loyalty of their audience, an influencer has the ability to drive traffic to the company's site, increase social media exposure, and sell a product or a service through their recommendation or story about their experience (Matthews; 2013).

Social media influencers (SMIs) represent a new type of independent third-party endorser who shapes audience attitudes through blogs, tweets, and the use of other social media (Freberg et al.; 2011, 90). According to Brown et. al. (2008, 50), an influencer is a third party who significantly shapes the customer's purchasing decision, but may ever be accountable for it. Consumers trust recommendations from a third party (an influencer) more often than a brand itself. Aligning with an influencer does not only bring their audience, but they bring their audience's network as well. Because of the loyalty of their audience, an influencer has the ability to drive traffic to the company's site, increase social media exposure, and sell a product or a service through their recommendation or story about their experience (Matthews; 2013).

Social media influencers don't always have an equally large following as a celebrity, but their connection with their followers is much stronger and more engaged; a social media influencer can be seen as a peer and a friend, as they are typically more relatable than a highly famous person (Haapasalmi; 2017, 16). The power of influencers does not necessarily lie in their follower count, but in their ability to actually influence through authenticity and curation. (Weinswig; 2016).

People learn from example, and influencers lead by example for those who "follow" them. By observing examples through social media, people are more likely to adopt the behaviors exhibited by the influencer. Companies are using their resources via social media influencers in hopes that the experience that a consumer has with an influencer allows the behavior of the influencer to be adopted, that is, copied by the consumer (Glucksman; 2017, 79). Since potential buyers want to be like them, they raise value for the brand. This is also a great way of improving brand awareness, building trust and credibility, as well as a great way of reaching potential buyers and target market.

Influencers have the „power“ to affect purchase decision because they are considered as people of knowledge, authority, position or experience Since successful influencers have a certain niche, a company can generate more relevant leads. Furthermore, people do not perceive this way of marketing as „pushy“ and this kind of marketing feels fresh, creative and different (Nujčić et al.; 2018, 1262).

Influencers are the new celebrity endorsements. One research shows that 92% of consumers trust an influencer more than an advertisement or traditional

celebrity endorsement. Even though there are some similarities with celebrities and influencers, there is also several difference. Among all the others, one of the biggest differences is their expertise. Influencers are usually considered as experts in the product or service segment they are promoting, which is why they are considered relevant and trustworthy, while celebrities do not necessarily have to be involved with product and they are only „lending“ their popularity to the product or service (Nujić et al.; 2018, 1263). A big difference is in the way they have built their influence – influencers have built theirs through social media (Facebook, Instagram, YouTube, blogs or similar) and traditional celebrities gained their popularity and influence mainly because of traditional media and their talent (TV, radio, paper magazines and similar).

With 47% of customers using Adblock technology, traditional digital advertising channels often have limited effectiveness (Weingswig; 2016). This spike in the popularity of influencer marketing is attributed to the favorable results advertisers are seeing. A joint research study found that influencer marketing can trigger 11 times more return on investment than other forms of traditional advertising annually. This return on investment is measured in terms of reach, engagement, and ultimately sales, where a positive association exists as identified in another joint research study (Woods; 2016, 7). Influencer marketing has come about as an alternative to paid social media advertising, which incorporates a brand message as part of an influencer’s valuable online content creation. Ordinary users who voluntarily wish to take part in the influencer’s content is thus exposed to the brand message. Using influencers as a communication intermediary, there is almost 20% higher consumer trust that is associated with word of mouth, compared to that of other online advertising (Lampeitl & Åberg; 2017, 1).

Influencer marketing works mainly because the influencer has expertise in the type of products they are promoting. They tend to inspire engagement within their audience (two-way communication) and they can start a conversation with their followers. Influencers are content creators - they have creative freedom when promoting the brand’s product or service. An important point to note is that some companies make the mistake of treating influencers like celebrities and try to control what the influencer says, and how they promote the product. This could harm their relationship with the influencer and may affect the quality of content being produced. Influencers usually focus on a specific niche audience and have built their followers through social media and other

online channels (Barker; 2017). Influencers lead by example, recommending or reinforcing products that they like through advertorials. Therefore, viewers watching these examples may be more likely to adopt those behaviors exhibited by the influencer (Bandura; 1971, 3). The more the consumer attributes the communicator's review about a product to that product's actual performance, the more the consumers will perceive that the communicator is credible, the more the consumer will have confidence in the accuracy of the review, the stronger the consumer's belief that the product has the attributes mentioned in the review (Lee & Yuon; 2009, 476).

Influencer marketing is essentially virtual word of mouth, and consumers are much more likely to positively perceive and react to a message that comes from a trusted friend or persona over a sponsored post that comes from a company. Advertisers are trying to capitalize on communicating their message through social media influencers, who are trusted nearly as much as a friend (Woods; 2016, 6).

People consider word of mouth to be non-commercial nature which adds credibility to the received information. Furthermore, WOM is understandable to the recipient and it saves time and money spent on researching. It is obvious that favorable WOM is definitely increasing the purchase probability, while negative WOM has got a drastically opposite effect. It is also important to note that while positive WOM increases expectations, it also affects the level of satisfaction of those who decide to purchase the product, and it becomes much easier to leave the person unsatisfied due to his high expectations (Davydova; 2012, 4).

The Internet has enabled consumers to engage in electronic word of mouth communication (e-WOM) and unlike the traditional WOM, e-WOM typically occurs in an online environment where the sources of information are individuals who have little or no prior relationship with the consumer seeking information (Lin et al; 2012, 7-9). E-WOM can be generated in a variety of ways, such as emails, instant messages, websites, blogs, online community, newsgroups, chatrooms, hate sites, review sites, and social networking sites (Ishida et al, 2016, 5). Influencers have the means to influence others through their high connectivity, knowledge and character traits and social media offers influencers the opportunity for one-to-many WOM (Lampeitl & Åberg; 2017, 10). These key individuals, who gained a stronger voice and became influential, started to

draw the attention of marketers, who saw the opportunity to access a specific audience and to communicate marketing messages. (Galeotti & Goyal; 2009, 509). E-word of mouth has been greatly empowered through the strengthening of social media and it is, without a doubt, impacting the behaviors of customers.

Influencer marketing is providing benefits for companies, no matter the industry. People will always seek for other people's experiences and advice and will look up to notable people, so influencers may be the correct marketing strategy. According to Lee (2018), there are several advantages of influencer marketing:

- ✦ No ad blockers since influencer marketing result in an editorial that ad blockers will not touch;
- ✦ The only way to reach certain demographics and psychographics; some consumers do not watch TV, listen to the radio, read certain newspapers or magazines and do not watch billboards;
- ✦ A personal connection with the consumer, as the consumer perceives it;
- ✦ Brand building through the „halo effect“ - the influencer's positive relationship with the brand in the eyes of the consumer raises the consumer's awareness and opinion of the brand simultaneously;
- ✦ Copycat behavior of influencer's followers;
- ✦ Second order effects – some influencers provide hard links to the sponsor.

Nielsen's survey of 28.000 consumers in 52 countries reports that 92% of the consumers said they trust earned media, such as recommendations from friends and relatives, more than other types of advertising. (Aquino; 2013, 32). Furthermore, online survey reports that 81% of fans purchased a product based on an influencer's recommendation (Moxie; 2014, 11). Murphy and Schram suggest that influencer marketing is a way to get unique branded social content from a trusted influential source, syndication of content through all platforms, the ability to target micro niches at scale, higher click-through rates and lower cost per clicks than traditional display, fresh and lasting content and loyal partners that care and share (Murphy & Schram; 2014, 35).

According to a survey involving 14.000 respondents in the US, 70% of millennial consumers are influenced by the recommendations of their peers in buying decisions. The same survey reveals that 30% of consumers are more likely to buy a product recommended by a non-celebrity blogger. Consumers can relate

more to these influencers and value their opinions more than that of celebrity influencers (Barker; 2017).

Influencer marketing generates 11 times more ROI than traditional forms of marketing, and 94% of marketers have found it to be effective in 2016. This has resulted in influencer marketing budgets to be doubled in 2017. Influencer Marketing Hub conducted a study showing an increase of 325% in Google searches for the phrase “influencer marketing” in a year. This indicates the growing popularity of this marketing strategy. In the same study, influencer marketing was ranked as the fastest online customer-acquisition method, with 28% of respondents ranked it in the first position. It means that influencer marketing is nearly two times faster in acquiring customers than organic searches (15%) and nearly 10 times more important than those who concentrate on affiliate marketing (Influencer Marketing Hub; 2017).

Lee (2018) has also pointed out the risks of using influencer marketing:

- Brand damage if an influencer gets into a scandal;
- Regulatory intervention due to insufficient or missing disclosure of sponsored content;
- Helping influencers to make them „bigger“ by becoming their sponsor;
- Influencer fraud; it is easy to be blinded by influencer’s ratings, huge follower base and engagement counts so the company does not pay attention to „red flags“;
- Brand safety and control; when a company is trying to script influencer’s campaign, lack authenticity may show through. Of course, the higher risk is to let the influencer interpret the instructions given by the company, but the reward is also higher.

Companies must be aware that some of the influencers are in it only for the money and lack of enthusiasm for the product or service may show. They also must know they may have a different vision in mind for the marketing campaign, so before the campaign starts it has to be clear what are the campaign’s goals. One of the potential risks of using a certain influencer is that one part of brand fans may alienate from the brand (if they do not support the influencer). Even though there are some risks of using influencer marketing that can cause damages to companies, it is still one of the best ways to connect with the certain audience and to raise awareness among target audience (Nujić et al.; 2018, 1267).

2.1. MEGA, MICRO, MACRO, AND NANO INFLUENCERS

As social media is rising, the influencer marketplace is starting to take a recognizable shape. Influencers can be split into four categories; mega-influencers, macro-influencers, micro-influencers and even nano-influencers (Ismail; 2018)

On a global level, mega influencers are the highest-ranking category of social media influencer, they typically have more than a million followers. They are not necessarily experts in a certain topic and they often have a diverse audience. Relationship with their audience tend to be more distant but the reach of their posts is substantial (Ismail; 2018). Mega-influencers are A-list celebrities on social media and in „real life“, with a web of followers over 1 million. Reach of their posts is very high, so partnering with them gives companies a great way to raise brand awareness and can even influence the brand's exclusivity (Influicity, 2018).

Macro influencers are professional creators with a strong passion for a subject. This tier's following ranges between 10.000 and 999.000 and are professional social media personalities with a passion for a specific topic. They are not celebrities in a traditional sense, but their following consists of a large, loyal fanbase (Influicity, 2018). Macro influencers have a high reach in specific markets. With a distinct theme and substantive following, macro influencers allow marketers to tap into a large portion of a target audience. Furthermore, the quality of created content is on a very high level which leaves companies the opportunity to leverage in amplification efforts across social, web, broadcast and even out-of-home. One more advantage is their accessibility – they are easier to connect with than mega influencers (Influicity, 2018). Macro influencers have established a well-known name for themselves, have a certain reputation and have a loyal audience. It can be concluded that collaboration with macro influencers gives companies and brands visibility and exposure, it boosts sales and can be measured.

Micro influencers are real people with a strong relationship with their audience. This tier boasts a following under 10.000. They are real people with a strong voice online. Micro influencers support a unique set of advantages, exclusive to a smaller audience, such as increased audience trust, high followers' engagement and lower cost (Influicity, 2018). Micro influencers focus on a specific niche or area and are generally regarded as an industry expert or topic specialist (Ismail; 2018). As followers decrease, engagements increase. Influencers with

followings under 10.000 have an engagement rate between 4% and 8%, whereas influencers with over one million drop to 1.7% (Influicity, 2018).

Nano influencers are a relatively new breed of influencer. They tend to have a smaller number of followers - less than 1.000 followers. A nano influencer is someone who has influence within their community. The idea behind nano influencers is to get “regular everyday people” to influence a brand’s product or service to their friends and family. One of the benefits of utilizing nano influencers is that they have the highest level of engagement, but despite this, the typical audience size of a nano influencer does not have a great reach (Ismail; 2018)

3. INFLUENCER MARKETING MARKET IN CROATIA

Research methodology for this paper is based on methods of compilation, analysis, synthesis and quantitative method in a descriptive approach to describe trends in Croatia’s influencer marketing market. This research is of explorative nature and it attempts to provide an insight into the present scope of influencer marketing in Croatia and to anticipate future trends in this matter. There is a lack of prior scientific research studies on the topic, so this paper’s research is based on secondary data obtained from the relevant websites. In terms of scope, this paper focuses on the analysis of influencer marketing as an advertising channel in Croatia.

To quantify the influencer market in Croatia, authors have created a list of influencers on social media in Croatia, with an emphasis on Instagram. The sample is purposive, made of 300 experts - influencers in the Republic of Croatia. On the list are, among others, currently the most well-known influencers with the largest number of followers, as well as those with a smaller number of followers. In case of a smaller number of followers on Instagram, into account have been taken individuals who have influence and a greater number of followers on at least one other social network (YouTube, Facebook, Twitter). Social network Instagram was considered in the analysis, as it has seen a tremendous growth of users in Croatia in the last 3 years (Poslovni dnevnik, 2018). Celebrities who have become famous for their work in mass media are excluded from the list. Given there is no base of influencers in Croatia, the limitation of this approach is in the possible overlooking of the influencers.

The study has shown that 41.3% of Instagram influencers in Croatia is in the category of macro-influencers, with a number of followers between 10.000 and 999.999. Within this category, 6.3% of influencers have more than 100.000 followers. Furthermore, 43.3% of influencers fall into the category of micro-influencers with a number of followers between 1.000 and 99.999, and 15% are nano-influencers with a number of followers less than 1.000.

According to the author's research, an account with the highest number of followers at Instagram has 1.129.487 followers which are also the only account with over a million followers. This Instagram profile belongs in the category of Fashion and Cosmetics and Lifestyle.

Considering the above and given the global trends, same as underdeveloped influencer market in Croatia, it is evident that there is room for improvement and growth, both in the user's number of social networks and in the number of influencers. It is undeniable that this way of advertising will increase in usage in the future, as organizations become more and more aware of the benefits that this form of promotion delivers. Growing investments are expected in this segment of advertising and communication.

The most popular category (measured in the number of Instagram accounts) is Fashion and Cosmetics (33%), which is not surprising given the nature of this social network where photographs are published and used as a communication tool. Next category is Lifestyle (26%) followed by Gastro (18%), Travel (11%) and Fitness (8%). It was possible to select multiple responses, meaning one Instagram profile could fall into several categories.

Regarding legal regulations, with the rapid expansion of social media and influencer marketing over the last few years, the FTC has expressed concern about a lack of transparency in sponsored influencer and celebrity posts. They have issued a series of Social Media guidelines on the topic to make influencer marketing clearer. The guidelines make it very clear that endorsements must reflect the honest opinion of the endorser, and that they don't make any claims that would be considered deceptive if the advertiser made them directly. An online influencer must be careful that they don't mislead their audiences with untruthful statements (Influencer marketing Hub).

Furthermore, guidelines state that when there exists a connection between the endorser and the seller of the advertised product that might materially affect the weight or credibility of the endorsement (CFR, 2019). In Croatia, there

is a law regarding media that can be invoked for paid content, but there are no regulations that unambiguously involve the influencers on social networks. But even though there is no such law, an ad is defined as a paid notice and it is done with a fee and the purpose of promotion. This means the ad must be labeled as such, and if not, it can be considered unethical and illegal covert advertising. Legal (marking and separation) and ethical (no misleading) dilemma is a big challenge for influencer marketing.

Since Croatia follows global trends in online marketing, with rapid technology growth and use of social media, this kind of regulations will be imposed. This can be a challenge for influencers, who will have to find a way to integrate products they are promoting in a more creative way since people do not like to see posts that have stated sponsored content.

There are no specialized marketing agencies that deal exclusively with influencer marketing, but as this market develops, their emergence is doubtless. One more challenge is – what metrics to use to measure when evaluating efficiency? Croatia follows a global trend of measuring visibility, engagement, revenue and similar. It is difficult to measure the impact of influencer marketing but setting goals can help in defining metrics that are going to be measured (most used are reach, impressions, engagement, sentiment, conversion).

4. CONCLUSION

Social networks have developed to the extent that they have a great impact on consumer behavior. People believe other online users far more the mass media, they feel close to social media and therefore trust them. The assumptions are that, because of this, the phenomenon of influencers will continue to grow, forcing companies to adapt to these new trends.

An influencer is every individual who is exposed in an online environment (through social media) and because of their popularity can reach a great number of users. This is very attractive to marketers, who are trying to capitalize on communicating their messaging through social media influencers, who are trusted nearly as much as a friend.

Influencer marketing works mainly because the influencer has expertise in the type of products they are promoting. They tend to inspire engagement within their audience (two-way communication) and they could start a conver-

sation with their followers. Influencers are content creators - they have creative freedom when promoting the brand's product or service.

Future of online advertising, not only in Croatia but in general, is oriented on creative storytelling, rather than on traditional forms of advertising. Influencer marketing will continue to grow, but consumers are starting to be aware of sponsored content – influencers must find a new, creative way to engage their followers and prove their authenticity to their audience. Furthermore, companies often use influencers with more than 100.000 followers, but as the number of influencers begins to grow, organizations will start to use nano influencers more.

Influencer marketing is going to be legally regulated with all unknowns minimized. Regulations are necessary to ensure the consumer is protected and that the question of ethics is not questionable.

There is no research done solely for the Croatian market on the profitability of investing in influencer marketing and there is no research done for the Croatian market regarding consumer perception of the credibility of influencers, which can be the direction for future research.

Abstract

Higher education is any form of education offered at post-secondary institutions of education, which after the end of study programme award diplomas or another higher education qualification. A richer market offer of higher education is a result of raising awareness of the key role of education in building a society of knowledge and advances in new technologies, as well as the influence of globalization itself. New technologies have resulted in even bigger internationalization and deregulation of higher education. The new centers of higher education are being created in the virtual world. The usual form of organization of higher education had to be physically available to the students in the form of big classrooms for lectures and exams. Due to technological advances, especially the internet, digital TV and mobile phones, higher online education has become a reality. E-learning or distance learning is the fastest growing trend in education. Moreover, technology is contributing to the idea of non-faculties entering the education sector, such as various vocational courses, training, etc. In a rich market offer, a client will choose the institution recognized by its successful brand. The paper will analyze the strategic thinking of the future

of education, as well as the importance of recognizing the benefits of the education itself.

Keywords: *education, brand, marketing, strategy*

JEL Classification: I21, M30

1. INTRODUCTION

Higher education is any form of education offered at post-secondary institutions of education, which after the end of study programme award diplomas or another higher education qualification. A richer market offer of higher education is a result of raising awareness of the key role of education in building a society of knowledge and advances in new technologies, as well as the influence of globalization itself. New technologies have resulted in even bigger internationalization and deregulation of higher education. The new centers of higher education are being created in the virtual world. The usual form of organization of higher education had to be physically available to the students in the form of big classrooms for lectures and exams. Due to technological advances, especially the internet, digital TV and mobile phones, higher online education has become a reality. E-learning or distance learning is the fastest growing trend in education. Moreover, technology is contributing to the idea of non-faculties entering the education sector, such as various vocational courses, training, etc. In a rich market offer, a client will choose the institution recognized by its successful brand. For instance, if we want to improve our skills or learn how to work in the Excel sheets, we will look online and find a whole line of workshops and courses which offer the same service: learning and improving our skills in information technology, but their competitive advantage lies in the brand that they had built. Due to globalization, the organizations of higher education belong to the international market which attracts more students and consequently the competition is higher because of the open market.

Practical part, personalization, and digitalization represent three major innovative trends in the field of education, together with lifelong learning.

There is definitely a need for marketing even in the non-profit sector, organizations in such an environment have to conduct marketing research so that they could meet the needs of the public and to reply onto those needs with appropriate services and limited resources.

Marketing is a combination of all activities conducted by the users and service providers during the exchange of products for a specific sum of money, where necessity is the main exchange motivator and spender the central point of the business of every service provider. In this case, specifically, the service provider is an institution of higher education, a beneficiary is a potential student, while the necessity is the education itself.

Education has a pivotal role in the economic and social progress of developed countries. The quality of education is becoming more important for those who directly participate in it, or for those who use its services. The higher the level of society growth becomes, the more rigid are the demands for education quality. (Fundu;2006, 9-13)

2. STRATEGIC PLANNING IN HIGHER EDUCATION INSTITUTIONS

The environment of a higher education system consists of all the components around it that have a certain impact on its activity in society and on the market. There are two types of environmental factors: general and specific ones. General factors are those affecting all the organizations (not just higher education institutions) and are not critical for their existence as such. For example, those are economic and cultural contexts. Specific factors are those directly affecting the ability of a higher education institution to attain its objective. Those are the state, the market and the international higher education area (the so-called triangle of power in the higher education system). Therefore, the efficiency of higher education depends on the characteristics of the political and economic configuration of a certain country, as well as the connection of the higher education system to the international academic community. The function of these environmental factors is co-dependent. Decreasing the role of the state in regulating higher education not only facilitates but opens up a way to an active market. The flexibility of a certain country facilitates the connection between the national higher education system and the international higher education area. (Štimac et al.;2015, 572)

Every organization needs a strategy as an answer to constant changes in the markets. Each and every one of them creates its own path taking into account all its resources, aims, opportunities and position of the organization itself. Strategic planning represents the first step towards planning the marketing of

the organization. If a company plans reasonably, it allows predictability and a reaction on time to the changes in its environment. Organizations usually have annual, long-term and strategic plans. The realization of those plans occurs in three stages: Analysis, Planning, Implementation, and Control.

The contemporary systems of higher education are based on set strategies and plans for quality development. Thereby the quality of learning and teaching is the key area for all higher education institutions which want to ensure sustainable success in a dynamic environment of today. Leadership and management are two different, but important elements of formal academic management and individuals who play those rolls have an impact on the culture of learning and teaching in a significant way. As a part of the project of the Ministry of Science and Education Educa-T, with the aim of development and improvement of competence of teaching on colleges, subsidized by the European Union from the programme Erasmus+, the analysis of the condition and activity on universities in the Republic of Croatia has been conducted, with the aim of improving the quality of learning and teaching, where the results of quantitative research showed the following:

- The majority of Croatian higher education institutions incorporate in their strategic guidelines and plans of conduct the questions of development of quality of learning and teaching, however, the institutional framework, according to which these guidelines should be realized in the work of higher education institutions, is not sufficiently developed,
- There aren't any significant differences in the attitudes of management of higher education institutions, in terms of existence and implementation of the institutional framework for the improvement of the quality of learning and teaching, between private and public higher education institutions, as well as between different types of institutions (university constituents, colleges, and academies)
- the management of Croatian institutions of higher education understand the importance of the application of strategies and plans for the development of the quality of learning and teaching and the application of innovative methods in learning and teaching, whereby only student questionnaires are conducted regularly and systematically
- after the content analysis of the key strategic documents and plans for the development of quality of learning and teaching it has been con-

cluded that they include questions regarding the improvement of the quality of learning and teaching, but they don't fulfill other functions like motivating the employees and informing external actors

- ✦ the analysis of the application of innovative methods of learning and teaching has shown that the majority of institutions puts emphasis on the application of contemporary technologies in learning and teaching as support to different forms of online-learning and application of contemporary methods in teaching based on solving tasks at the interactive workshops. (Dužević et al.; 2017, 63-64). The strategic plan is a plan describing a way in which a company will adapt in order to take opportunities in the ever-changing environment, and therefore maintains strategic overlapping between the objectives and abilities of the company together with changing opportunities in the market. (Kotler;2006, 49). Every strategic plan consists of several elements: Mission, Strategic objectives, Strategic revision, SWOT analysis, portfolio analysis, objectives, and strategies.

The mission is actually the sole purpose of an organization and it should be oriented towards the market or towards meeting the main needs of clients. Many organizations define their mission by answering questions such as: What work do we do? Who are our clients? Why do we do this job? What is our company like? The mission should be motivating, based on special abilities, specific and realistic. The mission of the organization should be offering vision and direction for the next decade, it shouldn't be prone to changing throughout a few years. Strategic objectives develop from the company's mission. Mission means direction and philosophy of the organization, while the objectives represent results which are measurable. In order to accomplish their vision, institutions of higher education should focus their attention on the following activities:

- ✦ keeping the relevant feedback from clients (students) and processing data on the outcomes of learning in order to intervene in student programmes on time,
- ✦ matching the number of students and professors, or taking the notion that the size of groups and methods of teaching are in accordance with Bologna standards,
- ✦ organizing different types of lifelong learning
- ✦ examples of e-learning

- ✦ forming the organization network of teachers required for setting up the field classes, practical part,
- ✦ creating new and adding modern equipment to the existing classrooms and laboratories
- ✦ managing human resources in a way that the focus is on admitting excellent and renowned experts from the economy to new staff and on improving the existing staff by stimulating teachers to work on vocational training, publishing works, attending professional and science gatherings
- ✦ encourage publishing professional and school literature by the staff employed at institutions of higher education,
- ✦ establishing international cooperation with partner institutions of higher education, as well as with economic subjects and the local community,
- ✦ improving student standards by opening student restaurants and other facilities (sport, cultural and social activities).

A SWOT analysis (Strengths, Weaknesses, Opportunities, Threats) means distinguishing between the results of internal and external revision which draws the attention on the key strengths and weaknesses of the company as well as the opportunities and threats the company is facing. (Kotler; 2006, 58) Opportunities represent the adaptation of the environment to the strengths of the organization. When assessing the opportunities, the management of the institution of higher education has to take into consideration how attractive the opportunity is and their chances of success. It is hard to expect the appearance of a perfect opportunity in the organization's environment which perfectly fits into its aims and resources. Therefore, the management has to estimate whether the level of earnings justifies the risk when carrying a decision. The institutions of higher education see the opportunities in:

- ✦ further increase of space resources
- ✦ increasing the mobility of students and teachers
- ✦ the realization of different programmes for lifelong learning
- ✦ supporting more e-learning in class
- ✦ organizing round tables and professional workshops with experts from the economy, former students and present students who will reflect the situation in the economy, labor market and development of teamwork.

- ♦ Further coordination of the curriculum to the needs of the labor market and economy,
- ♦ The possibility of applying for the projects funded by the EU, or the use of resources from the EU funds,
- ♦ Guest lectures by experts from abroad, together with local significant individuals.
- ♦ On the other hand, the possible threats in the environment of institutions of higher education are:
 - ♦ unfavorable situations and the structure of the economy,
 - ♦ frequent changes in the legislative framework,
 - ♦ unfavorable demographic image,
 human capital flight into another economy or country

These threats do not require the same amount of attention or concern. The head of the institutions of higher education should be aware of their appearance and possibility of the potential damage they may cause. The management should be primarily prepared for facing the most damaging and most probable threat of them all.

The strengths and weaknesses represent the key factors of success, they also represent the most important contribution to the success of the organization. They are being examined due to high competition and have to be based on facts.

Therefore, the strengths of the institutions of higher education are:

- ♦ firstly, the enthusiasm of the management and the professional faculty devoted to the growth of their institution
- ♦ awareness of the meaning of the improvement of quality,
- ♦ flexibility in modernizing the study programmes,
- ♦ active communication between the faculty and students,
- ♦ the staff kept up-to-date and their publishing activity
- ♦ guest lectures by the experts of the field
- ♦ field class and contacts with other institutions (non-educational) and economic entities,

while the weaknesses are:

- + insufficient number of staff for particular study programmes,
- + the big workload on the staff in class and abundance of administrative work
- + poor number of interdisciplinary research and study programmes,
- + insufficient co-operation/ between the curriculum and the economy needs and labor market,
- + insufficient number of working experts with the previous working experience in economy,
- + insufficient cooperation of economic entities in professional and research work
- + an insufficient number of study programmes held in English.

The purpose of strategic planning would be to find the ways in which a company can use its strengths in order to take attractive opportunities in their surroundings. (Kotler; 2006, 61) According to Strategic planning, an organization determines the work they will do, and afterward they define in detail the planning within every department. Certainly, the structures of organization defined as strategically important, have to work together in order to achieve the aims successfully.

It is not important to do some things better than others. Such organizations are more efficient from the operative point of view. Operative excellence can help the organization to keep the throne for a certain time, but other organizations will easily catch up if not even supersede them. The award goes to those companies which come up with new ways of creating values and delivering them to the markets they are aiming at. (Kotler, 2006, 19-22).

3. HIGHER EDUCATION AS SERVICE

Kotler defines a service as any other activity or benefit that one party offers to the other and which is in its essence intangible and doesn't result in ownership over anything. Services differ in the real sector and those in public ownership. There are five major characteristics of services:

1. Intangibility means that those services cannot be easily exposed, seen or heard, taste, smell before they are bought. Therefore, services are characterized by uncertainty, in order to minimize it, the clients look for

certain signs of quality. In this concrete example, the service relates to knowledge acquired at an educative institution, but the quality of gained knowledge and satisfaction with received service can be discussed only upon the completion of education. Due to the intangibility of the service of education, the clients will pay their attention onto visible and tangible characteristics such as classrooms, cabinets, image, and behavior of the employed professors, lecturers, equipment and technology used in the class as well as in communication.

2. Indivisibility means that it is not possible to separate the services from the service providers. Indivisibility is a characteristic especially common in education. The faculty of the institution of education is also a part of the offered service of education and is crucial in providing full service. A teacher cannot have a lecture in a classroom empty with students. Both teachers and students have a significant effect on the outcome of the provided service. The relationship built between the students and teachers certainly affects the quality of learning. Therefore, it is of crucial importance that the lecturers are appropriately educated in order to achieve a satisfying interaction with clients. Another characteristic of indivisibility is that during the provision of service there are other students in the classroom who also contribute to the satisfaction of clients.
3. The changeability of services means that their quality depends on the provision of service, time, location and the ways of providing service. Therefore, it is very difficult to control the quality of service. Because of this, very good marketing strategies cannot do much if service providers are not good at their jobs. The same provider can provide the same service to different clients in different ways, which can differ day by day as it depends on the interaction in the class, the mood of the clients, etc.
4. The passage represents the inability of storing services for postponed production or usage. This characteristic represents danger with changeable demand for services. The institutions of higher education use the possibility of employing freelance staff when the number of enrolled students increases.
5. The non-existence of ownership, the user of service usually has access to the service for a limited time. Referring to this, the institutions of higher

education have to work harder on branding their services and affection of the client.

Not until a while ago has marketing become necessary for the institutions of higher education, as well as for the other non-profit organizations. As traditional marketing probably cannot be successfully used in public services, it is therefore required to adopt the principles of traditional marketing based on the products to the service environment. Service organizations will use marketing services in order to create strong brands which are strongly positioned in the chosen targeted markets. Successful marketing in higher education would mean focus on clients and staff. The chain of services- profits consisting of five links are created in this way. The first one is internal service quality which represents a successful selection of faculty and their education, as well as a stimulating working environment which leads to the second link of satisfaction and the service productivity of employees, all of this leading to a higher value of service itself for the clients, leading again to the powerful performance of service companies. Therefore, every higher education institution would have three important marketing tasks:

- a) Differentiation management would be completed in three ways: through people, physical surroundings and process. Since the service is completed through people, they have a key role in satisfying clients. The organization can differentiate by more capable and reliable staff. The organization which makes a better selection of staff and is more focused on their education and growth can improve in this way the quality of performance of services which will eventually result in keeping the excellence of the performance itself. The institutions of higher education can also create superior physical surroundings where the service is provided, and in this way easily differentiate. Differentiation is definitely the priority of every organization in creating a strong brand.
- b) The control of the quality of services would mean perseverance in the consistency of providing services more successfully than their competitors. Successful organizations are aware that excellent quality leads to the competitive advantage which leads to bigger income and bigger profit. This was concluded on the round table meeting on Bologna process, held on 18 September 2018 at the Ministry of Science and Education in Zagreb. According to this, the institutions of higher education in Croatia

should be more concerned about the quality of education rather than on their form, which prevailed till then.

4. EDUCATION BRANDING

According to Kotler, a product is defined as anything that can be offered in the market with the purpose of drawing attention, initiating purchase or usage or spending, something which can satisfy wishes or fulfill needs. It includes physical products, services, persons, places, organisations, and ideas. According to him, the products are services which consist of activities, benefit or satisfaction offered on sale, intangible in its essence and not resulting in ownership. Every product consists of more levels, and every additional level on the basic product increases satisfaction and creates additional value for the clients.

Next to quality, creating a brand for the product and its maintenance is one of the main ways of positioning a product onto the market, used by marketing experts. The most accepted definition of a brand is the one set by David A. Aaker "Brand is a name, idea, design, symbol or any other characteristic identifying a product or service of one seller and differentiating it from other producers." However, Kotler defines a brand as a name, idea, sign, design or combination of them, representing a producer or seller of the product or service. The brand is a very important part of a product to clients, and creating a brand gives additional value to it. The stronger the brand of a product, the bigger the value of the brand, which means the bigger the loyalty of customers and assured quality. Therefore, marketing experts should focus on clear brand positioning to their clients. According to Kotler, the brand is a complicated symbol which can have several levels of meaning:

1. Attributes, when we are thinking about a brand of a product, our first association are specific attributes of a product.
2. Benefits, clients will not think about the attributes of a product but of the benefits, they can bring. The tasks of the marketing experts would then be to turn the attributes into benefits, either functional or emotional.
3. Values, brand defines the value of the client itself. It defines the essence of a brand.
4. Culture, brand represents a certain culture.

5. Personality, clients might think of a product or service as a person, the brand then represents a person, or what that person might be like. The most important attribute of a brand.

If we apply Kotler's method onto education and if we change an example of Mercedes for an example of a University, we will notice the same values: students want the education of good quality in a reputable institution known for the excellent service and competence of the lecturers. They want to be aware that they are competitive on the market and that the acquired knowledge is a guarantee of success on a professional level, while on the personal level they want to feel self-confident, competent and up to all challenges. Just as a boy training football wants to have Nike trainers to help him in building a successful career, an ambitious student will wish to study on Harvard because they know that many successful businessmen graduated from there. (Vrban; 2014, 47)

Brand positioning will not be entirely successful unless every employee of the organization doesn't work on the promotion of a brand. A brand should initiate a sense of pride with employees so that the enthusiasm of employees spreads further onto clients and customers.

5. CONCLUSION

Technology, globalization and deregulation have had a significant impact on business and activities of the institutions of higher education. Technology development made the appearance of online learning possible, globalization opened up the market which resulted in an increase of competition in the efficiency of higher education, as well as in the increased possibilities for "recruiting" potential students.

Such institutions should be focused on the global market by introducing study programmes in English. Furthermore, they should maintain contact with other divisions of belonging University and even further, to create cooperation with other organizations on the international level.

Society changes and develops with time, the same occurs with education. Therefore, it is very important for the organizations dealing with education to recognize social changes on time and react to them by changing or matching their own services and doing business and finally needs of their users. An awareness of the main role of education resulted in an even bigger market offer,

and global experience showed that the most successful organizations are those which made a strong brand, and those which can recognize on time and set new trends in their businesses and offers. Those institutions of higher education which expect the worst develop the fastest in providing new services.

Many authors consider differentiation the most significant in achieving market success over competitors, and which should be based on innovations and unique form of provision of services expected from the organization.

IMPACT OF THE PERCEIVED KNOWLEDGE ON THE ATTITUDES TOWARDS ORGANIC FOOD PRODUCTS

Marija HAM, Ph. D.

J. J. Strossmayer University of Osijek,
Faculty of Economics in Osijek

E-mail: marija.ham@efos.hr

Abstract

Stimulating the consumption and consequently, the production, of organic food products is a desirable goal for every society. Especially so in countries like Croatia which bases its basic strategic development goals on the factors closely tied with environmental preservation and production of healthy food. In order to foster this desirable kind of consumption, it is necessary to deeply understand all of the predictors of the relevant purchasing behavior.

The necessary prerequisite for making a decision to purchase organic food, are positive attitudes towards those products and one of the main influential factors on those attitudes is knowledge. The present study, therefore, aimed to explore which specific dimensions of knowledge have the largest effect on positive attitudes towards organic food.

The study is based on the outcomes of a questionnaire completed by a sample of 411 household primary shoppers from Eastern Croatia. Two of the proposed dimensions of knowledge were generally oriented and two were specifically oriented. The findings of the study reveal that the most important predictor of positive attitudes towards organic food is knowledge of the effects of organic food consumption on the health. It means that in order to stimulate positive attitudes, it is most important to make consumers fully understand the positive effects of organic food on health. Also based on the research results, the relevant attitudes will be steered in the positive direction if consumers are educated on organic food products characteristics and sources. The two remaining, generally oriented dimensions of knowledge (knowledge of eco-labels and knowledge of environmental issues) were found to be insignificant, meaning that the present

research strengthens the view that specific knowledge is more strongly related to relevant attitudes rather than general knowledge.

This paper aims to add to the previous cognitions regarding the cognitive dimension of attitudes towards organic food.

Keywords: *perceived knowledge, attitudes, organic food, Croatia.*

JEL Classification: L66, M39

1. INTRODUCTION

Considering a high growth potential of Croatia in terms of production and distribution of organic food products, this topic is of the utmost importance for all stakeholders interested in sustainable food industries. This is further emphasized by the fact that the production of organic food brings multiplicative positive effects on the whole economy. On the other hand, the existing literature does not provide sufficient information and knowledge about consumers, necessary for the development of marketing strategies in this growing market. (Brčić-Stipčević, Petljak & Guszak, 2013). Also, the existing knowledge is not sufficient to provide other social stakeholders the necessary information in order to foster the social change in the desired direction

An individual's attitude towards consuming a product is one of the most important antecedents for predicting and explaining consumers' choices across products and services, including food products (Honkanen et al., 2006). Organic food is the one that is produced without the use of chemical pesticides and fertilizers and which does not contain synthetic hormones. It is produced under legally defined methods, and its composition should match the general laws and regulations on the quality of food (Martić Kuran & Mihić, 2014, p. 181). Previous studies have associated organic food consumption with behavioural attitudes such as health consciousness, environmental consciousness, trust of organic food claims, desirability of organic food attributes such as taste, texture, freshness (Voon et al., 2011, Salleh et al., 2010; Michaelidou & Hassan, 2008; First & Brozina, 2009) and other attitudes such as attitudes toward local origin of products, fair trade (Tanner & Wölfling Kast, 2003) and reference knowledge (Amran & Nee, 2012; Saleki et al., 2012).

Personal attitude is usually defined as permanent mental or neural willingness gained from the experience, making the directive or dynamic influence on

an individual's response to objects and situations that he comes into contact with (Allport, 1935). Psychological attitude structure consists of three components: cognitive, affective and conative. Cognitive component includes the opinions, beliefs, and ideas about the object of the attitude, emotional refers to the feelings that are associated with the object of the attitude, and behavioral consists of the tendency or willingness to act in relation to the object of the attitude. When it comes to individuals' attitude formation, most contemporary psychologists take the cognitive approach. The focus on the cognitive component in most research stems from early research that showed a significant influence of knowledge and awareness on attitudes toward the environment. That early research assumes that knowledge affects attitudes and attitudes affect behavior. That is the so-called linear model.

The hypothesis that people who are better informed about environmental issues and their consequences have more positive attitudes and are more willing to act in accordance with such attitudes seems common-sense. However, empirical research has shown that proving this relationship, as well as the relationship with attitudes, is rather problematic. One of the basic assumptions is that very general knowledge is correlated with highly specific attitudes and specific behaviors. Research indicates that measures of specific attitudes (e.g., judgments about products or behaviors) rather than general measures of environmental concern (e.g., judgments about environmental problems) are likely to manifest in environmental behavior (Tanner & Wölfling Kast, 2003). It is necessary to take into consideration the possibility that attitudes of consumers toward different environmental issues as well as toward different environmental behaviors can vary. In that sense, there is also a need for more research looking into different dimensions of knowledge and the effects on specific attitudes. The present study aimed to explore which specific dimensions of knowledge have the largest effect on positive attitudes towards organic food in order to add to the previous cognitions regarding the cognitive dimension of attitudes towards organic food.

2. THEORETICAL BACKGROUND

Cognitive variables comprise knowledge, memory processes, intelligence, decision-making, and problem-solving behavior. Essentially, cognition relates to understanding – the manner of forming, applying and storing meaning in the individual's mind (Wagner, 2003, p. 192).

It can be said that the consumer's ability to differentiate between various decisions, acts and choices based on their actual impact on the environment is, in fact, the basic prerequisite for any environmentally oriented behavior. Thus, various environmental organisations, associations and governments of many countries invest substantial amounts of resources and make considerable efforts to overcome the barriers created by general ignorance and a lack of information, which prevent and/or discourage consumers from acting in accordance with their environmental beliefs, or even from forming such beliefs in the first place.

Makower and Pike (2009) point out that education (knowledge) leads to a high level of environmental awareness, but does not necessarily make a consumer an expert on environmental issues. He emphasizes that Americans (according to his research - A/N), even the greenest and most educated ones, want simple answers to environmental challenges we are faced with. Our minds function by processing information in terms of a simple cause and effect relationship. Therefore, economic operators must focus on the big picture and clarify the relationship between environmental challenges and their solutions, as well as specify the manner in which their products and services correspond to this relation. Banalisation must be avoided, but first of all, it is necessary to draw attention to these issues and only then to inform people about the details.

One of the main objectives of studying cognitive and emotional processes affecting the consumer's behavior is to make an impact on the consumer's knowledge. Knowledge can be defined as information stored in memory. Consumer knowledge is part of each person's overall knowledge defined as all the information stored in one's memory, used by a person to function in the role of a consumer (Kesić, 1999, p. 181). Market researchers have recognized this variable as a factor that affects each stage of the buying decision process and the manner in which customers obtain and organize information. This factor also defines the manner in which consumers evaluate products and services (Finisterra do Paco & Raposo, 2008, pp. 131-132)

Gambro and Switzsky (1996) define environmental knowledge as the students' ability (research was conducted among adolescents - A/N) to understand and evaluate the society's impact on the ecosystem. This knowledge is expressed by recognizing environmental issues, but also by understanding their causes, implications, and consequences.

Consumers' knowledge about environmental issues is a variable that is relatively difficult to measure. Due to specific characteristics of countries where research is conducted, scales measuring individuals' own perception of knowledge about environmental issues (such as those used in the research by Schlegelmilch and associates (1996) are often used instead of well-known and internationally tested scales measuring specific knowledge (such as the scale created by Maloney et al. (1975). Such scales do not necessarily draw a realistic picture of the actual level of knowledge. However, their advantage is that they are universally applicable, comparable, relatively simple to form and, depending on research objectives, sometimes render more adequate results. For instance, this is true for research measuring the level of perceived rather than actual knowledge as a measure of the subject's self-confidence, which can also be an important factor for environmental behavior. Such scales are frequently used in public opinion research, as well as in Eurobarometer surveys (probably the most extensive public opinion research today), which also follow environmental issues on a regular basis.

When it comes to objective measurement of knowledge, the problems are manifold. Firstly, the very nature of ecology, which comprises complex interactions between living organisms and the environment, complicates the understanding of this issue. Furthermore, regardless of its current relevance, it can be said that (at that time, in the 1970s, as well as today - N/A) an average person knows very little about ecology. Therefore, it is hard to develop a measuring instrument with a sufficient number of highly-likely, i.e. "easy" questions (Maloney & Ward, 1973). Also, the process of determining relevant environmental issues (topics) that must be considered while measuring knowledge is extremely complex. Finally, the manner of asking questions (and offered answers), as well as the manner of conducting the survey itself (the possibility of "cheating"), are extremely important as they may affect actual measurement results.

The relation between knowledge and environmental behavior does not seem to have a stable pattern. In the meta-analysis of 128 previous studies, Hines and associates (1987) determined that the average correlation coefficient between knowledge about environmental issues and ecological behavior is 0.30. This moderate, but statistically significant correlation was further confirmed in Grunert's research (1993) related to purchasing organic food products, as well as in the model developed by Chan and Lau (2000). On the other hand, Maloney and Ward (1973) did not find any significant correlations between those

variables and it must be mentioned that the research conducted by Arbuthnot and Lingg (1975) even showed a negative correlation. In brief, it can be concluded that the opinion about a positive correlation between these two variables prevails, partly due to empirical research results and partly due to logical reasoning and the general theory on attitudes and their impact on behavior. Namely, the hypothesis that people who are more informed about environmental issues and their consequences are more willing to act in accordance with such attitudes seems common-sense, but empirical research has shown that proving this relation is rather problematic.

Schan and Holzer (1990) assumed that low significance suggested in previous research can be attributed to the fact that scales used for measuring relatively abstract knowledge (general knowledge about ecology) are used for measuring highly specific activities.

Therefore, in this research, they used two different scales, one for abstract and one for specific/applicative knowledge (related to specific activities and strategies contributing to environmental protection). Authors concluded that a certain amount of information is required to make a particular behavior efficient for a specific purpose and that applicative knowledge acts as a moderating factor between attitudes and actual behavior. On the other hand, abstract knowledge has no such effects. Therefore, knowledge, particularly applicative (specific) knowledge, has an indirect effect on behavior.

Furthermore, it must be pointed out that a consumer can, but does not have to, be aware of or capable to realistically assess his level of knowledge about a particular environmental issue (“I do not know how much I do not know”). This stems from the fact that awareness of ignorance requires an individual to have at least a minimum amount of knowledge and the ability to adopt different attitudes towards that level of knowledge (“I want to and I must learn more.” or “This does not concern me at all.”).

According to Southern (1972), if children acquire a broad understanding of environmental issues, i.e. knowledge, they will gradually develop social/environmental awareness, i.e. adopt an attitude that will affect their environmental behavior and eco-friendly activities. Educational system can significantly affect environmental awareness of future consumers from an early age. Thus, many European countries have eco-kindergarten and eco-school programmes with integrated environmental education programmes.

We can conclude that, in general, knowledge about environmental issues represents a prerequisite and an important factor for developing critical awareness. Critical awareness enables individuals to analyze the environment with a critical eye and to realize the need to act with the aim of changing the current situation. In this manner, individuals can adopt adequate environmental behavior that is most efficient for making a positive impact on the current situation.

3. RESEARCH METHODOLOGY

3.1. PARTICIPANTS AND PROCEDURE

The research is based on an in-person survey carried out on a convenient sample of 411 primary household shoppers from five counties in the Slavonia and Baranya regions in Croatia. According to Tanner and Wölfing Kast (2003, p. 85), primary household shoppers are defined as “the people who make purchasing decisions and regulate what the other members of the household eat”, therefore representing the most relevant source of information. In this research, primary shoppers were selected by placing a filter question (Are you the person that does the most grocery shopping for your household?) in the very beginning of the questionnaire.

The information obtained was analyzed using the statistical software package SPSS version 18.0. Statistical techniques of univariate analysis (frequency distribution, central tendency measures), multivariate analysis (reliability analysis, linear regression) and comparative analysis (ANOVA, t-test) were used. Table 1 shows a sample description.

Table 1. Sociodemographic characteristics of a sample (N=411)

3.2. INSTRUMENT AND MEASUREMENT

To explore the effect of perceived knowledge on the attitudes toward organic food products, five measurement scales were employed. Four scales refer to per-

ceived knowledge: knowledge of environmental issues in general, knowledge of eco-labels (for all types of products), knowledge of organic food products (their characteristics and sources) and knowledge of effects of organic food on individual's health (and the health of their family).

Two of the mentioned scales are more generally oriented (environmental issues and eco-labels) and the remaining two are specifically related to organic products. The last scale measures attitudes towards organic food products.

Measurement scales were created by authors or adapted from previous studies in this field. Each scale comprised a set of statements presented in Likert-type format with a five-point scale to capture the extent to which respondents agree or disagree with the statements in the questionnaire. Mejovšek (2003, p. 42) states that five-point Likert type scale is especially suitable for collecting data on populations that have educational systems with grades from 1 to 5, as individuals are used to thinking and evaluating things in terms of that range.

Items used for measuring each construct and reliability measure Cronbach's Alpha are provided in Table 2.

Table 2. Items and reliability measures of the constructs

Construct	Items	Cronbach's Alpha
Attitudes toward organic food	Purchasing organic food for me has more advantages than disadvantages.	,854
	Purchasing organic food seems attractive to me.	
	If I had the chance and resources I would want to purchase organic food.	
	Purchasing organic food would give me great pleasure.	
Knowledge of eco-labels	From different kinds of nutrition, I would choose one with dominant organic food.	,711
	The level of my knowledge of eco-labels is excellent.	
	In the stores, I can distinguish between environmentally friendly and harmful food products based on labels.	
Knowledge of environmental issues	I know which eco-labels are reliable and which are not.	,753
	I have a good knowledge of ecological certificates so I could recognize ecological products.	
	My knowledge about the ways I can contribute to environmental protection is excellent.	
	My knowledge about the ways producers can contribute to environmental protection is excellent.	

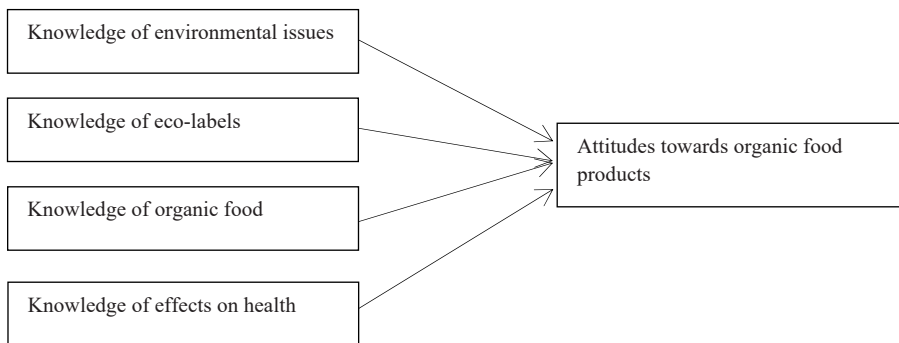

Knowledge of organic food products	My knowledge of organic food products is excellent.	,718
	My knowledge about the places where I can buy organic food is excellent.	
	I have adequate knowledge of buying organic food.	
	I feel informed enough to be able to purchase organic food.	
	I am familiar with the availability of organic food products.	
Knowledge of the effects of organic food on health	I am familiar with the characteristics of organic food products.	,788
	My knowledge about the influence of organic food on my health is excellent.	
	I know that organic food has a positive influence on my health.	
	I know enough about the nutrition characteristics of organic food.	
	The fact that organic food has fewer chemicals is good for my health.

4. RESEARCH RESULTS

The aim of the research was to determine the relationship between perceived knowledge and attitudes towards organic food products. The research model is presented in Figure 1. Linear regression tests using standard regression method were subsequently conducted to find out which knowledge dimensions could influence those attitudes.

Figure 1. The research model

Source: Author's work

The proportion of explained variance as measured by R-Squared for the regression is 25.4% as depicted in Table 3.

Table 3. Model summary

Model	R	R Square	Adjusted R Square	Std. The error of the Estimate
1	,504 ^a	,254	,247	,78817

a. Predictors: (Constant), knowledge_eco-labels, knowledge_env-issues, knowledge_organic-food, knowledge effects-on-health

	Residual	242,274	390	,621		
	Total	324,908	394			

a. Dependent Variable: attitudes

b. Predictors: (Constant), knowledge_eco-labels, knowledge_env-issues, knowledge_organic-food, knowledge effects-on-health

Source: Authors' work

Results obtained from the regression analysis are presented in Table 5. Based upon results, the predictive power of the following constructs was confirmed: knowledge of organic food products and knowledge of the effects of organic food on health. The influence of the remaining two constructs: knowledge of eco-labels and knowledge of environmental issues were found to be insignificant.

Table 5. Regression coefficientsCoefficients^a

Model	B	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		Std. Error	Beta			
1	(Constant)	1,526	,232		6,588	,000
	knowledge_organic-food	,243	,077	,190	3,179	,002
	knowledge_eco-labels	-,110	,081	-,076	-1,366	,173
	knowledge_env-issues	,033	,049	,034	,663	,508
	knowledge effects-on-health	,499	,059	,412	8,515	,000

a. Dependent Variable: attitudes

Source: Authors' work

The overall multiple regression model has worked well in explaining the variation in effects of organic food products (F=33,255; d.f. =4; p=0,000).

As presented in Table 5, knowledge of effects on health was found to have the largest significant positive influence on attitudes towards organic food ($t=8,515$; $p=0,000$; $\beta=0,412$). Significant positive effect was also found in one more independent variable: knowledge of organic food products ($t=3,19$; $p=0,002$; $\beta=0,190$). The influence of the remaining two variables was found to be insignificant: Knowledge of eco-labels ($t=-1,366$; $p=0,173$; $\beta=-0,076$) and knowledge of environmental issues ($t=0,663$; $p=0,508$; $\beta=0,034$).

5. CONCLUSION

Stimulating the consumption and consequently, the production, of organic food products is a desirable goal for every society. Especially so in countries like Croatia which bases its basic strategic development goals on the factors closely tied with environmental preservation and production of healthy food. The necessary prerequisite for making a decision to purchase organic food, are positive attitudes towards those products and one of the main influential factors on those attitudes is knowledge. This study, therefore, aimed to explore which specific types of knowledge have the largest effect on positive attitudes towards organic food.

Two of the proposed dimensions of knowledge were generally oriented and two were specifically oriented. The findings of the study reveal that the most important predictor of positive attitudes towards organic food is knowledge of the effects of organic food consumption on the health of an individual and his family. It means that in order to stimulate positive attitudes, it is most important to educate consumers and make them fully understand the positive effects of organic food on achieving health benefits. Also based on the research results, the relevant attitudes will be steered in the positive direction if consumers are educated on organic food products characteristics and sources.

The two remaining, generally oriented dimensions of knowledge (knowledge of eco-labels and knowledge of environmental issues in general) were found to be insignificant, meaning that the present research strengthens the view that specific knowledge is more strongly related to relevant attitudes rather than general knowledge. The general knowledge is presumably related to attitudes through some mediating or moderating variables.

The above mentioned presents one of the basic proposed directions of future research that could be directed towards discovering possible variables that moderate the effect of general dimensions of environmental knowledge on attitudes or relevant behavior. Also, the effect of other knowledge dimensions could be investigated. Furthermore, including demographics as a control variable would enable discovering possible differences based on gender, age group etc. Also eliminating one of the basic limitations of the present research regarding regional sample would provide results that are more generalizable. And finally, future research could strive to develop and test the scale for objective measuring of actual knowledge which could then be compared and discussed in relation to perceived knowledge.

This paper aims to add to the previous cognitions regarding the cognitive dimension of attitudes towards organic food. Understanding this, as well as other dimensions of those attitudes, will enable marketers to design the appropriate marketing strategies and provide other social stakeholders the necessary information in order to educate individuals in the way that will be most effective and most appealing to them.

Abstract

This paper presents the results of the research about purchasing decision-making styles in Croatia. The research tested the applicability of the Consumer Style Inventory instruments to measuring consumer decision-making styles in the Croatian market. Unlike most domestic and foreign surveys so far, this study was not conducted on a student sample.

A small number of studies on this subject has been conducted in Croatia, so one of the aims of this research is to contribute to the knowledge in this area in the Croatian context. The CSI measurement system may help practitioners to gain a better understanding of how to position their products and services more effectively.

Since the general position of the author was that the difference in the gender decision-making styles is lost after attaining mature years (35+), have a higher level of education and employment, the general hypothesis is made that the differences in decision-making styles of consumers who are between 35 and 45 years of age, live in an urban environment and have higher education and

employment are missing or are very small. The study was conducted on 253 people who have precisely these characteristics.

Keywords: *consumer behavior, segmentation, purchasing decision styles, women, Croatia*

JEL Classification: D10, D19

1. INTRODUCTION

Sproles & Kendall (1986, p. 267) define consumer decision-making style as a mental orientation that characterizes consumer choice when deciding which product to buy. The decision-making style is a key determinant of consumer behavior and possible gender stereotypes in decision-making styles could be useful information to experts in defining market communication strategies.

Shopping is a matter of fun, culture, and experience (Lehtonen & Maenpaa, 1997, p.141). Some authors believe that shopping is equally interesting to men and women and that they do it in a similar way (Otnes & McGrath, 2001, p.113). However, most find that gender is a basic prerequisite for understanding purchasing behavior, especially when it comes to impulsive purchasing that is more typical for women than for men (Campbell & Falk, 1997; Dittmar & Drury, 2000; Elliot, 1994; Faber, 1992; Roberts, 1998). According to some researches, women enjoy the purchasing process more than men, they spend more time (Jansen-Verbeke, 1987), and are more involved than men in the purchasing process itself (Dholakia, 1999). Generally, purchasing is perceived as a female activity (Lunt & Livingstone, 1992; Müller, 1998; Oakley, 1976). Although men spend more money than women, they buy more rarely (Arnold & Fischer, 1990; Cody et al., 1995) and make shorter purchases than women (McDonald, 1994).

Numerous researches on purchasing decisions have been made, but according to segments (by year) there are few, most of them are from the United States of America (Bettman, 1979; G.B.Sproles, 1985; Westbroke & Black, 1985), United Kingdom (Bakewell & Mitchell, 2006; Mitchell & Bates, 1998, Mitchell & Walsh, 2004), Germany (Mitchell & Walsh, 2004; Walsh et al., 2001), South Korea (Hafstrom et al., 1992), China (Fan & Xiao, 1998; Wang et al., 2004), Taiwan (Yang & Wu, 2007), Iran (Hanzaee & Aghasibeig, 2008), however most of them relied on the target group of students as homogeneous and

accessible. Rare researches, including the one done by Sinkovics et al (2010) have focused on the target groups different than the students.

This research by Nobilo et al (2017) contributes precisely by targeting a group of employed and well off people who have a higher purchasing power on the one hand, and on the other hand, lack of time to make purchases.

Almost all of these researches used a sophisticated version of the consumer decision-making questionnaire developed by Sproles & Kendall (1986) (CSI – Consumer Styles Inventory), which includes 40 statements that measure eight key features of consumer decision-making styles that affect their buying behaviour: (1) high-quality consciousness, (2) brand consciousness, (3) novelty-fashion consciousness, (4) recreational, hedonistic shopping consciousness, (5) price shopping consciousness, (6) impulsiveness, (7) confusion from over choice and (8) habitual, brand-loyal orientation towards consumption. Basic characteristics of the decision-making styles are listed in Table 1.

Theoretical differences in purchasing decision-making styles between women and men reflect mostly traditional views of the genders. However, times have changed, and various researches have tried to overcome old hypotheses. Various authors, including Mueller (1991), Underhill (2000), Anić et al (2010) made the following hypotheses on gender differences when it comes to decision-making on the purchase and continued their research based on these differences:

- ♦ Women are more prone to perfectionism than men
- ♦ Men tend to buy more brands than women
- ♦ Women are more prone to novelties and fashion than men
- ♦ Women tend to buy more for recreation and satisfaction than men
- ♦ Men are more price-sensitive than women
- ♦ Women tend to be more impulsive when buying than men
- ♦ Women will be more confused from over choice than men
- ♦ Women tend to buy more out of habit than men

Table 1. Characteristics of decision-making styles

Decision-making styles	Characteristics of decision-making styles
High-quality consciousness	Consumers prone to perfectionism search for the best quality products. They buy more carefully, systematically and compare products. These consumers are not happy with the average product.
Brand consciousness	This decision-making style measures the consumers' preference for buying more expensive and well-known brands. These consumers believe that the higher price of the product also represents its better quality.

Novelty-fashion consciousness	This decision-making style involves motivation to buy the latest, trendy product.
Recreational, hedonistic shopping consciousness	For customers who tend to buy for recreation and pleasure, it represents pleasure, recreation, and fun.
Price shopping consciousness	This decision-making style refers to the search for the products with the lowest prices. These consumers look for the best value for money and they search for stores to make the best purchase.
Impulsiveness	This factor measures consumer preference for impulsive purchases. Customers who have a high rating on this factor do not take into account how much they will spend and do not plan their purchases.
Confusion from over choice	This factor indicates the lack of confidence and consumers' ability to choose the right product. These consumers experience information overload, and therefore have difficulties making decisions.
Habitual, brand-loyal orientation toward consumption	This factor indicates consumer loyalty to certain brands and stores. Consumers are likely to buy the same brand in the same store by habit.

2. RESEARCH ON CONSUMER DECISION-MAKING STYLES IN CROATIA

There is very little research on consumer behavior in Croatia so every research on this subject is significant and welcome. Research by Anić et al (2010) refers to a convenient and homogeneous sample of 407 students in third and the fourth years of the Faculty of Economics in Zagreb. In this research, the authors used Likert's five-degree scale, with number 1 representing the claim "I strongly disagree" and 5 representing "I strongly agree".

In their sample, by analyzing the mean values, respondents gave the greatest significance to perfectionism (3.85), recreational shopping consciousness (3.48), habitual orientation towards consumption (3.44) and price shopping consciousness (3.22). The results of the chi-square test in their findings point to the conclusion that "in the segments of consumers prone to novelties and fashion, who tend to buy for recreation and pleasure, and in the segment of impulsive consumers, there is a higher share of female consumers. In the segment of consumers prone to high quality, there is a higher share of male consumers" (Anić et al, 2010, p.37). Since their research continues on earlier research and literary theory, it confirms the earlier hypothesis that women are more prone to novelties and fashion than men, as well as to shopping out of habit, impulsive shopping, and shopping for recreation and pleasure.

Contrary to the previous literature, their results showed that in a student sample:

- men are more prone to perfectionism than women,
- genders do not differ significantly according to price shopping consciousness, brand consciousness or confusion from over choice.

2.1. RESEARCH BY NOBILO, LANINOVIĆ, AND BILMAN

As mentioned earlier, a small number of studies on this subject has been conducted in Croatia, so one of the aims of this research is to contribute to the knowledge in this area in the Croatian context. Unlike most domestic and foreign surveys so far, this study was not conducted on a student sample. Since the general attitude of the author before the research was that the difference in decision-making styles among the genders disappeared after attaining mature years (35+), have a higher level of education and employment, so the general hypothesis was made that the difference in decision-making styles with consumers who are between 35 and 45 years of age, live in an urban environment and have higher education and employment are missing or are very small. The study was conducted on 253 people who have precisely these characteristics. The sample used has the characteristics of a convenient sample because the persons in it were selected with regard to their accessibility.

This research was conducted 2018, in Croatia, through the author's websites and their social networks, so the sample has the characteristics of a commodity and homogeneous sample because the respondents were selected because of their availability.

2.1.1. Instrument and research method

The CSI (Consumer Styles Inventory) is an instrument that consists of a set of forty claims divided into 8 dimensions that measure consumer decision-making styles. The respondents expressed their agreement with five Likert scale items, number 1 signifying "I strongly disagree" and 5 "I strongly agree". The number and percentage of response and the average response value for individual dimensions in the questionnaire are shown in Tables 4 to 12. For the purposes of this study, we have created an online questionnaire consisting of

the CSI scale and the dimensions intended to encompass respondents' relevant socio-demographic data.

2.1.2. Description of participants

There were 376 participants in the research, out of which 166 men and 208 women (two participants did not identify their gender). Tables 2 and 3 show the structure of the sample according to the demographic characteristics.

In order to verify the differences between men and women in these demographic characteristics, χ^2 chi-square tests have shown that men and women differ significantly on income ($\chi^2(4) = 11.60, p = .021$) and work ($\chi^2(6) = 21.99, p = .001$). In this respect, the relative percentage of women in income categories up to 10,000 HRK is higher than the percentage of men, while in the case of income above 10,000 HRK the situation is reversed. As far as employment status is concerned, men have more often identified themselves as entrepreneurs, while women are more often employed in state-owned companies. Other differences in demographic characteristics were not significant.

Tables 2 and 3 show the structure of the sample according to demographic characteristics, age, gender, monthly household income, education, and employment status.

Table 2. Structure of the sample according to age and monthly household income

Age	Men		Women		Monthly household income	Men		Women	
	n	%	n	%		n	%	n	%
18-24	13	7.8	17	8.2	Up to 7,000 HRK	27	16.3	61	29.3
25-34	34	20.5	62	29.8	7,001 – 10,000 HRK	38	22.9	54	26.0
35-44	82	49.4	103	49.5	10,001 – 15,000 HRK	40	24.1	44	21.2
45-54	33	19.9	20	9.6	15,001 – 20,000 HRK	28	16.9	23	11.1
55+	4	2.4	5	2.4	Above 20,000 HRK	30	18.1	26	12.5
Not stated	0	0	1	0.5	Not stated	3	1.3	0	0

Source: Authors' research

Table 3. Structure of the sample according to education and employment status

Education	Men		Women		Employment status	Men		Women	
	n	%	n	%		n	%	n	%
High school	45	28.0	57	28.2	Unemployed	11	7.0	18	9.0
Business school	13	8.1	24	11.9	Entrepreneur	51	32.5	32	16.1
Undergraduate study	36	22.4	25	12.4	Employed in a private company	66	42.0	79	39.7
Graduate study	59	36.6	81	40.1	Employed in state-owned company	15	9.6	38	19.1
Postgraduate study	8	5.0	15	7.4	Employed in budget institutions	4	2.5	3	1.5
					Student	6	3.8	16	8.0
					Not stated	4	2.5	13	6.5

Source: Authors' research

Among the respondents, the highest percentage of them belong to the age group 35 to 44 years, up to 49.5% of them. If we join them with the age group of 25-34 years, it is the second most numerous in this study, that is 75.2% of the total number of respondents, so we can say that most of our sample is in the age group of 25 to 44.

Of the total number of respondents, the largest percentage of them are employed in private companies (40.7%), equally men and women, followed by entrepreneurs involving 23.3% of participants, and employees in a state-owned company involving 14.9% of participants. Looking at gender, men are more often entrepreneurs than women, while women are more often employed in state-owned companies.

As for monthly income, women are somewhat more represented than men in the category of income up to 10,000 HRK, while men are more represented in income categories above 10,000 HRK. Although our data do not allow the final explanation of the cause of these differences, the differences in income in our sample could be partly related to the differences in employment status and the place of employment of men and women. If the genders are observed separately, it is concluded that the percentage of men over women is higher in the groups above 15,000 HRK or above 20,000 HRK, which indicates the already mentioned problem of inequality in payments for women performing the same job and moving much more slowly up the career ladder to managerial positions.

In view of the above, we can conclude that we have achieved the goal. A sample of our participants is well represented by highly educated people between 35 and 45 years with an income of 7,000 to 15,000 HRK and living in cities.

2.1.3. Results

In the first phase of the analysis, we calculated the reliability coefficients of the assumed subscales to verify the justification for calculating the total results in this way, and correlation analysis to determine the direction and size of the relationships between the CSI's subscales. Table 4 shows descriptive characteristics of subscales, their reliability, and correlation.

Table 4. Descriptive characteristics, reliability coefficient and correlation among CSI's subscales

	M	SD	MIN	MAX	Cronbach α	v2	v3	v4	v5	v6	v7	v8
High-quality consciousness	28.30	5.31	10	40	.76	.18**	.24**	.32**	-.09	-.16**	-.02	.21**
Brand consciousness	14.03	4.48	6	28	.80		.31**	.16**	-.14**	.22**	.11*	.20**
Novelty-fashion consciousness	14.78	3.97	5	24	.71			.50**	-.11*	.16**	.05	.11*
Recreational, hedonistic shopping consciousness	15.23	5.15	5	25	.84				-.06	-.04	-.03	-.04

Impulsiveness	13.64	4.03	5	24	.69						.13**	-.05
Confusin from overchoice	11.30	3.94	4	20	.77							.03
Brand-loyal orientation toward consumption	13.84	3.01	4	20	.69							

** $p < .01$; * $p < .05$; M = arithmetic mean; SD = standard deviation; Min = minimum value that a respondent achieved; Max = maximum value that a respondent achieved

Source: Authors' research

Since Cronbach alpha values greater than .6 - .7 are considered acceptable, according to Hinton et al (2014), we can conclude that most of the presumed dimensions meet this requirement. Also, the most positive, but low, correlations between the subscales indicate the different object of measuring different sub-

scales, that is, the meaningfulness of differences between these subscales. Therefore, we consider it justifiable to calculate the overall results of the participants on the assumed subscales and to carry out further analyses.

In order to verify the existence of gender differences in purchasing decision-making styles, we conducted a multivariate analysis of a variance where the results on CSI subscales were dependent variables and gender an independent variable. The analysis showed that there were significant differences between men and women in purchasing decision-making styles (Wilks $\lambda = .84$; $F(8, 365) = 8.78, p < .001$). To see on which exact subscales of decision-making styles the mentioned differences exist, we conducted univariate analyses whose results are shown in Table 5.

Table 5. Univariate differences in the results on subscales of decision-making styles between men and women

		M	SD	F (df)	p
High-quality consciousness	Men	28.47	5.20	.22 (1, 372)	.641
	Women	28.21	5.42		
Brand consciousness	Men	14.79	4.40	8.84 (1, 372)	.003**
	Women	13.42	4.46		
Novelty-fashion consciousness	Men	13.60	3.91	28.13(1, 372)	.000**
	Women	15.72	3.77		
Recreational, hedonistic shopping consciousness	Men	14.19	4.90	12.63 (1, 372)	.000**
	Women	16.06	5.21		
Price shopping consciousness	Men	10.37	2.21	.09 (1, 372)	.760
	Women	10.44	2.46		
Impulsiveness	Men	13.55	4.00	.14 (1, 372)	.706
	Women	13.71	4.06		
Confusion from overchoice	Men	11.02	4.13	1.53 (1, 372)	.218
	Women	11.52	3.77		
Brand-loyal orientaton toward consumption	Men	13.55	3.14	2.81 (1, 372)	.095
	Women	14.07	2.89		

** $p < .01$; * $p < .05$; M = arithmetic mean; SD = standard deviation; F (df) = F-test value (degree of freedom); p = the achieved significance level of the obtained difference (0.1 goes with 1 % of risk, 0.5 goes with 5 % of risk)

Source: Authors' research

Table 5 shows that men and women differed significantly in purchasing decision-making styles, on the dimensions of brand consciousness, novelty-fashion consciousness and recreational, hedonistic shopping consciousness. More

precisely, men are more prone to buy well-known brands than women while women are more prone to novelties and fashion as well as shopping for recreation than men.

In Table 6, which shows the number and percentage of responses and the average value of responses on dimensions of high-quality consciousness the questionnaire on shopping style, it is evident that there is no gender difference yet again on neither dimension.

Table 6. Number and percentage of responses and the average value of responses on the dimensions of high-quality consciousness

Question		1 (I strongly disagree)		2		3		4		5 (I strongly agree)		M	SD

Women more often have one or more pieces of clothing in the latest fashion styles ($t(251) = -3.44, p = .001, d = 0.49$), more often they take care of wardrobe being regularly filled with novelties according to the changes in fashion ($t(251) = -3.70, p = .000; d = 0.51$), they often shop in different stores and different brands to create diversity ($t(251) = -2.10, p = .037; d = 0.29$) and, to a greater extent, they think it is a great fun to buy something new and exciting ($t(251) = -2.38, p = .018; d = 0.35$), while genders do not differ in how much their fashion and attractive style is important to them.

To a greater extent, women go more often to the same shops when they go shopping ($t(251) = -2.37, p = .019; d = 0.33$).

3. CONCLUSION

Results of this research show that mostly there is no significant gender difference when it comes to shopping decision-making style. We just found some differences in the dimensions of brand consciousness, novelty-fashion consciousness and recreational, hedonistic shopping consciousness. More precisely, men are more prone to buy well-known brands than women while women are more prone to novelties and fashion as well as shopping for recreation than men.

In the questionnaire in this type of research, it is about hypotheses that refer to most respondents and the question is whether such general theoretical

hypotheses can really give a deep insight into each target group? Of course not. Students shop differently from employed people in urban environments, and these shops differently from retired people. Even within the same target group, it is difficult to provide general, secure answers. Therefore, smaller research is required to examine specific groups and their behavior when purchasing specific products. Survey questions such as “I make great efforts to choose the best quality”, “I mostly appreciate well-known brands” and “The product does not have to be perfect to satisfy me” require a unique answer that is impossible to give because the category of products we buy is not specified. There is a drastic difference in consumer behavior when buying food, summer shirts, printer colors or garbage bags, for example. Also, the questions on expected quality are not tailored to the product categories, since we do not expect the same quality when purchasing table cloth and electrical equipment. Consumers think completely differently when deciding on purchase in different categories. It is also questionable, for example, what the word “best” refers to - price, quality or something else.

Typical examples of questionnaires on consumer behavior relating to research on decision-making also contain questions about whether brands advertised are also the right choice and the like, which is irrelevant in some categories in Croatia. If we take a mobile operator as an example, all of them are advertised, but “everyone” in Croatia means four, because the competition in the sector is not strong, as the market is small.

What is the future then? In any case, CSI could be re-examined in a way that some categories are changed, some new added and customized to the Internet, as some authors suggest (Sinkovics et al., 2010).

Also, theorists say that only 5% of our cognitive activities (decisions, emotions, actions, behavior) is conscious whereas the remaining 95% is generated in a non-conscious manner. (Van Rymenant, 2008, p.1). Therefore, neuromarketing advocates actually believe that traditional methods of research, such as consumer surveys and focus groups, are inherently inaccurate, as participants can never articulate their unconscious impressions of individual products. Pradeep, the founder, and CEO of NeuroFocus, a neuromarketing company in Berkley, California, says it is necessary to examine subconscious levels in the brain, as this is where consumers have developed an initial interest in the products, the likelihood of buying them and loyalty to them. Only “by measuring the brain

waves can we measure the attention, emotion, and memory and calculate a deeply under-conscious response to stimuli. What you find there is a whisper of the brain”, says Pradeep (Singer, 2010, p.1).

Regardless of all the above-mentioned difficulties and disadvantages of researches, they are still needed, and researches on decision-making styles are one of the more desirable, as it is a stable category. Of course, it is necessary to carry out statistical analyses, since it is not enough to consider only the observed differences in the observed phenomena at the measurement itself. Without a statistical test, no assumption can be made whether the observed differences are generally applicable or whether the result is random. It is important to know whether the result reflects the actual situation in the whole population, and that is what the degree of statistical significance is about.

Abstract

Im Rahmen der Customer Journey hat ein Unternehmen die Möglichkeit, an einzelnen Touchpoints mit dem Kunden in Interaktion zu treten. In diesem Zusammenhang spielen digitale Technologien eine immer wichtigere Rolle. Durch deren erleichterte technologische Anwendung hat sich die Anzahl der Touchpoints stark erhöht. Für Unternehmen bekommt daher das Touchpoint Management eine immer größere Bedeutung. Dabei müssen Unternehmen diese Touchpoints innerhalb der Customer Journey identifizieren, priorisieren und mit digitalen Kommunikationsformen ausgestalten. In der vorliegenden

Untersuchung werden anhand des ‚Consumer-Decision-Journey‘-Frameworks von McKinsey die Veränderungen im Kaufverhalten beschrieben und die wesentlichen Touchpoints identifiziert. Zudem wird in einer empirischen Studie die Customer Journey von Adidas untersucht, die wesentlichen digitalen Touchpoints identifiziert (u.a. Augmented Reality, Virtual Reality, Social Media, Fitness Videos, Apps und 3D-Produktion) und die Akzeptanz der Kunden für diese digitalen Touchpoints analysiert. Die Befragung wurde im November/Dezember 2018 mit einem Umfang von 195 Teilnehmern durchgeführt. Insgesamt geben die Erkenntnisse Einblicke, wie Unternehmen digitale Technologien erfolgreich an den Touchpoints der Customer Journey nutzen können.

JEL Classification: M15, Z20

1. EINLEITUNG

Der Erfolg von Unternehmen wird wesentlich von einer erfolgreichen Bedürfnisbefriedigung der Kunden bestimmt (Nerdinger; 2003, 1). Unternehmensprozesse und -aktivitäten müssen an die Erwartungen der Kunden angepasst werden, um eine reibungslose Interaktion zu erreichen. Dies setzt voraus, dass Unternehmen das Kaufverhalten der Kunden beobachten und analysieren und bei Veränderungen schnell reagieren (Esch et al.; 2014, 49). Die zunehmende Digitalisierung eröffnet dabei neue Möglichkeiten in der Kundeninteraktion. Im Handels- und Konsumgüterbereich ist festzustellen, dass Unternehmen vermehrt auf digitale Technologien setzten, um den Ansprüchen der Konsumenten gerecht zu werden (Herbener; 2015, 63). Unter anderem zeigt sich dies beim Sportartikelhersteller Adidas. Das Unternehmen bietet seinen Kunden vermehrt digitale Touchpoints an, um auf individuelle Bedürfnisse einzugehen und so das Käuferlebnis zu steigern.

2. CUSTOMER JOURNEY

2.1 GRUNDLEGENDE ÜBERLEGUNGEN ZUR CUSTOMER JOURNEY

Zur Beschreibung des Kaufverhaltens von Kunden werden meist Mehrphasenmodelle herangezogen, wie bspw. das ‚Fünfphasen-Modell‘ von Kotler et al. (2017, 219). Der Nachteil dieser Modelle ist, dass Veränderungen im Kaufverhalten – bspw. bedingt durch zunehmende Digitalisierung – nicht berücksichtigt werden. Modelle zur Consumer Journey hingegen, wie bspw. die ‚Consu-

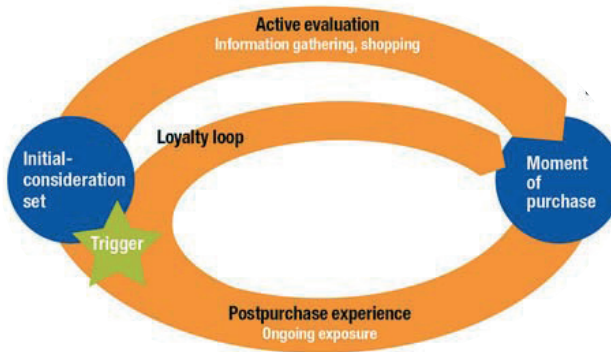

mer-Decision-Journey' von McKinsey, versuchen, diese Lücke zu schließen. Im Vergleich zu den Phasenmodellen des Kaufprozesses findet hier keine Abfolge von einzelnen Phasen in einer vordefinierten Reihenfolge statt. Vielmehr setzt sich der Entscheidungsweg der Konsumenten durch die Abfolge von mehreren Einzelmomenten zusammen (Cadonau; 2018, 38). Die Einzelmomente können flexibel durchlaufen werden, so- dass sich dadurch eine flexible und individuelle Abfolge ergibt, die die „erlebte Reise der Kunden“ beschreibt (Naskrent & Zimmermann; 2015, 3).

Bei diesen Einzelmomenten kommt es zur Interaktion zwischen Unternehmen und Konsument, die in beiden Richtungen stattfinden kann (Cadonau; 2018, 38). Unternehmen versuchen, durch Aktivitäten Einfluss auf die Kaufentscheidung zu nehmen, aber Konsumenten werden auch selbst durch das Heranziehen von Informationen und Bewertungen aktiv (McKinsey; URL1). Externe Faktoren, wie die Digitalisierung, steigern dabei die Unabhängigkeit der Konsumenten und stärken ihren Einfluss auf die Customer Journey.

2.2 CONSUMER-DECISION-JOURNEY NACH MCKINSEY

Das Modell der Consumer-Decision-Journey von McKinsey (McKinsey; URL1) stellt den Verlauf der Kaufentscheidung beim Kunden dar (siehe Abbildung 1). Insgesamt gibt es vier wesentliche Kontaktpunkte: Zu Beginn des Kaufprozesses berücksichtigen Konsumenten bestimmte Marken. Die Auswahl hängt davon ab, welche Marken die Konsumenten im Alltag wahrnehmen und mit welchen sie kürzlich in Kontakt gekommen sind.

Abbildung 1: Die ‚Consumer-Decision-Journey‘ nach McKinsey

Quelle: McKinsey; URL1

Als nächstes beginnen Konsumenten mit der Informationssuche. Zunächst konzentriert sie sich auf die Produkte, die ihnen bekannt sind. Während der Beurteilungsphase kann sich die Auswahl der ursprünglich bevorzugten Marken ändern. Zuvor nicht berücksichtigte Marken können die Aufmerksamkeit des Konsumenten erlangen und andere Marken verdrängen. Nach Informationssuche und Bewertung der Produkte wird abschließend eine Kaufentscheidung getroffen. Auch nach der Kaufentscheidung bestehen weiterhin Interaktionen zwischen Konsument und Unternehmen (Kruse et al.; 2017, 97f.), denn mit dem Erwerb beginnt der Beurteilungsprozess des gesamte Kaufprozesses. Unter anderem wird verglichen, inwieweit das Produkt die erhofften Erwartungen erfüllt und ob ein positives Erlebnis bei dem Konsumenten entstanden ist. Die Bewertung dieser Faktoren ist wichtig, da diese darüber entscheidet, ob der Konsument beim nächsten Kauf die gleiche Marke erneut berücksichtigt und durch ein positives Käuferlebnis die Loyalität beim Konsument steigt. So entscheidet er sich beim nächsten Einkauf wieder für die Marke und begibt sich in einen Loyalitätskreislauf (Stihler; 2000, 169-186).

2.3 HERAUSFORDERUNGEN FÜR DAS MARKETING

Die Customer-Journey wird durch die Digitalisierung wesentlich beeinflusst. Zahlreiche neue Kontaktmöglichkeiten mit potentiellen Konsumenten sind durch die Digitalisierung entstanden. Diese betreffen alle Bereiche der Customer-Journey.

Bereits in der ersten Stufe, dem ‚initial consideration set‘, hat sich die Anzahl der Touchpoints erhöht. Konsumenten kommen mit immer mehr und immer neuen Marken in Berührung, die sie nicht nur durch klassische Werbung wahrnehmen, sondern denen sie auch im Internet begegnen (Kruse et al; 2017, 4). Für Unternehmen hingegen erschwert dies, die Aufmerksamkeit der Konsumenten zu erlangen (McKinsey; URL2).

Auch bei der ‚active evaluation‘ kommt im Rahmen der Informationssuche der Digitalisierung eine besondere Rolle zu. Durch Social Media können Konsumenten Erfahrungsberichte austauschen, in Vergleichsportalen können Preise verglichen und auf Händlerseiten wie Amazon können Kundenrezensionen gelesen werden. Kaufentscheidungen der Konsumenten basieren mittlerweile zu 25% auf Informationen aus dem Internet (Stengel et al.; 2017, 127).

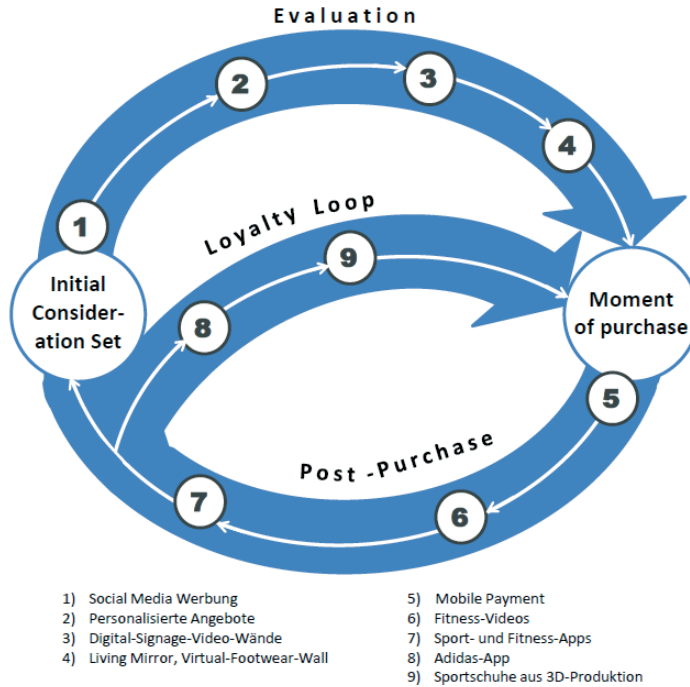

Auch beim ‚moment of purchase‘ gibt es mehrere Touchpoints. Die Erwartungshaltung vieler Konsumenten ist mittlerweile, dass Produkte nicht nur am POS angeboten, sondern diese auch zu ihnen nach Hause geliefert werden. Inzwischen ist dies ein wichtiges Kriterium, wonach sie Produkte auswählen (Kruse et al; 2017; 54). Werden ihre Erwartungen nicht erfüllt, bietet ihnen das Internet den Zugang zu zahlreichen Händlern aus der ganzen Welt. Die Konsumenten werden durch die Digitalisierung unabhängiger. Sie entscheiden, wo, wann und was sie kaufen (Ternés et al.; 2015, 7). Es entsteht eine Dezentralisierung des Konsums (Stengel et al.; 2017, 127).

Diese Vervielfachung der Touchpoints innerhalb der gesamten Customer-Journey stellt Unternehmen vor neue Herausforderungen, denn alle Kontaktpunkte zu bedienen, können sich viele Unternehmen nicht leisten (Kochann & Schneider; 2018, 14). Daher stellt sich die Frage, auf welche Interaktionsmöglichkeiten sie sich fokussieren sollten. Diese Priorisierung kann nur gelingen, wenn Unternehmen die richtigen Touchpoints identifizieren, nämlich die, die die Konsumenten am meisten bei ihrer Kaufentscheidung beeinflussen (McKinsey; URL1).

3. HYPOTHESEN

Im Rahmen der empirischen Erhebung soll am Unternehmen Adidas untersucht werden, welches die wesentlichen Touchpoints dieses Unternehmens sind und wie Konsumenten bei ihrer Customer Journey unterstützt werden können. Im Folgenden werden deshalb Hypothesen zu den wesentlichen Touchpoints innerhalb der Customer-Journey hergeleitet. Der Fokus liegt dabei auf den wesentlichen Technologien, die an diesen Touchpoints eingesetzt werden können. Einen Überblick hierzu gibt Abbildung 2.

Abbildung 2: Die ‚Consumer-Decision-Journey‘ mit wesentlichen digitalen Touchpoints bei Adidas

Quelle: Eigene Darstellung

Augmented Reality

Die Augmented-Reality-Technologie wird bisher selten von Unternehmen an Touchpoints eingesetzt. Dabei kann die Technologie über verschiedene digitale Geräte angewendet und in vielfältiger Form eingesetzt werden (Stengel et al.; 2017, 52). Eine spezifische Anwendungsmöglichkeit stellt der Living Mirror dar. Bei dieser Technologie handelt es sich um einen digitalen Bildschirm, der mit Kameras ausgestattet ist, die Personen erfassen und sie auf den Bildschirm projizieren. Über den digitalen Bildschirm kann der Konsument Modeartikel aus dem Sortiment des Unternehmens auswählen und sich über den Bildschirm in der Kleidung betrachten, ohne sich tatsächlich umziehen zu müssen. Für den Konsumenten entfällt das physische Auswählen von Produkten, der Transport der Kleidungsstücke in die Umkleide und die Anprobe. Das Anprobieren der Artikel erfolgt dabei per Click über den Bildschirm (Kruse et al; 2017, 245f.). Der Einkauf gestaltet sich dadurch einfacher und bequemer. Ein weiterer Vor-

teil ist die Größe des verfügbaren Sortiments. Die Konsumenten haben Zugriff auf das Gesamtsortiment an Produkten und Größen – mehr als am POS oft möglich wäre. Diese Vorteile des Living Mirror lassen folgende Hypothese zu:

H₁: Der Living Mirror wird von Konsumenten für das Anprobieren von Sportartikeln den Umkleidekabinen vorgezogen.

Eine weitere Möglichkeit von Augmented Reality ist das virtuelle Einblenden von Informationen zu Produkten. Anhand von Lokalisierungsdiensten wird die Umgebung der Person ermittelt und mit der Unterstützung technischer Geräte können Informationen zu nahe liegenden Produkten angezeigt werden. So können sich Konsumenten im Store über ihr Smartphone produktspezifische Eigenschaften, wie Preis, Materialverarbeitung und Funktionsweise, anzeigen lassen (Kruse et al; 2017, 245f.).

Der Käufer profitiert von der Anwendung, da ihm Informationen zur Verfügung stehen, die vorher für ihn gegebenenfalls nicht wahrnehmbar waren. Vor allem bei einem hohen Kundenaufkommen können sich Konsumenten zunächst selbst informieren. Zudem ist es möglich, die Informationen in vielfältiger Weise darzustellen. Unter anderem kann die Visualisierung anhand von Bildern und Videos erfolgen. Daraus ergibt sich folgende Hypothese:

H₂: Konsumenten empfinden die Augmented-Reality-Anwendung über ihr Smartphone als nützlich, um sich über Sportartikel zu informieren.

Adidas versteht sich selbst als ein innovatives Unternehmen (Adidas Geschäftsbericht; 2017, 83ff.). Eines ihrer Ziele ist es, innovative Produkte zu entwerfen, die den Sportlern Höchstleistungen ermöglichen (Adidas; URL1). Der Einsatz von neuen Technologien in der Customer-Journey, wie Augmented-Reality, kann die Wahrnehmung der Konsumenten auf das Unternehmen beeinflussen. Da die Augmented-Reality-Anwendung recht neu und technisch vielseitig ist, hinterlässt sie bei Konsumenten einen innovativen Eindruck (Universität Siegen; 2017). Es ist deshalb zu vermuten, dass sich der innovative Eindruck der Technologie auf die Wahrnehmung der Marke Adidas positiv niederschlägt.

Zudem wird davon ausgegangen, dass vor allem jüngere Konsumenten, die mit der Digitalisierung aufgewachsen sind, auch die Augmented-Reality-Technologie sowie deren Vorteile kennen. Bei älteren Konsumenten wird hingegen davon ausgegangen, dass sie mit der Technologie weniger vertraut sind. Sie ne-

hmen eher die Komplexität der Anwendung wahr und sehen daher weniger die innovativen Vorzüge von Augmented-Reality. Daher ergibt sich folgende Hypothese:

H3: Je jünger die Konsumenten sind, desto stärker nehmen sie durch den Einsatz von Augmented-Reality-Technologie Adidas als eine innovative Marke wahr.

Virtual Reality

Eine weitere mögliche digitale Anwendung ist die Virtual Reality Technologie. Die Anwendung kann ebenfalls in vielfacher Form an den Touchpoints zum Einsatz kommen. Eine Möglichkeit stellt die Virtual-Footwear-Wall dar, die bereits in ausgewählten Adidas-Stores eingeführt ist. Über die Footwear-Wall können Konsumenten das gesamte Produktsortiment von Adidas einsehen und produktspezifische Informationen abrufen (CIP Marketing; URL). Zudem werden durch die Funktionen der Technologie die üblichen Store-Aktivitäten der Konsumenten, wie die Informationssuche, Beratung und Auswahl, unterstützt. Konsumenten können alle Aktivitäten über den Bildschirm ausführen. So stellt die Virtual-Footwear-Wall eine hilfreiche Technologie zur Unterstützung der Kaufentscheidung der Konsumenten dar. Es ist daher Folgendes zu erwarten:

H₄: Konsumenten nehmen die Virtual-Footwear-Wall als Unterstützung für die Kaufentscheidung wahr.

Ferner ermöglicht die Virtual-Footwear-Wall den Konsumenten, auf Produktinformationen zuzugreifen, die sie zuvor lediglich vom Geschäftspersonal erhalten haben. Durch die Technologie sind die Konsumenten am POS unabhängiger. Mit der Virtual-Footwear-Wall können sie sich eigenständig informieren. Da die Technologie die Beratungsfunktion technisch und individualisiert weitestgehend übernehmen kann, ist anzunehmen, dass Konsumenten diese Technologie einer persönlichen Beratung vorziehen.

H₅: Die Virtual-Footwear-Wall ersetzt für Konsumenten die Beratung durch das Service-Personal.

Social Media

Die Social Media Plattformen zeichnen sich vor allem durch ihre anschauliche und visuelle Darstellungsform aus. Für Unternehmen bieten diese ein attraktives Umfeld, um ihre Produktwerbung zu platzieren. Die Visualisierung ermöglicht es, zu den Konsumenten eine emotionale Bindung aufzubauen (Heymann-Reder; 2011, 33f.). Dies führt zu der Annahme, dass Konsumenten eine positivere Einstellung zu Werbung auf Social Media haben als im Vergleich zu klassischen Medien, wie TV oder Print-Formaten.

H₆: Konsumenten empfinden Werbung in sozialen Netzwerken als eher relevant im Vergleich zu Werbung in klassischen Medien.

In Bezug auf Adidas bietet vor allem Instagram visuell ansprechende Werbeformate an. Beispielsweise können über die ‚Shopping in Instagram‘-Funktion Produkte in einem natürlichen Umfeld dargestellt werden. So kann Adidas etwa eine Sportszene zeigen, in der die Werbeträger Adidas-Produkte tragen. Konsumenten erkennen an der Darstellungsform nicht direkt, dass es sich um Werbung handelt. Falls sie jedoch an der Instagram-Story interessiert sind, gelangen sie per Klick auf die Instagram-Page von Adidas. Der Vorteil ist, dass Nutzer die Werbung im Vergleich zu anderen Medien wie Fernsehwerbung weniger aufdringlich wahrnehmen (Instagram Business; URL). Daher ist zu erwarten, dass die ansprechende visuelle Darstellungsform auf Instagram bei Konsumenten eine höhere Bereitschaft auslöst, sich über Produkte zu informieren.

H₇: Werbung auf Instagram löst bei Konsumenten eine höhere Bereitschaft aus, sich nach der Beobachtung der Werbung weiter über das Produkt zu informieren.

Fitness-Videos

Digitale Touchpoints können auch von Adidas genutzt werden, um Beziehungen zu ihren Kunden zu intensivieren. Eine Möglichkeit besteht für Adidas in der Kommunikation von Trainings-Videos auf Social Media Plattformen. In diesen Videos können etwa Spitzensportler ihre persönlichen Fitnessübungen beschreiben und vorführen. Der Einsatz von erfolgreichen Sportlern wird bewusst gewählt, da dadurch die Konsumenten die geleisteten Erfolge der Sportler mit Adidas in Verbindung bringen. Dies kann zu einer stärkeren Wah-

rnehmung von Adidas als Leistungssportmarke führen. Die Video-Formate stehen ebenfalls im Einklang mit der Strategie von Adidas, die Käufer bei ihrem sportlichen Erfolg zu unterstützen (Adidas URL3; U4f.). Darüber hinaus wird Adidas nicht nur als Sportartikel-Produzent gesehen, sondern als ein Assistent oder Coach, der beim persönlichen Training zur Seite steht. Daher wird angenommen, dass die Sport-Videos aufgrund der persönlichen Ansprache die Bereitschaft bei Konsumenten steigert, sportlich aktiver zu werden, dass die Videos mit den Eigenschaften von Social Media zusammenpassen und eine Verbreitung der Videos über diese Plattform stattfinden kann.

H_8 : Sport-Videos steigern die Bereitschaft von Konsumenten, sportlich aktiv zu werden.

H_9 : Die Verbreitung der Sport-Videos über Social Media passt mit dem Image der Werbepattform überein.

In der Nachkaufphase findet bei Konsumenten eine Beurteilung des Kaufprozesses statt. Die Sport-Videos können den Käufern ein Gefühl der Bestätigung für ihre Kaufentscheidung geben. Sie nehmen durch die Videos wahr, dass auch Spitzensportler auf Adidas setzen und ziehen gegebenenfalls daraus den Rückschluss, dass sie eine gute Entscheidung getroffen haben. Es wird angenommen, dass durch den Einsatz von erfolgreichen Sportlern die Konsumenten den Eindruck gewinnen, dass die Marke Adidas zum sportlichen Erfolg beiträgt. Ob sich dies auf die Einstellung der Konsumenten auswirkt, wird anhand der folgenden Hypothese untersucht.

H_{10} : Der Einsatz von erfolgreichen Sportlern in den Videos verstärkt bei Konsumenten den Eindruck, dass die Sportmarke zum sportlichen Erfolg beiträgt.

Video-Wände

Des Weiteren können digitale Technologien auch für das Store-Design eingesetzt werden. Eine Möglichkeit bieten digitale Video-Wände, die in den Schaufenstern von Geschäften eingesetzt werden können. Überdimensionale Video-Wände sind besonders aufmerksamkeitsstark und wecken das Interesse potenzieller Kunden (BIZ Community; URL). Durch die visuelle Darstellung in Form von Bildern und Videos findet bei Konsumenten eine emotionale Aktivierung statt. Je stärker diese emotionale Aktivierung, desto intensiver wird

die Aufmerksamkeit der Konsumenten in Richtung des Geschäftes gelenkt (Interrogare; 2012). Es wird daher vermutet, dass die Video-Wände die Bereitschaft auf einen Store-Besuch bei Konsumenten steigern.

H_{11} : Video-Wände steigern bei Konsumenten das Interesse auf einen Store-Besuch.

Mobile Payment

Konsumenten können ihr Smartphone nutzen, um über Shopping-Apps ihren Einkauf im Geschäft zu bezahlen. Mit dieser Bezahlmethode sind Konsumenten unabhängiger, denn sie müssen sich weder an der Kasse anstellen, noch sind sie für das Bezahlen auf die Angestellten angewiesen (W&V; URL). Dadurch, dass Konsumenten, unabhängig vom Kundenaufkommen an Kassen, jederzeit bezahlen können, verringert sich ihre Wartezeit. Die Zeitersparnis wirkt sich zudem auf die Stimmung der Kunden aus und Konsumenten verlassen das Geschäft deutlich entspannter und zufriedener (Andriulo et al.; 2014, 208). Daher nehmen wir folgendes an:

H_{12} : Konsumenten ziehen das Bezahlen ihres Einkaufes im Geschäft über ihre Smartphones dem an den Kassen vor.

3D-Herstellung

In der Sportartikel-Branche bietet der 3D-Druck ein neues Verfahren zur Herstellung von Sportschuhen. Adidas setzt diese Technologie bereits in seinen Speedfactories ein (3D Natives; URL2). Durch dieses Verfahren können die Sportschuhe deutlich schneller hergestellt und die Produktion erhöht werden (3D Natives; URL1). Aufgrund der technischen Neuheit werden folgende beide Hypothesen in Bezug auf die 3D-Herstellung untersucht:

H_{13} : Konsumenten ziehen Sportschuhe aus der 3D-Herstellung den bisherigen maschinell/handgefertigten Sportschuhen vor.

H_{14} : Konsumenten sehen die Zukunft der Sportschuh-Produktion in der 3D-Herstellung.

Push-Nachrichten

In Verbindung mit der Beacon-Technologie kann eine individuelle Kommunikation mit Smartphone-Besitzern hergestellt werden (Even; 2015, 15f.). Dabei richtet sich die Kontaktaufnahme an Personen, die sich im Umkreis des Geschäftes befinden. Mit Hilfe der Technologie kann über installierte Shopping-Apps der Standort der jeweiligen Smartphone-Besitzer bestimmt werden. Nutzer, die sich in der Nähe des Geschäfts befinden, erhalten personalisierte Nachrichten oder personalisierte Angebote (Leopold & Reuter; 2017, 361). So können die Adidas-Stores das Kundenaufkommen in ihren Geschäften steuern und steigern. Durch verschickte Coupons oder Rabatte soll dabei die Hemmschwelle für einen Store-Besuch bei Konsumenten gesenkt werden. Im Vergleich zu anderen Zustellungsmethoden, wie per Post oder Zeitung, können Konsumenten Coupons sofort im Geschäft einlösen. Zudem ist diese Variante für Unternehmen kostengünstiger (Schulten et al.; 2015, 52).

Konsumenten nehmen laut Untersuchungen die personalisierte Ansprache über Push-Nachrichten als positiv wahr, da sie sich dadurch direkt angesprochen fühlen (Venzke-Caprarese; 2014, 841). Zudem empfinden sie die Bereitstellung von personalisierten Nachrichten sowie von Angeboten über die Shopping-App als bequem. Aus diesen Gründen wird davon ausgegangen, dass Konsumenten dem Erhalt personalisierter Angebote positiv gegenüber stehen und eine hohe Bereitschaft aufbringen, diese einzulösen. Folgende Hypothesen können daraus abgeleitet werden:

H_{15} : Das Versenden von personalisierten Angeboten über Apps steigert das Interesse bei Konsumenten an einem Store-Besuch.

H_{16} : Das Versenden von personalisierten Angeboten an Konsumenten über die Adidas-App steigert die Bereitschaft, Adidas-Produkte zu kaufen.

Sport- und Fitness-Apps

Wie am Beispiel der personalisierten Angebote deutlich wurde, bieten Apps die Möglichkeit, mit Konsumenten zu kommunizieren. Darüber hinaus bieten die Applikationen zahlreiche weitere Anwendungsformen als Touchpoints. Adidas bietet bereits ein Portfolio aus verschiedenen Apps an, die zur Optimierung des Sport-Trainings sowie der Umsetzung einer gesunden Ernährung geeignet sind (Schulten et al.; 2015, 52).

Aus Sicht von Adidas dienen die Apps der Stärkung der Unternehmenspositionierung. Dabei ist der Grundgedanke der Apps, die Nutzer bei ihren sportlichen Zielen zu unterstützen. Konsumenten sollen dadurch den Eindruck gewinnen, dass die Produkte und Applikationen von Adidas zum sportlichen Erfolg beitragen (Adidas URL3; U4f.). Anhand der folgenden Hypothese soll daher die sportliche Wahrnehmungsempfindung durch die Nutzung der Apps untersucht werden.

H₁₇: Die Nutzung von Fitness-Apps steigert das Empfinden der Konsumenten, sportlich erfolgreicher zu sein.

Ein weiterer Vorteil der Applikationen besteht darin, dass Adidas diese nutzen kann, um Konsumenten über Eigenschaften von Produkten zu informieren. So erhalten Konsumenten über die Apps Hinweise zu hilfreichen Produktfunktionen. Vor allem zu technischen Artikeln, wie die Adidas-Laufuhren, sind Tipps für eine optimale Nutzung hilfreich. Konsumenten ermöglicht dies, die Artikel besser in ihr Training einzubinden. Es wird dadurch sichergestellt, dass sie die vielseitigen Funktionen des Produktes wahrnehmen und nutzen können. Dies ist ein Grund, der zu der Annahme führt, dass Konsumenten, die häufiger die Sport-Apps von Adidas nutzen, mit ihrer Kaufentscheidung zufriedener sind. Zudem ist davon auszugehen, dass die Nutzung von Sport-Apps sowie neuer Sportkleidung eine zusätzliche Motivation darstellt, sportlich aktiv zu werden. Dies wirkt sich positiv auf das eigene Wohlempfinden aus und steigert die Zufriedenheit mit der Kaufentscheidung. Daher nehmen wir folgendes an:

H₁₈: Die Häufigkeit der Nutzung von Sport-Apps wirkt sich auf die Zufriedenheit der Konsumenten mit ihrer Kaufentscheidung positiv aus.

4. FRAGEBOGEN UND DATENERHEBUNG

Die Datenerhebung erfolgte mit Hilfe eines selbst entwickelten standardisierten Fragebogens auf der Onlineplattform Unipark. Nach Durchführung eines Pretests setzte sich der finale Fragebogen der Umfrage aus 27 geschlossenen Fragen (a) zum allgemeinen Kaufverhalten von Sportartikeln sowie zu sportlichen Aktivitäten, (b) zum Einsatz von digitalen Technologien während des Einkaufes von Sportartikeln und (c) zur Soziodemographie des Befragten zusammen (vgl. Fragebogen im Anhang). Da neue digitale Technologien nicht allen potenziellen Käufern bekannt sein dürften, wurden zu den Technologien ‚Living Mirror‘, ‚3D-Druck‘, ‚Augmented Reality‘, ‚personalisierte Angebote‘,

‚Self-Check-Out-Systeme‘ und ‚Virtual-Footwear-Wall‘ Beschreibungen sowie Bilder eingefügt, um diese Technologien zu erklären und zu veranschaulichen. Die Messung von Perzeptionen erfolgte dabei auf fünf-stufigen Likert-Skalen.

Die zu erreichende Zielgruppe setzte sich aus Studierenden der Hochschule Pforzheim zusammen. Eine zufällige Bruttostichprobe wurde aus dem Studierendenpanel StudieQUEST der Hochschule Pforzheim gezogen. Die Umfrage wurde zwischen dem 29.11.2018 und dem 13.12.2018 online gestellt. Um die Response Rate zu erhöhen, erfolgte zusätzlich eine Ansprache über die Plattformen Facebook und LinkedIn. Nach der Datenbereinigung ergab sich für die Hypothesenüberprüfung eine Nettostichprobe von $n=195$ Probanden. Bei einer leicht rechtsschiefen Altersverteilung waren die Befragten durchschnittlich rund 25 Jahre alt.

5. ERGEBNISSE

Dass Probanden einen Living Mirror dem Anprobieren von Sportartikeln in der traditionellen Umkleidekabine vorziehen (H_1), konnte auf Basis der gegebenen Nettostichprobe nicht verifiziert werden. Vielmehr zieht mit 74 Prozent der Befragten die Mehrheit signifikant häufiger ($p=0,000$) die traditionelle Umkleidekabine dem Living Mirror (26 Prozent) vor.

Zu einem nicht-signifikanten Ergebnis kommen wir bei der Prüfung der Hypothese, ob Digital Natives – also Befragte, die mit digitalen Technologien aufgewachsen sind und deshalb 30 Jahre und jünger sind (Ziehe & Stevens; 2012, 7) – eine Augmented-Reality-Anwendung über ihr Smartphone als nützlicher empfinden, um sich über Sportartikel zu informieren, als die Digital Immigrants (H_2). Wenngleich der Anteil der über Dreißigjährigen mit nur rund acht Prozent der Befragten eher gering ist, ergibt der Mann-Whitney-U-Test mit $p=0,256$ keinen signifikanten Unterschied hinsichtlich der Einschätzung des Nutzens von Augmented-Reality-Anwendungen zwischen den beiden Altersgruppen. Zwar konnte ein signifikanter linearer Zusammenhang ($p=0,021$) zwischen dem Alter der Probanden und der Wahrnehmung von Adidas als innovativer Marke durch den Einsatz von Augmented-Reality-Technologie festgestellt werden. Allerdings ist der Erklärungsanteil mit $R^2=2,7$ Prozent nur sehr gering (H_3).

In der Umfrage wurden die Teilnehmer danach zu der Technologie der Virtual-Footwear-Wall befragt. Es wird davon ausgegangen, dass Konsumenten die

Anwendung als Unterstützung für ihre Kaufentscheidung wahrnehmen (H_4). Insgesamt zeigt sich aber, dass nur rund 40 Prozent der Befragten die Virtual-Footwear-Wall als Unterstützung für ihre Kaufentscheidung wahrnehmen, also diesem Statement ‚eher‘ oder ‚vollkommen‘ zustimmen (Top-2-Box). Mit rund 60 Prozent sieht die Mehrheit keinen kaufunterstützenden Mehrwert in dieser Technologie. Allerdings ergibt sich ein signifikanter und positiv-monotoner Zusammenhang (Kendall's Tau-b=0,522; $p=0,000$) bei den Statements, wie stark ein Befragter über die Virtual-Footwear-Wall relevante Informationen wahrnimmt und dem Gefühl, dass diese Technologie kaufunterstützend wirkt. Dies liegt vor allem daran, dass ein erheblicher Teil der Befragten in der Virtual-Footwear-Wall keine Unterstützung für die Kaufentscheidung sieht und gleichzeitig der Meinung ist, keine relevanten Informationen über die Anwendung zu erhalten. Es zeigt sich somit, dass nicht alle Probanden die durch die Technologie erzeugten Informationen explizit wahrnehmen. Deshalb mag auch das Ergebnis nicht verwundern, dass nur 35 Prozent der Befragten die Virtual-Footwear-Wall einer Beratung durch Service-Personal vorziehen ($p=0,000$). Auch H_5 ist auf Basis der vorliegenden Stichprobe somit nicht verifiziert.

Soziale Medien bieten aufgrund ihrer visuellen Darstellungsmöglichkeiten eine potenziell ansprechendere Plattform für Werbungen als die klassischen Werbeformen (H_7). Allerdings empfinden die Befragten in unserer Stichprobe die Werbung in sozialen Netzwerken insgesamt als nicht relevanter, denn die Messung der Relevanzdifferenz mit Hilfe eines gepaarten t-Tests ergibt keinen signifikanten Unterschied ($p=0,718$). Auch H_6 lässt sich somit nicht verifizieren.

Es kann aber davon ausgegangen werden, dass bestimmte Medienkanäle bei Konsumenten eine unterschiedliche Bereitschaft auslösen, sich nach der Wahrnehmung von Werbung weiter über ein Produkt informieren zu wollen (H_7). Die Plattform Instagram zeichnet sich beispielsweise sehr durch eine ansprechende visuelle Aufmachung aus, sodass insgesamt rund 43 Prozent der Befragten aufgrund von Instagram-Werbung eine höhere Bereitschaft bekunden, sich über ein Produkt weiter informieren zu wollen. Der Vergleich zu anderen Werbemedien mit Hilfe des Wilcoxon Tests ergibt eine signifikante Überlegenheit dieses Werbekanals gegenüber der Plakatwerbung ($p=0,004$), YouTube ($p=0,000$), Facebook ($p=0,000$) und Zeitungswerbung ($p=0,000$). Lediglich im Vergleich zum Medium TV konnte kein signifikanter Unterschied festgestellt werden ($p=0,508$).

Gezeigte Sport-Videos steigern dabei die Bereitschaft, selbst sportlich aktiv zu werden (H_8). Insgesamt wird diese Meinung von 73 Prozent der Befragten geteilt. Lediglich rund 27 Prozent der Befragten folgen dieser Einschätzung nicht. Die Verbreitung der Sport-Videos über Social Media formt daneben das sportliche Image der Werbepattform (H_9). Insgesamt vertreten rund 69 Prozent der Befragten die Auffassung, dass sich Social Media Plattformen besonders für die Verbreitung von Fitness-Videos eignen. Lediglich rund acht Prozent der Befragten vertreten die Einschätzung, dass sich die Verbreitung von Fitness-Videos nicht mit dem Image der sozialen Medien vereinbaren lässt. Nur 32 Prozent der Befragten glauben dabei an den Zusammenhang der Bekleidungsmarke mit dem sportlichen Erfolg eines Spitzensportlers. Hypothese H_{10} lässt sich deshalb nicht verifizieren.

Im Rahmen der Überprüfung der Hypothese H_{11} , ob Video-Wände bei Konsumenten das Interesse auf einen Store-Besuch steigern, wurden den Probanden zunächst positive und negative Adjektive zur Wahl gestellt, welche die Befragten möglicherweise mit Video-Wänden assoziieren. Es wurden insgesamt vier Adjektiv-Paare gebildet, dessen Zustimmungen auf einer bipolaren Skala gemessen wurden (siehe Frage 12 des Fragebogens). Diese Adjektivpaare erklären signifikant und zu rund $R^2=53$ Prozent die Bereitschaft, einen Store besuchen zu wollen ($F(3,191)=82.82$; $p=0,000$). Dabei muss die Videowand nicht einladend ($p=0,071$), sondern lediglich ansprechend ($p=0,000$) und interessant ($p=0,004$) wirken.

Digitale Technologien ermöglichen zudem neue Bezahlmethoden. Allerdings sprechen sich rund 75 Prozent der Befragten weiterhin für den traditionellen Bezahlvorgang an der Kasse aus. Lediglich 25 Prozent der Teilnehmer ziehen das Bezahlen per Smartphone vor. Entgegen der Hypothese H_{12} ziehen die Konsumenten somit moderne Bezahltechnologien nicht vor.

Ähnlich zurückhaltend verhalten sich die Befragten bei der Frage nach einem Kauf von Sportschuhen aus einer modernen 3D-Herstellung. Obwohl rund 78 Prozent der Befragten zumindest teilweise die Meinung vertreten, dass die 3D-Herstellung die herkömmliche Produktionsweise von Sportschuhen zukünftig ersetzen wird (H_{14}), ziehen nur rund sieben Prozent der Befragten bereits heute derartig produzierte Sportschuhe vor, während rund 24 Prozent die Sportschuhe aus traditioneller Produktion bevorzugen. Immerhin 69

Prozent ist die Produktionsmethode egal. Hypothese H_{13} kann zum heutigen Zeitpunkt deshalb nicht verifiziert werden.

Gleichartig verhält es sich mit Hypothese H_{15} : Zwar können Konsumenten über die Adidas-Apps mit personalisierten Angeboten angesprochen werden, allerdings lässt sich statistisch kein signifikanter Zusammenhang zwischen den personalisierten Angeboten und dem Interesse für einen Store-Besuch feststellen ($p=0,263$). Der Zusammenhang zwischen personalisierten Angeboten in der Adidas-App und der Bereitschaft Adidas-Produkte unabhängig vom Point-of-sale zu kaufen, ist zwar signifikant ($p=0,006$), der Erklärungsanteil ist mit $R^2=0,038$ aber nur äußerst gering.

Adidas bietet vier Sport- und Fitness-Apps an. Diese sind für unterschiedliche Trainings- und Gesundheitsbedürfnisse ausgelegt. Hauptsächlich sollen die Applikationen den Nutzern bei der Erreichung ihrer sportlichen und gesundheitlichen Ziele unterstützen (Adidas; URL2). Daher ist es von Interesse, mehr darüber zu erfahren, ob Nutzer sich durch die Verwendung der Apps sportlich erfolgreicher fühlen. Die Teilnehmer der Umfrage wurden gebeten, auf einer Likert-Skala anzugeben, wie sehr sie der Aussage zustimmen, dass die Verwendung von Sport- oder Fitness-Apps sich positiv auf ihren sportlichen Erfolg auswirkt. Die Frage wurde allerdings nur den Teilnehmern der Umfrage vorgelegt, die eine Sport- oder Fitness-App verwenden. Dies trifft für 51 Prozent der Befragten zu. Nur rund 39 Prozent der Befragten, die eine Sport- oder Fitness-App nutzen, haben dabei den Eindruck, dass sie sich durch die Nutzung sportlich erfolgreicher fühlen. Mit rund 61 Prozent vertreten viel mehr Befragte eine gegenteilige Meinung, weshalb Hypothese H_{17} nicht bestätigt werden kann. Dieses Ergebnis wird umso bedeutender, als dass sich auch Hypothese H_{18} nicht verifizieren lässt: Mit der Häufigkeit der Nutzung von Sport-Apps geht keine monotone Veränderung der Zufriedenheit der Konsumenten mit ihrer Kaufentscheidung für ein Adidas Produkt einher. Der p-Wert für Kendall's Tau-b liegt mit $p=0,552$ weit über der Signifikanzgrenze von fünf Prozent.

6. FAZIT

Die Möglichkeiten der Kommunikation mit den Kunden während ihrer Customer Journey über digitale Touchpoints ist vielfältig. Die vorliegende Untersuchung hatte zum Ziel, für die Sportartikelmarke Adidas die wesentlichen und relevanten Touchpoints zu identifizieren und die Präferenzen der Kunden

für die digitalen Technologien zu untersuchen. Dabei hat sich insgesamt ein eher zurückhaltendes Bild für die neuen Technologien ergeben. Eher etablierte Werbeformen, wie die Bereitstellung von Werbung auf Instagram oder das Posten von Sport-Videos auf Social Media, werden vom Kunden insgesamt als positiv wahrgenommen. Werbung auf Instagram motiviert Kunden, sich weiter über die Produkte von Adidas zu informieren, und Sport-Videos in Social Media steigern die Bereitschaft, sich sportlich zu betätigen. Allerdings werden eher innovative Technologien zurückhaltend bewertet. Die empirische Erhebung hat gezeigt, dass die klassische Umkleidekabine einem Living-Mirror noch immer vorgezogen wird und dass die klassische Bezahlung an der Kasse den neuen Bezahlformen immer noch überlegen ist. Ähnlich verhält es sich mit Virtual-Footwear-Walls oder Video-Wänden, die bei den Befragten nur auf mäßiges Interesse stoßen.

Hier gilt es in Zukunft zu beobachten, in wieweit neue digitale Technologien es schaffen werden, die Kunden zu begeistern und die derzeit noch bestehende Skepsis zu überwinden.

APPENDIX: Fragebogen

Frage 1

Wie häufig kaufen Sie für gewöhnlich Sportartikel innerhalb eines Monats ein?

Bitte wählen Sie eine Antwortmöglichkeit aus.

- Gar nicht
- 1 Mal
- 2 Mal
- 3 Mal
- Mehr als 3 Mal

Frage 2

Welchen Kanal nutzen Sie für gewöhnlich am häufigsten, um Ihre Sportprodukte zu kaufen?

Bitte wählen Sie eine Antwort aus.

- Flagship-Store (z.B. Adidas-Store)
- Fachgeschäft (z.B. Intersport)
- Kaufhaus (z.B. Karstadt)
- Online Shop (z.B. Amazon)
- Andere, bitte nennen

Frage 3

Welche ist Ihre favorisierte Sportmarke?

Bitte wählen Sie eine Antwort aus.

- Nike
- Asics
- Adidas
- Under Armour
- Puma
- Andere, bitte nennen

Frage 4

Wie häufig machen Sie in einer gewöhnlichen Woche Sport?

Bitte wählen Sie eine Antwort aus.

- Gar nicht
- 1 Mal
- 2 Mal
- 3 Mal
- Mehr als 3 Mal

Frage 5

Welche der beiden Möglichkeiten würden Sie beim Anprobieren von Sportartikeln im Geschäft favorisieren?

Beim Living Mirror handelt es sich um einen digitalen Bildschirm, wie auf dem Bild zu sehen ist. Dieser ermöglicht es, sich virtuell in Kleidung zu betrachten, ohne sich dabei umzuziehen. Über den Bildschirm lassen sich zudem weitere Informationen zum Produkt anzeigen, wie Materialzusammensetzung, verfügbare Kleidungsgröße und Farbe.

- Living Mirror
- Umkleidekabine

Frage 6

Bitte bewerten Sie auf der angegebenen Skala wie sehr Sie den folgenden Aussagen zustimmen.

Die folgenden Fragen beziehen sich auf die Augmented-Reality-Technologie. Es handelt sich hierbei um eine App, die es ermöglicht, sich im Geschäft weitere Informationen zu Produkten anzeigen zu lassen. Diese ermöglicht es, Informationen wie Materialeinsatz, verfügbare Größen und Produktbewertungen vorheriger Käufer zu betrachten.

	Stimme überhaupt nicht zu	Stimme eher nicht zu	Stimme teils zu	Stimme eher zu	Stimme vollkommen zu
Augmented-Reality erleichtert es mir, Produkte im Geschäft zu vergleichen.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Der Einsatz von Augmented-Reality verstärkt die Wahrnehmung der Marke Adidas als innovativ.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Augmented-Reality gibt mir einen guten Überblick über die wichtigsten Informationen eines Produktes.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Die Augmented-Reality-Anwendung empfinde ich als Unterstützung für meine Kaufentscheidung.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Frage 7

Bitte bewerten Sie auf der angegebenen Skala wie sehr Sie den folgenden Aussagen zustimmen.

Die Virtual-Footwear-Wall ist ein digitaler Bildschirm, der in Geschäften zum Einsatz kommt. Er ermöglicht, Schuhe im Detail zu betrachten und sich produktspezifische Informationen anzeigen zu lassen, wie Materialeinsatz, Anwendungsbereiche, verfügbare Farben. Die Virtual-Footwear-Wall kann dabei von Nutzern eigenständig bedient werden.

	Stimme überhaupt nicht zu	Stimme eher nicht zu	Stimme teils zu	Stimme eher zu	Stimme vollkommen zu
Die Virtual-Footwear-Wall erleichtert es mir, Produkte im Geschäft zu vergleichen.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Über die Virtual-Footwear-Wall erhalte ich relevante Informationen für mich.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Die Virtual-Footwear-Wall unterstützt mich bei meiner Kaufentscheidung.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Frage 8

Welche Möglichkeit würden Sie vorziehen, um sich im Geschäft über Produkte zu informieren?

Bitte wählen Sie eine Antwort aus.

- Virtual-Footwear-Wall
- Beratung durch Service-Personal

Frage 9

Bitte bewerten Sie auf der angegebenen Skala wie sehr Sie den folgenden Aussagen zustimmen.

	Stimme überhaupt nicht zu	Stimme eher nicht zu	Stimme teils zu	Stimme eher zu	Stimme vollkommen zu
Werbung in klassischen Medien (z.B. TV, Print) empfinde ich als relevant.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Ich nehme Werbung in sozialen Medien als relevant wahr.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Frage 10

Bitte bewerten Sie anhand der angegebenen Skala wie sehr Sie den folgenden Aussagen zustimmen.

	Stimme gar nicht zu	Stimme eher nicht zu	Stimme teils zu	Stimme eher zu	Stimme vollkommen zu	Weiß nicht
Werbung auf Instagram steigert meine Bereitschaft, mich weiter über das Produkt zu informieren.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Werbung im TV steigert meine Bereitschaft, mich weiter über das Produkt zu informieren.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Plakatwerbung steigert meine Bereitschaft, mich weiter über das Produkt zu informieren.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Werbung in Zeitungen steigert meine Bereitschaft, mich weiter über das Produkt zu informieren.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Werbung auf Facebook steigert meine Bereitschaft, mich weiter über das Produkt zu informieren.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Werbung auf YouTube steigert meine Bereitschaft, mich weiter über das Produkt zu informieren.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Frage 11

Bitte bewerten Sie auf der angegebenen Skala wie sehr Sie den folgenden Aussagen zustimmen.

Die folgenden Fragen beziehen sich auf Fitness-Videos von Adidas. Bisher ist lediglich das Konzept zu den Fitness-Videos verfügbar. Im Allgemeinen werden die Videos so aufgebaut sein, dass bekannte Spitzensportler Übungen aus ihrem eigenen Training zeigen und zudem hilfreiche Tipps für den sportlichen Erfolg geben.

	Stimme gar nicht zu	Stimme eher nicht zu	Stimme teils zu	Stimme eher zu	Stimme vollkommen zu
Spitzensportler verkörpern, dass die Wahl der Bekleidungsmarke Einfluss auf den sportlichen Erfolg hat.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Solche Fitness-Videos passen gut mit dem Kommunikationsstil der sozialen Medien zusammen.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Die Fitness-Videos empfinde ich als Motivation, um selbst sportlich aktiver zu werden.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Frage 12

Welche der jeweiligen Adjektive empfinden Sie bei der Betrachtung von Video-Wänden in Geschäften?

Bei den Video-Wänden handelt es sich um große Bildschirme, die in den Schaufenstern der Geschäfte platziert sind. Diese geben Bild- und Videoformate wieder, wie auf dem Bild zu sehen.

langweilig	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	interessant
hässlich	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	ansprechend
abschreckend	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	einladend
untergehend	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	hervorhebend

Frage 13

Bitte bewerten Sie auf der angegebenen Skala wie sehr Sie der folgenden Aussage zustimmen.

	Stimme gar nicht zu	Stimme eher nicht zu	Stimme teils zu	Stimme eher zu	Stimme vollkommen zu
Die Video-Wände würden mich zu einem Besuch des Geschäftes bewegen.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Frage 14

Würden personalisierte Angebote Sie zu einem Besuch von Sportgeschäften bewegen?

Personalisierte Angebote werden Nutzern über eine App auf das Smartphone gesendet und zeichnen sich durch eine direkte Ansprache aus. Dem Nutzer werden unter anderem Rabatte und Gutscheine für ein spezifisches Geschäft angeboten.

Ja

Nein

Frage 15

Bitte bewerten Sie auf der angegebenen Skala wie sehr Sie der folgenden Aussage zustimmen.

	Stimme gar nicht zu	Stimme eher nicht zu	Stimme teils zu	Stimme eher zu	Stimme vollkommen zu	Weiß ich nicht
Ich empfinde den Erhalt von personalisierten Angeboten auf meinem Smartphone als positiv.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Frage 16

Welche der beiden Möglichkeiten würden Sie beim Bezahlen im Geschäft vorziehen?

Mit der Bezahlmethode des Smartphones ist gemeint, dass der Käufer die App des Unternehmens nutzt, um das Geld zu überweisen. Dabei kann er den Bezahlvorgang eingeständig abschließen.

Smartphone

Kasse

Frage 17

Welche Art der Herstellung ziehen Sie bei Sportprodukten vor?

Die 3D-Herstellung ist ein Verfahren, bei dem die Sportschuhe durch eine Art von Drucker angefertigt werden, wie das Bild verdeutlicht.

3D-Herstellung

herkömmliche Produktion (maschinell/handgefertigt)

Die Art der Herstellung hat keine Bedeutung für mich.

Frage 18

Bitte bewerten Sie auf der angegebenen Skala wie sehr Sie der folgenden Aussage zustimmen.

	Stimme gar nicht zu	Stimme eher nicht zu	Stimme teils zu	Stimme eher zu	Stimme vollkommen zu	Weiß ich nicht
Das 3D-Herstellungsverfahren wird die herkömmliche Produktionsweise von Sportschuhen ersetzen.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Frage 19

Haben Sie eine Adidas-App auf Ihrem Smartphone installiert?

Ja

Nein

Frage 20

Haben Sie auf Ihrem Smartphone eine Sport- oder Fitness-App installiert?

- Ja
- Nein

Frage 21

Wie häufig nutzen Sie die Sport- oder Fitness-App für Ihr Training innerhalb einer Woche?

- Gar nicht
- 1 Mal
- 2 Mal
- 3 Mal
- Mehr als 3 Mal

Frage 22

Bitte bewerten Sie auf der angegebenen Skala wie sehr Sie der folgenden Aussage zustimmen.

- | | Stimme gar nicht
zu | Stimme eher nicht
zu | Stimme teils zu | Stimme eher zu | Stimme
vollständig zu |
|---|------------------------|-------------------------|-----------------------|-----------------------|--------------------------|
| Durch die Verwendung von Sport- oder Fitness-Apps fühle ich mich sportlich erfolgreicher. | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |

UGC AND FGC AS THE NEW CHALLENGES FOR TOURIST DESTINATION MANAGEMENT

Abstract

Social media has fundamentally changed the operation of the tourism market and tourism marketing and has taken control of destination management from their managers.

This paper aims to gain knowledge about the destination management and the role of user-generated content (UGC) and firm generated content (FGC) in the context of tourist destination choice. Customer perception toward UGC and FGC on four social media platforms (Facebook, YouTube, TripAdvisor, and Booking.com) was collected via an online survey on a sample of 1,057 Croatian tourists and users of social media in July 2016. The method of non-probability and snowball sample was applied. The data were analyzed using descriptive and inferential statistics with the support of SPSS 17.

The results show that when tourist choose a destination, UGC has greater significance than FGC which is particularly emphasized on platforms TripAdvisor and Booking.com, that puts new challenges for marketing managers of tourist destinations regarding promotion and management of their tourist des-

tinations. This paper offers the first insight into the relationship between UGC and FGC, and destination management in Croatia in the tourist destination choice setting.

Keywords: *user-generated content, firm generated content, marketing management, tourist destination management, social media*

JEL Classification: M31, Z33

1. INTRODUCTION

Information technology, as well as social media in the context of tourist destinations, and also companies in tourism, have led to revolutionary changes (Kim, 2007: 14) by changing their business from the foundation (Kim, 2007: 14; Munar, Gyimothy and Cai, 2013: 8) and the paradigm of marketing communication (Mangold and Faulds, 2009; O'Hern and Kahle, 2013: 29). In particular, they have led to a shift in the value chain in tourism through the transfer of power and accountability from their own centralized power of enterprise and destination, to millions of creative users around the world who are interested in sharing their opinions, experiences and attitudes (Munar, Gyimothy and Cai, 2013: 8, O'Hern and Kahle, 2013: 29), thus reducing the control of marketing managers over the product of their tourist destinations (Munar, 2011: 299).

Social media allows tourists to communicate with hotels or local tourist attractions, and provide feedback on the provided service. Suppliers and consumers increasingly appreciate the opinions, criticisms, and concerns of tourists who become more reliable and more trusted sources of information than providers themselves (Miguens, Baggio and Costa, 2008: 27). But in addition to the benefits for users and suppliers, social media has developed into an internet marketing tool that enables businesses and tourist destinations to access the market, learn about consumer trends and consumer communication (Holzner, 2009) in a way that can be translated into market share and income (Albee, 2010).

The essence of social media is the information sharing (Albee, 2010), and they may be generated by the firm (Eng. Firm generated content - FGC) and by the user (Eng. User-generated content - UGC) (Bruhn, Schoenmueller and Schäfer 2012: 771; Godes and Mayzlin, 2009; Vickery and Wunsch-Vincent, 2007). It is crucial to differentiate social media communications from these two sources because social media communication generated by firms is always un-

der the control of marketing managers, while the one generated by the users is independent from the firm (Bruhn, Schoenmueller and Schäfer, 2012: 771).

FGC characteristics are completely controlled by marketing managers and they transmit positive communication about brands (Bruhn, Schoenmueller and Schafer, 2012: 775; Godes and Mayzlin, 2009). Majority of the tourism companies, national tourism organizations and local destination marketing organizations spread out their massive amount of information through social media (Jacobsen and Munar, 2012: 40), and FGC has enabled them mass-driven promotion adjusted to the features of particular, narrow market segments (Krešić, Miličević and Boranić Živoder, 2011: 82), and creation of user profiles and personalized offers (Borouji Hojehghan and Nazari Esfangareh, 2011: 312), as well as personal communication with existing and potential tourists.

On the other hand, UGC represents the association and influence of consumer's participation on the web (Poster, 2006). Thanks to it, tourists have easy access to information and share their experiences, comments, and suggestions easily in an informal and collaborative way (Miguens, Baggio and Costa, 2008: 27). This can have a significant impact on the way consumers choose tourist destinations because UGC allows them to access points of view and opinions (O'Connor, Höpken and Gretzel, 2008) of other tourists.

Content from both sources is published on social media platforms. Given the popularity, the number of users and the importance for tourism, the focus of this research is on UGC and FGC published on four social media platforms, more specifically on Facebook as an example of social networking site, YouTube as an example of a content sharing site, and TripAdvisor and Booking.com as an examples of review sites. This approach to the observation of social media is called in literature Platform-and-content-based approach, and it has been observed by several scientists such as Illum, Ivanov and Liang, 2010; Munar, 2011; Xiang and Gretzel, 2010; and others. Although these four platforms represent different types of social media, whereby each platform has its own unique architecture, culture, and norms, they have a significant influence on the choice of a tourist destination and for this reason, they have been chosen as the most relevant for this research.

Basically, so far, little research has been carried out on the way organizations in tourism evolve with the Internet and the use of social media, and how they involve potential consumers (Hays, Page and Buhalis, 2013: 213). But what

previous studies have shown suggests that marketing managers of tourist destinations have poor knowledge of new technologies based on the Web, as well as their lack of opportunities to learn more about them (Hays, Page and Buhalis, 2013: 213; O'Connor, 2008). In addition to these findings, research conducted by Hays, Page and Buhalis (2013) has shown that most tourist destinations do not use the full potential of social media when it comes to interaction and engagement with consumers, as well as that social media are still not widely recognized and/or appreciated as a key instrument of marketing strategies and are often insufficiently funded and neglected. This shows that there is a significant need to develop new and improved ways to increase the awareness and acceptance of new technologies by marketing managers of tourist destinations (Byeong, 2011: 5).

Therefore, the aim of this paper is to provide an insight into the importance of UGC and FGC when tourist choose tourist destination, and to turn the attention of marketing managers of tourist destinations on the importance of managing their published content. Furthermore, the aim of the paper is to demonstrate the importance of these forms of content on a particular social media platform. This paper contributes to the literature on marketing management in tourism in three ways. First, marketing managers of tourist destinations have to understand the relationship of tourists to the content published on social media, which is the key for destination choice. Second, this primary research is the first attempt to gain insight into the relationship between UGC and FGC, and destination management in an emerging market, such as the tourism industry in Croatia. Third, the findings provide guidelines for marketing managers of tourist destinations for more advanced management of social media content.

2. LITERATURE REVIEW

2.1. TOURIST DESTINATION MARKETING MANAGEMENT AND SOCIAL MEDIA

Today's consumers have greater control over the market and their media-related habits. Moreover, with increased participation on the Internet, consumers have a greater influence over the products and brands they are considered to buy (Sharma and Rehman, 2012), and in the future the most successful destinations will be those who leave the traditional hierarchical approach from top

to bottom and embrace the bottom-up approach and the co-creation branding strategy (Oliveira and Panyik, 2015: 53). The systematic and continuous existence of tourist destinations in electronic distribution is imperative for all destinations that want to be competitive on the world tourist market (Krešić, Miličević and Boranić Živoder, 2011: 75; Xiang and Gretzel, 2010), so the management of information and communication technologies is constantly being mentioned as one of the most uncomfortable issues for marketing managers in tourism (O'Connor, 2008).

Those tourist destinations and tourism companies that have recognized the importance of social media as time (Dholakia and Bagozzi, 2001; Drury, 2008; Kirtis and Karahan, 2011: 267) and money-efficient marketing tool (Byeong, 2011: 4; Dholakia and Bagozzi, 2001; Drury, 2008; Hays, Page and Buhalis, 2013: 213; Kirtis and Karahan, 2011: 267), of global reach (Hays, Page and Buhalis, 2013: 213; Kirtis and Karahan, 2011: 267), through them try to realize their goals (Indrupati and Henari, 2012: 56) and affect tourists choice and behavior (Dholakia and Bagozzi, 2001; Drury, 2008; Garrigos-Simon, Alcamo and Ribera, 2012: 1883; Jalilvand and Samiei, 2012: 604). On the one hand, social media help them to connect with suppliers, different partners, and other market participants, on the other hand, to connect with potential and existing customers in order to gain competitive advantage (Chalkiti and Sigala, 2008; Indrupati and Henari, 2012). McKinsey's report on the use of social media in organizations has shown that as much as organization networks, it becomes more successful in the long run thanks to the multiplier effect of social media (Sherman, 2011). Social media also encourage tourist organizations to use, develop and increase their knowledge sharing skills with consumers and other market participants (Chalkiti and Sigala, 2008), because there is the belief that when tourist destinations use social media, they can provide tourists with more reliable information and content (Byeong, 2011: 31).

By using social media and the Internet as marketing tools, tourism organizations have also gained different advantages in access to the market (Constantinides and Fountain, 2008: 240, Holzner, 2009), cost reduction for promotion (Jalilvand and Samiei, 2012: 604), income growth, market research, database development and customer retention (Morrison et al., 1999). Furthermore, marketing managers in tourism can actively and consistently learn through social media about consumer trends (Holzner, 2009) and consumer behavior (Garrigos-Simon, Alcamo and Ribera, 2012: 1883, Jalilvand and Samiei, 2012:

604, Lee and Hu, 2004; Miguens, Baggio and Costa, 2008: 2) “to listen” to the consumer’s voice about the organization and its products (Constantinides and Fountain, 2008: 240), and in an economical way to collect user-generated content (Godes and Mayzlin, 2004) as a source for improving their products and services (Lee and Hu, 2004). Firms and destinations can provide a better service to consumers and gain insight into product innovation by using UGC (Lim, Chung and Weaver, 2012: 199).

Social media has an increasingly important role in the marketing of tourist destinations (Pan, MacLaurin and Crotts, 2007), forming their image and brand, as well as their communication with consumers (Jalilvand and Samiei, 2012: 604). Generally speaking, social media make it easier for the public to reach the way they want to be reached (Ginnakouris and Smihily, 2013). Wang, Yu and Fesenmaier (2002) claim that since people can overcome time and space and “be” anywhere and anytime, organizations need to adapt and accept this new virtual space as a marketing tool that is capable of organizing people’s knowledge and wishes according to the destination they may want to visit. As a consequence, Internet marketing gradually becomes the main force (Fesenmaier et al., 2003), and due to the drastic and global growth of social media, organizations of all sizes and different industries look to social media marketing as a mandatory element of their marketing strategy (Hanna, Rohm and Crittenden, 2011: 272) and consumer relationship management (Thomas, 2010).

2.2. SOCIAL MEDIA CONTENT

Content that is published on social media is an integral part of the content on the Web and can be distributed in the context of three categories; textual, visual and audio content. Such content, among other things, may include text, images, videos, and sounds (Figueiredo et al., 2013: 222), animations, graphics (Smith and Chang, 1997: 12) as well as combinations of above-mentioned.

The before-mentioned forms of social media content can be generated from two different sources, from the firm (firm generated content - FGC) and from the user (user-generated content - UGC) (Bruhn, Schoenmueller and Schäfer, 2012: 771; Godes and Mayzlin, 2009; Vickery and Wunsch-Vincent, 2007). The difference between these two sources is that the content from the firm is always under the control of firm marketing managers, while the content from the user is independent of the firm control (Bruhn, Schoenmueller and Schäfer,

2012: 771). Previous research reveals that consumers knowingly differentiate these two sources of information (Bruhn, Schoenmueller and Schäfer, 2012) and they trust the user-generated content more than they believe in marketing managers' opinions. Given the exponential increase in the volume of published UGC and FGC (Ghose, 2008), this paper describes the characteristics of each of them separately.

2.2.1. *The firm generated content (FGC)*

The firm generated content is the type of online content directly created and managed by the firm (Jonas, 2010: 121). In existing literature there are various names for this form of content, some of which are firm-created social media communication (Bruhn, Schoenmueller and Schäfer, 2012), farm-produced content (Jonas, 2010), firm-published online content (Ghose, 2008), marketer-generated content (Lim, Chung and Weaver, 2012), and finally firm-generated content (Kumar et al., 2015). The name FGC is used in this paper for its simplicity but also for the similarities with the name for the other form of content that is observed in this paper, ie user-generated content.

Since the FGC is the multi-layered construct (Kumar et al., 2015), its four main features are as following:

- it is controlled by marketing managers,
- it conveys a positive communication about the brand,
- it can initiate UGC about the firm, and
- it has an important impact on consumer behavior and buying decision.

As FGC is fully under the control of marketing managers, its trustworthiness is lacking in the eyes of consumers (Bruhn, Schoenmueller and Schäfer, 2012: 784). Hovland, Janis and Kelly (1953) have defined trustworthiness as a level of trust in the intent of the communicator to communicate the statement that he/she considers being the most valid. Therefore, the trustworthiness of the information published on companies profiles naturally associated with the success of companies branding (Gefen, 2000). In addition to trustworthiness, two more constructs are important in the context of the FGC; trust and credibility of the source. Mutual trust is important both for those who generate information and for those who receive this information in the online world (Boyd and Ellison, 2008; O'Connor, 2008). Previous studies have shown that con-

sumers trust fellow consumers more than the marketing experts (Lim, Chung and Weaver, 2012) of a particular company or tourist destination.

The FGC transfers only positive information that contributes to increasing firm or destination brand awareness (Bruhn, Schoenmueller and Schäfer, 2012; Godes and Mayzlin, 2009; Yoo, Donth and Lee, 2000), reinforces the positive attitude of the brand (Bruhn, Schoenmueller and Schäfer, 2012; Kumar et al., 2015: 3) and brand image (Bruhn, Schoenmueller and Schäfer, 2012). In addition, brand communication improves the brand's market value, which increases the likelihood that the mark will be included in a consumer-considered set, and will shorten the decision-making process and turn the choice into the habit (Yoo et al., 2000).

Marketing managers through the FGC have the power to influence the communication between consumers (Mangold and Faulds, 2009) by creating a framework or creating a platform where consumers can express their opinions, attitudes, and brand information. Godes and Mayzlin (2009) demonstrate how firms through FGC can create mouth-to-mouth promotion. They also prove that this so-called mouth-to-mouth promotion, generated by the firm increases sales over time and leaves an unmistakable impression on consumer's opinion (Mangold and Faulds, 2009). Similar findings have been made by Kumar et al. (2015) according to which the FGC can help firms to familiarize consumers with their promotion, current offers and prices, which ultimately has a positive and significant impact on consumer behavior and purchasing decision.

2.2.2. *User-generated content (UGC)*

With great certainty, it can be argued that UGC is the most researched area of social media, and it seems to be a very important subject of further research in this area. There are several different definitions and classifications of UGC in the literature. For Williams et al. (2010: 117) UGC is a practice that enables the general public to publish comments and reviews, and for Boyd and Ellison (2008) an important means through which consumers express and communicate with others; this is what was created at the time of sociability, as well as an object that is represented by sociality (Smith, Fischer and Yongjian, 2012: 102). Munar (2011) defines it as the information that is digitally formatted by the user and is available via the Internet, and for some authors, it is a modern version of WOM (Litvin, Goldsmith and Pan, 2008; Williams et al., 2010: 117).

As for the FGC, many different terms for UGS are used, such as consumer-generated content (O'Guinn, Allen and Semenik, 2009), user-driven content (Miguens, Baggio and Costa, 2008: 1), user-created content (Vickery and Wunsch-Vincent, 2007), and by far the most widely accepted term is the user-generated content (eg. Akehurst, 2009; Ghose, 2008; Smith, Fischer and Yongjian, 2012).

Previous research has shown that UGC is a stand-alone source of information, especially from the recipient's point of view (Xie, Miao, Kuo and Lee, 2011), and is an important tool for customers to get product information or the information about the quality of service (Chevalier and Mayzlin, 2006). UGC can help in informing and educating tourists and marketing managers, and in facilitating the implementation of tourist transactions. Besides being a source of information, it appeared that the UGC can affect customer's decision-making and purchase intent (Yoo and Gretz, 2008b). The value of UGC is generally underestimated, but its importance is not denied because the information it provides is most commonly summarized and relevant, which makes it much easier for users to search for desired information (Akehurst, 2009: 58).

Trustworthiness is considered to be a key element of success in the online world (Flavian, Guinali and Gurre, 2006) and an important factor in the behavior of users on the Internet (Vishwanath, 2003). The reason for this lies in the greater risk consumers perceive when using this medium (Harris and Goode, 2004). Therefore, more empirical research has been carried out in the context of trust in using and generating UGC (Nielsen, 2009, Sharma and Rehman, 2012). Studies have shown that in the context of online communities and user-generated content, the trust has a significant impact on the intention to seek information from other members of the community (Ridings, Gefen and Arinze, 2002), and that even 66% of respondents trust UGC on social media (Sharma and Rehman, 2012). As well as that many respondents trust user reviews more than they believe in the opinion of experts or marketing managers.

Numerous studies have confirmed that information on the Internet published by an independent source (such as UGC) is a much more reliable source of information than those published by the firm (FGC) (Jonas, 2010), as well as that consumers trust more the information received from their colleagues (Litvin, Goldsmith and Pan, 2008). The reason for this can be found in the fact that consumers prefer to rely on informal and personal communication

sources (eg other consumers) in making purchasing decisions instead of formal and organizational sources such as promotional campaigns (Marsden, 2006). Indeed, colleagues' recommendations are extremely efficient and useful because the source of information does not generate any benefit from the consumer's subsequent intentions (Schiffman and Knauk, 1997), and as a result, colleagues are considered as more objective sources of information (Nielsen, 2009).

Thus, tourist destinations and firms are no longer the primary sources of communication about brands (Berthon, Pitt and Campbell, 2008), and marketing and brand managers can assume that the communication about the brand will grow through UGC communication (Smith, 2011). Despite the fact that previous researches have shown that there is a positive correlation between FGC and consumer spending, there is a significant prevalence of the amount of published UGC over the FGC on social media. Reasons for this should be sought in the number of independent consumers over the number of firms and destinations, as well as in the likelihood that consumers will first seek the post of another consumer than marketing experts. Furthermore, the UGC published about certain products and services is more popular than the FGC. Therefore, it seems that UGC attracts far more people than the FGC (Lim, Chung and Weaver, 2012).

2.3. PROPOSED HYPOTHESIS ABOUT THE RELATIONSHIP BETWEEN UGC AND FGC WHEN CHOOSING A TOURIST DESTINATION

In the existing literature, there was a consensus that consumer communication is an influential source of information transfer (Dellarocas, 2003). The emergence of social media platforms build consumer-to-consumer communication, and in particular, speed up communication between unknown consumers (Duan, Gu, and Whinston, 2008). In tourism, consumers expressly value consumer-to-consumer communication, and recommendations on social media when deciding on a tourist destination choice (UGC) (Bruhn, Schoenmueller and Schäfer, 2012: 784). Leisure tourists prefer to collect information from other individuals rather than from official sources such as firms or tourist destinations (Midgley, 1983). For example, Murray (1991: 19) has found that personal information sources (UGC) are more preferred over impersonal information sources (FGC) for the services, which is also important for the choice of tourist destinations (Prebensen, Skallerud and Chen, 2010) and the way how it is managed.

Since social media provides the ability to communicate with hundreds, even thousands of other users around the world, marketing managers of firms and destinations are no longer the only source of products and services communication (Mangold and Faulds, 2009). The information exchanged through social media can have a significant impact on how consumers buy (chose) a tourist destination, because they provide them access to different points of view and opinions (O'Connor, Höpken and Gretz, 2008) of other tourists, and it reduces the perceived risk and uncertainty before buying (Walker, 2001). In addition, tourists perceive UGC as a more reliable source of information from the FGC (Akehurst, 2009: 55; Gretzel and Yoo quoted in Ye, Law and Gu, 2009) therefore it is assumed that UGC has greater significance than FGC when choosing a tourist destination. Thus, the following hypothesis was formulated.

H1: UGC has greater influence than FGC during tourist destination choice.

3. METHODOLOGY

3.1. MEASUREMENT

In conjunction with previous studies that argue the management of social media in tourism, a pilot study was conducted to examine the variables of social media, UGC, and FGC for the purpose of choosing a tourist destination. For the purpose of determining the variables, preliminary pilot research was carried out, which included the synthesis of the findings obtained by secondary research. More precisely, the research of previous experiences through two focus groups, the focus group on a sample of experts in the observed area, and the focus group on a sample of tourists. Experts from the field were Internet promotion specialists and marketing managers employed on social media platforms who were involved in maintaining and communicating with end-users. The focus group of tourists was the average Croatian leisure tourists who use social media on a weekly basis, and who had generated the UGC on social media at least one time. Based on the findings, the first version of the highly structured questionnaire was created in the Croatian language. The questionnaire was tested on five respondents and was discussed with marketing managers of tourist destinations. Questionnaires' flaws were identified, a new version of the questionnaire was created. The same test process and discussion about the questionnaire was repeated on two more occasions. Finally, the final version of the questionnaire was

created using Google's Forms application. All applications were measured using 5-point Likert scale (1 = strongly disagree, 5 = strongly agree).

3.2. DATA COLLECTION

The sample consisted of Croatian tourists, who are also users of at least one of the four observed social media platforms (Facebook, YouTube, TripAdvisor, and Booking.com). The data were collected in a way that from July 1 to July 7, 2016, to more than 7,000 respondents were sent an e-mail with a link to the survey questionnaire. Each contacted respondent was asked to fill out the questionnaire, and to forward the e-mail with the questionnaire access to his/her contacts. In order to increase the attention and interest of the respondents for participation in the research (Illum, Ivanon and Liang 2010: 340; Mangold and Faulds, 2009: 362), the researchers also organized a prize game "Wellness weekend for two in thermal spa Jezerčica". On July 22 and July 23, to all previously contacted respondents were sent an e-mail with a reminder to participate in the research.

Link to the questionnaire access remained active until October 17, when the last response was received, the total is 1,099. Further analysis found that 42 questionnaires received were not usable for analysis, and data processing continued on the basis of 1,057 valid questionnaires. Data were analyzed using descriptive and inferential statistics, with the support of SPSS 17.

3.3. DEMOGRAPHIC CHARACTERISTICS

1,057 respondents, mostly women, participated in this research. Out of a total of 1,057 surveyed tourists, 73.1% were female, while 26.9% of respondents were male. Considering the age of respondents, tourists aged between 25 and 34 (Table 1) dominated. The average age of respondents is approximately 37.4 years. Among those surveyed are those with a bachelor's degree (46.9%) and then the ones with master's degree and university specialists (14.9%). The average monthly income of respondents is approximately 7.237 in.

Table 1. Profile of respondents

Characteristics	Frequency	Percentage (%)	Characteristics	Frequency	Percentage (%)
Gender			Level of education		
Male	284	26,9	High school degree	153	14,5
Female	773	73,1	Bachelor's degree	135	12,8
Total	1.057	100,0	Bachelor's degree	496	46,9
Age (Years)			Master's degree/ university specialist	158	14,9
18 – 24	123	11,6	PhD	115	10,9
25 – 34	414	39,1	Total	1.057	100,0
35 – 44	284	26,9	Personal monthly income		
45 – 54	155	14,7	Up to 4.000 kn	157	14,8
55 – 64	73	6,9	4.001 – 8.000	452	42,9
65 and more	5	0,5	8.001 – 12.000	231	21,8
Unknown	3	0,3	12.001–16.000	56	5,3

3.4. RESULTS

The analysis of the importance of the published UGC in relation to the published FGC was first conducted for each of the four platforms of social media, but to be able to make general conclusions about the importance of content published on social media platforms which are important for tourism and to test the hypothesis stated, a collective analysis for all four platforms together is presented in the second part of this chapter.

The respondents' opinions regarding **the importance of published UGC in relation to the published FGC** on each of the observed social media platforms when choosing a tourist destination are presented in Table 2. Evaluations of respondents' range in the total range from "I strongly disagree" (grade 1) to "I strongly agree" (grade 5). There are a total of the highest number of claims, 769 exactly, which are rated with grade 4, "I agree", followed by grade 3 "I neither agree nor disagree".

Table 2. The degree of acceptance of the claim about the importance of UGC in relation to the FGC when choosing tourist destinations

Statement	Platform	The degree of acceptance of the statement					Total
		1 = strongly disagree	2 = disagree	3 = neither agree, nor disagree	4 = agree	5 = strongly agree	
The content posted by my friends / other tourists is more important than the official description of the tourist destination on the platform.	FB	138	128	224	212	145	847
	YT	217	172	273	208	126	996
	TA	6	15	73	132	170	396
	BC	22	43	142	217	207	631
	Total	383	358	712	769	648	2.870

Source: Authors survey

The significance of UGC in relation to the FGC on each of the platforms (FB, YT, TA, and BC) when choosing a tourist destination can be expressed more precisely on the basis of the arithmetic mean from Table 3. The smallest significance of UGC compared to the FGC is on the platform YouTube (2.85), a little stronger on the Facebook (3.12), while it is the strongest on Booking.com (3.86) and TripAdvisor (4.12). The dispersion of respondents' opinion is moderate for each observed platform (variation coefficients are between 23% and 46%).

Table 3. Descriptive indicators of acceptance of claims about the importance of UGC in relation to the FGC when choosing tourist destinations

Statement	Platform	Descriptive indicator		
		Arithmetic mean	Standard deviation	Coefficient of Variation
The content that my friends/other tourists have published on the platform is more relevant than the official description of the tourist destination.	FB	3,12	1,314	42
	YT	2,85	1,319	46
	TA	4,12	0,943	23
	BC	3,86	1,059	27

Source: Authors survey

The following analysis was conducted to determine the significance of published UGC versus FGC on all observed platforms together when choosing a tourist destination. The strength of this significance will be expressed in the analysis by an average rating of respondents for the observed statement. The average below 3 will be considered that UGC has **less significance** than the FGC when choosing a tourist destination, while an average of more than 3 would consider UGC to have **greater significance** than the FGC when choosing a tourist destination. Significance will be assessed as a whole with the inferential statistic (all four platforms together), and significance for each of the observed platforms will not be observed separately as it is done in Table 3. As mentioned in Table 4, the arithmetic mean with the corresponding standard deviation and coefficient of variation is shown.

Table 4. Descriptive indicators of the importance of UGC in relation to the FGC (FB, YT, TA, and BC together) when choosing a tourist destination

Statement	Arithmetic mean	Standard deviation	Coefficient of Variation
The content that my friends/other tourists have published on the platform is more relevant than the official description of the tourist destination.	3,33	1,313	39

Source: Authors survey

Note: The total number of reviews of 2.870 is made of 847 Facebook users, 996 YouTube users, 396 users of TripAdvisor and 631 users on Booking.com.

According to the result shown in Table 4, it is concluded that UGC has a greater significance than the FGC when choosing a tourist destination (3,33). In this way, H1 is accepted, ie UGC has greater influence than FGC during tourist destination choice. Higher ratings with the platforms TripAdvisor (4,12) and Booking.com (3,86) shown in Table 3 have contributed to the accepting of the hypothesis.

It is also necessary to ascertain whether the social media platforms differ statistically between each other, due to the fact that the respondents attribute to UGC over the FGC. This was determined by an H test whose results are listed in Table 5.

Table 5. Platform comparison considering the importance of UGC over FGC according to respondents' ratings

Variable	Platform	Number of ratings	Middle range	χ^2	df	p
Importance of UGC over FGC depending on a platform.	FB	847	1302,52	402,683	3	<0,001
	YT	996	1145,18			
	TA	396	1932,39			
	BC	631	1759,47			

Source: Authors survey

The results in Table 5 show that respondents do not give a similar significance to UGC over the FGC when the four platforms are considered. This significance is **statistically significantly different** ($p < 0.001$). The smallest significance of UGC over FGC was attached to YouTube, then to Facebook, then to Booking.com, and the largest on TripAdvisor. The same order of importance of UGC over FGC can be seen in Table 3, where arithmetic means are stated (3.12, 2.85, 4.12 and 3.86). From the same Table, it can be seen that the respondents using TA and BC are more homogenous in their ratings of UGC over FGC significance (coefficients of variation are 23% and 27%) compared to those using FB and YT (coefficients of variation in them 42% and 46%).

4. DISCUSSION AND CONCLUSION

The presented results extend existing knowledge of the importance of UGC and FGC when choosing a tourist destination, which is extremely valuable for marketing managers of tourist destinations. In line with previous research on UGC and FGC in other scientific areas, activities, and parts of the world, this research conducted in Croatia as an extremely propulsive tourist destination has shown that tourists prefer UGC over FGC in the context of choice of a tourist destination. This means that they prefer to collect information from other individuals than from official sources created by marketing managers of companies or tourist destinations. The findings of this research are also in line with the findings carried out by Bruhn, Schoenmueller and Schäfer (2012). Furthermore, the study concludes that UGC published about tourist destinations is more popular than the FGC and attracts more people than the FGC, which is also consistent with the research conducted by Lim, Chung and Weaver (2012).

The research has shown that according to the features of the observed platforms, the smallest significance is the one of UGC compared to the FGC on the platform YouTube because the YouTube is the platform with the least UGC, and the largest amount of FGC compared to other observing platforms. It is followed by the Facebook, which in spite of the significant overtaking of UGC compared to published FGC has relatively little meaning in the observed context as it is still the primary site for communication with friends and acquaintances, and less for collecting information about tourist destinations. On the other hand, UGC is extremely important at TripAdvisor and Booking.com because these sites are primarily based on the reviews, and the reviews are those that contribute to their popularity and browsing by tourists. As a result of this survey, marketing managers of tourist destinations and tourism organizations should turn the focus from Facebook and YouTube as a platform through they primarily promote their tourist destinations and products, and turn to tourist reviews of the destinations they manage published on TripAdvisor and Booking.com. This research confirms Gillin's (2007) earlier statement that there is evidence that consumer reviews published on social media are much more powerful as marketing tools than product reviews by experts, and that consumers are increasingly able to directly influence a firm's marketing results by contributing to their user-generated content (Bruhn, Schoenmuller and Schäfer, 2012; O'Hern and Kahle, 2013).

As a result, marketing managers of tourist destinations in their addressing target markets should focus more on UGC than on the FGC, and use it for their benefit by learning about trends in the tourist market, as well as the behavior of tourists. They have to "listen" the voice of consumers about what to do about a tourist destination and its products, and in a cost-effective way collect UGC as a source for product and service improvement in the future.

Achieving competitive advantage in times of rapid change demands from tourism participants to clearly understand the direction of these changes and their impact on business or destination management (Dwyer et al., 2009: 63). The competition on the international tourist market is becoming more pronounced, so in the long run will succeed only destinations with the best management (Buhalis, 2000: 104) and knowledge. Hence, the more knowledge about trends that support tourism development, the greater the ability of destination managers and entrepreneurs in tourism to formulate strategies that will achieve the competitive advantage of their destinations (Dwyer et al., 2009: 63).

5. LIMITATIONS AND SUGGESTIONS FOR FUTURE RESEARCH

Limitations are evident in the exclusive focus of the study on four platforms of social media. Also, the four observed platforms represent three different types of social media. Facebook is a social network, YouTube is a content sharing site, while Booking.com and TripAdvisor are review sites which further complicates their comparison and inference. In addition, Facebook and YouTube are the sites where tourism and travel-related topics are just one small piece of content amongst the amount of other content, while the TripAdvisor and Booking.com have an exclusive focus on tourism and travel. Lack of research is also the type of sample used (nonprobability sample).

In addition to observing the importance of UGC and FGC published on some social media platforms, future research should also focus on content types published on platforms, and conduct sentiment content analysis (text, images, and videos) or with SAS Enterprise Text Miner programme try to predict the future behavior of tourists based on the integration of text, ie. the words and their meaning when selecting destinations. However, not only in Croatia, but also in the world of social media research in tourism, researchers are still faced with very much unexplored space for further research not only in the context of consumer behavior on the tourist market and choice of tourist destinations, but also in the context of business and marketing communications of tourist destinations on social media.

Abstract

This study presents a new conceptual framework for digital marketing planning in real estate agencies. Earlier research (Mahmutović, 2018) suggests that more than half of 311 surveyed real estate agencies in Europe are doing business without formal marketing and digital marketing plans. These agencies achieve poorer business results compared to those who plan. They lack the capacity to adapt themselves to the new business ecosystem and to fully exploit the possibilities of digital technology to enhance their marketing activities, and their business performance. For small businesses with a limited number of employees and modest knowledge in the field of digital marketing planning, it becomes difficult to implement marketing theory in practice. They are lost in the abundance of opportunities offered by new technologies and most often, they

exploit a very small number of these possibilities. This is especially expressed in the context of situation analysis and analytical tracking of the achievement of the set goals, i.e. the measurability of the results as one of the great advantages of Internet technologies. The existing planning frameworks relate mainly to the general marketing planning process, and most new ideas in the field of digital marketing planning came from practitioners and companies specializing in digital marketing services. The idea of this paper is to fill this gap and using existing academic and practical knowledge to develop a new integrated framework for digital marketing planning in real estate agencies, including the proposal of a framework for the development of Key Performance Indicators (KPIs) in real estate agencies.

Keywords: digital marketing, e-marketing, marketing planning, real estate, key performance indicators

JEL Classification: M31, R39

1. INTRODUCTION

Today companies are competing in a dynamic, unstable and high-risk environment. With the development of the Internet and other digital technologies, for companies, it is increasingly challenging to identify competitors and monitor customer behavior (Fotiadis & Stylos, 2017). Many fail because they lack the capability to adapt themselves to the new business ecosystem. Many small and medium-sized firms, including real estate agencies, are doing business without formal plans. Earlier research shows that 58% of real estate agencies in Western Balkan countries and EU countries do not have marketing and digital marketing plan (Mahmutović, 2018). A marketing plan can be defined as the procedure, set of logical steps that one company follows, to achieve detailed goals or objectives it sets in narrow timeframe with limited resources. Some managers think that planning is only needed for large companies, some think that they are doing well even without formal planning, while some think the business environment is changing too fast, which prevents the use of plans. Kotler et al. (2005) emphasize that formal planning brings benefits to all types of companies, small and large, new and mature. Failure in planning means planning of failure. Planning encourages systematic thinking. It encourages the company to define clearly its goals and policies, influences the company's efforts to coordinate better and highlights clear standards of performance for control. In the last five

decades, there have been a large number of research studies into the relationship between planning and organizational effectiveness, and positive impact of planning on firm's growth and development (Ansoff, 1969; Unni, 1981; Bracker et al., 1988; McDonald, 1989; Fletcher and Hart, 1989; McColl-Kennedy et al., 1990; Piercy, 1991; Weinrauch et al., 1991; Mahmutović, 2018).

McDonald (1989, 1992) suggested that strategic marketing planning is an approach to business that can enable even the smallest competitors to survive successfully. Reviewing the findings of other authors who have criticized the marketing planning process, McDonald (1989) summarized difficulties in marketing planning. He defined ten barriers:

1. Confusion between marketing strategy and tactics.
2. Isolation of marketing function from business operations.
3. Confusion between marketing function and marketing concept.
4. Prevailing organizational structures along functional lines.
5. Lack of skills in in-depth analysis.
6. Confusion between process and output.
7. Lack of core marketing management knowledge and skills.
8. Lack of disciplined, systematic approach to marketing planning.
9. Need to prioritize objectives.
10. Need for a more appropriate marketing culture.

We think that even today, any marketing planning framework should try to close the theory/practice gap in respect to these marketing planning barriers.

Most of the existing literature deals with the general marketing planning process and its impact on business performance, and a very small number of academic authors devoted themselves specifically to the planning of digital marketing. Most new ideas in the field of digital marketing planning came from practitioners and companies specializing in digital marketing services. According to the author's knowledge, no one has yet offered a specific framework for digital marketing planning in real estate agencies, and the main purpose of this work is to fill that gap.

Brooksbank (1996, 1999) explained the basic marketing process and offered a practical framework for the smaller business. His planning framework is underpinned with three fundamental principles: adopt a marketing orientation, employ a comprehensive planning approach, and "keep on" marketing planning. His framework starts with business-customizing phase and goes through four

main phases: analyzing, strategizing, implementing and controlling. In his earlier work Brooksbank (1991) pointed out that for maximum effectiveness, a marketing plan should aim to conform to each of the seven characteristics he identified as essential characteristics of successful companies: strong top management support, compiled by staff and not for staff, thoroughly researched, external competitive focus, proactive/visionary, personalized/specific and continually reviewed.

Similarly, Paul Smith (2011) introduced one of the most known marketing planning frameworks called SOSTAC. It comprises six stages: situation analysis, objectives, strategy, tactics, actions, and control. Model is easy to learn and understand, and it is very suitable for digital marketing, which led us to use it as a ground for our framework development.

The long-term digital marketing plan should put a special emphasis on three key areas. First, identify significant changes and trends in the macro environment and changes of the competitive forces in the microenvironment. Second, develop and communicate the value proposition for customers who use online services in the buying process. Third, define the necessary technological infrastructure and database architecture, essential to provide value to customers. New technologies like CRM systems, as well as integrated databases that allow personalized communication sometimes require up to several years to develop and deploy, so they should be part of the long-term plan.

The annual plan is a short-term plan that describes the current situation of the company, its goals, strategy, action programs, budget, and control. Short-term operational digital marketing plans deal with the use of communication techniques and channels to attract new customers and clients (such as search marketing and online advertising) and their retention and engagement (incentive programs, customer contact strategies through opt-in e-mail marketing integrated with traditional media such as phone and direct mail).

The process of creating a digital marketing strategy and digital marketing plan is no different than creating other marketing plans. We can even say that it is quite strange that today companies make separate plans for “digital” and “offline” because customers do not look so separate on the company business.

Companies that do not have a clearly defined digital marketing strategy and digital marketing plan face different problems:

- ✦ They do not know where they are going and what they want to achieve;
- ✦ They do not know their market share;
- ✦ They do not have a clearly defined value proposition that should help them to position better;
- ✦ They do not know their customers/clients;
- ✦ Their digital marketing activities are not integrated with other channels;
- ✦ They do not optimize their digital marketing activities.

2. DEVELOPMENT OF DIGITAL MARKETING PLANNING FRAMEWORK FOR REAL ESTATE AGENCIES – NEW INTEGRAL APPROACH

In order to develop a new integrated framework for digital marketing planning in real estate agencies, we used elements of three models: the SOSTAC™ planning framework, the RACE framework (based on the REAN framework) and the model of the five-phase purchasing decision-making process.

SOSTAC™ is already a well-known general framework for the development of various types of plans (corporate, marketing, advertising plans, etc.). Paul Smith (Smith, 1999) has developed it, and it includes six stages in the planning process: situational analysis, goal setting, defining strategy, determining tactics and activities and defining a control system.

The model of the purchasing decision-making process (Kotler, 2000) suggests that the customer passes through the five levels in making a decision: problem identification, searching for information, developing alternative solutions (buying decisions), buying and post-buying behavior. If we omit the first phase, we can say that the potential buyer of real estate go through the remaining four phases, which are an integral part of our framework, and each phase corresponds to one of the stages of the RACE model. In the proposed framework, for each stage in the decision-making process, appropriate digital channels and activities (tactics) are proposed as well as key performance indicators.

RACE is a practical framework developed by company Smart Insight, based on the REAN model developed by company Quru Analytics, which helps to manage and improve the results of digital marketing. It consists of four steps, i.e. online marketing activities designed to help the company and its brand to

engage its customers throughout the customer lifetime. The acronym “RAC” (reach, activate, convert) deals with the questions of how to attract and reach customers/clients and encourage them to engage in activities that will lead to the desired conversion. “E” (engage) deals with the question of how to encourage a satisfied client to become a „lawyer/advocate“, who will continue to use the services of the agency, but also positively promote and advocate it to other customers.

The first step in the RACE model for agency is to “reach” potential clients and buyers, which involves building brand recognition, i.e. promotion of agency and its services on other websites and online media, in order to attract visitors to the agency’s website, social media page or micro website on other web services such as online classifieds platforms. In our planning framework, we recommend six digital channels for attracting visitors (potential customers and clients): search marketing, marketing on social networks, online PR, online partnerships, opt-in email, and interactive advertising.

The second step is to “activate” (InterAct) visitor, which involves interacting with the visitor and encouraging him to continue his customer journey after he reached the agency’s website, mobile application or another digital channel.

For example, the activity can be registration on the agency’s website, signing up for a newsletter, asking for more information about services and buying/selling process, searching a real estate database offered by the agency, or registering interest in selling or renting a property through the agency.

Accordingly, the goals that the agency can define in this step can be a specific number of registered potential buyers or sellers, the number of the newsletter sign-ups, the number of ad views, and so on. Interaction can also include sharing content on social networks, like recommending content to friends or writing reviews. The fact is that many companies have a bounce rate of more than 50%, so encouraging visitors to interact with site content is one of the major challenges for each agency.

The third step is “convert”, which involves converting visits (visitors) into sales leads (potential customers and clients) and sales (customers and clients). Since the real estate agency communicates with two key stakeholders, potential buyers of real estate and potential clients (sellers and renters who could hire an agency), the sales lead refers to inquiries for the purchase of specific real estate and inquiries for agency services. In the second step, the agency seeks to convert

the sales lead into the conclusion of a contract, which is usually preceded by the conversion of the sales lead into scheduling a client's visit to the agency.

The fourth step is „engage“, which involves building a long-term relationship with the client/buyer, through multiple agencies and client interactions using various paid, owned and earned media touch points such as website, social networks, e-mail or direct interactions. Engagement can be measured by measuring repeat activities such as sharing content from an agency's website by users on social networks. In addition, the agency should measure the percentage of active (registered) users, the activity of newsletter subscribers, as well as to measure client satisfaction and, if possible, the number of recommendations they have published.

The essence of the new integral framework for planning digital marketing activities in real estate agencies is to apply the stages of the RACE model within certain phases of the SOSTAC framework and within certain stages of the purchasing decision-making process. This integral approach will enable the company to re-examine the opportunities for engaging customers/clients and selling to them at different touch points in which the company contacts customers, whether it's web, mobile, e-mail or online social channels.

In the following table, we propose an integral framework for digital marketing planning in real estate agencies.

Table 1 – An Integral Framework for Digital Marketing Planning in Real Estate Agencies

<p>PHASE</p> <p><i>Situation Analysis</i> Where are we currently?</p>	<p>Activity in the planning process</p> <p>SITUATION ANALYSIS How well does the agency currently use digital media?</p> <ol style="list-style-type: none"> PEST analysis (analysis of the political, economic, social and technological environment that shapes real estate market) Analysis of the website visitors and customers/clients (Who are they? How many of them? Which channels they prefer? What are they searching online?) Benchmarking Competition (Who are competitors? How they act online? What is their OVP? The new types of competitors - FSBO Portals?) Analysis of the online partners (Who are existing and who are potential partners: mediators and syndication partners such as classifieds sites and property search engines; affiliate partners; link partners; advertising partners). How valuable are partners? How to better manage relationships with partners?) A SWOT analysis (What are our online strengths and weaknesses, opportunities and threats? To what extent do we use ICT technologies? Do we also have a database of users/customers/ clients? Does our database enable personalized communication? Are we properly linking online with offline activities? Do our e-mail and online advertising campaigns achieve the desired results? Who are our referrals and what is their quality? What are the experiences with mobile marketing? What is the quality of our website?) Analysis of web site (Is the web site user-oriented? Is it optimized for search engines? Is it customized for different devices?) 																
<p><i>Objectives</i> Where do we want to arrive?</p>	<p>DEFINING THE OBJECTIVES: What goals do we want to achieve and what Key Performance Indicators (KIP) should we use?</p> <ol style="list-style-type: none"> Vision and mission (How will digital channels help customers/clients? What value will we provide online? What benefits will the agency have from digital marketing activities in terms of efficiency and profitability?) Defining goals ("5S" Goals: Sales goals; Enhancing the service through extra benefits for customers/clients from online activity; Communication goals; Saving (costs) goals through the web publishing, process automation, self-service, fewer communication costs; Sizzle - Extending brand online) Defining Key Performance Indicators (KIP) (Google Analytics) 																
<p><i>Strategy</i> How to get there?</p>	<p>STRATEGY: How can we achieve our goals?</p> <ol style="list-style-type: none"> Segmentation and selection of target markets Positioning and defining Online Value Provision (OVP) Defining the engagement strategy and content strategy Integrated communication strategy

3. DIGITAL MARKETING METRICS IN REAL ESTATE AGENCY – FROM OBJECTIVES TO KEY PERFORMANCE INDICATORS

Real estate agencies should develop a performance management system to be able to adequately monitor and measure key performance indicators in order to control the achievement of the set goals and take timely corrective measures. In other words, in order to answer the question „whether we achieve the set goals“, the real estate agency must define key performance indicators that will be regularly monitored and measured to know „what is happening“, use them to diagnose “why something is happening” and “what needs to be changed”, i.e. which corrective actions need to be taken.

Before we propose a framework for the development of key performance indicators (KPI) for real estate agencies, we will briefly summarize the basic objectives that digital marketing can achieve in real estate agencies, which are the foundation for the development of a KPI. The “5S” model, developed by Chaffey and Smith (2008), suggests that real estate agencies should develop their digital marketing objectives in five areas:

1. Sell - grow sales (improve the sale of real estate and sale of brokerage services);
2. Serve - add value (improve serving customers/clients);
3. Speak - get closer to customers/clients through dialogue and participation (improve communication);
4. Save - save costs;
5. Sizzle - branding.

Each of the defined objectives should be specific, measurable, attainable, realistic and clearly timed.

Regarding the sales objectives, the real estate agent needs to set clear targets regarding the desired effect of digital marketing activities on real estate sales, as well on the number of brokerage contracts signed with new clients. In both cases, we are talking about the indirect contribution of online activity to total sales revenue, and to a number of signed contracts. These general objectives need to be broken down into sub-objectives called key performance indicators (KPIs). KPIs contribute to the achievement of the set objectives, and we can track and measure them (KPIs) using online analytical tools like Google Analytics.

In the area of serving potential buyers and clients, the agency needs to identify clear objectives for improving its service through online channels. Service enhancement can be achieved in two ways. The first way is by providing additional benefits to customers and clients, through the innovative service upgrade (e.g. providing better information, personalization, and new online services). The second way is by using online channels to listen to customers and clients and gain ideas for enhancing existing services and marketing initiatives.

In the field of communication, the main objective of the agency is to achieve two-way communication with the aim of getting closer to potential buyers and clients, understanding of their needs and requirements and building trust with them. Beside of classic marketing communication goals such as informing, persuading and reminding, a particularly important goal of bidirectional communication is the “listening” to the customers/clients. This can be achieved by tracking their communications in an online environment or by conducting online surveys, all with the goal of learning about their interests, needs, demands, and online habits. The ability to better target customers and clients by using different types of online targeting (geographic, psychographic, behavioral, contextually), as well as the ability to track the results of marketing communication campaigns in real-time, provide the ability to continuously optimize promotional slogans and other campaign parameters in order to achieve optimal results.

In the area of cost savings, the agency needs to define the areas in which it wants to make savings by using the online channels. Savings related to staff costs, printing costs, postal costs and communication costs. Innovations and the implementation of new online services, such as virtual panoramas, video presentations, detailed photo galleries, Google maps showing infrastructural objects in the environment, enable potential property buyers to make quality “virtual inspection” of specific properties from the comfort of their home, 24 hours per day. This reduces the number of field trips, transportation costs, and labor costs.

In addition to reducing the costs of “agents”, savings can be achieved with administrative staff responsible for placing ads on different online property portals. Thanks to online data exchange capabilities using technologies such as XML and RSS, manual ad insertion can be replaced with automated synchronization of agency database to a larger number of property portals and clas-

sifieds, which enables significant time and money savings, increase data quality and reduce errors of manual data entry.

Regarding the branding goals, the agency should define clear objectives related to the performance of its own brands such as reach, brand recognition, and brand appeal. Pavlek (2008) points out that branding as a process starts from creating an identity, the diversity that consumer will experience through the signals, accept as value, and create their own preferences. By providing new and different experiences in an online environment, the agency can achieve recognition, create interest and excitement of online users, enhance the online value proposition, and make it's brand recognizable ("hot brand").

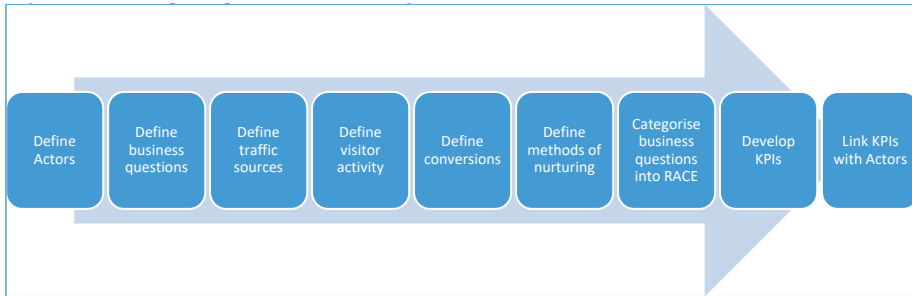

Each of the projected digital marketing objectives of a real estate agent needs to be more thoroughly elaborated on sub-objectives or key performance indicators (KPIs) that can be adequately measured by analytical tools.

4. PROPOSAL OF FRAMEWORK FOR THE DEVELOPMENT OF KEY PERFORMANCE INDICATORS (KPIs)

Web Analytics Association (2007) defines three types of web analytical measures: numbers, ratios, and KPIs (key performance indicators). Numbers are the most basic units of measure, such as the number of visits made to a particular web site, or the number of unique visitors to a particular web site within a given time period. Ratios represent the relationship between two numeric values, e.g. the number of web pages viewed per one visit. KPIs can be expressed in the form of a number, but more often, they are expressed in terms of the ratio. KPIs are based on business strategy and business goals. That is why this type of measure contains the term "key", and the list of appropriate KPIs depends on the type of business and the type of website.

Using the original Jackson S. (2009) 9-step model for key performance indicators development, based on the REAN model, to highlight the process of developing key performance indicators, we propose a new framework based on the RACE model.

Image 1 – KPI development process in real estate agencies based on the RACE model

Source: author

The first step in developing KPIs is defining “actors”. Actors can be divided into two groups: *technical personnel* related to web analytics system and *marketing staff* including company owners. In technical staff related to the web analytics system, we can include interest groups such as web administrators, SEO specialists, and web analytics, while marketing staffs can include marketing managers, ad campaign managers, and online editors. All of them are in charge of undertaking certain activities or corrective measures, based on the data obtained by KPIs measurement.

If the agency does not have enough resources to hire a web analyst, it should consider outsourcing, because KPIs design process requires at least one person, which will be in charge of the technical part of collecting, validating, formatting data and designing metrics based on the capacity of web analytics tools.

After establishing the “actors”, it is necessary to define business questions that the actors want to get the answer through key performance indicators. This process should take place through a workshop where the moderator will ask the actors on which business questions they would like to get the answer, and what they would like to know about the traffic on the agency site, and why they would like to know it. A quality workshop should result in 20-40 business questions.

The next step is to define traffic sources, that is, those online and offline channels through which the agency attracts potential buyers and clients on its web site. These sources can be search engines, specialized property search engines, social networks, classifieds, blogs, newspaper ads, paid online ads etc. In short, the goal of this step is to identify three to five most important traffic sources that send visitors to the agency web site.

The fourth step is to define the activity of a visitor. In this step, the agency needs to define “active” behavior in the context of the activity or process that a

visitor should perform on the web site to be considered as sufficiently active, i.e. engaged. This can be particularly interesting in order to answer the question of which sources of traffic to the web site bring “active/engaged” visitors, as the answer will enable the agency to evaluate the effectiveness of individual channels. For the agency, a visitor who stays on the site for more than ten minutes and reviews the twenty properties, which clearly shows his interest in the real estate, is more important and valuable than the one who leaves the site after only one page has been viewed.

As an example of the definition of engagement real estate agency can define three categories:

- + Lightly engaged visit: minimum of four viewed pages, lasting at least 60 seconds.
- + Engaged visit: minimum of eight viewed pages, lasting at least 150 seconds.
- + Highly engaged visits: minimum of 10 viewed pages of at least 240 seconds.

Defining activities should be carried out carefully, starting with the analyze of processes that exist on the agency’s web site, such as: analyzing the time required to fill in a registration form or newsletter application, filling out a real estate search form, filling in a real estate request form. Then, the agency should perform analyzing of statistical data about average retention on specific web pages and identification of the most important web pages.

The next step is to define conversions. The goal is to define the most important conversions according to the perception of actors. Example of conversion can be converting received “e-mail lead” to scheduling a meeting with a potential buyer and showing him a real estate, or scheduling a meeting with a potential client (property owner) and concluding a brokerage contract with him.

The sixth step in the process is defining the method of nurturing, retaining the engagement of users. Engagement starts after the user is activated, or after he performed a certain conversion. For example, it can be a user who has registered to receive agency newsletters or e-mail notifications with the latest offers, so the agency is now sending him a newsletter periodically, and the engagement can be rated by the number of reading newsletters or by the number of repeated visits.

The next step is to categorize questions into four categories of the RACE model. Examples of questions are presented in the following table.

Table 2 – Examples of business questions for defining KPIs in real estate agencies

No	Question	RACE phase
1.	What is the best channel to reach the user in terms of the number of visitors to the agency website?	Reach
2.	Where (how) can we attract more visitors to the website?	Reach
3.	How can we activate visitors of our web site?	Activate
4.	How can we keep visitors longer on our web site?	Activate
5.	How to encourage visitors to register on the web site?	Activate, Convert
6.	How to encourage visitors to sign up for the newsletter?	Activate, Convert
7.	How important are search engines in generating traffic to our blog?	Reach
8.	How important are search engines in generating visits to our ads?	Reach
9.	How can we better track and measure our promotional activities?	Reach
10.	How to encourage visitors to submit a query for a particular property?	Convert
11.	How to encourage visitors to submit a request for mediation in the sale of their property?	Convert
12.	How well does web site navigation work?	Activate
13.	How successful are our display ads?	Reach
14.	How do visitors search for our real estate offer?	Activate
15.	How effective are different ad headlines?	Activate
16.	How can we track the user's route from the moment of click on the display ad to the moment of conversion?	Activate Convert
17.	How many inquiries have we received from users who have heard a radio commercial for our site?	Reach Convert
18.	How many inquiries have we received thanks to specific classifieds site?	Reach Convert
19.	Which topics in our blog or facebook page are most read?	Reach Engage
20.	Which blog topics are most shared on social networks?	Engage
21.	Which parts of the web site have the greatest potential to exploit social networks in terms of activation?	Activate
22.	How do visitors use mobile devices to access our site?	Reach
23.	How can we increase customer loyalty?	Engage
24.	When and how often do we need to change content on the homepage?	Activate Engage
25.	How does a visitor spend time on our web site, what does he do?	Activate Convert Engage
26.	How many visitors did not complete the registration process (on a newsletter, or registering a user account, or sending a query to the agency)?	Activate Convert
27.	How do we track the lead generating process?	Activate Convert

28.	Does the quality and number of photos in ads affect the number of visits to certain properties?	Activate
29.	To what extent can we use internal display ads to promote services on your site without being too intrusive for visitors?	Activate
30.	Would the use of virtual panoramas increase the number of queries for a particular property enough to justify the cost of a new service?	Activate Convert

Source: author

Once the questions for each of the RACE model stages have been defined and the matrix with the set of questions for each of the RACE phases is created, the process continues with creating key performance indicators. This process can be presented in a few steps:

1. Determine which values (numbers) or ratios are needed to answer the question.
2. Identify reporting requirements.
3. Establish a benchmark.

The basic measures necessary to answer most of the questions are the number of unique visitors, the number of visits and the number of pages viewed. Depending on the analytical tools available to the agency, it is possible to develop a large number of measures that can help answer the questions asked.

How fast and how frequently actors (managers, online editors, etc.) can take corrective measures based on KPIs results is one of the questions that need to be asked before reporting.

Benchmark is the reference value with which the measured KPIs will be compared, in order to diagnose the condition or determine the positive or negative deviation of the measured KPIs in relation to the desired values. The best reference values are own data, i.e. monitoring and comparing KPIs over several periods. One of the options available to agencies is the standard deviation as a measure of statistical dispersion. By using standard deviation, it is possible to diagnose situations in which data significantly deviate from average.

The last stage in the process of developing KPIs is linking KPIs with actors, or persons in charge of carrying out certain activities. It makes no sense to develop KPIs unless appropriate activities are undertaken, based on the measured KPIs. An example of a KPI such as “cost per acquisition – CPA” (e.g. price per one registered user) can show how to link KPI with the actor. The web analyst measured the CPA for two different channels, such as contextual advertising on Google, and advertising with display ads on web portals. The marketing man-

ager analyzes the results and finds that the cost per acquisition using contextual advertising is 2 Euros, while the cost per acquisition through the display ads is 5 Euros. Based on these results, the marketing manager gives an order to the advertising agency to stop spending money on display ads and redirect the budget to contextual advertising. In the following table, we present a few examples of KPIs to measure the performance of digital marketing in real estate agency.

Table 3 – Examples of KPIs to measure the performance of digital marketing in real estate agency

KPI name	How to calculate	Description	RACE phase	Actions
Visitors per channel ratio (VPCR)	A number of visitors who have come through the specific channel divided by the total number of visitors.	It shows the best source of traffic to the web site in terms of the number of visitors. Helps in answering questions 1, 7, 8 and 13.	Reach	Manage promotional campaigns to focus on channels that provide more visits. Use in combination with engagement index and cost per visit to determine the source of traffic with the highest ROI.
Cost per visit per channel (CPVPC)	The total cost of the channel divided by the total number of visits through the channel.	It shows the best sources of traffic to the website in terms of costs. Helps answer the questions: 1 and 2.	Reach	Manage promotional campaigns to focus on the most favorable channels that provide traffic. Use in combination with the ratio of the number of visitors per channel to determine the source of traffic with the highest ROI.
Cost per active visit per channel (CPAVPC)	Total channel costs are divided by the total number of active visits through the channel.	Shows the best sources of traffic in terms of the cost ratio for an active (engaging) visit. Helps answer questions 2 and 4.	Reach	Manage promotional campaigns to focus on the most cost-effective source of active visits. Discard the costly campaigns that lead to inactive visits.
Visits to the specific content through the channel ratio (VSCPC)	A number of visits to content category per channel divided by the total number of visits to that category of content.	It shows the best sources of traffic in terms of consuming a particular category of content. Helps answer questions 2 and 3.	Reach	Manage promotional campaigns aimed at focusing on sources of more visits to a specific category of web site content.
Link click-through rate (LCTR)	The total number of clicks on a link divided by the number of page views (the page where the link is placed)	Indicates link performance on the page. Helps answer questions 12, 16, 25.	Activate	Optimize the link text and position if the percentage is too low.

Bounce rate per page (BRPP)	A number of single interaction visits to a page divided by total number of visits to a page.	Shows the performance of each page in relation to others, based on visitors who have not taken any action. Helps answer questions 12, 14, 15, and 24.	Activate	Optimize traffic sources to be more relevant to the content of a given page, optimize keywords and headlines, and increase the number of relevant links on the page.
The rate of abandonment of the registration process (ARRP)	The number of successful registrations divided by total number of visits to the registration page	It shows the performance of the registration process. Helps answer the questions: 3, 5, 6, 10, 11 and 26.	Activate	Optimize the registration process, observe it as a tunnel, and eliminate all the defects that lead to the abandonment of the registration process.
The index of the time spent on the page (PTI)	Total time spent on the page divided by the total number of visits to the page.	Shows the most popular pages in terms of retention on the page and helps answer the question 24.	Activate	If a visitor does not keep enough time on the web page, it needs optimization in terms of better title, clearer text, and reorganization of the content.
Visitor engagement index (VEI)	The number of active visits divided by the total number of visits.	The activity index is used to determine which type of visit is most active from the perspective of activation and reach of visitors. Help give answers to questions 4, 23, 24, 27 and 29.	Activate	The least active visits should be encouraged by using effective links and quality content, in order to encourage more readings, more clicks, downloads, and more.
Click-through rate on internal display ads (IBCTR)	The number of clicks on the internal banner divided by the number of pages on which the banner is located.	It shows the most effective and least effective internal display ads. Helps give answers to questions: 24, 27, and 29.	Activate	Internal display ads (banners) with the worst results should be optimized in terms of content and better positioning.
Content Consumption Index (CCI)	Number of page views in a particular category divided by the total number of page views	Indicates the most interesting content on the web site. Helps give answers to questions: 14, 21, and 24.	Activate	It helps to decide which content should be improved, or even to make decisions about the rejection of a particular category of content.
Conversion Rate (CR)	The number of confirmed conversions divided by the total number of visits.	It shows the number of visits that resulted in the desired action (conversion). Helps to provide answers to questions: 5, 6, 10, 11, 17, 18, and 27.	Convert	Helps identify traffic sources that provide the highest conversion rates.
Cost per Conversion - Action (CPA)	The total cost of the channel divided by the number of conversions through the channel.	It shows which traffic sources are the most cost-effective in the context of conversions. Helps to provide answers to questions: 5, 6, 10, 11, 17, and 18.	Convert	It should be comparable across channels, along with monitoring the cost per engaged visit. Activities relate to streaming budget to those sources that provide the most active visits and conversions.
E-mail Opening Rate (EOR)	The total number of opened e-mail messages divided by a total number of sent email messages.	It shows how many subscribers to the newsletter are active and read e-mails. Helps to answer question 9.	Activate Engage	Indicates an eventual need to optimize newsletter messages (titles, content, formats, e-mail database, etc.).

Email Link Click Through Rate (ELCTR)	The number of clicks on a link within an email message divided by the total number of opened e-mail messages.	Indicates how effective links are within the newsletter e-mail. Helps to answer question 9.	Activate Engage	Indicates the need to optimize the offer (calls to action, banner design) or better personalization of the content.
Return Visit Index (RVI)	The number of repeat visitors is divided by the total number of visitors	It shows how many visitors return to the web site in a given time period. Help give answers to questions 23 and 29.	Engage	Improve the initiatives that attract the visitor to visit the web site again, such as adding new content.

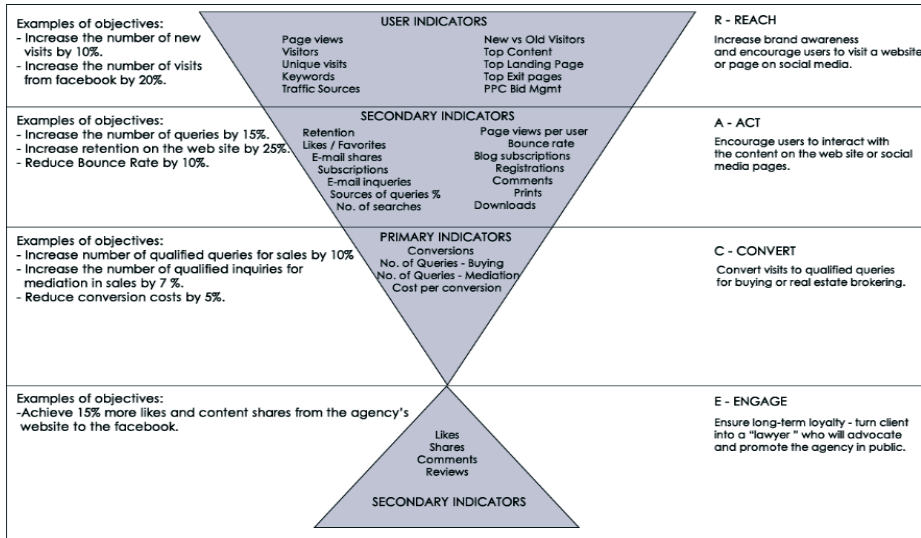

Source: author

For easy visualization of the links between the objectives and key performance indicators, we propose a new visual model of defining goals and indicators for each phase of the RACE model. The idea for the model came from a pyramidal approach to the goals developed by Joe Pulizzi¹.

Objectives and indicators are presented in the form of a reverse pyramid, which represents a sales tunnel through which customers/clients pass through the process of purchase, that is, until the moment when the agency will achieve the desired conversion (e.g. qualified query, contract conclusion, etc.). The pyramid consists of three parts: primary objectives, secondary objectives, and user objectives.

¹ <https://contentmarketinginstitute.com/2013/06/measuring-impact-content-marketing-strategy-pyramid-approach/> (5.11.2018.)

Image 2 – A visual model for defining goals and indicators of digital marketing in real estate agencies

Source: author

Objectives related to primary indicators are those goals, which are most interested in agency owners or managers: sales, number of concluded mediation contracts, cost savings. Therefore, these are goals related to achieving desired conversions, such as the conversion of a visitor into a potential buyer through the receipt of a “qualified query”, or the conversion of a visitor into a potential client through the receipt of inquiries for mediation in the sales process. The objectives associated with secondary indicators help achieve the primary objectives. For example, the number of qualified sales inquiries depends on the total number of queries and the quality of the received queries. A more engaged web site user represents a more specific potential customer/buyer. Ability to analyze the quality of visitors that come from the specific online source (channel), enables managers to make better decisions about budget allocation for online advertising.

Objectives related to the user indicators are those on which online content creators often rely on to help achieve secondary objectives, including site visits, a number of web site reviews, ranking on search engines, and so on.

5. CONCLUSION AND RECOMMENDATION FOR FUTURE RESEARCH

Planning helps real estate agencies to better adapt to the new “digital” market environment and to take full advantage of the opportunities of digital technologies to improve their marketing activities and business performance. In this paper, the author uses an analytical approach, combines three existing models, and develops a new integrated framework for digital marketing planning in real estate agencies. The framework helps real estate agencies develop a digital marketing strategy and plan digital marketing activities with a holistic approach. The big picture includes a strategic approach that also elaborates on specific digital marketing activities for customer engagement during customer lifetime. The framework is built on a theoretical basis, but also includes the good practice of digital marketing that the author has gained through many years of work in the industry. In the second part of the paper, a framework for the development of key performance indicators (KPIs) in real estate agencies has been proposed. It will help real estate agencies to adequately monitor and measure KPIs in order to control the achievement of the set goals and take timely corrective measures. Converting goals into KPIs, which can be further measured by free analytical tools like Google Analytics, will greatly help agencies to more clearly define the purpose of the website and the goals they want to achieve, and to use that knowledge already in the web site development phase. The development of KPIs will encourage real estate agencies to discover new advanced features of analytic services, such as custom dimensions within the Google analytics service. Custom dimensions allow the agency to connect data (on real estate, customers/clients) from its own CRM system to the data collected by Google Analytics, which provides new, highly valuable market information that agencies can use to adapt to the market or to improve their marketing approach to business. This leads to a better marketing orientation of the agency, which, according to previous research, leads to the improved business performance of the company. Developing a framework for the identification of the essential custom dimensions and their use for obtaining answers to important business questions can be the basis for future work. In addition, testing the framework within small businesses in similar industries is a new challenge for researchers. The proposed integrated digital marketing planning framework should also help ease syllabus planning in the field of digital marketing and entrepreneurial marketing at

higher education institutions. It can also serve as a basis for courses and training within the professional associations of real estate brokers.

Abstract

The purpose of this paper is to evaluate user satisfaction in the hospitality industry with existing software that helps to synchronize hotel Property Management Systems with booking platforms that they use. The aim of the research is to answer the question to what extent the hoteliers use the ICT tools offered on the hospitality market and how satisfied they are with their performance. This paper gives an overview of hotel ICT solutions such as Property Management Software, Online Reservation System, Central Reservation System, Mobile Versions of Booking System, Channel Management Software, Business Intelligence Software, Revenue Management Software, and Yield Software. In addition to the work organization within the online sales segment and/or revenue management department, the purpose is to see to what extent the dynamic parameters of the work process are synchronized in real time. The research was conducted on a sample of the 11 hotel chains in Croatia (130 ho-

tels). Descriptive statistics were used in the analysis of the results. Satisfaction with some ICT tools clearly indicates that respondents are most satisfied with the online reservation system, and at least satisfied with the Yield software. The scientific contribution of this work is reflected in the research of the most actual hospitality topic, which is the rate and inventory placement on online sales channels through the use of hotel software tools, which is a recommendation for further scientific research that gives important implications for theory and practice. Although research has been carried out in detail, limitations of the conducted research may be reflected in the fact that research was carried out at hotel chains in Croatia and therefore research has a spatial limitation since it is carried out solely on the example of one state, i.e. there is no comparison with other, similar or different destinations in the world.

Keywords: Hotel Software Tools, Property Management Systems, Hotel Revenue Management, Reservation Synchronization Processes, Online Distribution Channels

JEL Classification: L83, Z30

1. INTRODUCTION

The tourism industry has been radically transformed by Internet-related technologies (Zhang et al., 2017). ICTs provide a powerful tool that can bring advantages in promoting and strengthening the tourism industry's strategy and operations (Ayanfulu & Yekini, 2016). With the increasing demand for intensive information from customers and hotel managers, hotels have adopted computer-based IT facilities to improve operational efficiency, reduce costs, and enhance service quality (Law & Jogaratnam 2005, Buhalis & Law 2008, Law et al. 2013,). With the use of IT in their businesses, hotel managers expect that their profit margins and financial returns will increase. Improving productivity is the primary role of information technology (IT) in the lodging industry, while information resources have long played a crucial role in conducting successful lodging operations (Ham et al., 2005). According to Filieri & McLeay (2013), tourism and hospitality managers are realizing that managing online intermediaries may provide them with benefits over their competitors. Hospitality and tourism managers have been and will continue enhancing their competitive advantages by focusing their resources on the virtual business environment to capture the lucrative online business (Anuar et al. 2013, Sigala et al. 2001).

The market offers a number of technology solutions for hotels that can replace the existing reservation process synchronization systems and thus improve the operational and strategic effects of the hotel (Bilgiham et al. 2011, Daghfous & Barkhi 2009). Many studies have focused on the analysis of the application of these solutions by the hotel as well as the advantages that arise from the application of information technology (Winata & Mia 2005, Lam et al. 2007, O'Connor & Murphy 2004, Šerić & Gil Saura 2012, Chathouth & Law 2011, Sigala 2001, Buhalis & Law 2008, Ham et al 2005, Ayanfulu & Yekini 2016, Erdem & Jiang 2016). These surveys identified a large number of IT solutions in the hotel industry.

Furthermore, although research has been carried out from the perspective of hotel managers and their satisfaction with the existing hotel software, the problem of synchronization of reservation processes has not been investigated in detail.

Therefore, the aim of this paper is to explore in detail the application of IT solutions and data management in the hotel context from a manager's perspective and to answer the question to what extent the dynamic parameters of the work process are synchronized in real-time. This paper focuses on the application of IT tools to tourism/hospitality business in Croatia. The research was conducted by Sales Managers, Reservation Department or Revenue Management Department. The authors researched the ways to close sales when capacity was upgraded, how to change rates on OTA portal systems, how to change rates on hotel websites, and how to change the BAR rate on GDS. The purpose is to see in what extent the dynamic parameters of the work process are synchronized in real time.

This paper gives an overview of hotel ICT solutions such as: Property Management Software (PMS), Reservation System on the Web, Central Reservation System (CRM), Mobile Versions of Booking System, Channel Management Software, Business Intelligence (BI) Software, Revenue Management (RM) Software and Yield Software (chapter 2.). The third chapter contains an overview of the research methodology. The research findings are given in the fourth chapter. Finally, the conclusion includes the notes on the role of IT tools in the hotel industry and the level of synchronization of reservation processes using IT tools. There are also some limitations of this research.

2. AN OVERVIEW OF HOTEL ICT SOLUTION

2.1. HOTEL CENTRAL RESERVATIONS SYSTEM

A *Hotel Central Reservations system* or *CRS* is the central hub of hotel group's operations, centralizing the data from all hotel property management systems (PMS), call centers and phone reservation systems (Siteminder, 2019). CRS is a computerized reservation software that maintains a hotel's room availability, rates, guest information, payment processing, and hotel information all in one place. A CRS provides hotel room rates and availability for many different distribution channels such as the Global Distribution System (GDS), Internet Booking Engine (IBE), Online Travel Agency (OTA), 3rd party websites etc. (Xhotels, 2019). Essentially speaking it is an application with various functionalities to manage a hotel's distribution/bookings. Bookings are made via multiple sources (OTA, travel agencies, the IBE on the hotel's own website), and all reservations sources will appear in the system via interfaces. Its main functions are the administration of room allocations (of single properties and hotel chains) as well as control and monitoring of rates and availability in the distribution channels. A CRS is beneficial for a hotel because it allows reservations to be checked and booked with a simple search. It also allows revenue managers or front office managers to easily adjust the prices corresponding to demand multiple distribution channels and platforms at the same time (Toh et al. 2011; Schegg et al. 2013). It is kind of a mission control software for hotel distribution. Popular CRS systems include Travel Tripper (CRS), Travelclick (iHotelier CRS), Windsurfer CRS by SHR, Clock CRS, Vertical Booking CRS, Sabre (Synxis CRS) et al. (HotelTechReport, 2019).

2.2. ONLINE HOTEL RESERVATION SYSTEM

The *Online Hotel Reservation System (OHRS)* is an online web-based system with specified majorities in the field of hotel online reservation system. Online hotel reservations are becoming a very popular method for booking hotel rooms. Travelers can book directly on an individual hotel's website. An increasing number of hotels are building their own websites to allow them to market their hotels directly to consumers. Non-franchise chain hotels require a "booking engine" application to be attached to their website to permit people to book rooms in real time. One advantage of booking with the hotel directly is the use

of the hotel's full cancellation policy as well as not needing a deposit in most situations (Delizo & Esguerra 2013, Bemile et al. 2014). It lets the hotel in charge of over margins and pricing strategy. It enables one to check available inventory and complete an online booking form making the reservation process more efficient and less time-consuming. The clients can settle room rates and special offers at no extra cost (Loon et al. 2018, 14). Hotels have adopted several strategies to direct potential guests to their own websites. They often engage in data mining of their customer profiles, which are collected from their frequent-guest program databases or from information provided by guests upon check-in. Direct mail and magnet emails are sent to their past guests inviting them to return by providing them with bonus frequent-guest program points, or other incentives. Hotels can also lure guests by giving a "best rate guarantee," which promises that they will match lower prices found on OTAs (Toh et al., 2011).

2.3. MOBILE VERSIONS OF BOOKING SYSTEM

In 2016, 2.1 billion people have a smartphone. For many of those people, it's the only way they access and interact with the internet. By 2020, smartphone ownership is estimated to reach an astonishing 2.87 billion people, helping to expand the World Wide Web to more people than ever before. Last year, mobile internet usage surpassed desktop usage. As a result, a large portion of users is now using smartphones to look for a hotel and book travel. Murphy et al. (2016) revealed that the European online travel market is expected to grow more rapidly than the overall traditional travel market that is linked nowadays to a larger number of bookings being arranged on mobile devices. The hospitality industry has taken opportunities by launching Mobile Hotel Reservation Services that enable customers to access their favorable hotels with only a single click of a button (Wang & Wang 2010, Law et al. 2014). *Mobile booking systems* are, at their very basic, a mobile-friendly version of an online booking system. With mobile booking software embedded in the hotel website, a potential customer can arrive on hotel website via their mobile, discover your service and book directly from their smartphone or tablet (BookingLive, 2019). If the hotel wants to compete for mobile bookings, the hotel needs a mobile-friendly website to drive more mobile bookings. Mobile websites come in two different formats: Responsive and Optimized. A responsive website responds to the device that is being used to view it. It's the same website as the desktop one, however it loads differently depending on the mobile device. This is a good option if a hotel

wants a hotel website to be consistent across desktop and mobile platforms. If the hotel wants to go one step further, the hotel can think about developing an optimized website: a website completely different from hotel desktop version. It can still contain a lot of the same information but can be customized for mobile visitors giving them an even better user experience (ChardsBeds, 2019).

2.4. PROPERTY MANAGEMENT SYSTEM

Property Management System (PMS) is a local hotel administration system used for reservation, availability and occupancy management, check-in/out, images, guest profiles, report generation etc. PMS is also known as the Hotel Operating System (Hotel OS). PMS is one of the best data management software that helps in recognizing the knowledge of employees and being as source of information in the hotel industry to increase the business and its features helps in managing the property effectively and it can be upgraded according to their guest service with much higher facilities and also have access to all staffs with proper rights in their respective departments (Mohideen Moyeenudin et al. 2018, 327). This application is used in-house (in an individual hotel) to control the onsite property activities. The PMS can be connected with other applications such as the hotel point-of-sale (POS) or the CRS (Krželj-Čolović & Cerović 2013, Dzhandzhugazova et al. 2018). The interface to a CRS is an additional option in order to transfer availability, reservations and guest profile information. Additionally, various interfaces are available to create further links to internal and external systems such as room key systems, restaurant and banquet cash registers, minibar, telephone and call centers, revenue management etc. There are many PMS providers available on the markets today, that provide various software solutions for all sizes of hotels. The Capterra website evaluates 359 such PMS software providers (Capterra, 2019).

2.5. CHANNEL MANAGEMENT SOFTWARE

Channel Management (also Multi-Channel-Management) refers to the techniques and systems used by hotels in line with their distribution policy. This management method includes content management as well as data reconciliation in various distribution channels. Channel Manager for hotels keeps availability and rates always in synchronization on all connected channels and hotel website (Sabee Apps – Cloud Hotel Management, 2019). It means the updat-

ing of the hotel information, of room rates and availabilities across all distribution channels, such as hotels website, third parties (OTAs, IDS, ADS) and the CRS/GDS. Effective channel management solutions should improve efficiency by providing a centralized way to control multiple channels. Using a Channel Manager is a smart way to save time and avoid errors. There is no need to update dozens of extranets manually, as nowadays you can do that just from one system. Channel management software is often used by hospitality business owners and those who oversee and manage room bookings for a hotel or inn. These tools often integrate with hotel reservations software or hotel management software to coordinate bookings with other hotel operations. Channel management software may also work in tandem with various marketing software to increase bookings across channels. Best Channel Management Software is Cloudbeds, Bookwize, eZee Centrix, Phobs, RezGain et al. (G2 Crowd, 2019).

2.6. GLOBAL DISTRIBUTION SYSTEM

Global Distribution System (GDS) is a large computer network and at the same time, a reservation tool that passes hotel inventory and rates to travel agents and allows them to make bookings (Law, R. et al., 2014). The first development with regard to online distribution was initiated by the introduction of GDS, which was an airline computer-reservation system working as technical electronic intermediaries (Buhalis and Licata 2002, Tom Dieck et al. 2018). Independent travel agents, online agents, and travel agencies now use increasingly more sophisticated GDS systems to search for the best available travel and accommodations and rates for their clients. Agents will make airline and hotel reservations (in real time) for clients, and they will complete their research and bookings within minutes (Travel Technology & Solution, 2019). GDS is used by various travel segments and serves many different companies including airlines, ground handlers, hotels, railways, car rental companies, airports, cruise lines, and ferry operators. The property's information (rates, inventory, etc.) are loaded into both the GDS and ODD (Online Distribution Database) which connects hundreds of internet travel portals and OTAs. The benefits of GDS for the hotels are Worldwide exposure of the hotel, B2B and B2C distribution, Targeting all Travel Agencies independently of the GDS (distribution platform they may use), 24/7 travel agent access to hotel inventory, 24/7 travel agent access to a hotel full descriptive and multimedia content. There are three important GDS systems: Travelport (Galileo, Apollo, Worldspan), Amadeus and SABRE.

2.7. BUSINESS INTELLIGENCE SOFTWARE

According to Investopedia, *business intelligence (BI)* is “the procedural and technical infrastructure that collects, stores and analyzes the data produced by a company’s activities. Business intelligence is meant to take in all the data generated by a business and present easy-to-digest performance measures and trends that will inform management decisions.” Essentially, it is the act of making data-driven decisions based on data analysis and data visualization in order to better a business’s strategy and success. BI tools allow managers to make more accurate decisions based on the data analysis to reduce costs, increase profits, and all in all, improve the business. Instead of manually sorting through the data from a hotel’s PMS, POS, revenue management tools, reservation systems, etc., BI tools help speed up the manual work and automate the decision-making efforts that would have taken hoteliers more time and effort to produce (Park, 2018). There are many BI platforms available to the hospitality industry with the objective of assisting hotel with business intelligence decisions, however, they differ by specialization. Some BI tools target independent hotels or enterprise groups, a few tools offer customizable features and niche products, while others are more specialized to certain processes like revenue management or F&B related decisions. According to Capterra, the biggest and most well-known BI tools across industries are Tableau, Qlik, SAP Business Objects, IBM Cognos, and Microsoft Power BI. Within the hotel industry, BI tools are currently mainly used in Revenue Management, but this will eventually grow to hotel operations and more. Hotel Tech Report lists several tools in the Revenue Management category: Juyo Analytics, Hotel IQ, In Touch Data, Hotelistat, Datavision, and SnapShot Analytics (Hotel Tech Report, 2019).

2.8. REVENUE MANAGEMENT SOFTWARE

Revenue management (RM) is traditionally defined as being the art and science of forecasting demand while simultaneously adjusting the price and availability of products to match that particular demand (Queenan et al., 2011). The definition of revenue management has evolved as its application has moved from maximizing yield or average daily rate (ADR) to maximizing revenue – with the current focus on property-wide profits rather than just rooms revenue. In essence, one can now think of RM as managing customer behavior at the individual level via price and availability of constrained resources to maximize

profits (Anderson & Xie 2010, 54). Some of the pioneering organizations of RM in the hotel industry were Marriot, Hilton, Sheraton, Starwood, and InterContinental (Kimes, 2003). In the last decade, the rapid development and integration of technology-based tools, such as social media and mobile-device-based channels, have also influenced the way RM is practiced in the hotel industry (Erdem & Jiang, 2016). The processing of large databases is impossible without appropriate RM software and hotels that employ it gain a strategic advantage over those that rely on intuitive decisions only and have improved financial performance (Ivanov, 2014). RM software usually includes several modules: database module, a demand modeling module, forecasting module and controls and recommendations module (Ivanov, 2014). The popular RM software for the hotel is Xotels, IDeaS, RateGain, sports pilot, Atomize, et al. (Hotel Tech Report, 2019).

2.9 YIELD MANAGEMENT SOFTWARE

The process of effective *yield management* (YM) involves understanding, anticipating and reacting to consumer behavior (to ultimately maximize revenue). By optimizing yield management, an independent hotel or a chain of hotels can adjust its prices, to meet the total demand characteristics of its markets. In the hotel sector, YM generally consists in determining the minimum tariff the hotel can charge for a stay, taking into account the marginal costs resulting from the production of an additional unit. Controlling demand by a differentiated tariff policy is a common practice in the hotel trade. The hotel industry differentiates its tariffs according to the season, the date of payment, the length of stay, and the time of departure. The temporal frame is central to regulating hotel tariffs (Sahut et al, 2016). Today, smart yield managers or yield management teams use specifically developed software, particularly when formulating variable pricing strategies.

3. METHODOLOGY

The purpose of this research is to evaluate user satisfaction in the hospitality industry with existing software solutions that help to synchronize hotel Property Management Systems with booking platforms that they use. The aim of the research is to answer the question to what extent the hoteliers use the ICT

tools offered on the hospitality market and how satisfied they are with their performance. In addition to the work organization within the online sales segment and/or revenue management department, the purpose is to see to what extent the dynamic parameters of the work process are synchronized in real time.

The research was conducted in the period from March 2015 to January 2016 and included 11 largest hotel chains in the Republic of Croatia, namely 130 hotels, which are part of domestic and/or foreign brands. The research was conducted by Sales Managers, Reservation department or in the Revenue Management department.

In this study, the survey method was used. The research instrument was a structured questionnaire consisting of three parts. The first set of questions was related to some of the basic features of hotel chains, such as the number of hotels in the company, the category of hotels, the total number of rooms and employees in the hotel chain. The second set of questions were designed to allow managers to express their satisfaction about the hotel ICT solution such as Property Management Software, Online Hotel Reservation System, Central Reservation System, Mobile Versions of Booking System, Channel Management Software, Business Intelligence Software, Revenue Management Software, and Yield Management Software.

Table 1. Survey method (third part)

#	Question
1	When the hotel is fully booked who or which system closes sales?
2	Who or which system changes rates on the OTA??
3	Who or which system changes rates on the hotel website?
4	Who does the BAR rate adjustments on the internet?

The third part of the questionnaire contained identification questions about online booking and synchronization of the hotel reservation processes. The questions are about how to close sales when hotels are fully booked, how to change rates on OTA portals, how to change the rates on a hotel website and how to change BAR rates on GDS (Table 1). The results were analyzed by using the software package SPSS (Statistical Package for the Social Sciences). The data were analyzed by using the method of descriptive statistics.

4. FINDINGS

Average grades of hotel satisfaction with each system are shown below. Managers have been given the opportunity to evaluate their satisfaction using the five-stage Likert scale, where 5 represents the highest rating and 1 is the lowest (Table 2).

Table 2. Evaluation of the manager’s satisfaction by using hotel software

Items	Mean	SD
Property Management System (PMS)	3.22	0.416
Online Hotel Reservation System (OHRS)	4.25	0.558
Central Reservation System (CRM)	4.18	0.710
Mobile Versions of Booking System	4.00	0.537
Channel Management Software	4.20	0.623
Business Intelligence (BI) Software	4,00	0.000
Revenue Management (RM) Software	3.71	0.948
Yield Management (YM) Software	3.09	1.449
Overall average rating	3.83	-

(Note: Likert scale rating covers 5 degrees, where rating 1 is very satisfied, and rating 5 very unsatisfied).

Source: author’s research

The average rating of the hotel system’s satisfaction ranges from 3.09 to 4.25. The results of descriptive statistics indicate that respondents are very satisfied with the Online Reservation System ($M = 4.25$) and the Channel Management Software ($M = 4.20$). They are at least satisfied with the capabilities provided by Yield Management Software ($M = 3.09$). Most of the ratings are in the upper part of the rating scale, which is the total average rating, according to which the respondents are satisfied with the hotel systems used. Apart from Yield Management Software, respondents are also content with Property Management Software ($M = 3.22$). The standard deviation values show very slight deviations of the data from the average value, i.e. from the arithmetic mean.

When organizing business within the online sales segment and/or revenue management departments, the following questions are asked to determine the extent to which the dynamic parameters of the work process are synchronized.

Table 3. The way of closing sales when the hotel is fully booked

Closing sales when the hotel is fully booked	Frequency	Percentage
Person	114	87.7
System	16	12.3
Total	130	100.0
Name of system		
Opera	8	6.2
PHOBS	4	3.1
No answer	118	90.8
Total	130	100.0

Source: author's research

The results show that when the hotel is fully booked the hotel sales capacities are most often closed by the person (87.7%). The hotels that use the capacity locking system often use the Opera system in relation to the PHOBS system (Table 3).

Table 4. The way of changing rates (rate adjustment) on OTA portals

Rate adjustment on OTA	Frequency	Percentage
Person	107	82.3
System	23	17.7
Total	130	100.0
Name of system		
Channel Managers: Synxis and PHOBS	17	13.1
Person and TRUST	8	6.2
Ideas/PHOBS	5	3.8
My Fidelio	8	6.2
PHOBS	8	6.2
Valhalla	2	1.5
Rate Gain	37	28.5
No answer	45	34.6
Total	130	100.0

Source: author's research

Table 4 shows that hoteliers continue to manually change their rates on OTA portals, as the results show that the rates are most frequently changed by a person (82.3%). For the rate adjustment on OTAs, the Rate Gain (28.5%) system is most commonly used.

Table 5. The way of changing rates (rate adjustment) on a hotel website

Rate adjustment on a hotel website	Frequency	Percentage
Person	84	64.6
System	46	35.4
Total	130	100.0
Name of system		
Synxis (person via Synxis)	17	13.1
Ideas/PHOBS	5	3.8
My Fidelio	8	6.2
PHOBS	22	16.9
Valhalla	2	1.5
No answer	76	58.5
Total	130	100.0

Source: author's research

Even the rate adjustment on hotel own website in most hoteliers is not synchronized because the PMS systems used by hoteliers are not 2 way connected to the reservation system. According to the numbers of the above research, the results show that in most hotels in the sample (64.6%) rates on the web are changed by people. Still, 35.4% of the hotel uses the rate-changer system on their own web site, and although this system is not a hotel PMS (which would be ideal), it's a more cost-effective solution. Hotels that use the system to change rates on the web are most often using the PHOBS system (16.9%) and Synxis (13.1%). As such, 35.4% of hotels have a higher level of data synchronization, although it is not in real time because it takes at least half an hour for the data to reach the end destination (table 5).

Table 6. The way of adjusting BAR rates on GDS

Adjusting BAR rates on GDS	Frequency	Percentage
Person	112	86.2
System	18	13.8
Total	130	100,0
Name of system		
PHOBS	18	13.8
No answer	112	86.2
Total	130	100.0

Source: author's research

In 86.2% of hotels in the sample, the BAR rates on the Internet or GDS are adjusted by people. Hotels that use the rate change system on the internet use the PHOBS system (Table 6) for this purpose.

5. DISCUSSION AND CONCLUSION

Today's hotel software solutions development as well as web portals participating in the sales process of hotels or hotel chains completely determine the concept of rate distribution and sales strategies, especially marketing activities and sales promotion of services offered. The goal is to reduce manual entry and have up-to-date rates, accurate room occupancy levels – ARI (availability, rates, and inventory) (Ling et al., 2015). If the ARI connection is not well set up and synchronized to the maximum as current technology allows, there is a risk of overbooking as well as rate parity policy violations.

The results of this paper show that the managers of revenue management departments are moderately satisfied with the tools that exist in the market. It should be added to this statement that as the technological revolution of online rates placement and adjustment has occurred abruptly hotel sales and revenue management departments have to adjust to current conditions either by monitoring and budgeting through excel tables or by with hotel systems if they are lucky. (Chathoth & Law, 2011). However, today's guest requests through online sales channels are still a huge challenge.

These research results suggest that hoteliers continue to believe in their own estimates rather than software solutions, that the software they use does not offer the ability to synchronize the online room capacity availability in real time. For this reason, in the various steps of reserving or booking the capacity, it is still the person who makes and executes the decisions.

This conclusion is corroborated by the results of research that show how systems are used in the following percentages for the main tasks of Revenue Manager:

- When closing hotel sales due to overbooking 12% of the hoteliers use the software to do it.
- When adjusting rates on OTA portals, 17% of hoteliers use some hotel system.

- ♦ When changing rates on a hotel's own website, 35% of hotel managers use some hotel system.
- ♦ When adjusting rates on GDS, 13% of hotel managers use some hotel system

The scientific contribution of this work is reflected in the research of the most actual hospitality topic, which is the rate and inventory placement on on-line sales channels through the use of hotel software tools, which is a recommendation for further scientific research that gives important implications for theory and practice. Although research has been carried out in detail, limitations of the conducted research may be reflected in the fact that research was carried out at hotel chains in Croatia and therefore research has a spatial limitation since it is carried out solely on the example of one state, ie there is no comparison with other, similar or different destinations in the world.

Abstract

Marketing aims to satisfy consumer needs on the one hand and satisfy the needs of entrepreneurial subjects by gaining profits on the other. In the 21st century, the basis of business and marketing is the Internet, i.e. digital advertising. By comparing entrepreneurial and political subjects, a conclusion arises that marketing of political subjects aims to gain votes, i.e. the long-term positive perception of the public towards certain candidates or parties. Political subjects use modern techniques of marketing in order to accomplish their goals. The term political marketing refers to a set of techniques that aim to contribute to

the adequacy of candidates in reference to their potential body of voters. The goal of political marketing is to familiarize the highest possible number of voters with a candidate or a party they represent, to emphasize the differences from the competition and to optimize the number of votes necessary to gain during a campaign in order to win the elections.

This paper presents results of research whose main goal was to determine the effect of political marketing in a digital environment on gender, i.e. the analysis examined whether political marketing in the digital environment affects more men or women. Voters in IV and VIII electoral units were analyzed during the election campaign for Croatian Parliament in 2016. The hypothesis is: "Political marketing in the digital environment has a lesser impact on men than on women". The research was conducted through a questionnaire among potential voters. The examined group is defined as a stratified sample. Two electoral units were chosen due to their differences; IV as a primarily rural electoral unit and VIII as a primarily urban electoral unit. The conclusion was that political subjects and political marketing in the digital environment have a greater impact on women than on men, but differences are not as drastic. Generally speaking, the impact of political marketing on voters in the Republic of Croatia is very low. This research contributes to a better understanding of e-marketing implementation. Results can be used for the purpose of improving political e-marketing.

Keywords: *marketing, political marketing, digital environment, impact on voters*

1. INTRODUCTION

Influence of marketing activity is incredibly difficult to define and classify. One of the most popular branches of marketing in the 21st century is neuromarketing. The term represents a multidisciplinary scientific branch that encompasses a combination of marketing and neurology in which scientific methods measure emotional reactions of consumers, such as breathing pace, heartbeat, body movement and sweating. The goal of the aforementioned scientific discipline is to discover how the brain reacts to a certain marketing move. Scientifically proven fact states that 70 to 80% of purchase decisions are made without planning and unconsciously explains the growth of investment and research of new scientific disciplines. Consumers make decisions emotionally but try to

explain them rationally. Experts dealing with neuromarketing research the human brain in order to get closer to the customer. The fact is that each market is surrounded by a large competition. In a struggle among sellers, sophisticated ways of attracting attention are used, as well as advertising aimed at a precisely segmented audience, research that is becoming more unusual.

Marketing attracts great attention of all participants of the market competition. Today's marketing aims at pleasing the needs of consumers on one side and pleasing the needs of entrepreneurial subjects by gaining profits on the other. In very competitive advertising industry, science is becoming an important tool in clearly determining what kinds of marketing campaigns and products refer to a potential consumer. The only goal of marketing is to sell a certain product or a service. It denotes a business concept of entrepreneurial subjects. With market development and growth of competition, influences of marketing activities on the market are intensified as well. 21st-century marketing is based on e-commerce, or in other words, on the Internet.

Most users are always in proximity to their mobile devices that are usually connected to the Internet. Due to that reason, e-marketing and digital management are positioned as an unsurmountable part of business subjects' strategy. Besides focusing on transferring marketing activities on the Internet, modern marketing experts connect knowledge of marketing and neuromarketing in order to be more successful. By researching and analyzing political marketing, a question arises; is there a difference between business subjects and political parties? Marketing of political subjects has a goal of gaining votes, or in other words, a long-term positive perception of the public towards a certain candidate or a party. In the Republic of Croatia, political marketing is active during the election campaign, while during the realization of the political term it comes down to informing citizens on current events on a daily basis.

Political subjects use modern techniques of marketing in order to achieve their goals. The term political marketing refers to an aggregate of techniques whose goal is to contribute the adequacy of a candidate with reference to his potential voter body. The goal of political marketing is to familiarize the highest possible number of potential voters with a candidate or a party they represent, to emphasize the differences compared to the competition as well as opponents, and to optimize the number of votes necessary to gain in order to win the election using minimum resources. As well as business subjects, political subjects

use all familiar marketing techniques, including neuromarketing, in order to achieve bigger sales, or as political subjects, to gain a higher number of votes on the elections. Digital marketing is explained by political subjects in a way that they are trying to reach hesitant voters who will, due to their presence, circle their candidate's number on the elections.

This paper analyzes the impact of political marketing in a digital environment with regard to gender, or in other words, whether political marketing in a digital environment affects more women or men. The hypothesis is: "Political marketing in the digital environment has a smaller influence on men in comparison to women". The aforementioned hypothesis is brought with an assumption that men in the Republic of Croatia follow political events more than women, which results in decision making about a selected candidate or a party prior to elections and election campaigns.

The paper uses research conducted by the author (Stilin) who used a part of the research for a Ph.D. thesis titled "Political marketing in the digital environment". The paper is based on primary and secondary research. Methods of analysis, questionnaire, interview, compilation and synthesis we used. This research contributes a better understanding of the use of e-marketing in political campaigns. Results can be used to improve political e-marketing, as well as serve as a framework for further research. Voters of IV and VIII electoral units we analyzed during the election campaign for Croatian Parliament in 2016 with a goal of determining the influence on decision making concerning parties and candidates of a certain age segment of voters, by which it is determined which role social networks, or digital marketing plays, and which age group is under bigger influence of Internet media when choosing parties and candidates.

2. IMPACT OF POLITICAL MARKETING IN DIGITAL ENVIRONMENT ON GENDER

Nowadays marketing is not explained by its old definition: story and sales, but by new meaning that fulfills the needs of consumers. Marketing activities are done during the entire lifespan of a product, trying to find new consumers and keep the current ones by improving the attractiveness and product quality, based on facts provided by the sales results and managing repeated orders. There are various definitions of marketing:

- ♦ Marketing is a process that plans and conducts creation of ideas, products, and services by determining their price, promotion and distribution in order to achieve trade that realizes goals of subjects and organizations (Dibb et al. 1995: 4).
- ♦ A social and managerial process by which individuals and groups obtain what they need and want through creating and exchanging products and value with others (Kotler, 2001: 17).
- ♦ Marketing is a social process in which subjects and groups achieve what is needed and wanted by creating, offering and freely trading products and services of certain value with others (Renko, 2009: 5).
- ♦ Modern marketing denotes a business activity that connects manufacture with consumption in order to maximally and with profit fulfill the needs of a society that occurs on the market as demand (Rocco, 1994: 19-20).

As it is commonly seen in all marketing definitions, it is a process that ensures the sale of products or services in a way that satisfies the needs of consumers, that is to inform them of what they need. Marketing creates the need and tries to find those individuals who have a demand for these products. Based on the above definitions, the concepts of political marketing and political marketing in the digital environment will be analyzed. Political entities behave like business entities. They use market information in order to influence shaping the products they offer. Each political subject is oriented towards voters. Of course, there is a difference between marketing and political marketing. The biggest difference is that political marketing offers promises. Political subjects offer their program that aims to create interest in voters in order to result in entry to the polls and choosing a certain candidate. Buyers, or in this case, voters after elections do not have certainty whether his candidate will, in case of victory, implement the promised program and bring desired changes.

Below, the paper will theoretically present political marketing in a digital environment and present the results of the research of the impact of political marketing in a digital environment on the user's gender.

2.1. POLITICAL MARKETING

The most complete definition of political marketing is: "Political marketing is a set of techniques whose goal is to contribute the adequacy of a candidate

with regard to his potential body of voters, to familiarize the largest number of voters and each of them individually with the candidate, to emphasize the differences with regard to competition and opponents and to optimize the number of votes necessary to gain during the campaign using minimum resources (Bongrand 1997: 15). It is necessary to emphasize that political marketing is not only the utilization of marketing techniques in politics. Strategic political marketing process consists of the following phases (Lees-Marshment et al, 2010: 5-8):

1. Market research – using various methods, such as questionnaires, focus groups, interviews, with the goal of market segmentation. The first phase of political marketing process strives to research exactly what voters want from political subjects. This phase is conducted prior to the making of a campaign and political program.
2. Designing a political product – in the next phase, political subjects design their product according to research results and their personal beliefs. Certainly, the political program cannot be completely done according to market wishes because voters' wishes can differ from the basic ideology of a political party.
3. Product adaptation – political subjects have to present a political program that is feasible. If elections are won with the false and unrealized program, defeat on the next elections is inevitable.
4. Implementation – political subjects are expected to implement the program.
5. Communication – for successful communication of a program, it is necessary to engage marketing experts to lead a political campaign. Political marketing is a specialized form of marketing, not every marketing agency knows how to carry out.
6. Campaign – during a campaign, a party continuously promotes a key message or a slogan they perform with on the market. The goal is to reach the highest possible number of voters, which is achieved through political marketing in a digital environment. Mass media are used in order to achieve greater visibility among voters.
7. Elections – marketing communication is carried out with the goal of winning the elections. The goal of each party is to gain the highest possible number of terms and to partake in the implementation of authority.
8. Realization of the program (product delivery) – it is logical that political subjects, following the elections, realize a promised program.

9. Follow-up of market orientation – following the elections, political parties continue to implement their marketing campaign in order to have a good rating up until the next elections.

As evident, the strategic political marketing process is a complex process that brings long-term success. Political subjects through such activity achieve credibility, which results in a growth in a number of votes on the elections. However, it must be emphasized that this is only a theory. In the Republic of Croatia, political marketing is in most cases implemented only during election campaigns. Interesting is a comparison between before and after, which refers to the implementation of a political program. A small number of promises is fulfilled, and programs are removed from political subjects' websites. It is surprising that voters go to the polls and choose the same or similar political subjects. In the business world and classical marketing that sells a product or a service, such situations are repeatedly condemned by the market, which results in closing. In politics, promises are easily forgotten and media receives news that direct attention of the public in another direction.

The goal of each political marketing is coming to power. Following the comparison of phases of political marketing, one could conclude that there are no differences between products of business subjects and products of political subjects. In both cases, the marketing process begins with market research, designing a product, market adaptation and influencing the market in order to accept the product. Main participants of political marketing are political subjects (political parties, public organizations, pressure groups, terrorist organizations, governments...), media and citizens (Tomić et al., 2008: 39-40). Main channels used by political marketing are electronic media (radio and television), print media (daily and weekly press, magazines...), display media (posters, billboards), interpersonal communication channels (personal contact) and the Internet. In the next part of the paper, political marketing through the digital environment is presented. In the 21st century, the basis of each communication is the Internet. Each communication, regardless of a channel, must be coordinated and at the same time released to all channels. Today's average citizen watches less television or reads papers, but spends more time online. Due to that fact, more resources are invested in digital marketing, and political marketing is based on marketing in a digital environment.

2.2. POLITICAL MARKETING IN DIGITAL ENVIRONMENT

The digital environment, or in other words, marketing in a digital environment represents a term e-marketing. The stated term is fully explained by the following definition: "Electronic marketing (short for e-marketing) is defined as a process of creating an offer, determining the price, distribution, and promotion with the goal of profitable fulfillment of buyers' needs and wishes through intensive use of digital technology potentials (Ružić et al., 2014: 39)." Influence of the Internet is nowadays immeasurable. Because of that, political subjects use e-marketing in order to achieve the best results on the elections. The Internet has changed lives and shaped new trends. New technologies influenced the development of new forms of communication and promotion. Nowadays every Internet user has access to an e-mail and other information and promotion channels. Political marketing in a digital environment has a large potential. All media increase information flow, but the Internet is the leader.

When defining the role of the Internet, John Street emphasizes: "Traditionally, citizens have been passive recipients of political information from their papers, radio stations, and television channels. They have enjoyed a modest degree of participation through letters columns, phone-ins and the like, but for the most part, they have been consumers of political information. The internet appears to change all this, enabling people to become more involved, to interact with the political realm (Street, 2003: 180)". The main advantage of the digital environment is that it can transfer a large amount of information to every corner of the world. Politicians cannot allow themselves to lead a campaign without a website, social networks profiles, and other techniques of Internet presence. The activities above are used to get closer to voters, while voters have more direct contact with them.

We have now come to the term presented in the introduction – neuromarketing. The term represents a combination of marketing and neurology that uses scientific methods to measure emotional reactions of consumers, such as breathing pace, heartbeat, body movement and sweating. The goal is to discover how the brain reacts to certain marketing activity. Neuromarketing has proven to be a powerful tool for understanding the motives of consumers' decisions and, more importantly, for performing a hidden influence on their decisions. It uses the technology of comprehensive brain display to measure brain activity and by that get subconscious responses of consumers to stimuli such as brands, products, packaging, promotion and other marketing elements; in other words,

all relevant questions of satisfaction, commitment, and loyalty. In other words, the stronger the positive emotions created in consumers by a certain slogan, picture or an advertisement, the more valuable the marketing message.

Research shows that a higher level of presence of positive emotions during purchase is connected with consumer's motivation, who will, in such conditions, decide on the purchase of a certain product. Of course, the highest number of decisions on purchase is brought without planning and subconsciously. 70-80% of purchase decisions are brought subconsciously in the brain, even before the buyers-consumers experiences the result of decision making as their own and self-willed in their consciousness. There are six motivational and emotional areas in the brain. Psychological research have proven that a man, apart from vital needs, nutrition, sleeping, sexuality and basic motivational and emotional areas, so-called "Big 3" that determines thinking and action of consumers, which are balance (stability, safety, order), dominance (status, power, gain) and stimulation (curiosity, wish for experiencing, creativity). Each buyer brings a decision emotionally but tries to explain it rationally. Neuromarketing deals with research into the human brain in order to get closer to the consumer and promote its product or service more successfully. Knowledge of how the brain functions pay off greatly. Due to that fact, neuroeconomists invest resources to discover how the bringer of all decisions functions - the brain. There are various techniques for measuring what happens in the brains of consumers faced with a product.

Based on the aforementioned research, political subjects conclude that an excellent tactic is to be omnipresent. Neuromarketing plays with senses; it influences the listener of a certain message to react in a way that suits the advertiser. Big companies design marketing techniques with the help of medicine and other sciences, doing experiments on consumers in order to determine what happens in consumers' brain when they hear or see a certain advertisement. One of the studies shows how there is a greater chance that a person who votes in the election and is indecisive who to vote for, will opt for a person or a political party that positively influences their brains. Also, there is a greater chance that political subjects will gain a higher number of votes if they continuously promote themselves in the most visited places nowadays – the Internet.

Due to that fact, political subjects use all available digital marketing methods, neuromarketing, and guerilla marketing as well, in order to increase chances of winning the elections. Today political subjects create a competitive advantage us-

ing political marketing. The goal of e-marketing is to commence a dialogue with voters, which is enabled by the Internet in a quick and affordable manner. The entire election process and political action is a process of communicating. Development of electronic media and use of the Internet has influenced new approaches to shaping political content. It is an additional source of information for interested voters, as well as a way of finding disinterested voters. The Internet has become an ideal channel for accomplishing relevant tasks important for campaign success.

The most important tasks of each political campaigns facilitated by the digital environment are (Stilin, 2019: 149-150):

- ✦ Organization of pre-election campaign – simple use that enables effective and quick communication and flow of information and materials. It enables sending of the advertising material, sending the invitations, coordination of tasks... It increases the efficiency of political action and perfects the process of preparation.
- ✦ Mobilization of members – Internet is good for mobilizing party members and voters, recruitment of volunteers and transmitting messages on why their engagement is important and necessary for campaign success.
- ✦ Collecting funds for a campaign – the Internet is used for the collection of donations for the pre-election campaign. The aforementioned refers to the United States of America. In the Republic of Croatia, pre-election campaigns are financed by the budget of the party, donations, membership fees...
- ✦ An informative resource for media and voters – political parties and candidates use their Internet presentation largely for their media work.¹ Using the Internet, they prepare press release and information for other media. Through political subjects' websites, they place information as archive material.
- ✦ Segmentation of voters with regard to beliefs – the Internet enables segmentation of the market, or in other words, communication with potential voters. Political subjects create content that will attract their political like-minded fellows. The goal is to attract the user and make him interested in a political program, which can result in voting on the elections.

Political marketing that alongside traditional marketing techniques uses digital environment has a great potential for achieving success. Strategically

¹ Tomić, Z.: Political marketing - principles and application. University of Mostar, Mostar - Zagreb - Sarajevo, 2014, pg 469.

planned e-marketing communication can help political subjects in relationship with the external and internal public. It is necessary to emphasize how the website and social networks communication widens the available communication channels, reaches the public, enables change of public opinion, enables dialogue without a mediator, and brings politicians closer to the public... In conclusion, political marketing in a digital environment is a fundament of each election campaign of a serious political party. The impact of political marketing on gender will be presented further in the paper.

2.3. RESEARCH OF THE IMPACT OF POLITICAL MARKETING IN A DIGITAL ENVIRONMENT ON GENDER

The research hypothesis is: "Political marketing in the digital environment has a lesser impact on men in comparison to women". Voters from IV and VIII electoral units were analyzed during the election campaign for Croatian Parliament in 2016. Impact of political marketing in a digital environment on gender is analyzed, in other words, whether political marketing in a digital environment affects men or women more.

The aforementioned hypothesis is set with an assumption that men in the Republic of Croatia follow political events more than women, which results in bringing decisions about candidates or parties prior to elections or election campaigns. As mentioned in the introduction, the paper uses research conducted by the author (Stilin) who used a part of the research for his Ph.D. thesis titled "Political marketing in the digital environment". The study is based on primary and secondary research.

The research was conducted through a questionnaire among potential voters. Promocija plus from Zagreb used CATI system during the political campaign for parliament elections in August 2016 to conduct a questionnaire on a representative sample of participants in a political process in IV and VIII electoral units.

The goal of the questionnaire was to examine a sample of Internet users' about voting and following the campaigns in two electoral units. The sample in question is defines as a stratified sample. The process of stratification was conducted based on counties and the size of the settlement for the individual electoral unit. Two units were chosen due to their differences; IV as a predominantly rural unit and VIII as a predominantly urban electoral unit.

IV electoral unit chosen as a predominantly rural unit encompasses:

- Virovitica – Podravina County and
- Osijek – Baranja County.

VIII electoral unit chosen as predominantly urban unit encompasses:

- Istra County and
- West part of Primorje – Gorski kotar County (cities and municipalities: Baška, Cres, Crikvenica, Dobrinj, Kostrena, Kraljevica, Krk, Lovran, Mali Lošinj, Malinska – Dubašnica, Matulji, Mošćenička Draga, Omišalj, Opatija, Punat, Rab, Rijeka, Vrbnik).

In IV electoral unit, research was conducted on 703 participants. All participants use the Internet, while 490 of them use social networks. The difference is in the frequency of Internet and social networks use. Some participants use the Internet and social networks daily, while some users use the Internet and social networks several times per day. In the following paragraphs, questionnaire results researching the impact of political marketing in a digital environment on gender will be shown.

Table 1 – Gender structure of participants in IV electoral unit

	TOTAL	
	N	%
Male	307	43,7%
Female	396	56,3%
Sample (N)	703	100,0%

Made by the author based on the conducted research

Table 1 shows the gender structure of participants in IV electoral unit. In VIII electoral unit research was conducted on 700 participants. Similar to IV electoral unit, all participants use the Internet.

Table 2 – Gender structure of participants in VIII electoral unit

	TOTAL	
	N	%
Male	268	38,3%
Female	432	61,7%
Sample (N)	700	100,0%

Made by the author based on the conducted research

Table 2 shows the gender structure of participants in VIII electoral unit. As in IV electoral unit, a larger number of participants are female. Further, in the paper, an answer according to gender will be analyzed to a question “Did you make your voting decision prior to an election campaign or during the election campaign?”. In IV electoral unit 78,5 % answered that they brought the decision prior to a political campaign, while 29 or 9,45 % of participants brought the decision during the campaign. 24 of them still had not made the decision, while 8 of them emphasize how the campaign will not influence their decision. A small percentage of participants do not know whether the decision was made during or prior to the election campaign. The aforementioned data reveal that an election campaign has little influence on the citizens of the Republic of Croatia because over 80 % of participants made their decision about voting prior to the election campaign.

Table 3 – IV electoral unit men – Did you make your voting decision prior to or during the election campaign?

	TOTAL	
	N	%
I made a decision before prior to the campaign	241	78,5 %
I made a decision during the campaign	29	9,45 %
I still have not made a decision	24	7,82 %
The campaign will not affect my decision	8	2,61 %
I do not know	4	1,3 %
